REVIEW OF METAL LITERATURE

An Annotated Survey of Articles, Technical Papers and Reports Appearing in Engineering, Scientific and Industrial Journals and Books, Here and Abroad, Prepared at the Center for Documentation and Communication Research, Western Reserve University, Cleveland, Ohio.

Volume 16
1959

AMERICAN SOCIETY FOR METALS

LITHOPRINTED IN THE UNITED STATES OF AMERICA BY
CUSHING - MALLOY, INC., ANN ARBOR, MICHIGAN, 1960

PREFACE

The A.S.M. Review of Metal Literature is published monthly by the American Society for Metals and distributed to its members. The present volume is a collation of the issues from January through December 1959. It is the sixteenth volume in a series that began in 1944.

In most instances, the annotations are not intended to serve as a substitute for a reading of the articles listed. They are brief abstracts designed to indicate the scope and content of the article so that the reader may determine whether it is something he wants to read in its entirety. In other words, they are indicative rather than informative abstracts.

The table of contents lists the main headings into which the A.S.M. Review of Metal Literature is subdivided, together with secondary subdivisions indicating the scope of the main heading. The main sections are designated by capital letters, and individual annotations are identified by the appropriate capital letter preceded by a serial number.

The method of classifying the annotations into subject subdivisions is based upon the "ASM-SLA Metallurgical Literature Classification, International (Second) Edition," published by the American Society for Metals in 1958. Each annotation is likewise followed by code symbols which refer to the subdivisions and schedules of the ASM-SLA Classification.

An understanding of this coding system, however, is not essential to the use of this volume of the Review of Metal Literature, which is accompanied by a complete subject index starting on page 1107. Since the annotations are classified primarily by processes and properties, the subject index has been prepared with the emphasis primarily on materials. Subheads are included in sufficient detail to permit the location of articles on any specific subject related to the metal industry. Indexing is based on the content of the article and not merely on the title.

In using the book, if the primary interest is in the broad field of corrosion, or foundry practice, or heat treatment, turn immediately to the respective section as given in the table of contents. If the main interest is in aluminum alloys, or copper, or cast iron, turn to the corresponding heading in the subject index. If interest lies in specific aspects of foundry practices, or a particular type of heat treatment, these broad processes will be found indexed and subdivided in the subject index. An author index is also provided and a list of addresses of the journals and periodicals from which the literature references are taken.

PREFACE

The annotations have been prepared by technical abstractors and translators under the direction of Alan M. Rees, Manager, Acquisitions and Analysis Department, Center for Documentation and Communication Research of Western Research University.

TABLE OF CONTENTS

Section A. GENERAL METALLURGY 1

History; education; statistics and economics; plant management; industrial relations; health and safety; industrial pollution and waste disposal; research and development; conservation of resources; professional activities; laws and legal actions; literature techniques; audio-visual techniques

Section B. ORE AND RAW MATERIAL PREPARATION 46

Sampling; mining methods; crushing, grinding and sizing; concentration (beneficiation); roasting and calcining; sintering processes; fuel distillation and gasification; processing of fuels; processing of refractories; processing of scrap; water treatment; production of industrial gases

Section C. EXTRACTION AND REFINING 59

Chemical extraction; smelting (except iron and steel); distillation; electrolytic processes; nonferrous vacuum reduction and refining; reduction by metals and gases; precipitation; separation of metals; amalgamation; decomposition; nonferrous melting and casting; isotope separation

Section D. IRON AND STEELMAKING 101

Blast furnace practice; openhearth practice; converter processes; electric arc processes; multistage processes; special processes; ingot casting; oxygen furnace processes

Section E. FOUNDRY 160

Melting techniques; sand casting; permanent mold casting; die casting; centrifugal casting; precision investment casting; other methods; pattern making; sand technology; molding; coremaking; rigging; pouring; casting cleaning; metallurgical control; casting reclamation

Section F. PRIMARY MECHANICAL WORKING 206

Preparation for working; forging (hammer and press); rolling; extrusion of rod, shapes and tube; swaging; tubemaking (except extrusion); drawing of rod and shapes; wire drawing; finishing operations; applied mechanics of primary metalworking (stress analysis)

Section G. SECONDARY MECHANICAL WORKING—FORMING AND MACHINING 230

Presswork in general; shearing; stamping; drawing; impact and cold extrusion; bending; stretch forming; heading; roll forming; thread rolling; spinning; bulging; die sinking; machining (mechanical); grinding; finish machining; flame and arc cutting; finish forming; special machining methods; applied mechanics of forming and machining (stress analysis)

Section H. POWDER METALLURGY 267

Powder production; powder properties; mixing and blending; molding or compacting; sintering; post-sintering operations; fiber metallurgy

Section J. HEAT TREATMENT 285

Homogenization; austenitizing; annealing; normalizing; patenting; quenching; precipitation hardening; case hardening; tempering; residual stress control; heating and cooling methods; other carbon diffusion processes; surface alterations; hardenability

Section K. ASSEMBLING AND JOINING 313

Arc welding; gas welding; resistance welding; thermit welding; forge welding; other welding processes; soldering; brazing; process control; bonding metals to nonmetals; adhesive joining; mechanical assembling

Section L. CLEANING, COATING AND FINISHING 370

Mechanical cleaning and polishing; chemical cleaning and polishing; electrochemical cleaning and polishing; chemical conversion coating; diffusion coating; dip coating; electroplating; electroforming; anodic coating; cathodic oxide coating; cladding or bonding; metal spraying; coating by weld deposition; coating by vapor deposition; painting and organic coating; ceramic coating (vitreous enameling); coating by chemical reduction; other methods

Section M. METALLOGRAPHY, CONSTITUTION AND PRIMARY STRUCTURE 437

Specimen preparation; microscopy; diffraction methods; other techniques; phase diagrams; atomic and molecular structures; crystal structures; primary microstructures; macrostructure

Section N. TRANSFORMATIONS AND RESULTING STRUCTURES . . . 506

Diffusion; nucleation; grain growth; recovery; recrystallization; diffusionless transformations; precipitation; austenite formation and decomposition (Fe-C system); other eutectoid reactions; superlatice formation (order-disorder); other solid-state reactions; liquid-solid reactions; liquid-liquid reactions; gas-solid reactions; gas-liquid reactions

Section P. PHYSICAL PROPERTIES AND THEIR MEASUREMENT . . . 578

Mass and volume; thermal; thermodynamics and kinetics; chemical kinetics; electrical and electrochemical; magnetic; radiation properties (electromagnetic); nuclear

Section Q. MECHANICAL PROPERTIES AND TESTS 646

Elastic properties; anelastic properties; miscellaneous plastic properties; plastic deformation mechanism; stresses; fracture mechanism; tensile properties and tests; compression properties and tests; hardness and hardness tests; torsion properties and tests; shear properties and tests; creep properties and tests; bend properties and tests; impact properties and tests; fatigue properties and tests; damping properties and tests; wear properties and tests; other properties and tests

Section R. CORROSION 801

Mechanism of corrosion; corrosive effects; atmospheric corrosion; by waters; by chemicals, inorganic; by chemicals, organic; by soils; preventive measures; tests

Section S. INSPECTION AND CONTROL 879

Sorting and identification; composition analysis; statistical analysis and control; flaw detection; size, thickness and mass measurement; surface roughness; temperature measurement and control; process control and measurement; radiation detection and measurement; miscellaneous service testing (life testing); standard practice and specifications; calibration

Section T. METAL PRODUCTS AND PARTS 915

Automotive; marine; railroad; aircraft; structures; mining and oil field equipment; chemical processing equipment; electrical and electronic components; ordnance material (excluding explosives); agricultural equipment; civil engineering equipment; tools and hardware; machine parts; arts and crafts; consumer goods; nuclear reactor components

Section W. PLANT EQUIPMENT 942

Plant installations; power generation and distribution; materials handling; general service equipment; ore and raw material preparation; fuel distillation and gasification; furnaces and equipment for primary metallurgy; melting and refining furnaces and equipment; casting; ingot and slab preparation; forging; rolling; forming and shaping; machine tools; powder metal processing; heat treating furnaces; other heat treating equipment; welding, brazing and soldering; mechanical assembling; mechanical cleaning and finishing; chemical and electrochemical cleaning and finishing; other cleaning and finishing

Section X. INSTRUMENTATION—LABORATORY AND CONTROL EQUIPMENT 974

Size, thickness and mass; chemical laboratory; surface properties; thermal properties; electrical properties; nuclear properties; elastic and anelastic properties; mechanical properties; corrosion; radiation detection; optics and microscopy; metallography; photography and other visual aids; sorting and identification; atmosphere and humidity; flaw detection; temperature measurement; electricity; magnetism; pressure; rate, time and flow; computers and business machines; communication

ADDRESSES OF PUBLICATIONS 983

AUTHOR INDEX 999

SUBJECT INDEX 1107

SECTION A

GENERAL METALLURGICAL

1-A.* Vinyl-Metal Laminates. R. P. Hooker. *Machinery (London)*, v. 93, Sept. 17, 1958, p. 649-653.

Vinyl-metal laminated sheets are strong, decorative and easy to fabricate. The laminates can be deep-drawn, sheared, crimped, bent, punched and drilled without injury to the bond or the vinyl and show high resistance to abrasion, rust, chemicals and heat (up to 275° F.). Used commercially in automobiles, furniture tops, shelving and camera cases. (A-general; 7-59)

2-A.* Magnesium. C. E. Nelson. *Metal Progress*, v. 74, Oct. 1958, p. 125-127.

Greatly increased use of Mg is seen in die castings and extrusions. Missile applications also account for larger production. An electroless Ni plating process is now available for Mg whereby parts are immersed in a special Ni solution and plated without the use of electric current. (A-general; 5-61, 4-58, 17-57, Mg)

3-A.* Cast High Alloys. E. A. Schoeffer. *Metal Progress*, v. 74, Oct. 1958, p. 129.

High-strength corrosion resistant CD-4MCu alloy is finding many applications as a replacement for "comparable" 18-8 stainless alloys and contains 25 to 27% Cr, 4.75-6.00% Ni, 0.040% max. C, 1.75 to 2.25% Mo, 2.75 to 3.25% Cu, 1.00% max. Mn, 1.00% max. Si, 0.04% max. P, 0.04% max. S. (A-general; SGA-h, Cr, Ni, Mo, Cu, 17-57, 5-60)

4-A.* Dust Piping Modifications to Prevent Material Buildup and Wear. R. C. Ortgies. *Modern Castings*, v. 34, Aug. 1958, p. 80-82.

Slots and vents introducing dry or room air prevents excessive plugging and abrasion of elbows, pipes and ducts. Illustrates proper venting of sand mixers, aerators, elevators, rotary screens and sand bins. (A8a, E-general)

5-A.* Aluminum . . . Wrought Alloys. J. A. Nock, Jr., and F. Keller. *Metal Progress*, v. 74, Oct. 1958, p. 114-116.

New materials developed include a unique high-strength alloy for aircraft and other structures; a group of intermediate-strength alloys for welded tanks and fabricated structures; several alloys for architectural uses; a new sheet and an extrusion alloy adapted to bright finishing for automotive and appliance trim; a non-staining alloy for cooking utensils; two alloys for Al bus conductors; two alloys for use with porcelain enamel finishes. (A-general; 17-57, Al-b)

6-A.* Stainless Steels. Richard E. Paret. *Metal Progress*, v. 74, Oct. 1958, p. 116-117.

Recent additions to AISI stainless steel grades are Types 201 and 202. Type 202 has slightly greater hardness, tensile strength and ductility than 302 in the annealed condition. Its impact strength is lower than 302 and it provides slightly less resistance to corrosion. New pouring technique, known as "slag washing," produces steel free from harmful stringer-type inclusions or banding. (A-general, Q-general; SS)

7-A.* Ferrous Castings. Thomas E. Eagan. *Metal Progress*, v. 74, Oct. 1958, p. 118-119.

Recent developments in gray, nodular and malleable irons. Unique properties

of nodular iron, such as excellent machinability, good castability, a favorable range of mechanical properties, make it very popular in many applications. Advances in malleable iron have been in improved melting and molding practices. Melting practice has been improved by the use of cupola-air furnace duplexing. Annealing practices have been revised to give shorter cycles. (A-general, E-general; CI, 5-60, 17-57)

8-A.* Steels . . . Alloy and Carbon. E. W. Husemann. *Metal Progress*, v. 74, Oct. 1958, p. 120-123.

Applications of triple-alloy grades (Ni-Cr-Mo steels); boron grades; carburizing grades. Combination of Ni, Cr and Mo is good since the elements complement each other to give toughness and ductility, hardness and depth of hardenability to the heat treated part. (A-general; CN, AY, *Ni, Cr, Mo)*

9-A.* Copper . . . Wrought Alloys. Arthur I. Heim. *Metal Progress*, v. 74, Oct. 1958, p. 123-125.

An entirely new concept in a phosphor bronze strip product has emerged—a spring temper, phosphor-bronze with increased ductility of 200% or more which promises better formability, greater part uniformity and less wear, yet retains all the strength and hardness of regular spring temper bronze. Ni-Si bronze and new Al-bronze alloys discussed. (A-general; Cu-s, 4-53, *Ni, Si, Al*)

10-A.* Nonferrous Castings. D. L. Colwell. *Metal Progress*, v. 74, Oct. 1958, p. 127-128.

Interest in new Mg-base alloys with higher mechanical properties is increasing. The EK series, with additions of rare earths and Zr, the HK alloys containing Th and Zr, and the ZH and ZK alloys containing Zn with rare earths, respectively, give excellent mechanical properties. In both sand and permanent mold castings, these new Mg alloys have better properties at high temperatures than the usual Mg-Al-Zn alloys. (A-general, Q-general; 5-60, 5-63, Mg-b, *Zr, EG-g*)

11-A. Advances in the Application of Radioisotopes and Nuclear Irradiation in Metallurgical Research. M. T. Simnad. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/803, 1958, 21 p. (Available from U.S. Office of Technical Services, Washington 25, D.C.) $.50.

Application of radioisotopes to the study of segregation, friction, vapor pressure, slag-metal reactions, electrolytic action and corrosion on metal surfaces, diffusion and oxidation. 89 ref. (A-general, 1-59)

12-A. Clean Air and the Foundry Industry. H. T. Angus. *British Cast Iron Research Association, Journal*, v. 7, Oct. 1958, p. 325-329.

The various classes of emissions and effluents discharged by foundry melting furnaces in relation to the particular type of furnace concerned. Methods available for dealing with these emissions. (A8a, E-general)

13-A. Operation of the Cupola to Minimize Emissions. F. M. Shaw. *British Cast Iron Research Association, Journal*, v. 7, Oct. 1958, p. 330-334.

(A8a, E10a)

14-A. The Hot Blast Cupola: Fume Problems. T. R. Eaves. *British Cast Iron Research Association, Journal*, v. 7, Oct. 1958, p. 335-337.

(A8a, E10a)

15-A. Furnaces Used in the Malleable Cast Iron Industry and the Clean Air Act. H. G. Hall. *British Cast Iron Research Association, Journal*, v. 7, Oct. 1958, p. 343-354.

Design and operation of rotary furnaces used in the malleable iron foundry fired by pulverized fuel or oil, with special reference to the Sesci furnace. The malleable annealing furnace fired by solid or pulverized fuel. The emission of grit and fumes does not constitute a problem for such furnaces, since the recuperator acts as a dust catcher. (A8a, E-general, W18b, W27)

16-A. Fire Hazards and Their Avoidance in Organic Finishing. L. A. Smith. *Institute of Metal Finishing Bulletin*, v. 8, Summer 1958, p. 115-128.

Numerous common sources of ignition include open flames, hot surfaces and sparks and the less obvious lower-temperature surfaces and static electricity. 10 ref. (A7p, L26)

17-A. (Rumanian.) Sulphur Dioxide From Dilute Gases in Nonferrous Metallurgy. L. Grigoriu and I. Sebastian. *Studii si Cercetari de Metallurgie*, v. 1, July-Dec. 1956, p. 305-324.

(Allc; BG-a38)

18-A.* The Production of Copper. *Copper Development Association, Technical Survey*, no. 12, July 1958, 43 p.

Production, foundry practice, fabrication, plating, properties, corrosion, joining, powder metallurgy, testing and analysis, applications. 280 ref. (A-general; Cu, 10-54)

19-A.* High Speed Steel—Development of a New Type With 5% W and 5% V. Paul Kovesi. *Iron and Steel*, v. 31, Nov. 1958, p. 529-533.

Toolsteel, containing 1.25 to 1.40% C, 5% W, 5% V, shown to be an economical substitute for usual 12-18% W high-speed steels. 4 ref. (A-general, TS-m)

20-A.* Cobalt. L. Sanderson. *Canadian Mining Journal*, v. 79, Oct. 1958, p. 113-114.

Qualities, properties, uses for Co and its alloys. (A-general; Co)

21-A.* Ford's New High Strength Steels. *Tooling and Gaging*, v. 13, Nov. 1958, p. 7.

Process consists of plastically deforming metastable austenitic steels above the martensite temperature and then transforming them to martensite. High ductility possessed by the as-quenched martensite; toughness and fatigue. (A-general, J26; ST, SGB-a)

22-A.* (German.) Metallurgy of Fissionable Elements. A. Steinegger. *Chimia*, v. 12, Sept. 1958, p. 266-270.

Characteristic properties of uranium; corrosion. Coating materials for reactor bars and their neutron insulating properties. Thermal behavior of U and behavior under radiation. "Dispersion-type" uranium oxide and metallic U-type reactor bars. (A-general, T11, 17-57; U)

23-A.* (German) Electrolytic Regeneration of Used Pickling Solutions. Hans Hohn, Erich Fitzer and Gerhard Jangg. *Stahl und Eisen*, v. 78, Oct. 16, 1958, p. 1462-1469.

Extraction of Fe from used pickling solutions by mercury cathodes. Fe can be recovered from the resulting amalgam by two methods: leaching in a solution of 10 g. per liter trivalent and 50-60 g. per l. divalent iron and 25 g. per l. ammonium sulphate, followed by electrolysis; by slow distillation after increasing the size of iron particles by heat treatment. 23 ref. (A8b, A11d; Fe)

24-A.* (German.) Materials, Tests and Testing Methods. Karl Weilinger and Dietrich Vebing. *VDI Zeitschrift*, v. 100, Sept. 1958, p. 1233.

Survey of literature on filler metals for fusion welding of steel; construction materials for atomic reactors; fission materials; moderator and reflector materials; materials for control and steering apparatus; coolants. Changes of properties of graphite caused by radiation; metallurgical problems with fissionable materials; problems with reactor construction materials; their corrosion resistance in air and water; behavior under radiation; melted metals as coolants. 115 ref. (A-general, S-general, W11p)

25-A. Disposal of Plating Wastes. F. G. Green. *Canadian Technical Information Service*, TIS Report no. 55, Feb. 1958, 16 p.

(A8b, 11-65)

26-A. New Day for Newer Metals. D. J. McPherson. *Frontier*, v. 21, Winter 1958, p. 4-8.

Beryllium, titanium, vanadium, chromium, zirconium, columbium, molybdenum, hafnium, tantalum, tungsten and rhenium are included among the newer metals. Except for Hf and Re they are now promising as structural metals in the tonnage class. Though nearly all of them are expensive, and nine of them have one or both of two basic problems (reactivity with gases in the atmosphere and brittleness), they face a great future. (A-general; Be, Cb, Hf, Cr, Mo, Re, Ti, Ta, V, W, Zr)

27-A. In the Wilderness of Brazil Men Stand on Mountains of Iron Ore as They Search for Tomorrow's Steel. Nathan Federgreen. *Frontier*, v. 21, Winter 1958, p. 18-22.

Exploitation of world's richest iron ore deposits. (A11a, Fe)

28-A. Cadmium. Arnold M. Lansche. *U. S. Bureau of Mines Minerals Yearbook, 1957, Preprint,* 1958, 8 p.

Production statistics, consumption and prices. (A4p; Cd)

29-A. Chromium. Wilmer McInnis and Hilda V. Heidrich. *U. S. Bureau of Mines Minerals Yearbook, 1957, Preprint,* 1958, 15 p.

Production statistics, consumption and prices. (A4p; Cr)

30-A. Iron and Steel Scrap. James B. Larkin. *U. S. Bureau of Mines Minerals Yearbook, 1957, Preprint,* 1958, 29 p.

Production statistics, consumption and prices. (A4p; RM-p, CI, ST)

31-A. Thorium. James Paone. *U. S. Bureau of Mines Minerals Yearbook, 1957, Preprint,* 1958, 11 p.

Production statistics, consumption and prices. (A4p; Th)

32-A. Zirconium and Hafnium. F. W. Wessel. *U. S. Bureau of Mines Minerals Yearbook, 1957, Preprint,* 1958, 8 p.

Production statistics, consumption and prices. (A4p; Zr, Hf)

33-A. (German.) Copper-Bearing Sandstones in Oligozene Strata of Northern Spain. George Burg. *Zeitschrift fur Erzbergbau und Metallhuttenwesen,* v. 11, Oct. 1958, p. 478-484.

11 ref. (A11a; Cu)

34-A. (Portuguese.) Gold Will Repair the Brazilian Economy. José Frederico de Souza Martins. *Engenharia, Mineracao e Metalurgia,* v. 28, Sept. 1958, p. 145-150.

Research on exploration of old gold mines. (A11a, B12; Au)

35-A. (Portuguese.) Uranium Ores: Exploration, Concentration and Industrial Use. Octacilio Cunha. *Engenhania, Mineracao e Metalurgia,* v. 28, Sept. 1958, p. 157-159.

Research and development in Brazil. (A9, C-general; U)

36-A. (Portuguese.) Classification of the Main Minerals Found in Brazil. Olivero H. Leonardos. *Engenharia, Mineracao e Metalurgia,* v. 28, Sept. 1958, p. 161.

(A11a)

37-A. (Portuguese.) List of Brazilian Mines. Olivero H. Leonardos. *Engenharia, Mineracao e Metalurgia,* v. 28, Sept. 1958, p. 162-164.

(A11a)

38-A.* Development of Beryllium for Nuclear Reactor Applications. Pt. 2. G. C. Ellis. *Metallurgia,* v. 58, Nov. 1958, p. 243-250.

Production of ingot and powder metal, fabrication, mechanical properties. 25 ref. (A-general; Be)

39-A.* (French.) Thorium, a Fertile Metal. Marcel Englander. *Mines,* v. 13, May-June, 1958, p. 267-271.

Role of Th in atomic energy field; methods of extracting from ores; products of spontaneous disintegration of natural Th; deposits and ores; physical and mechanical properties of metallic Th; toxicity and inflammability. 3 ref. (A-general; Th)

40-A.* (French.) Sheet Metal Clad With Alloy Steel. H. Lejay. *Revue Generale de Mecanique,* v. 42, May 1958, p. 273-278.

Fabrication, machining, flame cutting, welding; advantages for applications in petroleum and chemical industries, in nuclear energy field; base steels and plating alloys. (A-general; ST, AY, 8-66)

41-A.* (French.) Blackheart and Whiteheart Malleable Cast Irons and Their Applications in Machinery Construction. M. Gailly. *Revue Generale de Mecanique,* v. 42, May 1958, p. 283-289.

Heat treatment of white cast iron to produce blackheart, whiteheart and pearlitic malleable; carbon and silicon in these irons; physical and mechanical properties; design limitations for parts of different sizes. (A-general; CI-S)

42-A.* (French.) Hot Work Toolsteels. Paul Wagener. *Revue Technique Luxembourgeoise,* v. 50, July-Sept. 1958, p. 157-179.

Indispensable and desirable properties of steels used in making forged hot work

tools; methods of measuring these properties; influence of alloying elements and heat treatment; standard alloys used in Luxembourg compared with those used elsewhere. Table of 164 American and European designations with chemical composition and hot working applications. 15 ref. (A-general, S22; TS)

43-A. Review of Iron and Steel Literature for 1957. Esther Chesire. Pt. 3. *Blast Furnace and Steel Plant*, v. 46, Nov. 1958, p. 1192-1193, 1226-1228.

140 ref. (A-general, D-general; ST, SS, 11-65)

44-A. Aluminum-Cobalt Alloys. *Cobalt Information Center*, Feb. 1957, 4 p.

Bibliography covering 1897-1957. (A-general; Al-b, Co-b, 11-65)

45-A. Cobalt in Cast Iron. *Cobalt Information Center*, Feb. 1957, 1 p.

Bibliography covering 1930-1956. (A-general; *Co*, CI)

46-A. Cobalt in Stainless Steel. *Cobalt Information Center*, Feb. 1957, 1 p.

Bibliography covering 1941-1957. (A-general; *Co*, SS)

47-A. New Corrosion Research Laboratory. *Corrosion Technology*, v. 5, Nov. 1958, p. 361-362.

Equipment and layout at Carpenter Steel Co., Reading, Pa. (A9h, R-general, 1-53)

48-A. Beryllium: Present and Potential Uses. *Engineer*, Oct. 31, 1958, p. 688-689.

Physical and mechanical properties; toxic hazards. (A-general, 17-57; Be)

49-A. Mill Scale Wastes. Grant A. Pettit. *Industrial Wastes*, v. 3, Nov-Dec. 1958, p. 133-136.

Facilities at Armco Steel Corp., Middletown, Ohio, (A8d, D-general)

50-A. Solid Cyanide Waste Incineration From Diesel Engine Manufacture. C. Fred Gurnham and Charles T. Gruner. *Industrial Wastes*, v. 3, Nov-Dec. 1958, p. 137-140.

Disposal of skimmings from molten salt heat treating baths and rinses and sludges from the electroplating of Cu and Cd. (A8b, A8d; Cu, Cd)

51-A. Heat Endurance. W. Schweisheimer. *Iron & Steel*, v. 31, Sept. 1958, p. 465-466.

Excessive temperature conditions which prevail in various phases of the metal industry affect efficiency of workers. Four factors that determine man's sensation of cold and warmth are: air temperature, humidity, air movement, radiation. Methods to compensate for these abnormal factors. (A7q)

52-A. Lithium: Its History and Growing Importance. M. Schofield. *Mining Magazine*, v. 99, Oct. 1958, p. 201-202.

(A2, A4; Li)

53-A. Production of Nickel-Base Alloys. *Oil Engine and Gas Turbine*, v. 26, Oct. 1958, p. 237-238.

New processing operations for Nimonic alloys. (A-general; Ni-b)

54-A. Coming — 3400° F. Alloys. *Precision Metal Molding*, v. 16, Nov. 1958, p. 35.

Ti-base alloys are useful up to 1600° F; Cb-base alloys may be worked up to 2500° F.; Mo and Mo-base alloys should find use up to 2600° F., W-base materials indicate working temperatures near 3400° F. (A-general; Ti-b, Cb-b, Mo-b, W-b, 2-62)

55-A. Analytical Chemical Laboratories for the Handling of Plutonium. C. F. Metz. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/533, 1958, 22 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $.50.

Elimination of biological hazards by the drybox or glove box method. (A7r; Pu)

56-A. Economics of Unirradiated Processing Phases of Uranium Fuel Cycles. J. P. Murray, F. S. Patton, R. F. Hibbs and W. L. Griffith. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/439, 1958, 25 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $.50.

Manufacture of unirradiated U fuel materials, including conversion of uranium hexafluoride to U metal and uranium dioxide; subsequent fabrication into fuel elements; processing and recycle of accrued scrap. 58 ref. (A-general, T11g; U)

57-A. Wanted: a Revolution in Manufacturing. *Steel*, v. 143, Nov. 24, 1958, p. 100-103.

Development work that must be done for aircraft and missile makers and metals industry as a whole. (A-general, T24)

58-A. Beryllium--Lighter and Stronger Than Aluminum, Stiffer Than Steel. Preston L. Hill. *Tooling & Production.* v. 24, Dec. 1958, p. 37-40.

(A-general; Be)

59-A. Aluminum. R. August Heindl, Arden C. Sullivan and Mary E Trought, *U.S. Bureau of Mines Minerals Yearbook, 1957*, Preprint, 1958, 26 p.

Comparative figures in production, trade, consumption, uses and technology throughout the world. 51 ref. (A4, A-general; Al)

60-A. Bauxite. Richard C. Wilmot, Arden C. Sullivan and Mary E. Trought. *U.S. Bureau of Mines Minerals Yearbook 1957*, Preprint, 1958, 20 p.

World production, consumption and uses, stocks, prices, foreign trade, technology. 25 ref. (A4, A-general; Al, RM-n)

61-A. Copper. A. D. McMahon and Gertrude N. Greenspoon. *U.S. Bureau of Mines Minerals Yearbook 1957*, Preprint, 1958, 53 p.

Government programs, domestic and foreign production, consumption, prices, foreign trade, technology. 31 ref. (A4, A-general; Cu)

62-A. Minor Metals. C. T. Baroch, William R. Barton, Donald E. Eilertsen, Frank L. Fisher, James Paone and H. Austin Tucker. *U.S. Bureau of Mines Minerals Yearbook 1957*, Preprint, 1958, 17 p.

Production, consumption and uses, prices, technology of Cs, Rb, Ga, Ge, In, Ra, Re, Se, Si, Te, Tl and rare earth minerals and metals. 64 ref. (A4, A-general; Cs, Rb, Ga, Ge, In, Ra, Re, Se, Si, Te, Tl, EG-g)

72-A. Continuous Removal of Fission Products From Uranium-Bismuth Reactor Fuel. O. E. Dwyer, R. M. Eshaya and F. B. Hill. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1781, 1958, 10 p. (Available from U.S. Office of Technical Services, Washington 25, D.C.) $.50.

Fuel is a dilute solution of U, Mg and Zr in B; Volatile fission products consisting principally of Xe and Kr, represent roughly $\frac{1}{4}$ of the total by weight. The Xe problem is to prevent it from collecting on core surfaces. Fission-product I and Br, as alkali and alkaline-earth halides, are also extracted. (A11d, T11g; U, Mg, Zr, Bi, Xe, Kr)

73-A.* Recovery or Disposal of Plating Wastes? R. J. Keating. *Metal Finishing,* v. 56, Sept. 1958, p. 46-48.

Ion exchange and chemical precipitation, alone or in combination, are accepted methods of solving plating waste problems. Increased use of ion exchange equipment in plating rooms has made possible the recovery of valuable constituents which previously were removed from waste streams and destroyed to meet legal requirements. (A8b; L17, NM-a)

74-A.* (German.) Tantalum - Survey Based on Recent Literature. H. Spindler. *Metall,* v. 12, Oct. 1958, p. 921-924.

Occurrence, preparation, separation of Ta and Cb; methods for winning the metallic powder; sintering; use of Ta scrap; physical and mechanical properties of compacts; working processes with compacts; applications. 12 ref. (A-general, H-general; Ta, Cb)

75-A.* (French.) Titanium. Pierre Vachet. *Metaux-Corrosion-Industries,* v. 33, Sept. 1958, p. 353-365.

History, geology, production data; chemical and metallurgical techniques for production of metallic Ti; hydrogen embrittlement; allotropic forms; alpha-beta alloys; casting, mechanical working, plating, heat treatment; physical and mechanical properties; reactions of Ti at ambient and high temperatures; applications in aircraft, armament, automobile, and chemical industries, electronics and surgery. (A-general; Ti)

76-A.* Future Metals. H. R. Ogden. *Chemical Engineering Progress,* v. 54, Nov. 1958, p. 54-57.

High-temperature properties, general corrosion behavior and applications of V, Cb, Ta, Cr, Mo, W and Re. (A-general, Q-general, R-general; V, Cb, Ta, Cr, Mo, W, Re, 17-57)

77-A.* Stainless Alloys. Present and Future. W. O. Binder. *Chemical Engineering Progress,* v. 54, Nov. 1958, p. 45-50.

Properties and applications of high-manganese stainless, austenitic Cr-Mn steel, precipitation hardening and ferritic high-temperature steels. Data for Ni-Cr and Ni-Cr-Fe alloys. (A-general; SS, Cr, Mn, Ni, Cr, Fe, SGA-h)

78-A.* Nonferrous Castings. How to Get More for Your Metalworking Dollar. *Iron Age,* v. 182, Dec. 11, 1958, p. 121-136.

Current machining practice, composition and properties of Al, Cu, Mg and Zn alloy castings. (A-general, G17; Al-b, Cu-b, Mg-b, Zn-b, 5-61)

79-A.* (Czech.) Problem of Dust in Metallurgical Works. Miloslav Havelka. *Hutnicke Listy,* v. 13, no. 9, 1958, p. 778-786.

Emission of dust in iron works may reach 30 kg. per ton of pig iron produced. Properties, sources, quantities of dust emitted by various shops and installations. Applicability, efficiency, installation and operating costs of dust control systems. 14 ref. (A8a, D-general)

Location, geography, deposit structure, mining and genesis of Cryptomelane (a manganese ore), and Jaspilite or Proto-Itaribite (an iron ore). Cryptomelane, a Psilomelane variety, is of low BaO but high K_2O content. Jaspilite contains 55% Fe. (A11a; Fe, Mn, RM-n)

138-A. (Japanese.) Melting Procedures and Properties of High-Purity Metals and Alloys. Pt. 2. Ti-Al Alloys. Hidetake Kusamichi. *Light Metals (Tokyo)*, v. 8, Mar. 1958, p. 53-58.

11 ref. (A-general; Ti, Al, 2-64, 9-19)

139-A. (Russian.) Steel Industry in Eastern Siberia. A. B. Rozentreter. *Metallurg*, v. 3, Nov. 1958, p. 1-2.

Conference on building Siberian steel industry as part of 7-year plan for economic development. Resources of iron ore, Mn and chromite, electric power and railroad facilities. (A-general, A11a; ST, *Mn, Cr*)

140-A. (Russian.) Twenty-Fifth Anniversary of "Zaporozhstal'". L. D. Yupko. *Stal'*, v. 18, Oct. 1958, p. 865-866.

After being largely destroyed in World War II, mill has made great progress in terms of increased productivity, reduction of coke consumption, extensive mechanization, reduction of down-time. Much of progress due to improvements suggested by employees—of which there were some 8152 since the plant was built, resulting in saving of 85 million rubles. (A-general; ST)

141-A. (Russian.) Tin Recovery From Waste Products of Tin-Plating. I. N. Treiger, N. A. Kashcheeva and A. P. Savranskya. *Stal'*, v. 18, Oct. 1958, p. 957-959.

Chemical method of recovering tinplate waste products permits combining Sn sediment in solution with Zn using a tinning flux. (A11d, L17; Sn, Zn)

142-A. (Russian.) Automation Trends in Rolling Mills. A. I. Tselikov. *Vestnik Mashinostroeniya*, v. 38, Nov. 1958, p. 40-46.

To attain annual steel production of 120 million tons in next 15 years will call for rolling mill capacity of 90 million tons. Need to increase speed of rolling mills; expand heavy machine building; increase precision of rolling and tube mills. (A4p, W23, 18-74)

143-A.* Nickel in Industry. Sidney M. Renof. *Australasian Engineer*, v. 50, Oct. 7, 1958, p. 65-66.

Ni and its alloys; uses. (A-general, 17-57; Ni)

144-A.* Columbium (Niobium) and Tantalum. Pt. 2. World Occurrences. R. Williamson and Lorraine Burgin. *Colorado School of Mines Mineral Industries Bulletin*, v. 1, Nov. 1958, 15 p.

Listing in table and map form with production data for recent years. 142 ref. (Alla, A4p; Cb, Ta)

145-A.* Germanium and Silicon. Gustav Szekely. Paper from "Modern Materials". Academic Press, Inc., New York, 1958, p. 273-305.

Electrical and chemical properties, preparation, refining by zone melting and crystal growth. Determination of trace impurities. 65 ref. (A-general; Ge, Si, EG-j)

146-A.* Zirconium. G. L. Miller. Paper from "Modern Materials". Academic Press, Inc., New York, 1958, p. 307-386.

Occurrence, applications, extraction from ore, separation from Hf, production of metal. Melting, forging, rolling, extrusion, tubemaking, wiredrawing, cold forming, cold working, welding, brazing, soldering, annealing, cleaning, finishing, machining, grinding, powder metallurgy. Physical, electrical, crystallographic, atomic, nuclear, mechanical, impact, creep and corrosion properties. 104 ref. (A-general; Zr)

147-A.* (Japanese.) Vacuum Metallurgy of Metallic Lithium. M. Kobayashi. *Metals*, v. 28, Dec. 1958, p. 933-936.

In a vacuum furnace Li_2Co_3 is converted into Li_2O with CaO at 800° C. and then ground and heated with Si at 1000° C. It is used for deoxidation of Cu, for production of Li-Mg and Li-Al for aeronautic and atomic industries. (A-general, C25; Li)

148-A. Nickel. L. Sanderson. *Canadian Mining Journal*, v. 79, Dec. 1958, p. 65-67.

Physical and electrical properties; extraction and refining, applications. (A-general; Ni, 17-57)

149-A. Cutting-Tool Materials--Today and Tomorrow. Robert T. Hook. *Machinery*, v. 65, Jan. 1959, p. 116-119.

High-speed steels, tungsten carbide, titanium carbide, ceramics, titanium boride, cemented diamonds. (A-general; SGA-j)

150-A. (Japanese.) Home-Produced Beryllium Copper. G. Ojima and S. Yabuki. *Metals*, v. 28, Dec. 1958, p. 905-911.

History. (A2; Cu-b, *Be*)

151-A. (Japanese.) Electronic Cooling and Heating by Semiconductors. N. Makino and H. Shidara. *Metals*, v. 28, Dec. 1958, p. 946-950.

Bi_2Ti_3 -Bi and Bi_2Te_3 examined. HgTe, PbTe, PbS, PbSe, Sb_2Te_3, Bi_2S_3 and SbZn considered. (A-general; EG-j)

152-A.* Beryllium and Beryllium Alloys. Pt. 1. A. R. Collins. *Australasian Engineer*, v. 51, Nov. 7, 1958, p. 52-56.

Properties, applications, extraction, fabrication of Be metal; Cu-Be casting and wrought alloys; health hazards. (A-general, A7; Be, Cu)

153-A.* A Range of Ferrous Alloys to Combat Abrasion, Corrosion and Heat. H. G. Horrell. *South African Mechanical Engineer*, v. 8, Nov. 1958, p. 89-116.

Characteristics of austenitic Mn steel, high-Cr white iron, martensitic steel, austenitic Fe-Cr-Ni, Fe-Cr-Ni-Mo and Fe-Cr-Ni-Mo-Cu regarding abrasion, corrosion and heat resistance. 7 ref. (A-general, Q9, R-general, 2-62; AY, SS, CI-p)

154-A.* (German.) Apprentice Training in the Foundry Industry. G. Jentsch. *Giesserei Praxis*, no. 19, Oct. 10, 1958, p. 389-395.

Curriculum comprising such courses as small coremaking, molding, large coremaking, molding of heavy castings, patternmaking, cupola technique, cleaning of castings, inspection methods and sand preparation. System of progress charts on which teaching should be based. (A6k, E-general)

155-A.* (German.) Utilization of Gas Scrubber Sludge. Bernhardt Weilandt and Fritz Kruse. *Stahl und Eisen*, v. 78, Nov. 13, 1958, p. 1657-1662.

Nature of gas sludge, admissible Zn content in blast furnace burden and removal of Zn in sintering. Sintering of gas sludge and efficiency of the process depends on amount of differently treated gas sludge in the sintering mixture. Effect of moisture content of ore and amount of additional lime. 15 ref. (A11d, D1; *Zn*)

156-A. (Hungarian.) Weldable Constructional Steel Type ST-52 With High Yield Point. Istvan Balsai. *Kohaszati Lapok*, v. 13, Feb-Mar. 1958, p. 72-80.

New series of steels containing primarily Mn-Si, Mn-Si-Cu and Mn-Cr-Cu alloys, but other compositions are also used. (A-general, K9s; SGB-s, ST)

157-A.* (Hungarian.) Use of Radioactive Isotopes in Metallurgy. Sandor Simon. *Kohaszati Lapok-Ontode*, v. 9, Feb-Mar. 1958, p. 42-46.

Practical application in various branches of metallurgy and foundry practice depends on reliable measurement of radioactivity of artificial isotopes added to natural ones; both have to participate in the same chemical composition. Equipment and method of computation used to perform and to correlate measurements. 10 ref. (A-general, 1-59)

158-A. (Book.) Modern Materials. v. 1. Henry H. Hausner, Ed. 402 p. 1958. Academic Press, Inc., 111 Fifth Ave., New York 3, N. Y. $12.50.

Sections on wood, synthetic rubbers, fiber materials, high-voltage insulation papers, special glasses for nuclear applications, modern ceramics, Zr, Ge and Si. Papers on Ge and Zr abstracted separately. (A-general; Ge, Zr)

159-A. (Book.) History of British Iron and Steel Industry. H. R. Schubert. 445 p. 1958. Macmillan Co., 60 5th Ave., New York, N. Y. $12.

From earliest times to introduction of steam power. (A2, D-general; Fe)

160-A. (Book.) English-Russian, Russian-English Electronics Dictionary. Dept. of the Army. 943 p. 1958. McGraw-Hill Book Co., 330 West 42nd St., New York 36, N. Y. $8.

Some 22,000 Russian terms and abbreviations of radio, radar, telegraphy, television, tubes, X-rays, electroacoustics, etc., collected from literature published in U.S.A., U.S.S.R. and U.K. and from Soviet factories, research institutions and scientists. (A-general, X15, 11-67)

161-A. (Book-French-English.) Nonferrous Metals Statistics. 131 p. Sept. 1958. Organisation for European Economic Cooperation, 2 Rue Andre-Pascal, Paris 16e, France. $1.50.

Production, consumption, foreign trade, breakdown of uses, from 1955 to 1957, for Sn, Zn, Cu, Al and Pb. (A4; Sn, Zn, Al, Cu, Pb)

162-A. Oxygen: Demand to Rocket. *Chemical and Engineering News*, v. 37, Jan. 19, 1959, p. 78-84.

Production statistics, applications. (A-general; O, 17-57)

163-A. The Structure of Steel. Pt. 9-10. Edwin Gregory and Eric N. Simons. *Edgar Allen News*, v. 37, Dec. 1958, p. 275-276. (A-general; ST-b)

164-A. Growth of Grey-Iron Castings Production and Some Factors Affecting It. Lars Villner. *Foundry Trade Journal*, V. 106, Jan. 1, 1959, p. 3-10.

Review of production during the last decade. (A4p; CI-n)

165-A. Build $2-Million Facility to Study Rare Metals. *Industrial Laboratories*, v. 10, Jan. 1959, p. 74-76, 78-81

Research program at Nuclear Metals Inc., Concord, Mass., in the development of W, Mo, Ta, Ch, Be. (A9; W, Mo, Ta, Cb, Be, 17-57)

166-A. Are American Steel Methods Growing Old? J. B. Austin. *Industrial Research*, v. 1, Jan. 1959, p. 19-28.

American steel industry compared with Britain, Sweden, West Germany, France and Russia. (A-general, D-general)

167-A. Statistical Computations Increase Production. Melvin J. Greaves. *Iron and Steel Engineer*, v. 36, Jan. 1959, p. 99-102.

Computers make possible statistical production studies previously impractical. (A4p, S12, X14k)

168-A. The Air Pollution Situation Today With Special References to Control Legislation. Allen D. Brandt. *Iron and Steel Engineer*, v. 36, Jan. 1959, p. 103-108. (A8a, A13p)

169-A. Developments in the Iron and Steel Industry During 1958. I. E. Madsen. *Iron and Steel Engineer*, v. 36, Jan. 1959, p. 112-158. (A-general, D-general; Fe, ST)

170-A. (Dutch.) Lifetime of Bentonite. *Gieterij-Centrum Berichten*, v. 6, Nov. 1958, p. 63-64.

Regeneration by the addition of soda. (A11d; NM-f45)

171-A. (German.) Experimental Melt in a Prehistoric Blooming Fire. Josef Wilhelm Gilles. *Stahl und Eisen*, v. 78, Nov. 13, 1958, p. 1690-1695.

Experimental smelting in a bloomery furnace with natural draft, built like a furnace of La Tene period. The result of 30 hr. of smelting was a slag lump in which iron with 0.09% C was present in the form of different size grains. 8 ref. (A2, D8; Fe)

172-A. (German.) Utilization of Surplus Blast Furnace Gas. Georg Bremer. *Stahl und Eisen*, v. 78, Dec. 25, 1958, p. 1867-1871. (A8a, A11d; RM-m39)

173-A. (Hungarian.) Curriculum of Metallurgical Engineers' Education in Hungary and in Foreign Countries. Zoltan Horvath. *Kohaszati Lapok*, v. 13, Feb-Mar. 1958, p. 51-69.

Curricula of the technical universities of various countries including Russia. (A3)

174-A.* Two New Superalloys Excel at Elevated Temperatures. E. E. Reynolds and R. K. Pitler. *Iron Age*, v. 183, Jan. 22, 1959, p. 70-71.

Precipitation hardening steels, D979 and A71, developed by Allegheny Ludlum for gas turbines, missiles and airframes. (A-general; ST, SGA-h)

175-A.* High-Temperature Metallurgy. Robert Bakish. Digest from "Notes on the Third Internal Plansee Seminar", Reutte, Tyrol, Austria. *Metal Progress*, v. 75, Jan. 1959, p. 142, 144.

Papers on effect of oxygen in Cb, Ta-O and Ta-N systems; Mo coating, investigation of new alloys, metallographic studies and nuclear applications. (A-general, R11h, T11, 2-62; Cb, Mo, Ta, SGA-h, 11-57)

176-A.* Fabrication of Beryllium. K. G. Wikle. *Metal Industry*, v. 93, Dec. 26, 1958, p. 529-533.

Vacuum hot pressing Be powder into blocks. Extrusion, rolling, forming, machining, forming, joining, annealing and surface treatment of Be metal. Toxicity. (A-general, G-general, H-general, Be)

177-A.* Treatment of Effluents in the Metal Finishing Industry. Richard Justh. *Electroplating and Metal Finishing*, v. 12, Jan. 1959, p. 11-14.

Treatment of harmful effluents from pickling, bright dipping, soldering, electroplating and hardening processes. (To be concluded.) (A8b)

178-A. Solid State Division, Annual Progress Report. Oak Ridge National Laboratory. *U.S. Atomic Energy Commission*, ORNL-2614, Nov. 20, 1958, 176 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $3.

Results of 47 research projects evaluated. Includes irradiation of Ge; gamma irradiation of n-type Si; neutron damage effects in metals at low temperatures; irradiation and quenching experiments on Cu-Al alloys; radiation metallurgy. (A-general, A9; Ge, Si, Cu, Al, 2-67)

179-A.* Uses of Cobalt. *Cobalt*, no. 1, Dec. 1958, p. 5-12.

Historical survey, uses of heat resisting alloys, magnetic alloys, hard facing alloys, cermets, high-speed toolsteels, wear resistant and other alloys. 11 ref. (A-general; 17-57; Co)

180-A.* (German.) Sparking of Metals and Rocks. P. Brenner and P. Eversheim. *Aluminium*, v. 34, Dec. 1958, p. 700-701.

Al alloys examined by drop, friction and impact tests for safety as structural material in mines. Among alloys, Al-Mg-Si and Al-Zn-Mg (besides pure Al and other soft alloys) had best spark resistance in methane-air mixture. Resistance increased by addition of Be. 5 ref. (A7p, Q-general, T28m; Al-a, Al-b, *Mg, Si, Zn*)

181-A.* (Hungarian.) Utilization of Blast Furnace Slag in Agriculture. Istvan Palfalvi. *Kohaszati Lapok*, v. 13, no. 8, 1958, p. 367-374.

Effect of blast furnace slag on pH and hydrogen acidity values of the soil poor in Ca. 4 ref. (A11d; RM-q)

182-A. Growth of Grey-Iron Castings Production and Some Factors Affecting It. Lars Villner. *Foundry Trade Journal*, v. 106, Jan. 8, 1959, p. 29-37.

6 ref. (A4p; CI-n)

183-A. Metallurgy in Israel. Ariel Taub. *Metal Progress*, v. 75, Jan. 1959, p. 75-78. (A3, A4, A6)

184-A. Institute of Metals. Its First 50 Years. J. C. Chaston. *Metal Progress*, v. 75, Jan. 1959, p. 95-97. (A2, A12g)

185-A. Metallurgy in the U.S.S.R. J. Herbert Hollomon. *Metal Progress*, v. 75, Jan. 1959, p. 120-123. (A-general)

186-A. Health and Safety Considerations for Uranium Fuel Fabrication Facilities. William A. Brobst. Chicago Operations Office. Aug. 1, 1958. *U. S. Atomic Energy Commission*, COO-212, 50 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.

Contamination control; monitoring and sampling; maximum permissible levels and concentrations. (A7r, T11g; U)

187-A. Fire Prevention and Protection in Welding and Cutting Operations. Roger Cholin. *Welding Engineer*, v. 44, Jan. 1959, p. 57-58.

Safety tips applicable to various situations met in welding. (A7p; K-general)

188-A. (Hungarian.) Development of Metal Founding in the Middle Danube Valley, Up to the Introduction of Iron. Viktor Zsak. *Kohaszati Lapok-Ontode*, v. 91, May-June 1958, p. 128-132.

Bronze culture flourished from 15th to 5th Century B.C. around Lake Balaton. Cu was alloyed with 10-18% Sb in the absence of Sn to make bronze. Excavated Avarian dress ornaments of 6th Century B.C. contain: 5% Sn, 8% Zn, 2.5% Pb, 1% Sb, 83.5% Cu. (A2, E-general; Cu-b, Cu-s)

189-A. (Hungarian.) 1600 Year Old Wrought Iron Column in New Delhi, India. Laszlo Takats. *Kohaszati Lapok-Ontode*, v. 91, May-June 1958, p. 133.

The chemical composition of the 7.25-m. long dull black column is 0.08% C, 0% Mn, 0.046% Si, 0.06% S, 0.114% P, 0.034% Cu and the rest iron. Yearly average precipitation in New Delhi is 660 mm. (A2; Fe-m)

190-A.* What's Happening to Titanium Alloys? *Journal of Metals*, v. 11, Jan. 1959, p. 29-32.

New alloys with improved ultimate strength and elongation include crucible B120VCA, 8Al-1Mo-V, Rem-Crucible 900 and Ti-6Cu-7Al-6Zr. (A-general, Q-general; Ti-b, 2-62)

191-A.* (German.) Nodular Iron; a New Material. Pt. 1. Mechanical Properties,

Manufacture and Use. *Schweisstechnik*, v. 12, Nov. 1958, p. 141-144.

Nodular iron, both unalloyed and Ni-alloyed, in as-cast and heat treated states compared with standard qualities of steel castings, malleable cast iron and pure gray iron with respect to mechanical, physical and technological properties. (A-general, Q-general; CI-r)

192-A. Problems Connected With the Plutonium Factory at Marcoule and Their Solution. R. Galley. *Institution of Chemical Engineers*, v. 36, no. 6, 1958, p. 401-414.

Production of Pu from natural U is primarily a problem of neutron control, but its extraction from thousands of fuel elements taken from the pile where they were irradiated for many months is quite another problem. Chemical and technological questions and solutions adopted. (A11d, A8c; Pu)

193-A. The Early Ironworker and Public Opinion Through the Ages. H. R. Schubert. *Iron and Steel Institute, Journal*, v. 191, Jan. 1959, p. 18-19.

17 ref. (A2; Fe)

194-A. Pyrophoricism in Metals. Henry Allen. *Metal Treatment and Drop Forging*, v. 26, Jan. 1959, p. 31-32.

(A7p, P13; Zr, U, Na, Li, Al, Zn, Mg, Ti)

195-A. Zirconium: Where It Is; Where It's Going. *Steel*, v. 144, Jan. 26, 1959, p. 76-77.

(A-general; Zr)

196-A. Bibliography of Zirconium. Eleanor Abshire. *U.S. Bureau of Mines, Information Circular 7830*, 1958, 216 p. Free.

Supplement to Information Circular 7771. (A-general, 11-65; Zr)

197-A. (French.) Foundry Displays at the 1958 Brussels Fair. J. V. Bairiot. *Fonderie Belge*, v. 28, Sept-Oct. 1958, p. 272-277.

(A12j; E-general)

198-A. (French.) Structure and Professional Organization of Belgian Iron Foundries. P. de Keyser. *Fonderie Belge*, v. 28, Sept-Oct. 1958, p. 278-279.

(A4p, A12g, E-general)

199-A. (French.) A Medieval Masterpiece: The Baptismal Fonts in St. Bartholomew's Church in Liege. Francois Boussard. *Fonderie Belge*, v. 28, Sept-Oct. 1958, p. 280-283.

7 ref. (A2, E-general, T9q)

200-A. (French.) Survey of Trends in the Beneficiation of Iron Ores; Effects on World Trade and Supply. J. Astier. Paper from "Symposium on the Beneficiation of Iron Ores". Editions Brun, Paris, France, Aug. 1958, p. 5-13.

(A4, B-general; Fe)

201-A. (German.) Fighting Industrial Noise by Confining the Noise Spectrum. Reinhard Kohler. *Stahl und Eisen*, v. 79, Jan. 8, 1959, p. 37-41.

Analysis of various noise sources; machine specifications for reducing generation of noise. 6 ref. (A7s, S22)

202-A. (Portuguese.) Domestic Production Now Fills All Brazilian Tin Requirements. *Engenharia, Mineracao e Metalurgia*, v. 28, Oct. 1958, p. 209-210.

(A4p; Sn)

203-A. (Russian.) Comparative Costs in Casting Openhearth and Electric Furnace Steels. N. S. Sachko. *Liteinoe Proizvodstvo*, Nov. 1958, p. 4-6.

Electric furnace steel requires less fuel, raw materials and labor time. (A4s, D2, D5, ST-e, ST-f)

204-A. (Slovenian.) Lead, Zinc and Molybdenum Deposits in Mezica, Yugoslavia. Stanko Grafenauer. *Rudarsko-Metalurski Zbornik*, no. 3, 1958, p. 263-294.

47 ref. (A11a; Pb, Zn, Mo)

205-A. Twenty Years of Progress in Raw Materials. John Pace. *Metal Forming & Fabricating*, v. 21, Jan. 1959, p. 28-31.

Galvanized and cold rolled steel, coating, Al and its alloys, superalloys, Ti, Ch and heat resistant alloys. (A4p; ST, Al, SS, Ti, Cb, SGA-h, SGB-a)

206-A. Foamed Aluminum. *Modern Castings*, v. 35, Feb. 1959, p. 37.

Fabrication and properties. (A-general; Al-b, *Mg*)

207-A. (Czech.) Equilibrium State and Its Importance in Metallurgy. Ladislav Jenicek. *Hutnicke Listy*, v. 13, Dec. 1958, p. 1058-1061.

Historical survey on the development of the science of equilibria. 28 ref. (A2, M24e)

208-A. (Dutch.) Main Facts From the Iron and Steel Market. T. Hagtingius. *Metalen*, v. 13, Dec. 31, 1958, p. 444-445. (A9q)

209-A. Semi-Annual Summary Research Report in Metallurgy for July-December 1957. Iowa State College. *U.S. Atomic Energy Commission ISC-977*, Oct. 15, 1958, 101 p. (Available from U.S. Office of Technical Services, Washington 25, D.C.) $2.50.

Results of 29 research projects summarized and evaluated. Topics include purification and separation studies; preparation of pure compounds; preparation of V, Cb, Th, Y, U; alloy systems; corrosion studies; solid state investigation; vacuum fusion analysis of metals. (A-general, A9; V, Cb, Th, Y, U)

210-A.* (German.) Use of Radioactive Isotopes in Metallurgical Research. K. Sagel. *Metall*, v. 13, Jan. 1959, p. 25-30.

Applications as source of radiation and as tracer; preparation of specimens, diffusion tests, oxidation test, friction test, metal-slag reactions, steam pressure measurements, activation analyses. 116 ref. (A-general, 1-59)

211-A.* Fifty Years' Progress in Non-Ferrous Metals Technology. G. L. Bailey. *Institute of Metals Journal*, v. 87, Dec. 1958, p. 97-111.

Advances in the fields of smelting and refining, melting and casting, rolling, wire drawing, tube drawing, extrusion, forging, thermal treatment, inspection and control. 6 ref. (A-general; EG-a38)

212-A. Properties and Handling Practices for Magnesium: A Literature Survey. M. Breederman, G. A. Bennett, L. Burris, I. G. Dillon, I. O. Winsch, M. W. Nathans, E. Greenberg and J. Wolkoff. Argonne National Laboratory. U.S. Atomic Energy Commission, ANL-5749, Mar. 1958, 132 p. (Available from U.S. Office of Technical Services, Washington 25, D.C.) $2.75.

Cost and availability of various high-purity grades, safe handling considerations, methods of distillation and production, physical and thermodynamic properties. 157 ref. (A4, A11, A7p, P-general, Q-general; Mg)

213-A. Pilot Production, Fabrication and Evaluation of Promising Titanium Alloys. F. A. Crossley, B. R. Rajals and D. W. Levinson. Illinois Institute of Technology. (Wright Air Development Center.) U.S. Office of Technical Services, PB 131978, Mar. 1958, 46 p. $1.25.

Fabrication and evaluation of approximately 300 lb. of Ti-7Al-3Mo alloy which was distributed to various jet engine manufacturers. 140 J-57 7th stage compressor blades were produced from 70 lb. of hot rolled, centerless-ground bar. The endurance limit for these blades bench-tested at room temperature under completely reversed stress was 75,000 psi. (A-general, Q-general, 2-66; Ti-b, *Al, Mo*)

214-A. (Book.) Dictionary of Metallurgy. A. D. Merriman. 401 p. 1958. Pitman Publishing Corp., 2 West 45th St., New York 36, N. Y. $25.

Includes engineering as well as metallurgy; over 7000 definitions, 283 illustrations and 236 tables. (A-general, 11-67)

215-A. (Book.) Marks' Mechanical Engineers' Handbook. Theodore Baumeister. Sixth Ed. 2270 p. 1958. McGraw-Hill Book Co., 330 West 42nd St., New York 36, N. Y. $23.50.

Eighteen sections of facts, descriptions, formulas, methods, tables, diagrams of mechanics of materials; numerical analysis and computing machines; vibrations; aerodynamics; jet propulsion; atomic power; automobiles; steam boilers; instruments and controls; railway engineering; aircraft propellers; corrosion; industrial engineering; turbo compressors; gas turbines; displacement pumps; fans; pipe and pipe fitting; lubricants and lubrication; structural design of buildings; welding. (A-general, 11-68, 11-67)

216-A. (Book.) Semiconductor Abstracts. Battelle Memorial Institute, Compiler, v. 4, 1956. 456 p. 1959. John Wiley & Sons, Inc. 440 Fourth Ave., New York 16, N. Y. $12.

Compilation of abstracts for 1956 arranged by material. Principle materials are Ge, Si, C, Se, intermetallics, oxides, arsenates, phosphates, silicates and tungstates. (A-general; EG-j, 11-65)

217-A. (Book.) Soviet Research in Fused Salts. Pt. 2. Electrochemistry; Aluminum and Magnesium, Corrosion, Theoretical; Thermodynamics; Slags and Mattes. 268 p. 1958. Consultants Bureau, Inc., 227 W. 17th St., New York. $20.

Articles selected from Soviet journals on electrochemistry, including Al and Mg. Electrochemical theory, corrosion, ther-

modynamics and properties of slags and mattes. Some papers abstracted separately. (A-general, C23n, P12, P15, R6; Al, Mg, RM-q)

218-A. (Book.) Soviet Research in Fused Salts. Pt. 1. Systems. 146 p. 1958. Consultants Bureau, Inc. 227 W. 17th St., New York. $30.

Articles selected from Soviet journals. Phase diagram studies of binary systems, ternary and quaternary reciprocal systems. Papers deal with melts containing halides, oxides or mixtures. (A-general, B19, M24, NM-a33)

219-A. (Book—German.) Statistical Tables on Aluminum, Lead, Copper, Zinc, Tin, Cadmium, Magnesium, Nickel, Mercury and Silver. 247 p. 1958. Metallgesellschaft Aktiengessellschaft, Frankfurt am Main, Germany.

Statistics on prices, production and consumption from 1948 to 1957. Survey on countries and continents. Summary of metal industry in 1957 and first half of 1958. (A4p, A4s; Al, Pb, Cu, Zn, Sn, Cd, Mg, Ni, Hg, Ag)

220-A. (Book.) 1959 Wire Industry Encyclopaedic Handbook. 484 p. 1959. Wire Industry Ltd., 33 Furnival St., London, England.

A 1957 trade summary; buyers guide to supplies; identifies manufacturers with brand names; technical and commercial terms; wire tables; British Standards; directory of recent articles in journal; general tables; associations, societies. (A-general, 4-61, 11-67)

221-A. (Translation—BISI, no. 1195.) Wetting Agents in Dust Control and Special Reference to the Wetting of Finely Distributed Iron Oxides in Steelworks Smoke. Robert Meldau. *Archiv fur das Eisenhuttenwesen,* v. 28, Oct. 1957, p. 615-621.

See item 254-A, 1958. (A8a; ST)

222-A.* (Japanese.) High Silicon-Aluminum Alloy. Shiro Terai. *Sumitomo Metals,* v. 10, July 1958, p. 174-185.

Effects of Cu, Mg, P, Na, As, B, Be, Cd, Co, Cr, Fe, Mn, Ti and Zn on tensile strength. Grain refinement. (A-general, 2-59, 2-60, 3-71; Al-b, *Si, Na*)

223-A. Data on World Wide Metals and Alloys. *Alloy Digest,* Feb. 1959, 16 p.

Data on Firth-Vickers FV .520 (age-hardenable stainless steel), Carpenter K-W (water hardening toolsteel, Type F2), TI-Namel (enameling steel), AISI 4320 (alloy carburizing steel), Inconel 713 "C" (high-temperature nickel alloy), Unitemp L-605 (high-temperature alloy), Magnesium ZH62A (high-strength casting alloy), Aluminum 2618 (heat treatable aluminum alloy). (A-general; SS, TS, AY, Mg-b, Al-b, SGA-h)

224-A. Higher Temperature Metals and New Forming Methods Mark 1958 as Year of Progress in Metals. Clarence H. Lorig. *Industrial Heating,* v. 26, Jan. 1959, p. 46, 48, 50, 52, 56.

Outstanding achievements include melting metals in jets of heat ranging up to 30,000° F., steels with strengths exceeding 400,000 psi., perfection of techniques for the forming of metal parts by controlled explosions and the rolling of metal strip directly from metal powders. (A-general)

225-A. Purification of Chromic-Acid Solutions by Means of Cation Exchangers. Gunnar Gabrielson. *Metal Finishing Journal,* v. 5, Jan. 1959, p. 19-21.

(A8b, L17)

226-A. Plating Waste Disposal. Walter Mikos and Alfons Szkudlapski. *Metal Finishing,* v. 57, Feb. 1959, p. 61-64.

(A8b, L17)

227-A. Science for the Coatings Technologist. Pt. 12-2. E.S. Beck. *Metal Finishing,* v. 57, Feb. 1959, p. 65-68, 75.

Mildewcidal paints; toxicity of Hg, Cu and other pigments. 5 ref. (A7p; Cu, Hg, NM-g30)

228-A. Maunsel White. An Early Worker on High Speed Steels. Eric N. Simmons. *Metallurgia,* v. 59, Jan. 1959, p. 10-12.

(A2; TS-m)

229-A. Improved Material Handling Methods. Stephan E. Schattman. *Precision Metal Molding,* v. 17, Jan. 1959, p. 54-56.

Equipment and layout at the new Zn die casting foundry of the Wolverhampton, England, Die Casting Co., Ltd. (A5a, E13; Zn)

230-A. Research Life-Blood of the Steel Industry. J. Stubbs Walker. *Steel Review,* v. 13, Jan. 1959, p. 10-21.

Research programs of the British Iron and Steel Association and some British companies. (A9; ST)

231-A. Consett of Durham. Earl B. Thomas. *Steel Review*, v. 13, Jan. 1959, p. 23-31.

Story of the Consett Iron Co. from the days of the first small ironworks, established nearly 120 years ago, to the present integrated million-ton capacity plant. (A2; ST)

232-A. (Japanese.) Treatment of Waste From Metal Finishing Industry. Tetsuo Ide. *Metal Finishing Society of Japan, Journal*, v. 9, Dec. 1958, p. 466-468.

(A8b, L-general)

233-A.* (Japanese.) Study on High-Purity and Iron-Free Magnesium and Its Alloys. Hiroshi Asada, Shinichi Komori, Kenichiro Aoki and Kozo Aoyama. *Light Metals*, v. 8, Nov. 1958, p. 65-73.

Manufacture of 99.99 to about 99.999% Mg by the distillation method and its mechanical and corrosion resistant properties. (A-general; Mg-a)

234-A.* (Russian.) Beryllium. G.A. Meerson, D.D. Sokolov and N.F. Mironov. *Atomnaya Energiya, Akademiya Nauk, SSSR*, v. 5, Dec. 1958, p. 624-630.

Methods of extraction developed by SSSR; variants of powder metal technology in manufacturing Be products; structure and properties. 4 ref. (A-general; Be)

235-A. Selection and Evaluation of Rare and Unusual Metals for Application to Advanced Weapons Systems. B. Love. Research Chemicals, Inc. (Wright Air Development Center.) *U.S. Office of Technical Services*, PB 151311, June 1958, 185 p. $3.

Survey of literature dealing with the rare earth metals, hafnium, rhodium and ruthenium; aimed at utilization of the promising high-temperature properties of these scarce materials in weapons. (A-general, 2-62; Hf, Rh, Ru, 11-65)

236-A. Some Metallurgical Applications of Radioactive Isotopes. W.R. Ellis. *Australasian Engineer*, v. 51, Dec. 8, 1958, p. 61-64.

(A-general, 1-59)

237-A. Soviet Steel—Expansion and Research. R. Sewell. *British Steelmaker*, v. 25, Feb. 1959, p. 52-57.

Planned plant building, estimated production; blast furnace development, steelmaking trends, steelmaking research. 14 ref. (A4p, A9; ST)

238-A. Versatile Molybdenum. M. Schofield. *Mining Magazine*, v. 100, Jan. 1959, p. 11-14.

Brief review of element and its compounds. (A-general; Mo)

239-A. Why Use Magnesium Castings? *Precision Metal Molding*, v. 17, Feb. 1959, p. 38-39.

Advantages include favorable weight to strength ratio, lower machining costs, reduced shipping charges. (A-general; 5, Mg-b, 17-57)

240-A.* Magnesium Alloy Investigation. *Metal Industry*, v. 94, Jan. 30, 1959, p. 87, 92.

New wrought Mg-base alloys (Mg-Mn-Zn) with improved mechanical and physical properties; effect of Ti, Hf, Rh, Y, Ni, Co, Ta, Cr, V, Cb, B, W and Mo additions. (A-general, Q-general, 2-60; Mg-b, *Zn, Mn, Ti, Hf, Rh, Y, Ni, Co, Ta, Cr, V, Cb, B, W, Mo*)

241-A.* The Fabrication and Properties of Commercially Pure Beryllium. J. Williams. *Metallurgical Reviews*, v. 3, no. 9, 1958, p. 1-44.

Refining processes; melting and casting; powder production; compacting and sintering; extrusion; rolling; forging; machining; welding; brazing; mechanism of deformation. Corrosion behavior; heat treatment; mechanical properties of polycrystalline Be at room and elevated temperatures. Effect of processing conditions; brittleness and health hazard. 70 ref. (A-general; Be)

242-A.* State of the Art: Beryllium. *Space Aeronautics*, v. 31, Feb. 1959, p. 48-51.

Microstructure, fabrication, mechanical properties, applications. (A-general; Be)

243-A. Beryllium: Hazard Evaluation and Control in Research and Development Operations. E. C. Hyatt, H. F. Schulte, R. N. Mitchell and E. P. Tangman, Jr. *A.M.A. Archives of Industrial Health*, v. 19, Feb. 1959, p. 211-220.

6 ref. (A7p; Be)

244-A. Problems in the Control of Operations in a Berryllium-Processing Plant. Harry M. Donaldson. *A.M.A. Archives of Industrial Health*, v. 19, Feb. 1959, p. 221-224.

(A7p; Be)

245-A. Control of Beryllium Machining Operations. Richard I. Chamberlin. *A.M.A.*

Archives of Industrial Health, v. 19, Feb. 1959, P. 231-238.
(A7p, G17; Be)

246-A. Treatment of Effluents in the Metal Finishing Industry. Richard Justh. *Electroplating and Metal Finishing*, v. 12, Feb. 1959, p. 47-50.
Disposal of plating solutions; handling chromate effluents; Lang Process. (Concluded.) 5 ref. (A8b, L17; Cr, Ca, Zn)

247-A. Problems Connected With the Plutonium Factory at Marcoule and Their Solution. R. Galley. *British Nuclear Energy Conference, Journal*, v. 4, Jan. 1959, p. 1-11.
Extraction of Pu from spent fuel elements for use in scientific studies. (A11d, C19n, T11g; Pu, U)

248-A. Density of Solid Blast-Furnace Slag Separator Being Developed by BISRA. *Iron and Coal Trades Review*, v. 178, Feb. 6, 1959, p. 327.
Equipment to separate usable from porous slag. (A11c; RM-f, 1-52)

249-A. How to Design Stainless Steel Extrusions. Pt. 2. Applications and Design Concepts. Richard E. Paret. *Machine Design*, v. 31, Jan. 22, 1959, p. 118-121.
Design fundamentals, fitting the extrusion to the product, how to modify existing shapes, stepped, tapered and multiple extrusions. (A-general, 3-73; SS, 4-58, 17-51)

250-A. (French.) Hazards of Vanadium. *Machine Moderne*, v. 53, Feb. 1959, p. 59.
Maximum permissible concentration levels for V, V_2O_5, VCl_4 and VCl_3. (A7p; V)

251-A.* (French.) Zirconium and Its Alloys. *Metallurgie et la Construction Mecanique*, v. 91, Jan. 1959, p. 29-34.
Properties, present and future applications; production methods; influence of O and N on properties; effect of Hf, Ti, Al, Cu, Ta and Be as alloying additions. (A-general, 2-60; Zr-b, *Hf, Ti, Al, Cu, Ta, Be*, 17-57)

252-A.* Rare Earths (Lanthanons). D. R. Williamson and Lorraine Burgin. *Colorado School of Mines Mineral Industries Bulletin*, v. 2, Jan. 1959, p. 1-16.
Sources, extraction and applications. (A11a, C-general; EG-g, 17-57)

253-A.* Aluminum + Foamed Plastic = . *Modern Metals*, v. 15, Feb. 1959, p. 32-34.
Versatile new sandwich material with a very high strength-weight ratio, exceptional stiffness and dimensional stability, superb insulation value, excellent moisture resistance. (A-general; Al-b, NM-d, 17-57, 7-59)

254-A.* Materials. A. W. Herbenar and G. R. Heckman. *American Society of Mechanical Engineers*, Paper no. 58-A-468, 1958, p. 5-11.
Intrinsic and extrinsic properties of stainless steels, low-alloy steels, superalloys, iron-base, nickel-base, cobalt-base and chromium-base alloys and analysis of critical gas-turbine components. 6 ref. (A-general, T7h; SS, ST, Fe-b, Co-b, Cr-b, Ni-b, 17-57)

255-A.* Plutonium. Bernhard Blumenthal. *Journal of Metals*, v. 11, Feb. 1959, p. 125-129.
History, extraction, properties, applications. 18 ref. (A-general; Pu)

256-A.* Zirconium Alloys. *Advanced Materials Technology*, v. 1, Dec. 1958, p. 6-7.
Physical and mechanical properties, including strength and heat treatment response when alloyed with Hf, Al, Si, Cb, Mo, Ti and steel. (A-general, P-general, Q-general, 2-60, 2-64; Zr-b, *Hf, Cu, Si, Al, Cb, Mo, Ti, ST*)

257-A.* (French.) Beryllium. R. Syre. *Metaux Corrosion-Industries*, v. 33, Oct. 1958, p. 406-419.
Characteristic properties and applications; casting and powder metallurgy techniques; physical properties of primary products and of drawn and rolled material; fabrication processes; toxicity. (A-general; Be, 17-57)

258-A.* (French.) Metals of the Future. H. Frenay and C. Ek. *Revue Universelle des Mines, de la Metallurgie de la Mechanique*, v. 15, Feb. 1959, p. 80-89.
Heat resistance and properties, corrosion resistance of Zr, Ti, V, Ta, Cr, W, Cb and Mo. Problems in extraction and refining; applications. 17 ref. (A-general, Q-general, R-general, C-general; Zr, Ti, V, Ta, Cr, W, Cb, Mo, 17-57)

259-A.* (German—French.) Aluminum Alloys in Reactor Construction. *Zeitschrift fur Schweisstechnik*, v. 49, Jan. 1959, p. 25.
Comparative listing of standardized denomination, composition and properties of some 14 Al alloys used in U. S., Great

Britain, Germany, Switzerland and Holland. (A-general, S22, T11, Al-b, 17-57)

260-A. Tungsten. L. Sanderson. *Canadian Mining Journal*, v. 80, Jan. 1959, p. 71-73.
Sources, extraction, properties, applications. Emphasis on W carbide. (A-general; W, 6-96)

261-A. New Handling and Storage Techniques. *Foundry*, v. 87, Mar. 1959, p. 132-134, 136-139.
System of overhead double-chain tray conveyors provides for the indexing, storage, circulation and delivery, on demand, of investment casting process patterns and castings. (A5a, E15)

262-A. (Italian.) Present Status and Future Trends in the Refractories Industry. Luigi Pompei. *Fonderia*, v. 7, Oct. 1958, p. 444-471.
Applications in the iron and steel industry. 17 ref. (A4p, D-general; RM-h)

263-A. Pearlitic Malleable Iron (High Strength Cast Iron). *Alloy Digest*, CI-26, Mar. 1959, 2 p.
Recommended for dependable service, strength and machinability in highly stressed parts at work in mobile and stationary mechanisms. (A-general; CI-s, SGB-a)

264-A. Dynavar (High Strength Cobalt Alloy). *Alloy Digest*, Co-16, Mar. 1959, 2 p.
Corrosion resistant, nonmagnetic, age-hardening type Co-base alloy with good hot and cold working properties characterized by high fatigue resistance, tensile strength, torque values and corrosion resistance. (A-general; Co-b, *Cr, Ni, Fe, Mo*)

265-A. Haynes Alloy No. 36. (High-Temperature Alloy). *Alloy Digest*, Co-17, Mar. 1959, 2 p.
Cobalt-base alloy having excellent strength up to 1800° F. Used successfully in jet engine blading and nozzle vanes. (A-general; Co-b, *Cr, Ni, W*)

266-A. NI-VEE Type C (Constructional Bronze). *Alloy Digest*, Cu-72, Mar. 1959, 2 p.
Leaded precipitation hardening Ni bronze alloy suitable for constructional, pressure and bearing metal casting. (A-general; Cu-s, *Pb*, Ni)

267-A. Udimet 700 (High Temperature Alloy). *Alloy Digest*, Ni-51, Mar. 1959, 2 p.
New vacuum-induction melted Ni-base alloy having excellent mechanical properties at high temperature. (A-general; Ni-b, *Co, Cr, Mo, Ti, Al*)

268-A. Alloy 300 M (Ultra-High-Strength Steel). *Alloy Digest*, SA-81, Mar. 1959, 2 p.
Alloy steel with a combination of hardenability, ductility and toughness at tensile strengths from 280,000 to 320,000 psi. (A-general, Q-general; AY, SGB-a)

269-A. Jethete M.160 (Heat Resisting Steel). *Alloy Digest*, SS-85, Mar. 1959, 2 p.
A 12% Cr air hardening alloy steel having high resistance to stress-corrosion cracking recommended for use at temperatures approaching 1200° F. (A-general, R1d, 2-62; SS, *Cr*, SGA-h)

270-A. Croman (Oil Hardening Tool Steel). *Alloy Digest*, TS-80, Mar. 1959, 2 p.
Properties of new high-carbon, Cr-Mg-Mo toolsteel for fine-edged tools. (A-general; TS, *Cr, Mg, Mo*)

271-A.* Why and Where to Use Carbide-Base Cermets. William W. Wellborn. *Materials in Design Engineering*, v. 49, Feb. 1959, p. 79-81.
Corrosion and oxidation resistance, high-temperature properties, physical and mechanical properties and applications of WC-Co, Cr-C, and Ti-C base cermets. (A-general; 6-70, 6-69, W, Co, Cr)

272-A.* (French.) Development of Light Bearing Alloys. Charles Guinard. *Revue de l'Aluminium*, v. 36, Jan. 1959, p. 64-69.
Applications for Al-base bearing alloys, including Al-Si, Al-Zn, Al-Sn and Zn-Al. 11 ref. (A-general; Al-b, *Si, Zn, Sn*, SGA-c, 17-57)

273-A. (Pamphlet.) Phosnic Bronze. 8 p. 1959. Chase Brass & Copper Co., Waterbury 20, Conn. Free.
Brochure on high-Cu (1.10% Ni, 0.25% P) alloy with high strength, and high electrical and thermal conductivity. (A-general; Cu-s, *Ni, P*)

274-A. (Pamphlet.) Titanium. 35 p. 1959. Harvey Aluminum, Inc., Titanium Div., Torrance, Calif. Free.
Brochure on reduction, fabrication, properties and applications of Ti. (A-general; Ti, 17-57)

275-A. (Book.) Glove Boxes and Shielded Cells for Handling Radioactive Materials.

G. N. Walton. Academic Press Inc., 111 Fifth Ave., New York 3, N. Y. $16.80.

Symposium on radiation shielding. Safe handling of plutonium, uranium-233 and cesium isotopes. (A7r, 1-52; Cs, Pu, U, 14-63)

276-A. (Book.) Elements of Physical Metallurgy. A. G. Guy. 528 p. 1959. Addison-Wesley Publishing Co., Inc., Reading, Mass. $9.50.

Second edition of text for engineering and science students. Added sections include: introduction to dislocation theory, additional material on electron theory of metals and a new chapter, "Phases in Metal Systems". (A-general, M-general, N-general)

277-A. (Book.) New Fabrication Techniques. American Society for Metals, 7301 Euclid Ave., Cleveland 3, Ohio, 1958, 62 p. $2.95.

Compilation of papers presented at the First Southwestern Metal Congress, Dallas, Tex., May 12-16, 1958. Items abstracted separately. (A-general, G-general K-general)

278-A. (Book.) Iron and Steel Industry in Europe. 146 p. July 1958. Organization for European Economic Cooperation, 1346 Connecticut Ave., N. W., Washington 6, D. C. $1.50.

Capacity, production and supplies; problems in the industry. Forecast of raw material requirement in 1961. (A4p; ST)

279-A. (Book.) Market Sampling Study on Iron and Steel Products. Results of a Pilot Study Carried Out in Switzerland, Project no. 328. 116 p. June 1958. Organization for European Economic Cooperation, 1346 Connecticut Ave., N. W., Washington 6, D. C. $1.25.

Demand for Fe and steel products at present and for the next five years. (A4p, D-general)

280-A. (Book.) Radioisotopes in Scientific Research. 4 vol. 1958. Pergamon Press, 122 E. 55th St., New York 22, N. Y. $7.00 each vol.

Metallurgical papers abstracted separately. (A-general, 1-59)

281-A. (Translation—BISI no. 1065.) Possible Uses of Blast Furnace Gas for the Synthetic Production of Hydrocarbons. H. Kolbel. *Stahl und Eisèn*, v. 78, Aug. 21, 1958, p. 1165-1169.

See item 667-A, 1958. (A11e, A8a; RM-m39)

282-A.* Clad Aluminum Alloys. F. C. Porter. *Metallurgia*, v. 59, Feb. 1959, p. 67-73.

Manufacture, properties and applications. 24 ref. (A-general, T24, T29; Al-b, 8-66)

283-A.* 3 New Alloys Beat Heat, Nuclear Barriers. *Chemical Engineering*, v. 66, Feb. 23, 1959, p. 168-172.

Armco 22-4-9, a stainless steel with very high carbon content, retains hardness to 1600° F. New Jones and Laughlin series of carbon steels do not retain radioactivity. New group of National Research Corp. Fe-Al-Mn alloys combine light weight, excellent ductility, high-temperature strength, and oxidation resistance. (A-general, P17, Q29, 2-62; SS, CN, Fe-b, *Al, Mn*)

284-A. Refractory Metals and Their Alloys. Thoedore F. Davis. Technical Information Service Extension, Oak Ridge National Laboratory. *U. S. Atomic Energy Commission, TID-3524*, Jan. 1959, 10 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

93 references to unclassified AEC and non-AEC reports relating to Mo, Ta, Cb, V and W. (A-general; Mo, Ta, Cb, V, W, EG-d37)

285-A.* Beryllium, J. W. F. Blizard, Jr., and Frank A. Twitchell. *Materials in Design Engineering*, v. 49, Mar. 1959, p. 91-93.

Practical report on properties, fabrication and uses. (A-general, Q-general; Be)

286-A.* Why and How to Use Gray and Ductile Iron Castings. Richard C. Meloy. *Modern Castings*, v. 35, Mar. 1959, p. 24-26.

Properties and applications of iron castings with emphasis on economy and design. (A-general; CI-n, CI-r, 17-57)

287-A.* Why and How to Use Steel Castings. C. W. Briggs and G. K. Dreher. *Modern Castings*, v. 35, Mar. 1959, p. 30-33.

Properties and applications of carbon and alloy steel castings. (A-general; ST, CN, AY, 5-60, 17-57)

288-A.* (French.) Semi-Stainless High-Strength Steels for Welded Construction Produced in the United States. J. Pitaud. *Revue du Nickel*, v. 24, Nov-Dec. 1958, p. 105-115.

Principal compositions, mechanical properties, impact strength, wear and corrosion resistance, fabrication, applications. 15 ref. (A-general, Q-general; SS, SGB-a, 17-57)

289-A. Vanadium. Ronald Cowgill and Jack Bishop. *Colorado Engineer*, v. 55, Jan. 15, 1959, p. 10-13.

History, mineralogy, chemistry, refining, properties, use as a catalyst. 11 ref. (A-general; V)

290-A. Annual Report-1958. *International Tin Research Council*, Publication no. 294, 1958, 39 p.

Activities, research program, publications. (A9; Sn)

291-A. New Look Comes to Steel. *Metal Progress*, v. 75, Mar. 1959, p. 126-127.

Vinyl-coated steel; properties, applications. (A-general; ST, NM-d, 7-59)

292-A. Atomic Hazards During Fires. F. R. Farmer. Digest from "Radioactive Materials and Industrial Fire Protection, Industrial Fire Officers' Conference", May 15, 1958. *Metal Progress*, v. 75, Mar. 1959, p. 184, 189A.

Protective measures for firemen and others during and after fires creating atomic hazards. (A7r)

293-A. Vanadium. *Metal Treatment and Drop Forging*, v. 26, Feb. 1959, p. 77-78.

Reduction processes; mechanical and working properties; applications. (A-general, Q-general; V, 17-57)

294-A. Aluminum and Its Alloys in 1958. E. Elliott. *Metallurgia*, v. 59, Feb. 1959, p. 79-89.

Research and technical progress in the various aspects of the metallurgy of Al and its alloys, including extraction, founding, fabrication, constitution, properties and standardization. 102 ref. (A-general; Al)

295-A. Copper and Copper Alloys. E. Voce. *Metallurgia*, v. 59, Feb. 1959, p. 88-92.

Raw material resources, extraction, fabrication, finishing and properties. (A-general; Cu)

296-A. Health Protection in Beryllium Facilities. Summary of Ten Years of Experience. A. J. Breslin and W. B. Harris. Health and Safety Laboratory, New York Operations Office. *U. S. Atomic Energy Commission, HASL-36*, May 1, 1958, 58 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.75.

In-plant design and operation; transfer of material; waste disposal; maximum permissible exposure levels. 35 ref. (A7; Be)

297-A. (Italian.) The Metal of Necklaces Found in Ancient Tombs Near St. Peter's Bridge in Castro d'Ischia, Naples. L. Cambi. *Rendiconti*, v. 92, no. 2, 1958, p. 169-172.

Scientific examination revealed that these relics of Bronze Age were made of Sb instead of Sn as previously supposed. 4 ref. (A2; Sb)

298-A.* (Hungarian.) Plutonium. Rezso Hantos. *Kohaszati Lapok*, v. 91, Oct-Nov. 1958, p. 513.

Methods of producing pure metallic Pu; physical properties; reactor applications. (A-general, T11g; Pu, 17-57)

299-A. How Science Serves Canadian Foundries. Pt. 1. S. L. Gertsman. *Canadian Metalworking*, v. 22, Mar. 1959, p. 26-28, 30, 32.

Canadian Department of Mines and Technical Surveys facilities and programs in field of foundry practice. (To be continued.) (A9h, E-general)

300-A. Horsehay Blast Furnaces. R. A. Mott. *Engineer*, v. 207, Mar. 13, 1959, p. 424-425.

Historical note on blowing equipment. 7 ref. (A2, D1)

301-A. Design Pointers for Investment Castings. W. O. Sweeny. *Materials in Design Engineering*, v. 49, Mar. 1959, p. 110-112.

(A-general, 5-62, 17-51)

302-A. Aid for the Design Engineer: Foundrymen! "Accentuate the Positive". Jules J. Henry. *Modern Castings*, v. 35, Mar. 1959, p. 53-60.

Engineering advantages of castings include design freedom, reduction of stress concentrations, low end cost, uniform strength, good appearance, choice of properties. 16 ref. (A-general; 5, 17-51)

303-A. Design Engineering as Related to Magnesium Castings. George H. Found. *Modern Castings*, v. 35, Mar. 1959, p. 67-72.

10 ref. (A-general; Mg, 5, 17-51)

304-A. Development of Steel. W. R. Patterson. *Yale Scientific Magazine*, v. 33, Feb. 1959, p. 21-28.

Historical review of iron and steel making. (A2, D-general)

305-A. (French.) Copper Metallurgy Among the Ancients. Andre Roos. *Cuivres, Laitons, Alliages*, v. 46, Nov-Dec. 1959, p. 32-36.
Antiquity of Cu and bronze metallurgy; As in ancient coppers. (A2; Cu, Cu-s, As)

306-A. (French.) Complexity of Materials Handling Problems in the Foundry. *Journal d'Informations Techniques des Industries de la Fonderie*, Oct. 1958, p. 11-14.
(A5a, E-general)

307-A.* Manufacture and Applications of a Cobalt-Base Alloy. P. van Bleyenberghe. *Cobalt*, no. 2, Mar. 1959, p. 3-10.
Alloy containing 50% Co and 50% ferrochromium is easy to cast, requires no heat treatment and may be used in applications requiring high strength and corrosion resistance at elevated temperature. (A-general; Co-b, *Cr, Fe, Mo*, 17-57)

308-A.* (Italian.) Boron in Steels. Pt. 1. Low-Boron Steels. D. Pittoni. *Metallurgia Italiana*, v. 51, Jan. 1959, p. 21-30.
Development of boron steels. Effects of B on hardenability, case hardening processes and isothermal and martensite transformations. Mechanical and technological properties. Manufacturing principles and techniques; ferroboron alloys used, deoxidation of bath prior to B addition. Spectrographic and chemical methods of analysis. 18 ref. (A-general, N-general, J-general, Q-general, 2-60, S11k; AY, *B*)

309-A.* (Italian.) Boron in Steels. Pt. 2. High-Boron Steels. D. Pittoni. *Metallurgia Italiana*, v. 51, Jan. 1959, p. 31-34.
B, B_4C and BN for nuclear reactor control rods; mechanical, physical and technological properties of these steels; manufacture, mechanical working. 4 ref. (A-general, Q-general, T11j; ST, *B*)

310-A.* Production and Use of Plutonium. F. Foote. *Organization for European Economic Co-Operation, Information Conference on Nuclear Energy for Management*, June 1957, p. 123-132.
Properties, reduction, applications. (A-general; Pu, 17-57)

311-A. Noral 62S (Aluminum Extrusion Alloy). *Alloy Digest*, Al-77, Apr. 1959, 2 p.
Composition, characteristics, physical and mechanical properties. (A-general. P-general, Q-general; Al-b, 4-58)

312-A. Ambraloy-901 (Aluminum Bronze, 5%). *Alloy Digest*, Cu-73, Apr. 1959, 2 p.
Characteristics, physical and mechanical properties of ductile Cu alloy. (A-general, P-general, Q-general; Cu-s, *Al*)

313-A. Unitemp M-252 (High-Strength Nickel-Base Forging Alloy). *Alloy Digest*, Ni-52, Apr. 1959, 2 p.
Composition, characteristics, physical and mechanical properties. (A-general, P-general, Q-general, 2-62; Ni-b, 4-51)

314-A. MST 3A1-2.5V. *Alloy Digest*, Ti-18, Apr. 1959, 2 p.
Composition, characteristics, physical and mechanical properties of a new weldable Ti alloy. (A-general, P-general, Q-general, 2-62; Ti-b)

315-A. CHW (Hot Work Steel, Type H24). *Alloy Digest*, TS-81, Apr. 1959, 2 p.
Composition, characteristics and properties. (A-general, Q-general; TS)

316-A. A.C.I. Type HI (Heat and Corrosion Resisting Steel). *Alloy Digest*, SS-86, Apr. 1959, 2 p.
Composition, characteristics, physical and mechanical properties of new stainless steel. (A-general, P-general, Q-general, R-general, 2-62; SS)

317-A. Rytense (Free-Cutting Machinery Steel). *Alloy Digest*, CS-9, Apr. 1959, 2 p.
Composition, characteristics, physical and mechanical properties of new carbon steel. (A-general, G17k, P-general; CN)

318-A.* Fabricating Techniques for High-Strength Superalloys. H. E. Haley. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 175. American Society of Tool Engineers, Detroit, 1958, 13 p.
Classification, elevated-temperature properties, surface preparation, joint design, welding techniques, production of vessel linings, forming, heat treatment, descaling and forging. (A-general, K-general, J-general, G-general, L12g, F22; SS, Ni-b, Co-b, SGA-h, SGB-a)

319-A.* Fabrication of Beryllium. K. G. Wikle. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 176. American Society of Tool Engineers, Detroit, 1958, 16 p.
Mechanical properties at room and elevated temperatures of vacuum hot pressed Be powdered compacts and of forms following extrusion or rolling. Physical properties, machining, forming, joining

and stress relief. (A-general, Q-general, H-general; Be)

320-A.* (German.) Beryllium—New Research Results in U.S.A. H. Weik. *Metall*, v. 13, Mar. 1959, p. 202-213.
Historical development, preparation, chemical and physical properties and fabrication of Be. 66 ref. (A-general, Q-general; Be, 17-57)

321-A. Nickel Applications. *Corrosion Prevention & Control*, v. 6, Feb. 1959, p. 47-48.
Consumption figures of 1958 show that corrosive, mechanical and thermal properties provided new and restoration of older uses. (A-general; Ni, 17-57)

322-A. Lanthanons and Yttrium. R. J. Callow. *Drug and Chemical Exports*, v. 19, Feb. 1959, p. 27-30.
Sources, preparation, properties, uses. (A-general; EG-g, La, Y)

323-A. Iron and Steel Industry of Japan. Tetsuo Shimamura. *Journal of Metals*, v. 11, Mar. 1959, p. 163-167.
Development, production, consumption and raw materials. (A4p, A11a; ST)

324-A. Metallurgical Research in Japan. Tokushichi Mishima. *Journal of Metals*, v. 11, Mar. 1959, p. 168-169.
Past and current work with iron and steel; high-temperature metals; fabrication; magnetic materials; nuclear metallurgy and metal physics. (A9)

325-A. Slag Recovery at Yawata Works. Kamekichi Wada. *Journal of Metals*, v. 11, Mar. 1959, p. 187-188.
Beneficiation and magnetic separation of openhearth slag; use in blast furnace and sintering plant. (A11d, RM-q)

326-A. Aluminum and Its Alloys in 1958. E. Elliott. *Metallurgia*, v. 59, Mar. 1959, p. 109-116.
Properties, corrosion, applications and standards. 222 ref. (A-general; Al)

327-A. Copper and Copper Alloys. A Survey of Technical Progress During 1958. Pt. 2. E. Voce, *Metallurgia*, v. 59, Mar. 1959, p. 131-138.
Properties, corrosion, joining, powder metallurgy, chemical analysis, history. 303 ref. (A-general; Cu)

328-A. Cadmium. Robert L. Mentch and Arnold M. Lansche. *U. S. Bureau of Mines, Information Circular*, 7881 (Revised), 1958, 43 p.
Geology, sources, beneficiation and war-time controls. (A-general; Cd)

329-A. (German.) Metallographic Examination of Prehistoric and Ancient Iron Objects. Radomir Pleiner. *Stahl und Eisen*, v. 79, Mar. 5, 1959, p. 294-298.
Fabrication methods included welding of steels with widely differing carbon content to produce tools, and carburizing of tool edges. 17 ref. (A2, K-general, J28g; ST, Fe)

330-A. (Hungarian.) Dust Control in Foundry Operations. Lajos Hirsch. *Kohaszati Lapok-Ontode*, v. 91, Oct-Nov. 1958, p. 246-249.
5 ref. (A8a, E-general)

331-A. (Italian.) Metallographic Examination of Gallic Sword Blades From the Second Century B. C. C. Panseri and M. Leoni. *Metallurgia Italiana*, v. 51, Jan. 1959, p. 5-12.
10 ref. (A2, Fe)

332-A.* Metallurgy of the Less Common Metals. Arthur R. Lytle. *Chemistry & Industry*, Mar. 21, 1959, p. 378-385.
Ta, Cb, W, Be, Li and rare earths. (A-general; Be, Cb, Li, Ta, W, EG-g)

333-A. (Book.) ASTE Collected Papers 1958. v. 58, Book no. 2. n.p. 1958. American Society of Tool Engineers, 10700 Puritan, Detroit 38, Mich.
Technical papers and panel conferences presented at 26th semi-annual meeting. Papers abstracted separately. (A-general, G-general)

334-A. (Book.) The Engineer Buyers Guide. 959 p. 1959. The Engineer, 28 Essex St., Strand, London, W.C.2, England. 9s 3d.
Lists technical societies, commercial firms, British Government offices. Principal sections include sheet metal working machinery, machine tools, electrical equipment. (A-general, W24, W25, 11-67)

335-A. Rhenium. L. Sanderson. *Canadian Mining Journal*, v. 81, Mar. 1959, p. 70-72.
(A-general; Re)

336-A. Tantalum. Pt. 2. G. L. Miller. *Chemical Industry and Engineering*, v. 12, Feb. 1959, p. 41-44.
19 ref. (A-general; Ta)

337-A. Rare-Earth Carbides. Pt. 1-3. R. C. Vickery, R. Sedlacek and Ardys Ruben.

Chemical Society, Journal, Feb. 1959, p. 498-510.
26 ref. (A-general; EG-g, NM-a35)

338-A. Production, Fabrication, Properties and Uses of Some Newer Metals. N. P. Inglis. *Machinery Market,* no. 3043, Mar. 12, 1959, p. 25-28.
Titanium, zirconium, beryllium. (To be continued.) (A-general; Be, Ti, Zr)

339-A. Aircraft and Missile Problems Spur Successful Western Metal Congress. *Metal Progress,* v. 75, Apr. 1959, p. 96-F-96N.
Technical sessions included discussion of selection criteria for materials, carbon control in heat treating and hydrogen embrittlement, vacuum melted alloys, welding of high-strength metals for pressure vessels, materials for extremely high temperatures and radiation effects on materials. (A-general)

340-A. Manganese. Marvin J. Udy. *Mines Magazine,* v. 49, Mar. 1959, p. 26-31.
Sources of ores. (Alla; Mn)

341-A. Role of National Metallurgical Laboratory in Ferrous Metallurgical Research and Development in India. B. R. Nijhawan. *NML Technical Journal,* v. 1, Feb. 1959, p. 29-40.
(A9h; Fe)

342-A. Industrial Sources of Air Pollution. Pt. 4. Metallurgical. Thomas C. Wurts. Paper from "National Conference on Air Pollution, Proceedings," U. S. Public Health Service, Publication 654, 1959, p. 161-164.
Dust control in the iron and steel industry. (A8a; D-general)

343-A. The Use of Bio-Assays in the Safe Disposal of Electroplating Wastes. Clarence M. Tarzwell. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society,* 1958, p. 60-62.
Detection and measurement of various metal process wastes. (A8b, L17)

344-A. Industrial Waste Treatment and Water Reclamation. A Case Study. Wayne L. Gasper. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society,* 1958, p. 63-67.
Procedures for disposing of electroplating wastes. (A8b, L17)

345-A. (German.) Testing and Measuring Apparatus in the Metal Industry. A. Schwarz. *Metall,* v. 13, Apr. 1959, p. 313-318.
8 ref (A-general, X-general)

346-A.* How to Get More for Your Metalworking Dollar: Tool Steels With a Directory of AISI Types. *Iron Age,* v. 183, Apr. 1959, p. 109-124.
Composition, heat treatment, fabrication and mechanical properties of water hardening, shock-resisting, cold work, hot work, high speed and special-purpose toolsteels. (A-general; TS)

347-A. Symposium: Technology of Molybdenum and Its Alloys. Office of Naval Research. *U. S. Office of Technical Services,* PB 131793, Sept. 1956, 16 p. $.75.
Abstracts of papers on metallurgy, fabrication and applications. (A-general; Mo)

348-A. Steelmaking, U.S.A. Pt. 1. Leo F. Reinartz. *Journal of Metals,* v. 11, Apr. 1959, p. 261-264.
Development of early bessemer and openhearth plants. (A2, D2, D3)

349-A. Zirconium and Beryllium. N. P. Inglis. *Machinery Market,* no. 3044, Mar. 19, 1959, p. 312-315.
(To be continued.) (A-general; Be, Zr)

350-A. Bulk Handling Titanium Sponge. A. E. Williams. *Mining Magazine,* v. 100, Mar. 1959, p. 137-140.
Methods and equipment used at the New York State plant of the National Lead Co. (A5a, W12; Ti, 6-74)

351-A.* (French.) New Refractory Alloys Developed in Czechoslovakia. Adolphe Plesinger. *Fonderie,* Feb. 1959, p. 75-89.
Lamellar and spheriodal graphite 3-8% Si iron alloys, 28-30% Al "Pyroferal": melting procedures, metallurgical control, furnace requirements, pouring and molding; principal mechanical and physical properties, resistance to oxidation, fracture, structure, applications. Defects found in "Pyroferal" casting. 16 ref. (A-general, E-general, P-general, Q-general, R1h; CI-q, *Si, Al,* 9)

352-A.* (French.) Bronze and Its Application. Pierre Weill-Couly. *Technique de L'eau,* no. 147, Mar. 15, 1959, p. 37-43.
Cu-Al alloys (Inoxyda 3, 3P, 53, 72, 85 and 90) containing Br, Ni, Fe and Mn; mechanical, physical, chemical properties. (A-general, Q-general, P-general; Cu-s, *Br, Ni, Fe, Mn, Al,* 17-57)

353-A. Emissions From Iron Foundries. F. M. Shaw. *Foundry Trade Journal,* v. 106, Apr. 16, 1959, p. 439-444.

Smoke, grit and dust can be reduced. 7 ref. (A8a, D-general)

354-A. Dust and Fume Problems in the Finishing Industry. J. B. Stribling. *Industrial Finishing (London)*, v. 11, Apr. 1959, p. 21-24.
(A8a, W13c, L-general)

355-A. Removal of Dust and Fume From Openhearth Waste Gases. Pt. 1. Non-Electric Filtering Methods. K. Guthmann. *Iron & Coal Trades Review*, v. 178, Apr. 10, 1959, p. 831-838. (From *Radex Rundschau*, v. 6, 1958.)
33 ref. (A8a, D2, W13c)

356-A. (French.) Copper Through the Ages: Some 16th Century French Founders. *Cuivre, Laitons, Alliages*, Feb. 1959, p. 24-27.
(A2; Cu)

357-A. Department of Defense Titanium Sheet Rolling Program, Status Report no. 4. H. R. Ogden. *Defense Metals Information Center*, Report no.46F, PB 151065, Mar. 20, 1959, 84 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.)
Progress in the development of Ti-6Al-4V, Ti-4Al-3Mo-1V, Ti-2.5Al-16V and Ti-13V-11Cr-3Al (B12OVCA) alloys. Data on fabrication processes, heat treatment and mechanical properties. (A-general, J-general, Q-general; Ti-b, 4-53, *Al, V, Mo, Cr*)

358-A.* Beryllium—Past, Present and Future. Charles T. Baroch. *Mines Magazine*, Apr. 1959, p. 19-22.
Resources, applications, cost. 10 ref. (A-general; Be, 17-57)

359-A.* New Metals. M. K. McQuillan. *Birmingham Metallurgical Society, Journal*, v. 39, Mar. 1959, p. 3-17.
Ti, V, Cr, Zr, Cb, Mo, Hf, Ta, W. (A-general; Cb, Cr, Hf, M, Ta, Ti, V, W, Zr)

360-A.* Some Trends in American Metallurgy. W. O. Alexander. *Birmingham Metallurgical Society, Journal*, v. 39, Mar. 1959, p. 18-33.
Resources, production, technology, research. (A-general)

361-A.* Current Tin Research. *Corrosion Prevention & Control*, v. 6, Mar. 1959, p. 55-58.
Latest developments in following tin industry techniques: tin plating, hot tinning, testing, electroplating, alloying, soldering, sintering. (A-general, 17-57; Sn)

362-A.* Newer Metals. N. P. Inglis. *Mass Production*, Apr. 1959, p. 65-68, 113-114.
Ti, Zr, Be and Cb. (A-general; Be, Cb, Ti, Zr)

363-A.* Niobium (Columbium)—Its Future Prospects. J. Sandor. *Metallurgia*, v. 59, Apr. 1959, p. 185-194.
Sources; consumption; advances in extraction techniques; physical properties. Use in steels, heat resisting alloys and nuclear engineering. 28 ref. (A-general, C-general, P-general; Cb, SGA-h, SGB-p)

364-A.* For Many Thin Parts Powder Metallurgy Can Compete With Stamping. John Haller. *Product Engineering, (Design Show Issue)*, v. 30, May 11, 1959, p. 82-83.
Powder metal parts are less costly for thin parts and bearings and in cases where stampings require excessive secondary forming operations. (A-general, T7d; 4-59, 6-72, 17-57, 17-53)

365-A.* (Hungarian.) Production and Use of Beryllium Bronze. Pt. 1. Fulop Balazs and Bela Paar. *Kohaszati Lapok*, v. 92, Jan. 1959, p. 8-13.
Composition and effect of impurities; mechanical properties with and without preliminary heat treatment; grain size and growth related to annealing time and temperature. (A-general, J-general, Q-general, N3, 3-69; Cu-s, *Be*)

366-A. Wrought Iron Learns New Tricks. *Chemical Engineering*, v. 66, Mar. 9, 1959, p. 172, 174, 176.
New type shows improved resistance to corrosion by atmosphere, acids and alkalies. (A-general, R-general; Fe-m)

367-A. The Measurement and Control of Dust in Foundries. A. H. Sully, C. M. Stoch and J. M. Slater. *British Foundryman*, v. 52, Apr. 1959, p. 193-211.
44 ref. (A8a, E-general)

368-A. The Forging Industry. Past, Present and Future. G. H. Jackson. *Metal Treatment and Drop Forging*, v. 26, Apr. 1959, p. 137-144.
History of iron and steel forging. Development of forging hammers and open and closed die techniques. 8 ref. (To be continued.) (A2, F22, W22; ST)

369-A. (Russian.) Borides of Rare Earth Metals. G. V. Samsonov. *Uspekhi Khimii*, v. 28, no. 2, 1959, p. 189.

A survey of structure and properties of boride rare earth metals. 72 ref. (A-general; EG-g, NM-a37, *B*)

370-A. (Book.) National Conference on Air Pollution, Proceedings, Nov. 1958. *U. S. Public Health Service*, Publication 654, 1959, 525 p. $1.75.

Papers of interest are abstracted separately. (A8a)

371-A. (Book.) Metal Industry Handbook and Directory, 1959, 564 p. 1959. Iliffe & Sons Lts., Dorset House, Stamford St., London, S. E. 1., England. 22s. 9d.

Data on metals and processes; British standards, directory, trade names. (A-general, 11-67)

372-A. (Book.) Industrial Procurement: Galvanized Steel Sheets. 36 p. 1959. American Zinc Institute, Inc., 60 East 42nd, New York 17. Free.

Properties, applications, specification, purchase and maintenance of galvanized steel sheet for industrial uses. (A-general; ST, Zn, 4-53, 8-65)

373-A. (Book.) Seamless Aircraft Tubing: Carbon and Alloy Steels. Ohio Seamless Tube Div. of Copperweld Steel Co., Technical Handbook no. A-2, 7th Revision, May 1, 1959, 70 p. Free.

Definitions, specifications, properties and mill practice. (A-general, S-22; AY, CN, 4-60)

374-A. (Book.) Radioisotopes in Scientific Research. v. 1, R. C. Extermann, Editor. 761 p. 1958. Pergamon Press, 122 E. 55th St., New York 22. $22.50.

Proceedings of the International Conference held in Paris, Sept. 1957. Pertinent papers previously abstracted separately. (A-general, 1-59, 14-63)

375-A. (Translation.) Removal of Dust and Fume From Openhearth Waste Gases. Pt. 2. The Electrostatic Filter. *Iron & Coal Trades Review*, v. 178, Apr. 17, 1959, p. 903-908. (From *Radex Rundschau*, v. 6, 1958.)

16 ref. (A8, D2, W13c)

(A-general; Ge)

377-A. (Translation—BISI no. 1154.) Utilization of the Sludge From Gas Scrubbers. B. Weilandt and F. Krause. *Stahl und Eisen*, v. 78, Nov. 13, 1958, p. 1657-1662.

See item 155-A, 1959. (A11d, D1, Zn)

378-A.* (French.) Semifinished Cast and Sintered Beryllium Products Compared. R. Syre, A. Saulnier and M. Perex. *Revue de Metallurgie*, v. 56, Apr. 1959, p. 359-370.

Advantages and disadvantages of Be ingot and part preparation by casting and powder metallurgy techniques; machining; crystal structure in annealed, extruded and rolled conditions; mechanical properties. (A-general, E-general, H-general, Q-general; Be)

379-A.* (French.) Titanium and Titanium Alloys in Aircraft Construction. Pierre Vachet. *Technique et Science Aeronautiques*, v. 5, Oct. 1958, p. 221-241.

Physical metallurgy, influence of impurities and addition elements; mechanical working, heat treatment, welding, brazing, descaling, electroplating; mechanical properties at ordinary and high temperatures; economic factors. 29 ref. (A-general, Q-general, 2-60, T24; 17-57, Ti)

380-A.* (German.) Beryllium in Modern Engineering. R. Reinbach. *Industrie-Anzeiger*, v. 81, Mar. 24, 1959, p. 15-17.

Properties and uses of pure Be and Be alloys. (A-general, 17-57, Q-general; Be)

381-A.* (German.) New Materials for Chemical Industry. R. Oppenheim. *Industrie-Anzeiger*, v. 81, Feb. 17, 1959, p. 191-198.

Composition and properties of stainless steels; Cr-Ni steels with low carbon content; high Mn steels; ferritic-austenitic Cr-Ni-Mo steels; precipitation hardening steels; nuclear reactor steels; high-temperature resistant steels; corrosion resistant special alloys; Ti and Zr. 17 ref. (A-general, T29, Q-general; SS, SGA-h, SGA-g, 17-57, *Ti, Zr*)

382-A.* (German-French.) Properties and Weldability of New Metals and Alloys. C. G. Keel. *Zeitschrift fur Schweisstechnik, Journal de la Soudure*, v. 49, Apr. 10, 1959, p. 103-110.

Physical, chemical and mechanical properties of Zr, V, Hf, Be, Pu, Rh, Ta and U. Machinability, weldability and brazing properties; industrial applications. 37 ref. (A-general; Zr, V, Hf, Be, Pu, Rh, Ta, U, 17-57)

383-A. Beryldur (Beryllium-Copper Alloy). *Alloy Digest,* Cu-74, May 1959, 2 p.

Low-cost, easy to work alloy having age-hardening characteristics, high tensile properties and excellent corrosion resistance. (A-general, Q-general; Cu-b, *Be,* 17-57)

384-A. Aluminum Brass. *Alloy Digest,* Cu-75, May 1959, 2 p.

Used in tubes for condensers, evaporators, heat exchangers and distillers. (A-general; Cu-n, *Al,* 17-57)

385-A. Ti-155A (Titanium-Base Alloy). *Alloy Digest,* Ti-19, May 1959, 2 p.

Ti alloy having guaranteed heat treat capability up to 175,000 psi. tensile strength for bar stock and 180,000 psi. for forging stock. Used as forgings for aircraft applications such as propeller blades. (A-general, Q-general; Ti-b, 4-51, 17-57)

386-A. (Czech.) Economical Composition for Austenitic Stainless Cr-Mn-Ni-N Steels. Karel Hybek, Jan Solc and Marcela Zezulova. *Hutnicke Listy,* v. 14, Apr. 1959, p. 287-237.

Metallographic, corrosion, mechanical, deformability and weldability tests with samples of various compositions. Effect of nitrogen on the preservation of austenitic structure. 18 ref. (A-general, Q-general, R11, K9s, 2-60; SS-e, *Cr, Mn, Ni, N*)

387-A.* Radioisotopes Utilization in the Foundry Industry. M. Pobereskin and D. N. Sunderman. *Modern Castings,* v. 35, May 1959, p. 69-74.

Applications include wear measurement, tracing of chemical reactions, measurement of thickness, location of alloying elements. (A-general, E-general, 1-59)

388-A. Meltron AM503 (Wrought Magnesium Alloy). *Alloy Digest,* Mg-41, May 1959, 2 p.

Medium strength Mn-type Mg-base alloy does not respond to a hardening heat treatment but is useful where maximum formability, weldability, and resistance to corrosion are desired. (A-general; Mg-b, *Mn,* 17-57)

389-A. Lukens Nine Nickel (Nickel Alloy Steel). *Alloy Digest,* SA-83, May 1959, 2 p.

Dependable for service to -320° F. and resistant to brittle fracture at low temperatures. Used for storage and process vessels handling liquified gases. (A-general, 2-63; AY, *Ni,* 17-57)

390-A. Westinghouse W545 (High Strength, High Temperature Alloy). *Alloy Digest,* SS-87, May 1959, 2 p.

Heat treatable alloy with good high-temperature strength and oxidation resistance, designed for high temperature, high stressed parts in missiles and turbines. (A-general, R-general, 2-62; SGB-a, SS, 17-57)

391-A. AISI Type 431 (Corrosion and Heat Resisting Steel). *Alloy Digest,* SS-88, May 1959, 2 p.

A ferromagnetic, corrosion and heat resistant stainless steel suitable for aircraft and marine applications. (A-general, R-general, Q-general, 2-62; SS, 17-57)

392-A. Ferro-Tic Gr. C (Machinable Cemented Carbide). *Alloy Digest,* TS-82, May 1959, 2 p.

Can be fabricated in the annealed condition with conventional tools and subsequently hardened. Used for dies, cutting tools, gages, valves and shafts. (A-general, G17k, J-general; Ti, 6-69, 17-57)

393-A.* (German.) New Developments in Nickel Containing Materials. *Metall,* v. 13, May 1959, p. 420-427.

Composition and characteristics of Cr-Ni stainless steels, Ni-Cr, Ni-Cr-Fe, Ni-Mo-Fe, Ni-Mo-Cr-W alloys and a Ni-Mo-Fe alloy with V that shows corrosion and wear resistant Ni-alloyed cast iron. Ni-Fe alloys with special magnetic properties; effect of Ti on the elastic limit of Ni-Co-Fe alloys; magnetorestriction in Co-Ni alloys. (A-general, R-general, P16; Ni-b, *Fe, Cr, Mo, W, V, Co*)

394-A. Progress Relating to Civilian Applications During January 1958. Russell W. Dayton and Clyde R. Tipton. Battelle Memorial Institute. *U. S. Atomic Energy Commission,* BMI-1253, Feb. 1, 1958, 62 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.75.

Summary of research relating to Zr-clad and Al-clad fuel elements, uranium and uranium alloy fuels, fatigue studies on Inconel, reactor materials and components, and corrosion problems associated with the recovery of spent reactor fuel elements. (A-general, T11g, Q7, R-general, A8c; U, *Zr, Al,* Ni-b)

395-A. Further Studies of Sintered Refractory Uranium Compounds. Arch B. Tripler, Jr., M. Jack Snyder and Winston H. Duckworth. Battelle Memorial Institute.

U. S. Atomic Energy Commission, BMI-1313, Jan. 27, 1959, 46 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.75.

Properties of a number of refractory binary compounds of uranium. Methods of preparation, fabrication and some physical and chemical properties of UC, UC_2, UBe_{13}, UN and UB_2. 16 ref. (A-general; U, *B, C, N, Be,* 6-71)

396-A. Steel in the German Economy: A Comparison With Britain. *Steel Review,* no. 14, Apr. 1959, p. 11-25.
(A-general, D-general; ST)

397-A. Another Look at the History of Stainless Steel. *Vancoram Review,* v. 14, no. 1, 1959, p. 13-14.
(A2; SS)

398-A. (French.) Beryllium. P. Vachet. *Chimie et Industrie,* v. 81, Jan. 1959, p. 64-77.
(A-general; Be)

399-A. (French.) The New Industrial Metals. Emile Pruvot. *Societe Francaise des Electriciens, Bulletin,* v. 9, Jan. 1959, p. 16-27.

Ores, extraction, metallurgy, properties, applications of Be, Ti, Zr, Ta, Cb. (A-general, 17-57; Be, Ti, Zr, Ta, Cb)

400-A.* (Hungarian.) Production and Use of Beryllium Bronze. Pt. 1. F. Balazs and B. Paar. *Kohaszati Lapok,* v. 92, Feb-Mar. 1959, p. 55-60.

Influence of tempering temperature and time on strength and electric conductivity, changes in properties due to cold working between quenching and drawing, grain boundary precipitations. Production methods such as melting, casting, hot and cold forming, heat treatment and pickling. 12 ref. (A-general, P-general; Cu-s, *Be,* 17-57)

401-A. Trends in Metals—Aluminum's on the Move. *Steel,* v. 144, June 8, 1959, p. 103-118.

Review of Al industry. (A-general, A4n; Al)

402-A. Technical Survey of the Two-Million-Ton Expansion Program. *TISCO (Technical Journal of the Tata Iron & Steel Co.)* v. 6, Jan. 1959, 67 p.

Planning, transportation and construction activities of the Tata Co. in conjunction with the expansion program. (A-general, D-general; ST)

403-A. Thorium Data Manual. E. L. Francis. *United Kingdom Atomic Energy Authority,* IGR-R/R-303, Oct. 6, 1958, 19 p.

Compilation of best available unclassified data on physical, mechanical, chemical and irradiation properties. 19 ref. (A-general; Th)

404-A. Niobium Data Manual. E. L. Francis. *United Kingdom Atomic Energy Authority,* IGR-R/R-304, Oct. 16, 1958, 15 p.

Compilation of best available data on physical, mechanical and chemical properties of columbium (niobium). (A-general; Cb)

405-A. Vanadium Data Manual. E. L. Francis. *United Kingdom Atomic Energy Authority,* IGR-R/R-306, Oct. 29, 1958, 16 p.

Compilation of the best available unclassified data on the physical, mechanical and chemical properties. (A-general; V)

406-A. Zirconium: A Review and Summary of Published Data. H. Loevenstein and H. L. Gilbert. Harvey Aluminum. *U. S. Atomic Energy Commission,* AECU-3818, Oct. 1958, 227 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $3.50.

Physical, chemical and mechanical properties; corrosion resistance of Zr and Zr alloys; crystal structure; working and fabrication techniques. (A-general; Zr)

407-A. Tantalum Breaks Through With New Production and Fabrication Techniques. Burton Payne. *American Machinist,* v. 103, June 1, 1959, p. 109-111.
(A-general; Ta)

408-A. Treatment of Waste Acid and Effluent From Continuous Strip Pickling Lines. A. E. Matthews. *Wire Industry,* v. 26, May 1959, p. 453-455, 457-459, 492.
(A8b, L12g)

409-A.* (Italian.) Titanium: Production, Properties, Applications. Eugenio Hugony. *Ingeneria Meccanica,* v. 8, Feb. 1959, p. 25-31.

Preparation and refining processes. Behavior of Ti in the presence of corrosive agents of varying concentration and at different temperatures. Improvement of mechanical properties and hot strength by alloying with Al and Sn (alpha alloys). Beta alloys of high plasticity are obtained by adding Mn, V, Cr, Mo. Alpha and beta (Ti-Al-Mn) alloys combine hot strength

and plasticity. (A-general, Q-general, C26, R-general, Ti-b, *V, Mo, Al, Sn, Mn*)

410-A.* Metals for the Future—The Rare Earths. R. B. Howes. *Metal Progress*, v. 75, June 1959, p. 108-112.

Ion-exchange separation, developed during World War II, helped these little-known metals to achieve individuality. With purer metals and oxides available, these metals are now being used as scavengers for steel melts, sources for X-rays and getters for vacuum pumps. In the future, their unique nuclear properties will probably make them valuable as structural materials in reactors. (A-general; EG-g, 17-57)

411-A.* Steel Castings for the Aircraft Industry. Y. J. Elizondo. *Modern Castings*, v. 35, June 1959, p. 79-85.

Requirements for quality steel castings are high strength steels capable of operating at temperatures as high as 1500° F., reproducibility of results, guaranteed strength levels, adequate inspection criteria, improved tolerances, improved cost and time estimates. (A-general, Q-general, 2-62, T24; SS, 5-60, 17-57)

412-A. New Alloy More Resistant Than Pure Ti. *Chemical Engineering*, May 18, 1959, p. 200.

Ti with 0.1% of a noble metal is much more of a "wonder" metal for corrosive service than pure Ti. (A-general, R-general, 2-60; Ti, *EG-c*)

413-A. Rhenium Metal for High Temperature Uses Being Produced at Chase Brass & Copper Co. *Industrial Heating*, v. 26, May 1959, p. 977-978, 980.

Properties, applications, powder metallurgy techniques. (A-general, H-general; Rh, 17-57)

414-A. Production, Fabrication, Properties and Uses of Some of the Newer Metals. N. P. Inglis. *Institution of Production Engineers Journal*, v. 38, May 1959, p. 219-237.

Ni, Hf and Ta. (A-general, Ni, Hf, Ta, 17-57)

415-A. Steelmaking Processes in Relation to Atmospheric Pollution. R. J. Sarjant. *Iron & Steel*, v. 32, May 1959, p. 185-190.

27 ref. (A8a, D-general)

416-A. Collection and Filtration of Toxic Particles. *Machinery (London)*, v. 94, May 27, 1959, p. 1193-1195.

Equipment for handling Be and other toxic substances in finely divided form. (A8c, A7r; Be)

417-A. Industrial and Engineering Uses of the Platinum Metals. A. R. Myhill. *Mechanical World and Engineering Record*, May 1959, p. 198-202.

The noble metals belonging to the Pt group (Pt, Pd, Ir, Rh, Os and Ru) although expensive in first cost, are employed extensively in many industries since their high melting point and resistance to corrosion at all temperatures enable them to be used for purposes where it would be impracticable to use other materials. (A-general; EG-c, 17-57)

418-A. (Book.) Fabrication of Molybdenum. 221 p. 1959. American Society for Metals, 7301 Euclid Ave., Cleveland 3, Ohio. $6.50.

Alloy development, rolling, welding, brazing, machining, press extrusion, forming, forging and coating. Application requirements. Papers abstracted separately. (A-general; Mo)

419-A. (Book.) Physical Metallurgy. C. Ernest Birchenall. 323 p. 1959. McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York 26, N. Y. $8.50.

Textbook for advanced undergraduate students in engineering and science, structures and equilibria; kinematics of physical and chemical reactions with emphasis on plastic deformation mechanisms; diffusion and solid-solid reactions. Solidification, ingot formation and zone melting; diffusion in metals and oxides, recovery and age hardening. (A-general)

420-A.* (Italian.) Properties and Applications of Nickel Silver. *Nickel*, no. 78, Feb. 1959, p. 1-16.

Composition and mechanical properties of 65-10, 65-12, 65-12 Pb, 65-15, 65-18-46, 5-10 Pb, 64-18, 64.18 Pb-B 149.52-No. 10A, 11A, 11B in relation to temperature, corrosion behavior, heat treatment, cold working, welding, machining, polishing and finishing. (A-general, J-general, Q-general, R-general; Cu-b, *Ni, Pb*)

421-A.* (Italian.) Cast Chromium-Nickel Austenitic Stainless Steels. *Nickel*, no. 78, Feb. 1959, p. 17-19.

Mechanical properties, heat treatment, machining, welding of CF8M and CF12M (18-21 Cr, 9-12 Ni, 2-3 Mo) steels. (A-general, Q-general, J-general, K-general; SS-e, *Cr, Ni, Mo*, 5-60)

422-A.* (French.) U.S.S. Ti-Steel. An American Construction Steel, Fully Heat Treated, Weldable and Semi-Stainless. *Revue du Nickel*, v. 25, Mar-Apr. 1959, p. 27-29.

Composition and heat treatment, mechanical properties, abrasion and wear resistance. Corrosion behavior (industrial, marine and rural atmosphere). Hot and cold working, welding and applications. (A-general, J-general, Q-general, R-general; SS, 17-57)

423-A. Progress in the Development and Application of Steel Plates. W. Barr. *Iron & Steel*, v. 32, May 22, 1959, p. 219-223.

Development of notch ductile steels in Britain for ship and boiler plate; problems of crack initiation, brittle fracture, mechanical properties; heat treatment of plate. (A-general, Q26, Q-general, J-general; CN, 4-53)

424-A. Columbium: Is It Headed for a Boom? *Mining World*, v. 21, May 1959, p. 38-41.

(A-general; Cb, 17-57)

425-A. (French.) Improvement of Productivity in Small and Medium-Size Foundries by Job Analysis and Introduction of New Methods. Gabriel Delatour. *Fonderie*, no. 159, Apr. 1959, p. 176-179.

(A5b, E-general)

426-A. (Japanese.) Design for Steel Castings. Tsuguyoshi Matsuura. *Japan Foundrymen's Society, Journal*, v. 31, Jan. 1959, p. 41-47.

Comments and exemplifications. (A-general; ST, 5-60, 17-51)

427-A. (Portuguese.) Sonics in Modern Industry. Pt. 3. L. S. Nepomuceno. *Engenharia, Mineracao e Metalurgia*, v. 29, Apr. 1959, p. 171-173.

12 ref. (Conclusion.) (A-general, 1-74, K6r, S13g)

428-A.* How to Select the Right Stainless Steel. Richard E. Paret. *Machine Design*, v. 31, June 11, 1959, p. 162-169.

Alloy classification, properties and applications. Available mill shapes and finishes. (A-general, Q-general, G17k, R-general; SS, 17-57)

429-A.* Future Trends in Vacuum Metallurgy. James H. Moore. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 435-442.

Future possibilities and applications of vacuum techniques in reduction and distillation, molten refining and casting, powder metallurgy, heat treatment and brazing and vacuum coating. (A-general, 1-73)

430-A. (Italian.) Development of Titanium Alloys in U.S.A. *Alluminio*, v. 38, Apr. 1959, p. 186-187.

(A-general, Q-general; Ti, 17-57)

431-A.* Plutonium Metallurgy in the United Kingdom. M. B. Waldron. *Journal of Metals*, v. 11, May 1959, p. 339-343.

British research programs and achievement. 20 ref. (A-general, P-general, M24b; Pu, *Zr*, *U*)

432-A. Aluminum 357 (High-Strength Aluminum Alloy). *Alloy Digest*, Al-80, July 1959, 2p.

Composition and properties of a casting alloy with high tensile and high yield strengths and with good ductility for highly stressed aircraft and missile structures. It has exceptionally high purity which permits the use of more complete artificial aging to develop the full potential strength values without approaching brittleness. (A-general, Q-general, N7a; Al-b, SGB-a)

433-A. Cupro Nickel, 10%-755 (Copper-Nickel Alloy). *Alloy Digest*, Cu-77, July 1959, 2 p.

Composition and properties of a Cu-base alloy having high resistance to corrosion and erosion, particularly in salt or brackish water. It is primarily a condenser tube alloy which, because of its composition, is less costly than 30% cupro-nickel, and its performance under certain operating conditions compares favorably. (A-general, R-general; Cu-b, *Ni*)

434-A. Berylco 50 (Beryllium-Copper Alloy). *Alloy Digest*, Cu-78, July 1959, 2 p.

Properties and characteristics of a resistance welding electrode material which offers high electrical conductivity, low surface contact resistance and resistance to mushrooming. It responds to an age hardening heat treatment. (A-general, Q-general, P15g; Cu-b, *Be*, SGA-q)

435-A. Dodge D-1 (Alloy Steel Castings). *Alloy Digest*, SA-86, July 1959, 2 p.

Properties and characteristics of a water quenched steel, designed for a wide variety of parts requiring combinations of high impact, high tensile and wear resistant properties at minimum costs. The

addition of Mo practically eliminates any tendency toward temper brittleness and stabilizes the mechanical properties at hardness and increases the depth of hardening by slowing down the heat treatment transformation rate. (A-general, Q-general; AY, 5-60)

436-A. Timken CBS-600 (Carburizing Steel). *Alloy Digest,* SA-87, July 1959, 2 p.

Composition and properties of Si-Cr-Mo case hardening steel that maintains good case hardness at temperature and recovered hardness at room temperature after service up to 600° F. (A-general, Q29n, J28; Ay, *Si, Cr, Mo*)

437-A. Carpenter Stainless No. 3 (Heat Resisting Chromium Steel, Type 443). *Alloy Digest,* SS-91, July 1959, 2 p.

Properties and characteristics of a heat resisting steel which stands up very well under destructive scaling conditions up to 1600° F. This grade compares favorably with 18-8 grades in both corrosion resistance and scale resistance. It is a ferritic alloy that does not respond to any thermal treatment for hardening or strengthening. (A-general, Q-general, R-general; SS-d, SGA-L)

438-A. Crucible A-40 (Commercially Pure Titanium). *Alloy Digest,* Ti-20, July 1959, 2 p.

Composition, characteristics and mechanical properties of a special grade of unalloyed Ti for applications requiring maximum ductility and formability. (A-general, Q-general; Ti-a)

439-A. Colhed (Cold Heading Tool Steel, Type W3). *Alloy Digest,* TS-83, July 1959, 2 p.

Composition, characteristics and properties of a carbon-vanadium steel that will harden with a tough core and have a suitable depth of hardened case. It is particularly recommended for cold heading dies. (A-general, Q-general, W24n; TS, *C, V*)

440-A.* Aluminum 5454 (Welding Grade Aluminum Alloy). *Alloy Digest,* Al-78, June 1959, 2 p.

New high-strength Al alloy designed especially for welded structures that must operate in the 150-300° F. range. Heat treatment, machinability, workability, weldability, corrosion resistance, finishing and applications. (A-general, Q-general, P-general; Al-b, 17-57, SGB-a)

441-A.* ALCAN 57S (Wrought Aluminum Alloy). *Alloy Digest,* Al-79, June 1959, 2 p.

Medium-strength alloy having resistance to corrosion, especially by salt water. It is not heat treatable. Machinability, workability, weldability, corrosion resistance and applications. (A-general, Q-general, R-general, P-general; Al-b, *Mg,* 17-57, 4)

442-A.* Riverside No. 4 (Nickel Silver Alloy). *Alloy Digest,* Cu-76, June 1959, 2 p.

Spring quality Ni-Ag alloy having high resistance to corrosion and tarnish, used primarily for springs and electrical resistances. Machinability, workability, weldability, corrosion resistance, pickling and applications given. (A-general, J-general, Q-general, R-general; Cu-b, *Ni, Mn,* 17-57, SGA-g, SGA-q, SGA-b)

443-A.* Magnesium HZ 32A (Magnesium Casting Alloy). *Alloy Digest,* Mg-42, June 1959, 2 p.

Alloy containing Th, Zr and Zn for elevated-temperature applications. Castability, heat treatment, machinability, weldability, corrosion resistance and applications. (A-general, E25p, Q-general, P-general, 17-57, 2-62; Mg-b, *Th, Zn, Zr*)

444-A.* AISI 4063 (Molybdenum Alloy Steel). *Alloy Digest,* Sa-84, June 1959, 2 p.

Low-Mo steel for heavy-duty applications requiring strength and toughness with decrease in temper brittleness. Mechanical properties, heat treatment, workability, machinability, weldability, and applications. (A-general, Q-general, 17-57; AY, *Mo*)

445-A.* Airsteel X-200 (Ultra-High-Strength Alloy Sheet Steel). *Alloy Digest,* Sa-85, June 1959, 2 p.

U. S. S. Airsteel X-200 is a high-strength, workable, air hardening steel. Mechanical properties, effect of annealing temperatures and times, effect of tempering temperature, machinability, workability, weldability and applications. (A-general, Q-general; SGB-a, AY, *Cr*)

446-A.* Hoskins 502 (Heat Resistant Alloy). *Alloy Digest,* SS-89, June 1959, 2 p.

Austenitic, nonmagnetic, high Ni-Cr alloy steel for use on mechanical applications requiring high resistance to heat, corrosion and oxidation. Mechanical properties, heat treatment, machinability, workability, weldability, corrosion resistance and applications. (A-general,

Q-general; SS-e, *Cr, Ni,* 17-57, SGA-g, SGA-h)

447-A.* Pyrocast (Heat Resistant Alloy). *Alloy Digest,* SS-90, June 1959, 2 p.

High-carbon high-chromium cast alloy having good oxidation and heat resistance at elevated temperatures. Mechanical properties, machinability, weldability and applications. (A-general, Q-general; SS, *Cr, Ni, Mo, C,* 17-57, SGA-h, SGB-a, 5)

448-A.* (French.) Indium and Its Applications. *Technique Moderne,* v. 51, May 1959, p. 251-254.

Properties and applications as pure metal or as an alloying component with Bi, Pb, Sn and Cd. Melting points of various alloys and solders containing In. 10 ref. (A-general, Q-general, P-general; In, *Bi, Pb, Sn, Cd,* 17-57)

449-A.* (Hungarian.) Production and Applications of Beryllium Bronze. F. Balazs and B. Paar. *Kohaszati Lapok,* v. 14, May 1959, p. 185-193.

Physical, mechanical and chemical properties, processing of semifinished beryllium-bronze products; soldering and welding of parts. Applications include use as spring materials. (A-general, Q-general, P-general; Cu-S, *Be,* 17-57)

450-A. Nuclear Fuel Resources and Fuel Utilization. *Power Reactor Technology,* v. 2, June 1959, p. 1-12.

Structure of U. S. energy consumption, fossil fuel resources, rate of growth of nuclear electric capacity, uranium demands for process and space heat, nuclear fuel reserves, degree of fuel utilization and consumption of uranium resources. 28 ref. (A11a, T11g, 16-62; U)

451-A. (German.) Documentation in the Field of Corrosion. W. Wiederholt. *Werkstoffe und Korrosion,* v. 10, June 1959, p. 363-372.

Historical survey of various systems; types of indexing and classification systems. (A14, R-general)

452-A.* The New 5XXX Aluminum Alloys--Strong and Weldable. R. T. Myer and D. R. Cheyney. *Materials in Design Engineering,* v. 50, July 1959, p. 91-95.

How and where to use a recently developed series of Al-Mg alloys containing 2.5 to 5.5% Mg and up to nearly 1% Mn. (A-general, K-general; Al-b, *Mg, Mn,* 17-57)

453-A.* Permanent Magnet Materials. Robert J. Fabian. *Materials in Design Engineering,* v. 50, July 1959, p. 108-114.

Comprehensive survey of composition, properties and magnetic characteristics of magnet steels, Alnicos and other magnetic alloys. (A-general, P16; SGA-n)

454-A. Early Radiophotographs. Clarence T. Patterson. *Metal Progress,* v. 76, July 1959, p. 91-92.

Early in 1915 the radioactivity of uranium was used to mark the position of its carbides in ferro-uranium. Intimate details of the microstructure could not be determined because these contact prints could not be magnified very highly; the "grain" of the photographic emulsion was too coarse. (A2, M23q; Fe, U, AD-n)

455-A. Safe Handling of Beryllium. Webster Hodge. Digest of "Some Notes on Safe Handling Practices for Beryllium". Battelle Memorial Institute, DMIC Memorandum 2, Sept. 22, 1958. *Metal Progress,* v. 76, July 1959, p. 142, 144, 147-A.

Air sampling; hygienic programs; collection systems; waste disposal. (A7r; Be)

456-A.* New High-Strength Aluminum Alloy. *Precision Metal Molding,* v. 17, July 1959, p. 27.

Composition, specifications and mechanical properties of X357 high purity Si-Mg-Ti-Al alloy. (A-general, Q-general; Al-b, *Si, Mg, Ti*)

457-A.* High-Temp, High-Strength Die Casting Alloy. *Precision Metal Molding,* v. 17, July 1959, p. 37.

Mechanical properties for new lightweight HM11XA alloy containing approximately 1% Th, 1% Mn, balance Mg. (A-general, Q-general; Mg-b, *Th, Mn,* 5-61, SGB-a)

458-A. (Book.) Year Book of the American Bureau of Metal Statistics, 38th Annual Issue for the Year 1958. 137 p. June 1959. American Bureau of Metal Statistics, 50 Broadway, New York. $4.

Statistical information for market analysis, research and industry surveys. (A4)

459-A. (Book.) Vacuum Metallurgy. Rointan F. Bunshah, Editor. 472 p. 1958. Reinhold Publishing Co., 430 Park Ave., New York 22, N. Y.

Lectures presented during a course on vacuum metallurgy sponsored by the De-

partment of Metallurgical Engineering in cooperation with the Office of Special Service to Business and Industry, New York University, New York, N. Y., June 10-14, 1957. Papers are abstracted separately. (A-general, 1-73)

460-A. (Book-German.) Metallurgy - Pt. 2, Sammlung Goschen Band 433/433a. Heinz Borchers. 179 p. 1959. Walter de Gruyter and Co., Berlin W35. DM 5.80.

Properties of metals and alloys. Preparation, sintering, casting, deformation, heat treatment, metal spraying, machining, welding, joining and assembling. (A-general)

461-A. Computer Holds Stainless Costs. D. C. Hilty, R. W. Taylor and R. H. Gillespie. *Iron Age*, v. 184, July 9, 1959, p. 100-101.

Use of computer to find methods of producing steel more economically. (A4s, X14k, D-general)

462-A.* Status and Future of Nickel-Base Alloys. F. L. Ver Snyder. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 3-15.

Mechanical properties, structure, role of precipitation of Ni_3Al, intergranular fracture in Ni alloys. Complexity of these alloys in relation to the large number of alloying elements is expected to decrease with increased understanding of factors that promote high-temperatures properties. (A-general, Q-general, 2-60; Ni-b, SGA-h)

463-A.* History, Status and Future of Cobalt Alloys. Glenn A. Fritzlen. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 56-80.

Microstructure, room and high-temperature mechanical properties of a number of Co alloys in cast, wrought, cold worked and aged conditions. Principal applications to date and potential industrial and military applications based on development trends. (A-general, A2, Q-general, M27, 2-62; Co-b, 17-57, SGA-h)

464-A.* Refractory Metals: Tungsten, Tantalum, Columbium and Rhenium. John W. Pugh. Paper from "High Temperature Materials". John Wiley & Sons, New York 16, 1959, p. 306-318.

Physical and mechanical properties; strain aging; oxidation behavior; comparison with properties and behavior of Mo. 35 ref. (A-general, P-general, Q-general, R1h; W, Ta, Co, Re, Mo, EG-d37)

465-A. Red X-8 (Aluminum Casting Alloy), *Alloy Digest*, Al-81, Aug. 1959, 2 p.

Heat treatable alloy retains its strength well at temperatures up to 400° F. It has excellent casting qualities and is leakproof and pressure-tight. (A-general, Q-general, 2-62, E25p; Al-b, 5-60)

466-A. Kumanic (Heat Treatable Copper Alloy). *Alloy Digest*, Cu-79, Aug. 1959, 2 p.

Cu-Mn-Ni alloy that responds to hardening by heat treatment has high tensile and fatigue strength along with excellent resistance to corrosion. It is particularly suitable for use in springs, diaphragms and other parts in which design requirements make it desirable first to shape the part and then heat treat it to attain desired hardness, tensile strength and fatigue strength. (A-general, Q-general, 2-64; Cu-b, *Mn, Ni*)

467-A. NILO K (Controlled Expansion Alloy). *Alloy Digest*, Fe-16, Aug. 1959, 2 p.

Nilo K matches very closely the expansion characteristics of medium hard glasses of borosilicate type, used for envelopes of special high-power valves, such as transmitters and rectifiers, and for glass-to-metal seals on X-ray tubes and numerous electronic components. (A-general, P11g; Fe-b, *Ni, Co*, SGA-s)

468-A. Magnesium AZ61A (Magnesium Extrusion Alloy). *Alloy Digest*, Mg-43, Aug. 1959, 2 p.

Not recommended to be used above 400° F. Its strength increases and ductility decreases with decrease in temperature. Does not respond to any age hardening heat treatment. Strength level is between that of AZ31B and ZK60A. (A-general, Q-general, 2-61; Mg-b, 4-58)

469-A. Impacto (Nickel-Molybdenum Case Hardening Steel). *Alloy Digest*, SA-88, Aug. 1959, 2 p.

Recommended for applications where high toughness and excellent wear resistance are required. Outstanding for its uniformity of case and response to heat treatment, relative freedom from distortion during quenching and excellent toughness at high hardness. Resistance to abnormal grain growth is of particular

advantage in forging. (A-general, Q-general, 2-64; AY, *Ni, Mo,* SGA-m, 14-69)

470-A. A. C. I. Type HC (Heat Resisting Casting Alloy). *Alloy Digest,* SS-92, Aug. 1959, 2 p.

Fe-Cr alloy containing about 28% Cr and up to 4% Ni, providing excellent resistance to oxidation and high-sulphur flue gases at temperatures as high as 2000° F. This grade is limited to applications where strength is not a consideration, or for moderate load-bearing service around 1200° F. (A-general, R1h, 2-62, R7k; Fe-b, *Cr, Ni,* SGA-h, SGA-g)

471-A. MST 5A1-2.5 Sn (High Strength Titanium Alloy). *Alloy Digest,* Ti-21, Aug. 1959, 2 p.

A single-phase all-alpha grade having excellent toughness, fatigue strength, creep strength at elevated temperatures, machinability and weldability. Combines good hot strength and good ductility, has good tension-tension fatigue properties, the typical unnotched fatigue strength being 85% of the ultimate strength. (A-general, Q-general, 2-62; Ti-b, *Al, Sn,* SGB-a)

472-A. Bethlehem 57HW (Tungsten Hot Work Tool Steel Type H21). *Alloy Digest,* TS-84, Aug. 1959, 2 p.

A 9% tungsten hot work toolsteel, having excellent red hardness and abrasion resistance combined with relatively good shock resistance for high operating temperatures. Corresponds to AISI Type H21 hot work toolsteel. (A-general, Q-general; TS-k)

473-A. Steelmaking Research in the USSR. John F. Elliott. *Journal of Metals,* v. 11, July 1959, p. 465-467.

Research trends include investigation of transformations in very-high purity iron, structure of liquid alloys, Fe-Ni-O system at 1600° C., slag metal distribution, vacuum purification of metals, flow characteristics of metallurgical systems, levitation melting, sintering, direct reduction, oxygen in steelmaking, continuous casting and vacuum degassing of steels. (A9, D-general; ST)

474-A.* Soviet Vacuum Metallurgy. A. M. Aksoy. *Journal of Metals,* v. 11, July 1959, p. 468-470.

Report on the second Moscow symposium on the application of vacuum to metallurgy. Papers covered vacuum induction melting, vacuum arc remelting, vacuum degassing, desulphurization in vacuum, vacuum reduction and vacuum rolling. (A-general, D-general, F23, E10, 1-73)

475-A. International Symposium on Physical Chemistry of Process Metallurgy. George R. St. Pierre. *Journal of Metals,* v. 11, July 1959, p. 454-455.

Brief review of papers presented an AIME convention at Pittsburgh, Apr. 27-May 1, 1959. (A-general)

476-A.* Castings of AM-355. J. E. Mosser. *Steel Horizons,* v. 21, no. 3, 3rd Quarter, 1959, 4 p.

Composition, specifications and properties for this precipitation hardening stainless steel. (A-general, Q-general; SS, 5)

477-A.* Materials Based on Intermetallic Compounds. Robert Steinitz. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York, 16, 1959, p. 182-189.

No intermetallic compound has been found that is, in general behavior, superior to standard carbide or boride cermets, although some materials, such as molybdenum disilicide, chromium silicide, nickel aluminide and titanium aluminide, have properties that make them potentially useful for high-temperature applications. (A-general, Q-general, R-general, 2-62; Mo, Cr, Ni, *Si, Al,* 14-68, SGA-h)

478-A. Cermets and Bonded Hard Metals. John T. Norton. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 119-124.

Problems of further development for high-temperature applications. (A-general; SGA-h, 6-70)

479-A. Make Exotic Metals Practical. J. S. Rodgers and E. A. Wright. *Iron Age,* v. 184, July 30, 1959, p. 109-111.

Problems in the development of Be, Cb, Hf, Mo, Re, Ta, Ti, W, V, Y and Zr. (A-general; EG-b)

480-A. Beryllium. T. H. H. Skeet. *Mine & Quarry Engineering,* v. 25, June 1959, p. 263-269.

Occurrence, output and reserves of beryl. (A11; Be)

481-A. Semi-Annual Summary Research Report in Metallurgy. Ames Laboratory Staff. Ames Laboratory. *U.S. Atomic*

Energy Commission, ISC-1050, Jan-June 1958, 94 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $2.25

Separation studies, preparation of pure compounds, metal preparation and purification studies, alloy research, solid state investigations. (A-general, A9h)

482-A. (Pamphlet.) Guide for Zirconium. *National Fire Protection Association*, no. 482M, June 1959, 12 p. $.40.

Guide for fire and explosion prevention in plants producing and handling Zr. (A7p, S22; Zr)

483-A. (Pamphlet.) Standard for Titanium. *National Fire Protection Association*, no. 481, June 1959, 32 p. $.50.

Fire and explosion prevention and protection in the production, processing, handling and storage of Ti. (A7p, S22; Ti)

484-A. (Pamphlet.) Standard for Magnesium. *National Fire Protection Association*, no. 48, June 1959, 22 p. $.50.

Fire and explosion prevention and protection in the production, processing, handling and storage of Mg. (A7p, S22; Mg)

485-A. (Pamphlet.) British Steel Castings Research Assoc. Sixth Annual Report, 1959. British Steel Castings Research Assoc., 5 E. Bank Rd. Sheffield 2, England.

Research on steelmaking, foundry processes and molding materials, metallurgy, plant engineering and industrial health. (A9, A9h, D-general, E-general; ST)

486-A. (Book.) Basic Engineering Metallurgy. 2nd Ed. Carl A. Keyser. 507 p. 1959. Prentice-Hall, Inc., Englewood Cliffs, N. J.

Structure of metals; the solid state—freezing, solutions, diffusion; mechanical properties and metal failure; equilibrium diagrams; hardening of metals; annealing—recovery, recrystallization and grain growth; iron and steel; heat treating equipment and operations; light metals; Cu and Zn; casting; powder metallurgy; electroplating and electroforming; methods of fabrication and mechanical working. (A-general)

487-A. (Book.) Progress in Metal Physics. v. 7. Bruce Chalmers and R. King, Editors. 408 p. 1958. Pergamon Press Inc., 122 E. 55th St., New York 22, N. Y.

Topics covered include imperfections in semiconductors, physical metallurgy of Ti alloys, thermodynamics and kinetics of martensitic transformations, stored energy of cold work and properties of metals at low temperatures. Papers are abstracted separately. (A-general, N8p, Q-general, 2-63; Ti-b, EG-j)

488-A. (Book.) High Temperature Materials. R. F. Hehemann and G. M. Ault. 544 p. 1959. John Wiley & Sons, Inc., 440 Fourth Ave., New York 16.

Conference held in Cleveland, Ohio, Apr. 16-17, 1957, sponsored by the High-Temperature Alloys Committee, Institute of Metals Division, the Metallurgical Society, American Institute of Mining, Metallurgical and Petroleum Engineers. Papers are abstracted separately. (A-general; SGA-h)

489-A.* Lithium. . .The Lightest Metal. F. B. Litton. *Metal Progress*, v. 76, Aug 1959, p. 94-96.

Both the pure metal and its alloys, most of which are still in the laboratory stage, have unusual properties which can be useful. Its addition to other metals increases tensile strength and refines grain size. The metal's high reactivity makes it potentially a good scavenger in melts. (A-general; Li)

490-A. (Portuguese.) Beryllium, Metal of the Future. Paulo Dias Veloso. *Engenharia, Mineracao e Metalurgia*, v. 29, May 1959, p. 215-217.

(A-general; Be)

491-A. (Portuguese.) Metallurgical Research in Brazil. G. Soares de Moraes. *Engenharia, Mineracao e Metalurgia*, v. 29, May 1959, p. 237-239.

Shortage of research personnel; education, research programs. 6 ref. (A3g, A9)

492-A. Compilation of Available Information on the Ti-7Al-(3-4)Mo Alloy. R. W. Douglass and F. C. Holden. Titanium Metallurgical Laboratory. *U. S. Office of Technical Services*, PB 151322, July 1958, 104 p. $2.25.

New bar and forging, heat treatable alpha-beta alloy. Al additions increase the temperature limit of the alpha-beta field, thereby extending the hot working range, and strenghten the alpha phase both at room and high temperatures by solid-solution strengthening. Mo additions, in stabilizing the beta phase, render the alloy heat treatable, and strengthen the beta phase by solid-solution strengthening.

Data on physical, mechanical and high-temperature properties. (A-general, Q-general, P-general, N7; Ti-b, *Al, Mo*)

493-A. (German.) New Developments in Hard Metals and Hard Materials for Cutting Purposes. C. Agte and R. Kohlermann. *Technik*, v. 14, Apr. 1959, p. 287-291.

Developments in East Germany. (A-general; SGA-q, EG-d)

494-A. Bohnalite L-4. (Aluminum Casting Alloy). *Alloy Digest*, Al-82, Sept. 1959, 2 p.

Al-Si Cu-Mg-Ni permanent mold casting alloy having good wear resistance and high-temperature strength, good castability and excellent machinability. Its corrosion resistance is very high. Aging at 400° F. for 7-9 hr. improves tensile properties appreciably. (A-general, Q9n, 2-62, G17k, R-general, 2-64; Al-b, 5-63)

495-A. Meehanite SC. (Heat Resisting Casting Alloy). *Alloy Digest*, CI-27, Sept. 1959, 2 p.

Alloy is recommended for applications where fairly constant temperatures are involved and for exceptional resistance to growth and scaling. Maximum working temperature is 1650° F. (A-general, R2q, 2-62; CI, SGA-h)

496-A. Low Brass, 80%. (Copper-Zinc Alloy). *Alloy Digest*, Cu-80, Sept. 1959, 2 p.

Alloy has high ductility and malleability combined with good corrosion resistance and relative freedom from season cracking. (A-general, Q23p, R-general, R1d; Cu-n, SGA-g)

497-A. Revere No. 508. (Cupro-Nickel, 10%). *Alloy Digest*, Cu-81, Sept. 1959, 2 p.

Highly ductile, malleable and corrosion resistant Cu-Ni alloy suitable for condenser and heat exchanger tubes and many engineering applications such as salt water piping aboard ship, many components of salt water and fresh water stills, feed water heater tubes and marine coolers. (A-general, R-general, R4b; Cu-b, *Ni*, SGA-g)

498-A. Nicrotung. (High-Temperature Alloy). *Alloy Digest*, Ni-53, Sept. 1959, 2 p.

Ni-base alloy, designed for service up to 2000° F., has a combination of high heat resistance, high and low-temperature stress-rupture strength, and ductility. It is intended for production of parts by precision casting. The good high-temperature properties are combined with good room-temperature tensile strength, ductility, good castability and oxidation resistance. (A-general, Q-general, R1h, 2-62; Ni-b, 5-62, SGA-h)

499-A. USS Carilloy 1% Cr-1/2% Mo. (Moderate Corrosion, Oxidation and Graphitization Resistant Steel). *Alloy Digest*, SA-89, Sept. 1959, 2 p.

Although this grade was originally developed as a low-cost alloy having the high-temperature strength of the regular 1/2% Mo grade, with some measure of corrosion and oxidation resistance, it is principally used for steam service up to 1000° F. The higher Cr content is considered advantageous in obtaining less susceptibility to graphitization than is possible with 1/2% Mo grade. (A-general, R-general, 2-60; AY, *Cr, Mo*, SGA-g)

500-A. Allegheny Ludlum 440C. (High-Carbon Chromium Stainless Steel, Type 440C). *Alloy Digest*, SS-83, Sept. 1959, 2 p.

General purpose hardenable stainless steel, which upon quenching develops maximum hardness together with high strength and corrosion resistance. Besides the wear resistance imparted by heat treatment, it has intrinsically superior wear resistance due to its chemical composition. (A-general, Q9n, Q-general, R-general, 2-60, 2-64; SS)

501-A. Peerless-A. (Hot Work Steel, Type H21). *Alloy Digest*, TS-85, Sept. 1959, 2 p.

Low-carbon medium-tungsten hot work steel possesses excellent red hardness. It is used in those applications where the tool operates at a dull red heat. It conforms to AISI Type H21, SAE Type H21. (A-general, Q29n; TS)

502-A. Recent Developments in the Zinc Industry in Great Britain. S. W. K. Morgan. *Chemistry & Industry*, May 16, 1959, p. 614-620.

Advances in metallurgy of Zn during recent years at the Avonmouth Refining Co. (A-general; Zn)

503-A. Metallurgical Developments. H. M. Finniston and L. Grainger. *Journal of the British Nuclear Energy Conference*, v. 4, Apr. 1959, p. 115-130.

Review of some 250 papers covering topics relating to materials, fuel elements and irradiation effects presented at six sessions of the 2nd United Nations

Conference on the Peaceful Uses of Atomic Energy, Geneva 1958. (A-general, T11)

504-A.* The Availability, Recovery and Properties of Rhenium Metal. Ivor E. Campbell. *Journal of the Less-Common Metals*, v. 1, June 1959, p. 185-191.

Outline of physical and mechanical properties. Its extremely high melting point and good metal properties indicate a growing use where a relatively high cost can be tolerated. Uses in the electronics industry, as an electrical contact material, alloyed with W and Mo, and for high-temperature thermocouples, are among potential industrial applications. 12 ref. (A-general, P-general, Q-general, 17-57; Re)

505-A. Investigation of the Properties of Tantalum and Its Alloys. W. D. Klopp. Battelle Memorial Institute. (Wright Air Development Center.) *U.S. Office of Technical Services*, PB 151562, Nov. 1958, 85 p. $2.

Literature survey. Emphasis is placed on subjects which closely relate to the objectives of the WADC research program; vacuum purification, gas-metal reactions, physical properties, mechanical properties and alloying behavior. 205 ref. (A-general, 11-65; Ta)

506-A. Beryllium. J. C. Nixon. *Chemical Engineering and Mining Review*, v. 51, Apr. 15, 1959, p. 40-43.

Use of Be in the United Kingdom; recent developments in production and fabrication. 10 ref. (A-general; Be, 17-57)

507-A.* New Tungsten Know-How. P. Stambler. *Space Aeronautics*, v. 32, July 1959, p. 48-51.

Advances in fabrication prove tungsten one of the best metals for high-temperature design. To obtain workability tungsten can be heated to temperatures where superalloys would melt. For recrystallization tungsten must be heated to 2500° F. Data on forging, sintering, extruding, drawing and finishing. (A-general, F-general, G-general, N5, 2-62; W)

508-A. (Italian.) Current Applications of Some of the Rare Metals. Raoul Dupuis. *Fonderia Italiana*, v. 8, June 1959, p. 209-215.

Data on Be, Zr and Ti. (A-general; Be, Ti, Zr, 17-57)

509-A. (Translation—Brutcher no. 4364.) Some Theoretical Questions About Vacuum Metallurgy. D. S. Kamenetskaya. *Primenenie Vakuuma v Metallurgii*, Moscow 1958, p. 49-53.

(A-general, 1-73)

510-A. (Translation—Brutcher no. 4646.) Dust Removal at the Bochumer Verein LD Steelworks. R. Harr, K. Wagner and T. H. Willmer. *Berg-und Huttenmann Monatshefte*, v. 104, no. 2, 1959, p. 50-55.

(A8a, D-general)

511-A.* The Application of Low-Alloy High-Tensile Steel. I. M. Mackenzie. *West of Scotland Iron and Steel Institute*, v. 66, 1958-1959, p. 93-103.

Reasons suggested for the limited use of these steels are design stresses, fabrication problems, availability and cost. Design stresses have to be based on the yield stress to take full advantage of the alloy content of the steel. (A-general, Q25; AY, 17-51, 17-57; AY-n)

512-A.* Thorium. H. A. Wilhelm. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 50-55.

Survey of reports on preparations, alloys and fabrication that have been published or made available since the Conference on Peaceful Uses of Atomic Energy, Geneva, 1955. 27 ref. (A-general, C-general; Th)

513-A. HI Tensile. *Alloy Digest*, Al-83, Oct. 1959, 2 p.

Room tempering aging Al alloy capable of developing high tensile properties without the usual prior quench as with other heat treatable Al alloys. The high elongation and ductility before aging (within a few days after casting) qualifies the alloy for forming operations. It has dimensional stability and good corrosion resistance, excellent ductility, high impact and shock resistance and good machinability rating. (A-general, J27d, Q-general, Q27a; Al-b)

514-A. Aluminum 7079 (Age-Hardenable Aluminum Alloy). *Alloy Digest*, Al-84. Oct. 1959, 2 p.

High-strength forging alloy providing higher and more uniform properties in thick sections (over 3 in.) and greater ductility in cross-grained directions. Tests indicate fatigue strength similar to

7075-T6 for both smooth and notched specimens in longitudinal and transverse directions. This alloy is at least equal to and probably superior to 7075-T6 from the standpoint of stress-corrosion cracking in salt water atmospheres. (A-general, Q7a, Q23p, R1d; Al-b)

515-A. Jalcase No. 8. (Free-Cutting Carbon Steel). *Alloy Digest*, CS-10, Oct. 1959, 2 p.

Free-machining carbon-manganese steel recommended for high production machining in automatic screw machines. (A-general; CN, *Mn*, SGA-k)

516-A. Nionel (Corrosion Resistant Nickel Alloy). *Alloy Digest*, Ni-54, Oct. 1959, 2 p.

Nionel was developed primarily to provide an alloy more resistant to both oxidizing and reducing chemical environments, or combinations of both, than other Ni-base alloys available. Its relatively high Ni content plus Mo and Cu make the alloy considerably more resistant to reducing conditions, such as hot sulphuric acid, sulphurous and phosphoric acid solutions, than any of the common stainless steels. (A-general, R-general; Ni-b, *Mo*, *Cu*, SGA-g)

517-A. Hy-Ten "MC" (Tough Alloy Steel). *Alloy Digest*, SA-90, Oct. 1959, 2 p.

Tough oil-hardening toolsteel having high strength, good wear resistance and desirable shock resistance. It is fine-grained, deep-hardening, and has non-deforming characteristics in hardening. (A-general, Q-general; TS)

518-A. AISI-Type 403. (Corrosion Resisting Steel). *Alloy Digest*, SS-94, Oct. 1959, 2 p.

Straight Cr, martensitic-type stainless steel recommended for applications requiring moderate corrosion resistance and high mechanical properties developed by heat treatment possesses good corrosion resisting properties, fair resistance to heat and is not appreciably affected by exposure to subzero temperatures. (A-general, R-general, Q-general; SS-c, SGA-g)

519-A. Misco Ms. (Heat and Corrosion Resistant Steel, Type HU). *Alloy Digest*, SS-95, Oct. 1959, 2 p.

Alloy endures high heat, and is most useful at operating temperatures between 1500 and 2100° F. It will withstand prolonged heating in air at temperatures up to 1900° F. without excessive scaling. In reducing or neutral atmospheres that are free of sulphur it is safe up to 2150° F. It has good resistance to thermal shock where air, oil, or salt quench cycles are involved. (A-general, R2q, 2-62; SGA-h, ST, SGA-g)

520-A.* Solid Lubricants. A. J. Stock. Digest of "Solid Lubricants". Paper Presented Before the American Society of Lubrication Engineers, Buffalo, N. Y., Apr. 21, 1959. *Metal Progress*, v. 76, Sept. 1959, p. 147-A-150.

Particle size, temperature, load and speed affect use of graphite, Mo disulphide, nylon and tetrafluorethylene resin. Examples of uses. (A-general; NM-h, NM-k36, 17-57)

521-A.* (French.) High-Conductivity Copper Alloys. *Cuivre, Laitons, Alliages*, no. 50, July-Aug. 1959, p. 3-6.

Manufacture, mechanical working, joining, physical and mechanical properties and applications of 0.7-1.0% Cd-Cu alloys. (To be continued.) (A-general, Q-general, P-general; Cu-b, *Cd*)

522-A. Historical Background. H. D. Carus. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 1-8.

Composition, structure and corrosion resistance of gun bronzes from the 17th century. 15 ref. (A2, T2m, M26, R4b; Cu-s)

538-A. Collection and Filtration of Toxic Particles. *Australasian Manufacturer,* v. 44, Aug. 29, 1959, p. 62, 64-66.

Conditions designed to safeguard health while working with Be. (A7; Be)

539-A.* Tantalum. *Metal Treatment and Drop Forging*, v. 26, July-Aug. 1959, p. 273-274, 283.

Extraction processes, methods of working, applications in chemical industry and medicine. (A-general, C-general, F-general, T10e, T29; Ta, 17-57)

540-A.* A Brief Survey of the Influence of Alloying Elements in Stainless Steels. K. Bee. *Murex Review*, v. 1, no. 19, 1958, p. 545-570.

Effects of Cr, Ni, Mn, Si, Mo, W, Ti and Cb in martensitic alloys, ferritic and austenitic steels, and on corrosion, oxidation, embrittlement and intergranular corrosion. 16 ref. (A-general, R1h, R2h, Q26, 2-60; SS, *Cr, Ni, Mn, Si, Mo, W, Ti, Cb*)

541-A.* Copper-Base Alloys. *Metal Progress*, v. 76, Oct. 1959, p. 129-131.

Use in radar tubes, boat trailer bushings, water pumps, rings for lawn sprinkler systems and printed circuits. (A-general; Cu-b, 17-57)

542-A.* Stainless Steels. Richard E. Paret. *Metal Progress*, v. 76, Oct. 1959, p. 131-134.

Development of a modified Type 316, termed alloy D-319; improvements in fabrication; hot extrusion; welding of a number of stainless alloys. (A-general, G-general, K-general; SS)

543-A.* Magnesium Alloys. T. E. Leontis. *Metal Progress*, v. 76, Oct. 1959, p. 134-136.

Use of ZE 10A, AZ91A, AZ91B and AZ31B in luggage, structures and tooling plate. (A-general; Mg-b, 17-57)

544-A.* Wrought Aluminum Alloys. E. P. White, R. C. Kasser and L. M. Dunn. *Metal Progress*, v. 76, Oct. 1959, p. 136-140.

Use of 5154 and 5086 alloys in tank trailers; typical properties of weldable Al-Mg alloys; use in structures. (A-general, Q-general; Al-b, *Mg*, 4, 17-57)

545-A. Coalbrookdale 1709 to 1959. A. Raistrick. *Foundry Trade Journal*, v. 107, Oct, 1, 1959, p. 239-247.

History and development of processes at the Coalbrookdale Co., Wellington, Shropshire, England. (A2, E-general; Fe)

546-A. British Steel Castings Research Assoc. *Foundry Trade Journal*, v. 107, Oct. 8, 1959, p. 275-285.

Current research activities. (A9h, E-general)

547-A. Metals Research at the N.P.L. *Metal Treatment and Drop Forging*, v. 26, Sept. 1959, p. 328-330.

Research activity at National Physics Laboratory, Teddington, England, relating to the constitution, structure and physical and mechanical properties of metals and alloys. (A9, A9h)

548-A.* Special Applications of the Carbides. E. H. Sanders and Robert M. Pozzo. *Carbide Engineering*, v. 11, Oct. 1959, p. 13-16.

Structural applications of W, Ti, Cr, and Ta carbides and their mixtures. (A-general; 6-69, 17-57, W, Ti, Cr, Ta)

549-A. Titanium! Metal With an Exciting Future. J. M. Wentzell. *Design Engineering*, v. 5, Oct. 1959, p. 52-55.

Reviews properties and processing of Ti and Ti alloys. (A-general; Ti, 17-57)

550-A.* Nitrogen in Early Steelmaking. H. R. Schubert. *Iron and Steel Institute, Journal*, v. 192, Aug. 1959, p. 383.

A short history of use of nitrogen in steelmaking. 10 ref. (A2, J28k; ST, *N*)

551-A. Report of the Annual General Meeting, 1959. *Iron and Steel Institute, Journal*, v. 192, Aug. 1959, p. 325-329.

Proceedings and research activities of the Iron and Steel Institute during 1959 including presentations, announcements and future programs. (A9, D-general)

552-A. Metal Selector. *Steel*, v. 145, Oct. 26, 1959, p. S1-S32.

Chart listing 1050 alloys, their composition, properties and typical uses and suppliers. (A-general, S22)

553-A. (Italian.) Metallurgy of Iron and Steel in the Area Around Leczyca (Central Poland) in the 12th and 13th Centuries. J. Piaskowski. *Fonderia Italiana*, v. 8, July-Aug. 1959, p. 269-281.

25 ref. (A2; Fe, ST)

554-A. Birmabright B.B.5 (Aluminum Cast and Wrought Alloy). *Alloy Digest*, Al-85, Nov. 1959, 2 p.

Corrosion resistant, medium-strength Mg-Al alloy has high resistance to corrosion under the influence of the atmosphere and a variety of conditions existing in industrial and marine usage. In contact

with sea water it exhibits a greater tendency than other Al alloys to form an even, protective film of oxide. (A-general, R3, R4b; Al-b, *Mg*)

555-A. Red X-11 (Aluminum Casting Alloy). *Alloy Digest*, Al-86, Nov. 1959, 2 p.

Heat treatable Al alloy of the Si-Cu-Mg type has excellent castability and can be used for thin-walled intricate castings. It is pressure tight and has good strength at elevated temperatures. The alloy can also be forged and hot impact-extruded. (A-general, E25p, J-general; Al-b, *Si*, *Cu*, *Mg*)

556-A. GE Alloy P-6 (Magnetic Alloy). *Alloy Digest*, Co-18, Nov. 1959, 2 p.

Carbon-free permanent magnet material which, when properly heat treated, exhibits a high residual induction, high permeability and high hysteresis loss characteristics. (A-general, P16; Fe-b, *Co*, SGA-n)

557-A. Tuf-Stuf 224H (Aluminum Bronze). *Alloy Digest*, Cu-83, Nov. 1959, 2 p.

Heat treatable Al bronze forging alloy has high hardness and high compressive strength and good bearing characteristics, combined with unusual resistance to wear. It is tough and does not squash or pound out in service. A good proportion of its strength is retained at elevated temperatures as high as 1000° F. (A-general, Q29n, Q28g; Cu-s, *Al*, 4-51)

558-A. AISI 5150 (Chromium Alloy Steel). *Alloy Digest*, SA-91, Nov. 1959, 2 p.

Deep hardening steel exhibits a combination of high strength and fair ductility. When hardened it does not decarburize at the surface of the part unlike other alloys containing no chromium. The high surface hardness which this alloy attains in an oil quench produces excellent wear resistance. (A-general, Q29n, Q23p, Q9; AY, *Cr*)

559-A. HS-220 (Ultra-Strength Steel). *Alloy Digest*, SA-92, Nov. 1959, 2 p.

High-strength steel, designed for minimum tensile strength level of 220,000 psi. in the heat treated condition, exhibits good ductility and impact values consistent with the high hardness. (A-general, Q27a, Q23p; ST, SGB-a)

560-A. MicroMach (Ductile Stainless Steel). *Alloy Digest*, SS-96, Nov. 1959, 2 p.

New, nitrogen-containing austenitic stainless steel with higher ductility than standard AISI Type 301 combines strength and ductility in the extra-full-hardened condition. It work-hardens readily. Stress relieving in the range of 600-900° F improves the tensile and yield strengths about 10% with no significant effect on ductility. (A-general, Q23p, J1; SS-e, *N*)

561-A. Carpenter No. 883 (Red-Tough Tool Steel, Type H13). *Alloy Digest*, TS-86, Nov. 1959, 2 p.

A 5% Cr hot work steel with extreme toughness combined with good red hardness will give an extra margin of safety in tools subject to heavy hammer blows and tools containing deep recesses or sharp corners. Because it will harden in either oil or air, it holds size and shape exceptionally well. (A-general, Q29n; TS-k, SGA-j)

562-A. (Russian.) Utilization of Waste Products of the Titanium Industry. B. S. Gulyanitskii. *Tsvetnye Metally*, no. 5, 1959, p. 91-95.

Review of foreign literature. 77 ref. (A8; Ti)

563-A. Predicting Minimum Materials Cost for Stainless Steel. D. C. Hilty, R. W. Taylor and R. H. Gillespie. *Blast Furnace and Steel Plant*, v. 47, Sept. 1959, p. 962-964.

How to obtain maximum cost efficiency in production of stainless steel by considering sources and costs of raw materials, conservation in variables of processing such as bath temperature and condition, blowing rate, slag basicity, alloy blending, materials handling, maintenance of stocks, scrap usage, etc. Conclusions based on study of linear program model for a 70-ton furnace process for Type 430 stainless steel. (A4s, D-general)

564-A. (German.) New High-Magnesium Casting Alloy X250, From Alcoa. *Aluminium*, v. 35, Oct. 1959, p. 568.

4 ref. (A-general; Al-b, *Mg*)

Properties, extraction and refining, applications. (A-general; Ru)

569-A. Metals Documentation. A Fast New Problem-Solving Service. Marjorie R. Hyslop. *Metal Progress*, v. 76, Nov. 1959, p. 123-128.

Literature searching by machine is fast, thorough and prompt. The new American Society for Metals Documentation Service will provide, at two-week intervals, abstracts of all current publications pertaining exactly to the subscriber's problems. Ultimately, bibliographic searches of all metallurgical documents published in preceding years will be provided overnight. (A14e)

570-A.* Beryllium—The Metal and Its Design Potential. F. M. Yans and N. R. Gardner. *Electrical Manufacturing*, v. 64, Nov. 1959, p. 181-187.

Advantageous physical, thermal, electrical, optical and nuclear properties make Be useful for many applications. (A-general, Q-general, P-general; Be, 17-57)

571-A.* New Steel Alloy. Jack H. Schaum. *Modern Castings*, v. 36, Sept. 1959, p. 43.

New alloy uses approximately 3% Cu and 6.5% Ni to develop an austenitic matrix, instead of the 11-15% Mn contained in conventional austenitic Mn steel. The finely dispersed hard carbides are formed by the 2-5% Cr, Mo V, W, Cb or Ti present in the alloy. (A-general, Q-general; SS, *Cr, Mo, V, W, Cb, Ti*)

572-A. (Pamphlet.) Allegheny Ludlum Potomac, a Hot Die and High Strength Structural Steel. 22 p. 1959. Allegheny Ludlum Steel Corp., Pittsburgh 22, Pa.

Cr-Mo-V hot work steel for tool and die applications requiring strength at elevated temperatures. Data on short and long-time properties, fabrication techniques and heat treatments. (A-general, Q-general, J-general, 2-62; TS-k)

573-A. (Pamphlet.) Pocket Guide to Steel Analyses. 20 p. 1959. Jones & Laughlin Steel Corp., Stainless and Strip Div., Box 4606, Detroit 34, Mich.

Tables of composition of a large number of alloys, carbon and stainless steels. (A-general; ST)

See item 100-A, 1959. (A11d, L13p; CN)

SECTION B

RAW MATERIALS and ORE PREPARATION

1-B.* Ups Lithium Concentrate Recovery 11%. Ted F. Meinhold and J. W. Walker. *Chemical Processing*, v. 21, Nov. 1958, p. 33, 104-105.

Li extracted from burkeite by a compact, prefabricated, flotation separator. The unit operates on principle of aspirating air into influent at suction side of the feed pump and compressing the mixture in the pump. (B14h; Li, 1-52)

2-B. Assessment of Ladle Firebrick Quality and Performance. G. M. Workman. *British Ceramic Society, Transactions*, v. 57, Sept. 1958, p. 551-572.

(B19d; W19b)

3-B.* Research in the Development of a Metallurgical Fuel From Brown Coal. G. L. Kennedy and D. G. Evans. *Australian Institute of Metals, Journal*, v. 3, May 1958, p. 61-75.

Improved carbonization techniques which yield a hard lump char equal in strength to hard coke from black coal. Char was applied to melting of iron in a cold blast cupola; development of the process to semi-commercial scale of operation is imminent. 9 ref. (B17h, E10a; CI)

4-B.* Application of Table Flotation to the Removal of Sulphides From a Scheelite Concentrate. M. H. Buckenham and F. L. Sanderson. *New Zealand Journal of Science*, v. 1, Sept. 1958, p. 425-435.

Upgrading and elimination of arsenic from a scheelite concentrate containing a large amount of sulphides. Test results, test condition covering the table floating of sulphides and the table floating of the sheelite. 6 ref. (B14h; W, As, Se)

5-B.* (French-German.) Zinc. Wilhelm F. Kaiser. *Pro-Metal*, no. 64, Aug. 1958, p. 11-23.

Characteristics, ores, mines, statistics. Refining by roasting, used for rich ores, including suspension roasting, resulting in zinc oxide, then further reduction using carbon monoxide or coal in muffle or electric furnaces. Raw Zn is refined by melting or distillation, removing Pb, Fe, Cu, Sn and Cd. Wet proceses and electrolysis used for poor or complex ores. Manufacture of Zn oxides: Zn white for paint, raw Zn oxide for varnishes by rotating oven, vat-oven or Walz oven. Waste products are remelted but unsatisfactory for alloys. Brass alloys can be reclaimed and waste oxides can be reduced and distilled satisfactorily. (B15, C21, C22, C23; Zn)

6-B.* (French.) Corrosion Tests Currently Used in Research on Electromelted Refractories. P. Bortaud. *Silicates Industriels*, v. 22, Sept. 1958, p. 443-446.

Furnace developed for testing electromelted refractories for resistance to corrosion by molten glass is adapted to testing of resistance of such refractories to slag attack. (B19d; RM-h, RM-q)

7-B.* (Rumanian.) Concentration of Poor Chromites of the Banat. Gh. Vanci. *Studii si Cercetari de Metalurgie*, v. 1, July-Dec. 1956, p. 349-352.

The ratio Cr_2O_3:FeO in the concentrates obtained remains below 2 because of crusts of chromites richer in FeO which

enclose the chromospinels. By regrinding the concentrates to particle size below 0.15 mm., separation is obtained of the two kinds of chromites and the separation of the chromite which is richer in FeO can be realized by magnetic methods. 3 ref. (B13c, B14j; Cr)

8-B. Magnetic Concentration of a Uranium Table Concentrate From E1 Sherana, Northern Territory, Australia. S. B. Hudson. *Australian Scientific and Industrial Research Organization, Ore-Dressing Investigations,* Report no. 554, Apr. 1958, 18 p.

Contains U_3O_8, hematite, limonite and pyrite. Sizing was not necessary if a reduction roast preceded magnetic separation. 8 ref. (B14j; U)

9-B. Flotation Tests on an Oxidized Copper Ore From Marble Bar, W. A. A. T. Miles, E. Tasker and R. A. Hobson. *Australian Scientific and Industrial Research Organization, Ore-Dressing Investigations,* Report no. 694, Feb. 1958, 11 p.

(B14h; Cu)

10-B. Development of a Foamed Alumina Castable Cement. W. F. Zimmerman. *Industrial Heating,* v. 25, Nov. 1958, p. 2330, 2332, 2334.

Because of the large amount of fine, uniform pores, it possesses extremely light weight, low thermal conductivity and significant strength. For use in hot gas propulsion systems and in other insulating applications at temperatures above 3000° F. (B19; Al-b, RM-h40)

11-B.* (Swedish.) Some Chemical Reactions Involved in Pelletizing and Iron Ore Reduction. John Olof Edstrom. *Jernkontorets Annaler,* v. 142, no. 7, 1958, p. 401-466.

Gaseous diffusion and flow through porous materials. Reaction between gas and solid oxide phases; reaction between solid oxide phases, solid state diffusion and equilibrium diagrams. Investigation of pelletizing dealing with oxidation of magnetite and reactions between lime and hematite. Quantitative expression for rate of reaction when oxidizing ore pellets in pure oxygen gas and in mixtures of oxygen and inert gases. Observations of processes occurring during reduction of pure ore grains, with emphasis on changes in microstructure and the mechanisms of reactions in the solid state. Reduction studies including calcium ferrites and ore pellets containing lime. 40 ref. (B15n, B16b, D11, N1a, Fe)

12-B. (German.) Water Economy in Iron and Steel Works. Friedrich Wesemann. *Jernkontorets Annaler,* v. 142, no. 6, 1958, p. 271-288.

15 ref. (B24, W10h, 17-53)

13-B. (Translation—SLA, ASLIB-GB152.) Determination of Optimum Moisture and Fuel Contents in Fine Ore Mixtures Intended for Sintering. H. Kosmider and E. Bertram. *Stahl und Eisen,* v. 76, no. 14, 1956, p. 858-879.

(B16)

14-B.* (Russian.) Calcination of Iron Ores for Their Magnetic Conversion in Rotary Kiln. P. A. Tatsienko and A. G. Gerasimov. *Stal',* v. 18, Oct. 1958, p. 877-882.

Experience in operation of rotary kiln for magnetic conversion of iron ores has suggested new ideas for design improvement. Most effective method for raising output and design simplification of kiln is the substitution of a gaseous for solid reducing agent. Furnaces 30 m. long and 2.2 m. diameter which can rotate with speed of 0.64:0.46, and 0.33 rpm. recommended. 10 ref. (B15p; Fe)

15-B.* (Spanish.) Influence of Different Types of Basic Additions on the Physical Properties of a Sinter of Siliceous Iron Ore. J. A. Boned. *Instituto del Hierro y del Acero,* v. 11, July-Sept. 1958, p. 155-167.

Additions of lime, flux, crude and roasted dolomite, and magnesia, separately and in mixtures of varying proportions, were tried and particle size of sinter and amount of fines was measured. Particle size is independent of percentage of coke dust and in many cases depends not only on nature of addition but on amount. Ore alone gives sinter product slightly larger than ore plus additions. Degree of oxidation can be used as indirect index of physical properties. 3 ref. (B16a, 2-60; Fe)

16-B.* Screening of Blast Furnace Burden Materials. H. N. Wilkinson and E. E. Farmer. *Iron and Steel Institute, Journal,* v. 190, Sept. 1958, p. 55-71.

Burden material sized to increase furnace output. Different types of screening

equipment and screening surfaces. Construction, principles of operation and material handled. 7 ref. (B13d, W15p)

17-B.* (Czech.) Roasting With $CaCl_2$ Additions. Jiri Hruby and Bohuslav Hadacek. *Hutnicke Listy*, v. 13, no. 8, 1958, p. 706-708.

Enthalpy of fundamental reactions in slag after $CaCl_2$ addition. Oxidizing roasting with $CaCl_2$ addition to remove nonferfous metals and reduce iron loss. Treatment of lead smelting slag to obtain pig iron. 6 ref. (B15n, A11d, P12r; Fe, Pb)

18-B.* (Russian.) Preheating of Sintering Mixture in Pug Mills. D. A. Kissin, V. E. Ioffe, B. A. Stanishevskii and N. S. Karpushinskii. *Stal'*, v. 18, Oct. 1958, p. 867-869.

Preheating of sintering mixture by coke oven gas in pug mills from 28-33° to 48-49° has resulted in 3.5% increase in productivity of sintering machines. By increasing the comparatively low heat efficiency (40%) through improvement in burner construction and use of cheaper gas fuel, even greater economies are anticipated. By reduction of initial sintering temperature it is possible to prevent super-humidification of charge, thereby increasing its gas penetrability. 3 ref. (B16; Fe)

19-B. How High Tension Electrostatic Separation Recovers Iron Ore. R. E. Barthelemy. *Engineering and Mining Journal*, v. 159, Dec. 1958, p. 86-91.

In one single operation, requiring no alternative heat treatment, method can successfully beneficiate complex iron ores containing magnetite in any proportion. (B14n; RM-n, Fe)

SECTION C

NONFERROUS EXTRACTION and REFINING

1-C.* (Japanese.) Industrial Degassification Treatment for Molten Aluminum. Pt. 1. Takashi Ikeno, Kizo Shibata and Yasumasa Yokoyama. *Light Metals*, no. 31, July 1958, p. 51-54.

The amount of chlorine gas passed through the molten metal per unit of time influences total amount of chlorine and total time needed for degassification. Relationship expressed by equation. Chlorination time decreased with increasing metal temperature. Activation energy for degassification by chlorine was about 50,000 cal. per mol. Relationship between blisters and fine fractures on sheet surface. 12 ref. (C5m, E25s; Al-b)

2-C.* (Russian.) Reduction of Oxides From Nonferrous Heavy Metals and of Mixtures of Metallic Oxide and Carbon Monoxide. G. G. Gvelesiani, T. E. Konyshkova, Yu. V. Tsvetkov and D. M. Chizhikov. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskich Nauk*, Aug. 1958, p. 19-25.

Reduction of Cu, Pb and Zn oxides using carbon monoxide as a reducing agent. Kinetics and mechanism of reduction studied for various steady pressures of CO and temperatures. 8 ref. (C26, 2-61, 3-74; Cu, Pb, Zn)

3-C.* Development of Beryllium for Nuclear Reactor Applications. G. C. Ellis. *Metallurgia*, v. 58, Oct. 1958, p. 173-176.

American, Soviet and French methods of reduction compared. American thermal reduction process (conversion of the oxide to ammonium beryllium fluoride, thermal reduction of the double fluoride at 900° C. in a graphite crucible), is contrasted with the French electrolytic reduction process. Both methods are used in the Soviet Union. 10 ref. (C-general; Be)

4-C. Preparation of Dense, Metal Grade Uranium Tetrafluoride From Uraniferous Ores. R. J. Allen, H. G. Petrow and A. Whitman. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/503, 1958, 8 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $.50.

Optimum methods of preparation of a pure concentrated U solution from sulphuric acid leach liquors; development of a means of reducing U and precipitating UF_4; drying techniques capable of dehydrating UF_4 without materially affecting its physical and chemical properties. 10 ref. (C19r; U)

5-C. Selection of Uranium From Aqueous Solutions by Liquid-Liquid Extraction. E. H. Crabtree and C. J. Lewis. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF. 15/P/507, 1958, 17 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $.50.

Liquid-liquid extraction may be considered as an ion-exchanging process. Organic reagents used may be chosen on the basis of their selectivity toward ions and cations. Since U in its sulphuric acid leach solutions exists in an equilibrium involving the U in both anions and cations, U may be recovered by either cation exchanging or anion exchanging liquid-liquid systems. (C19s; U)

6-C. Design and Operation of a Uranium Processing Mill Using Liquid Ion Exchange (Solvent Extraction). K. M. Black, J. Koslov and J. D. Moore. Second United Nations

International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/511, 1958, 13 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $.50.

Substantially higher-grade feed liquor can be processed by increasing the solvent concentration to achieve higher saturation loadings. U recoveries on the order of 99.5% from the feed solution have been recorded. (C19s; U)

7-C. Continuous Process for the Direct Reduction of Uranium Hexafluoride to Uranium Tetrafluoride of High Purity and Density. S. H. Smiley and D. C. Brater. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/523, 1958, 11 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $.50.

In the basic hydrogen method uranium hexafluoride and about 100% excess H, both preheated to about 500° F., are charged into the top of a vertical pipe reactor which is preheated to about 1000° F., and complete reduction to uranium tetrafluoride is realized almost instantaneously. Reduction of uranium hexafluoride with gaseous trichloroethylene has also been developed but the product was low in density and highly contaminated. 15 ref. (C1p; U)

8-C. Development of a High-Capacity, Continuous Process for the Preparation of Uranium Hexafluoride From Uranium Oxides or Ore Concentrates. S. H. Smiley and D. C. Brater. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/525, 1958, 11 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $.50.

Process involves a series of three highly exothermic reactions in which uranium trioxide is converted to dioxide with hydrogen, to tetrafluoride with anhydrous hydrogen fluoride, and finally, to hexafluoride with fluorine. The hexafluoride can be recovered by solid condensation, liquefation, stripping by an organic solvent, or absorption-desorption employing solids such as uranium tetrafluoride or sodium fluoride as carriers. (C19r; U)

9-C. Zirconium Alloy Fuel Reprocessing. D. G. Reid, C. E. Stevenson, R. B. Lemon and F. K. Wrigley. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/526, 1958, 20 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $.50.

Processing facility was designed to recover enriched U from Zr fuel elements containing up to about 2% U using an aqueous process. Three solvent-extraction cycles are used to separate the U from the Zr, fission products and transuranic elements with which it is associated in the fuel elements. The first cycle employs pulse column contactors and a tributyl phosphate solvent, while packed columns with hexone as the extractant are used in the second and third cycles. (C19a, A11d, T11g; U, Zr-b)

10-C. Americium and Neptunium Recovery Processes. W. H. Lewis. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/537, 1958, 13 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $.50.

Chemical processes for recovering Np-237 from irradiated natural U, irradiated enriched U, and fluorination ash produced in the conversion of recovered UO_3 to UF_6, and for recovering Am-241 from a waste containing large amounts of La and Ce. 5 ref. (C19, C6; Am, Np, U, La, Ce)

11-C. Preparation and Properties of Zirconium-Uranium-Hydrogen Alloys. Ulrich Merten, L. J. Dijkstra, Frederick D. Carpenter, Allen P. Hatcher and Lee D. La Grange. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/789, 1958, 15 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $.50.

Zr-enriched U alloys are prepared by conventional melting techniques and by adding H at elevated temperatures in a gas-handling system. All necessary forming operations are performed on the Zr-U alloy before the H is added, so that the relatively brittle final alloys are ready for cladding without further handling. 7 ref. (C5, Q26s; *Zr*, U, *H*)

12-C. Recovery of Uranium From Highly Irradiated Reactor Fuel by a Fused Salt-Fluoride Volatility Process. G. I. Cathers, W. H. Carr, R. B. Lindauer, R. P. Milford and M. E. Whatley. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/535, 1958, 14 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $.50.

Volatility processing is a promising new nonaqueous method for recovering U from heterogeneous reactor fuels containing Zr and from molten fluoride fuels. It is potentially applicable to other types of reactor fuels not amenable to aqueous dissolution and subsequent solvent extraction processing. 7 ref. (C19r, A11d, T11g; U)

13-C. Development and Application of Ion Exchange in Columns for the Recovery of Uranium From Ores. W. D. Charles. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/2353, 1958, 15 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $.50.

Recovery of U from solutions resulting from acid leaching and liquid-solid separation of U-bearing ores. System involves the hydrolic movement of the resin from adsorption columns to the elution section, which are arranged in series so that a countercurrent flow is effected. (C19s; U)

14-C. Fluoride Volatility Processes for Spent Reactor Fuels. R. K. Steunenberg and R. C. Vogel. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/2388, 1958, 29 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $.50.

Fluoride volatility separation processes for the recovery and decontamination of reactor fuels depend on differences in volatilities of the pertinent fluorides. All constituents of the fuel are converted to the fluorides. The uranium hexafluoride is then recovered by distillation from the fission product and diluting material fluorides. 36 ref. (C19r, A11d, T11g; U)

15-C. Continuous-Casting of Tough Pitch Copper Slabs. *Machinery (London)*, v. 93, Sept. 17, 1958, p. 659-660.

Slabs up to 25 ft. long by 36 in. wide can be cast at rate of 20 in. per min. (C5q; Cu)

16-C. The Shrouded Mixer Impeller in Solvent Extraction of Uranium. L. D. Lash. *Mining Engineering*, v. 10, Nov. 1958, p. 1161-1164.

Acid leaching and counter-current decantation combined with liquid-liquid extraction to produce a refined U. (C19a; U)

17-C. Solvent Extraction at Gunnison, Colo. H. L. Hazen. *Mining Engineering*, v. 10, Nov. 1958, p. 1164-1165.

Acid leaching, counter-current decantation, solvent extraction for production of U. (C19; U)

18-C.* (German.) Chemical Regeneration of Fission Materials. P. Baertsch. *Chimia*, v. 12, Sept. 1958, p. 270-273.

Reasons for the degeneration of reactor bars: "poisoning" by byproducts; occasional unfavorable metallurgical properties of alpha-uranium causing deformation; formation of Pu^{240} and Pu^{242}. In regeneration, U is purified after dissolution in nitric acid. (C19; U)

19-C. Technique of Zone Melting. G. R. Whalley. *Laboratory Practice*, v. 7, Aug. 1958, p. 462-464.

General summary applied to both organic and inorganic materials. 8 ref. (C28k)

20-C. Entrainment Studies on Solvent Extraction. D. A. Ellis, R. S. Long and J. B. Byrne. *South African Mining and Engineering Journal*, v. 69, Sept. 26, 1958, p. 623, 625, 627.

Application of solvent extraction to slurry systems. (C19a; U)

21-C. Aqueous Processes for Separation and Decontamination of Irradiated Fuels. V. R. Cooper and M. T. Walling. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/2409. 1958, 13 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Aqueous solvent extraction processes are ideally suited for installation in central processing plants which are designed to handle fuels from a number of power

reactors generating a total of several thousand megawatts or more. 5 ref. (C19a, T11g; 14-70)

22-C.* Production of Hafnium. *Mining Magazine*, v. 99, Oct. 1958, p. 210-218.

HB metal may be produced in Zr-plant equipment without modification. Greater sensitivity of Hf tetrachloride to atmospheric moisture and higher stability of hafnyl chloride requires some additional care and effort in chloride purification. Byproduct Mg chloride and excess Mg were removed by vacuum distillation. Sponge metal was somewhat reactive in air. Metal ingots had hardness but could be hot forged and rolled to sheet. (C29p; Hf)

23-C.* (Japanese.) Separation of Zirconium and Hafnium by Solvent Extraction. Pt. 1. Extraction of High Concentrated Zirconium Aqueous Solution With Methylisobutylketone. Kin'ya Sono, Kazuhiko Hori and Yoshihiro Hirabayashi. *Nagoya Government Industrial Research Institute, Reports*, v. 7, Sept. 1958, p. 59-65.

Ratios of both Hf and Zr extracted were diminished by increasing the concentration of crude Zr (Hf content 2.9%) in the feed solution. Increasing acidity resulted in a decrease in the degree of extraction but an increase in the separation factor. 7 ref. (C19a; Hf, Zr)

24-C.* (Rumanian.) Extraction of Columbium and Tantalum From the Minerals of the R.P.R. Al. Lupu and L. Grigoriu. *Studii şi Cercetări de Metalurgie*, v. 1, July-Dec. 1956, p. 297-303.

The best yield (98%) was obtained by using a quantity of potassium hydroxide four times larger than theoretically required. The two metals were separated as fluorides. The attempts at direct extraction with sulphuric acid gave poor yields, and potassium carbonate even poorer (40%) Separation also was tried, with very small yield. 14 ref. (C-general; Cb, Ta)

25-C. Columbium and Tantalum. C. H. Chilton. *Chemical Engineering*, v. 65, Nov. 3, 1958, p. 103-107.

Liquid-liquid extraction carried out in a cascade of mixers and settlers leads to pure metals. Process flowsheet. (C19a; Cb, Ta)

26-C. Production of Pure Metals by Hydrogen Reduction of Their Salt Solutions. Pt. 2. Tuhin K. Roy. *Indian Institute of Chemical Engineers, Transactions*, v. 8, 1955-1956, p. 83-95.

Equilibrium and kinetic data obtained on the precipitation of Cu, Ni and Co metal from their salt solutions by reduction with compressed H at high temperatures and pressures. 13 ref. (C27, Cu, Ni, Co)

27-C. Uranium Recovery From Slag by Fluoride Volatilization. A Process Proposal. R. M. Edwards, J. A. Kennelley and E. F. Sanders. Mallinckrodt Chemical Works. U.S. Atomic Energy Commission MCW-1418, Sept. 15, 1958, 30 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $1.

Two possible process routes studied: direct fluorination of slag and pretreatment of the slag by roasting, reduction and hydrofluorination prior to fluorination. Residual U contents were in the range 0.14-0.20% with a feed rate of 100 lb. per hr., slag retention time at 1 hr. and temperature at 435-545° C. 20 ref. (C19r; U)

28-C. Research and Development in the Field of Thorium Chemistry and Metallurgy. Vol. II. Pilot Scale Production of Thorium Metal by Fused Salt Electrolysis. Lothar Abraham, Edward L. Thellman and James L. Wyatt. Horizons Inc. United States Atomic Energy Commission SRO-12, June 20, 1956, 248 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $6.

Design and operation of an electrolytic cell rated for the semicontinuous operation at a level of 7500 amp. Outline of the metal recovery process; operating data and suggested modifications for large-scale production facilities; physical properties of electrolytically produced granular Th metal. (C23; Th)

29-C.* (French.) Extraction of Uranium From Its Ores. M. P. Sugier. *Echo des Mines et de la Metallurgie*, Sept. 1958, p. 545-548.

Three principal phases in production of metallic U; procedures that can be used, advantages of each. 16 ref. (C-general; U)

30-C.* (Italian.) Electrothermal Reduction of Sardinian Iron Ores. G. Zuliani. *Metallurgia Italiana*, v. 50, July 1958, p. 273-279.

Quantity and characteristics of ores; availability of electrical energy; production of hematite pig from heterogeneous ores, with low specific consumption of energy and using Sardinian vegetable coal; possibilities of complete use of Sardinian ores for electrothermal production of low-cost converter pig from poor ores and of higher priced hematite pig from selected ores. 9 ref. (C23n; Fe)

31-C.* (German.) Segregation Occurring in Pigs of Cast Alloys, Especially of the Type G-AlMg and G-AlSiCu. A. Buckeley. *Metall*, v. 12, Oct. 1958, p. 918-921.

Composition of cast pigs at different levels and depths. Alloying elements are present in higher concentration near the mold wall, lower in the interior and porosity zones. 8 ref. (C5, 9-69; Al-b)

32-C.* (French.) How to Make Molds for Cruciform Specimens of Tin Bronze. *Fonderie*, no. 153, Oct. 1958, p. 486-488.

Analysis based on 41 ingots comprising 17 different molding patterns shows varying results in tensile strength. (C5, W19c, S22; Cu-s, *Sn*)

33-C.* (German.) Importance of Speed in Continuous Casting of Copper. H. Klatte. *Metall*, v. 12, Nov. 1958, p. 992-995.

With increasing casting speed, the cone-shaped liquid portion grows in length. The angle at the vertex becomes more and more acute which causes accumulation of impurities in this location and susceptibility to cracking near the longitudinal axis of castings. (C5q, 9-51; Cu)

34-C.* (Russian.) Obtaining Metals by Amalgamation Process. M. T. Kozlovskii. *Khimicheskaya Nauka i Promyshlenost*, v. 3, no. 4, 1958, p. 439-443.

Metals can be obtained by directly processing natural materials containing metals or metallurgical waste and scrap with mercury or electrolytic solution of metal salts using Hg as a cathode or by displacing the metal from its salt solution with the aid of an amalgam having a stronger electro-penetration than the metal sought. Some of the metals that lend themselves to such separations are Fe, Zr, As, Sb, Cr and W. (C29)

35-C.* (Russian.) Anodic Dissolution of Metals in Molten Salts. Beryllium. M. V. Smirnov and N. Ya. Chukreev. *Zhurnal Phizicheskoi Khimii*, v. 32, Sept. 1958, p. 2165-2173.

Anodic efficiency determined in the electrolysis of molten alkaline metal chlorides (LiCl + KCL eutectics), lithium and potassium chlorides with a beryllium anode. (C23; EG-e)

36-C. Solvent Extraction Bypasses Process Snag. *Chemical Week*, v. 83, Nov. 8, 1958, p. 67-68, 70.

New combined-extractant technique consisting of an aliphatic amine combined with an alkyl phosphate in a solution of kerosene containing tributyl phosphate has eliminated carbonate neutralization and filtration operations. Now solvent extracts U and V directly from the acid solution resulting in a simple operation with better recovery at lower cost. (C19n; U, V)

37-C. Boron Isotope Enrichment: Pilot Plant Proposal for the Anisole-Bf_3 System. Kenneth O. Hambrock and George T. Miller. Hooker Electrical Co. U. S. Atomic Energy Commission, HEC-82, Dec. 23, 1957, 59 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.75.

Pilot plant for separating B isotopes 10 and 11. (C6; B)

38-C. (German.) Vacuum Arc Melting With a Consumable Electrode. H. Gruber. *Metall*, v. 12, Oct. 1958, p. 901-912.

Furnace, process, technology and applications. 37 ref. (C25, W18s, 1-73)

39-C. (Russian.) Kinetics of Chlorination of Titanium Dioxide and Columbium Pentoxide. I. S. Morozov and S. L. Stefaniuk. *Zhurnal Neorganischeskoi Khimii*, v. 3, no. 10, 1958, p. 2367-2374.

Chlorination speed depends on temperature, size of briquette, linear velocity and partial pressure of chlorine. (C19r; Cb, Ti)

40-C. (Translation—SLA, ASLIB-GB39.) Use of Oxygen-Enriched Blast in Nonferrous Metallurgy. A. Lange. *Neue Hutte*, v. 1, no. 9, 1956, p. 545-554.

(C21, C5r)

41-C.* The Continuous Casting of Aluminum Alloys. Norman Goss. *Precision Metal Molding*, v. 16, Dec. 1958, p. 61-65, 70

Problems include overcoming mold wall friction, mold design, pouring methods and chill rates. Control of continuous casting is secured by metal temperature, pouring rate and amount of lubricant. (C5q; Al-b)

42-C. Processing of Monazite Sands. John J. Barghusen and M. Smutz. Ames Laboratory. *U. S. Atomic Energy Commission*, ISC-947, Dec. 1957, 105 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $2.50.

Recovery of Th, rare earths and U from monazite sands. Process whereby the oxalate ions used to precipitate the mixed Th and rare earth oxalates can be recycled. Possibility of recovering U from the oxalate filtrate by anion exchange also investigated. 39 ref. (C19; Th, EG-g)

43-C. Developments in Pyrometallurgical Processing. J. H. Schraidt and M. Levenson. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1795, 1958, 14 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Melt refining, extraction by fused salts or liquid metals, fractional crystallization from low-melting metal solvents and electrorefining methods of fuel reprocessing. Status of extraction processes is presented for blanket processing by liquid Mg extraction of Pu and for U-Bi fuel purification by fused salt extraction. (C-general, T11g; U, *Bi*, Pu)

44-C.* (German.) Preparation of High-Purity Selenium. F. Eckart and H. Berg. *Naturwissenschaften*, v. 45, no. 14, 1958, p. 335-336.

Melting in a "Supremax" flask at 460° C. Air is led through the melt for 90 min. Spectrum purity can be reached by one or two vacuum distillations. (C5, C22h; Se)

45-C.* Investigation on the Chlorination of Indian Ilmenite. D. P. Kharkar and C. C. Patel. *Journal of Scientific and Industrial Research*, v. 17B, Sept. 1958, p. 367-371.

Effects of temperature, carbon, reaction period, grain size, catalyst and binders on chlorination of ilmenite. Control of temperature and carbon resulted in preferential chlorination of the iron and upgrading of the titania content. 11 ref. (C19r, B15r, 2-59, 2-62; Ti)

46-C.* Continuous Casting of Solder. *Tin and Its Uses*, no. 44, Autumn 1958, p. 6-7.

Metal temperatures and pouring rate for 40-60 Sn-Pb solder varied over wide limits without detriment to billet quality. (C5q; Pb, Sn, SGA-f)

47-C. The Oxide-Drossing Furnace for the Processing Refabrication Experiment. J. L. Ballif. Atomics International. *U. S. Atomic Energy Commission*, NAA-SR-2852, Sept. 1958, 56 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.

Equipment and techniques for oxide drossing designed to remove gaseous fission products and more volatile elements, Ce, I and gases like Kr and Xe; and to reconstitute irradiated fuel slugs from many small cylindrical slugs to a large single ingot designed as feed for the vacuum casting operation. 19 ref. (C28j, T11g; U, *Ce, I, Kr, Xe*)

48-C. The Carbothermic Reduction of Uranium Oxide. R. M. Powers, O. J. Blaber, C. I. Whitman and R. B. Holden. Sylvania-Corning Nuclear Corp. *U. S. Atomic Energy Commission*, SCNC-241, June 27, 1957, 139 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $3.75.

Uranium oxide reduced by C under vacuum at 2250° C. to yield a product consisting of dendritic uranium carbide in a matrix of U. U sponge is obtained from this cermet by hydrolyzing the interconnected UC. This is followed by pickling in dilute nitric acid to remove the residual hydrolysis product. 12 ref. (C22g; 6-74, U)

49-C.* (Japanese.) Recent Developments in Vacuum Refining. E. Fujita. *Metals*, v. 28, Nov. 1958, p. 801-806.

Halide decomposition and Kroll process for Ti and Zr. 10 ref. (C1p, C25, C26; Ti, Zr)

50-C.* (Japanese.) Vacuum Arc Melting of Refractory Metals. K. Tsuya. *Metals*, v. 28, Nov. 1958, p. 807-812.

Refining Ti, Zr, Be, Mo and Cb. 10 ref. (C5h, 1-73; Cb, Be, Mo, Ti, Zr)

51-C.* (Japanese.) High-Purity Magnesium. A. Suzuki. *Metals*, v. 28, Nov. 1958, p. 821-827.

Distillation from binary alloys is more useful than from simple substances; 99.99% pure Mg may be produced from Mg-Al alloy. 5 ref. (C22; Mg-a)

52-C.* (Japanese.) Production of Uranium Metals. Pt. 2. S. Tarara. *Metals*, v. 28, Nov. 1958, p. 843-846.

Solvent extraction of $U(NO_2)_4$, conversion to U_2O_5, fluoridation, reduction of UF_4 with Mg. (C1p, C26; U)

53-C. Aluminum Billet Casting. H. Henry Sinason. *Light Metal Age*, v. 16, Dec. 1958, p. 12-17.

Various processes for casting with general conditions for quality billets. 10 ref. (C5; Al)

54-C.* (German.) Contributions of Pressure Reduction Processes to the Extraction of Metals. G. Bauch, F. Pawlek and K. Plieth. *Zeitschrift fur Erzbergbau und Metallhuttenwesen*, v. 11, Nov. 1958, p. 520-527.

Influence of hydrogen-ion concentration on equilibrium concentration is stronger than influence of partial pressure of CO_2. Silver sulphate and copper sulphate solutions reveal kinetic reactions of a secondary order when carbon monoxide is used as pressure reducing agent. Activating energy for buffered Ag solution is 9.3 kcal. per mol. and for Cu solution 33.5 kcal. per mol. Half-life period of pressure reduction process is 0.05 mol. per l. for Ag and 0.8 mol. per l. for Cu. Hydrogen-carbon monoxide gas mixtures are not economical. 14 ref. (C26, 3-74; Ag, Cu)

55-C. Preparation of Plutonium Alloys in the Reduction Process. A. N. Morgan. Los Alomos Scientific Laboratory. *U. S. Atomic Energy Commission*, LA-2231, Oct. 10, 1958, 6 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Homogeneous binary alloys of Pu with Al, Fe, Co, Ni, Cu, Zr, U and Ce can be prepared in the plutonium tetrafluoride process. Methods used are the direct addition of the element, either as a fluoride compound or as metallic powder or chips into the Ca and I before mixing with the plutonium tetrafluoride, and by the loading of metallic powder or chips into the ceramic crucible before the premixed reduction charge is introduced. 5 ref. (C1p; Pu-b, *Al, Fe, Co, Ni, Cu, Zr, U, Ce*)

56-C.* Redistribution of Solute During Freezing. W. G. Pfann. Paper from "Liquid Metals and Solidification". American Society for Metals, 1958, p. 218-242.

Influence of freezing rate, turbulence, and other conditions on effective distribution coefficients for several solutes in various melts. Over-all segregation for solute distribution resulting from solidification in normal freezing process or under zone melting conditions. Zone refining, zone leveling, perturbing the distribution by changing composition of melt, dimensions of melt or growth conditions. 13 ref. (C28k, N12)

57-C. Fifty Years in the Port Pirie Lead Smelting Industry. Frank A. Green. *Chemical Engineering and Mining Review*, v. 51, Oct. 15, 1958, p. 71-80.

Processes and equipment at Port Pirie, South Australia. (C21; Pb)

58-C. Solvent Extraction in the Mining Industry. *Industrial and Engineering Chemistry*, v. 50, Dec. 1958, p. 53A-55A.

Economics and processing details by liquid-liquid extraction. (C19n)

59-C. Precipitation of Uranium Tetrafluoride From Aqueous Solution by Catalytic Reduction. R. J. Allen, H. G. Petrow and P. J. Magno. *Industrial and Engineering Chemistry*, v. 50, Dec. 1958, p. 1748-1749. (C27; U)

60-C. Solvent Extraction With Alkyl Phosphoric Compounds. Charles A. Blake, Jr., Charles F. Baes, Jr., and Keith B. Brown. *Industrial and Engineering Chemistry*, v. 50, Dec. 1958, p. 1763-1767.

New solvent extraction reagents, unlike tributyl phosphate, have advantage of recovering U from nearly any solution. 17 ref. (C19n; U)

61-C.* Recovery of Enriched Uranium From Uranium Dioxide-Stainless Steel Fuel Elements by Solvent Extraction. J. R. Flanary and J. H. Goode. *Industrial and Engineering Chemistry*, v. 51, Jan. 1959, p. 23-26.

Darex head-on process uses dilute aqua regia in Ti equipment to dissolve the stainless steel-clad or alloyed fuel elements; the chloride is then removed by oxidative distillation. The product from this dissolution-distillation procedure is suitable for extraction with tributyl phosphate and the aqua regia can be recovered for recycle. 36 ref. (C19n, A11d, T11g; SS, U)

62-C.* Plutonium Peroxide Precipitation. J. A. Leary, A. N. Morgan and W. J. Maraman. *Industrial and Engineering Chemistry*, v. 51, Jan. 1959, p. 27-31.

Precipitation of the hexagonal structure of plutonium peroxide is an excellent con-

centration and purification step in Pu metal preparation. Impurities such as alkali and alkaline earth elements, Al, Si, Cr, Fe, Ni, Cu and many fission product elements are effectively removed. 12 ref. (C27; Pu, *Al, Si, Cr, Fe, Ni, Cu,* EG-f43)

63-C.* Trialkyl Phosphates and Dialkyl Alkyl Phosphonates in Uranium and Thorium Extraction. *Industrial and Engineering Chemistry*, v. 51, Jan. 1959, p. 41-44.

Phosphonates are strikingly superior to phosphates in extracting U and Th and separating them from Zr. 4 ref. (C19; U, Th, Zr)

64-C.* Concentrated Nitric and Dilute Hydrofluoric Acid Mixtures in Dissolution of Zirconium Metal. E. M. Vander Wall and E. M. Whitener. *Industrial and Engineering Chemistry*, v. 51, Jan. 1959, p. 51-54.

These acid mixtures hold promise for an aqueous recovery process for Zr-U alloys of variable composition. Rate constants are given for the dissolution rate of Zr at various temperatures. (C19; Zr, U)

65-C.* Recovery of Neptunium-237 From Process Residues by Solvent Extraction. J. R. Flanary and J. H. Goode. *Industrial and Engineering Chemistry*, v. 51, Jan. 1959, p. 55-57.

Tributyl phosphate process for recovery and separation of Np isotopes from U process residues. Material containing the Np is dissolved in nitric acid and aluminum nitrate. Np and U are extracted with tributyl phosphate solvent, with aluminum nitrate as the primary salting agent, scrubbed free of ionic contaminants, and finally separated and recovered by selective stripping with nitric acid. 21 ref. (C19n, A11d, Np, 14-63)

66-C.* Recovery and Purification of Plutonium by Anion Exchange. J. L. Ryan and E. J. Wheelright. *Industrial and Engineering Chemistry*, v. 51, Jan. 1959, p. 60-67.

Absorption and elution rates up to 100 mg. of Pu per min. are possible with anion exchange in nitric acid. Purity is very high, with product concentration in excess of 50 g. per liter. Effects of audity, nitrate concentration, temperature and metallic and nonmetallic impurities on resin capacity and absorption kinetics. (C19s; Pu)

67-C.* Preparation of Rhenium From Iodo Compounds. A. A. Woolf. *Journal of Inorganic & Nuclear Chemistry*, v. 7, Oct. 1958, p. 291-292.

Potassium hexaiodorhenate decomposes in vacuo at 500° mainly to potassium iodide, rhenium and iodine. Ammonium hexaiodorhenate prepared quantitatively from rhenium heptoxide decomposes quantitatively to Re at 700° in vacuo. The hexaiodorhenates can be prepared quantitatively from the corresponding chlorides. (C1n; Re)

68-C.* Processing—Refabrication of Metallic Uranium Fuel. D. I. Sinizer, K. L. Mattren, J. R. Folz and E. G. Kendall. *Nucleonics*, v. 17, Jan. 1959, p. 50-53.

Oxide drossing process for partial removal of fission products. When irradiated U is melted in a zirconia or magnesia crucible, some of the metallic fission products, notably the rare earths, are oxidized to their respective oxides and separated from the melt in the form of a dross, or crust, which adheres to the crucible after the molten metal is poured. Other fission products, such as Mo, Zr, Cb and Pu, remain as alloying constituents in the cast ingot. (C28j, A11d, T11g, 14-70; U)

69-C.* (Hungarian.) Thermodynamic Examinations of Reactions Occurring During the Oxidizing Period of Copper Refining. Drzoltan Horvath. *Kohaszati Lapok*, v. 13, Feb-Mar. 1958, p. 99-110

Refining converter Cu of a given composition by pyrometallurgical process and assuming a homogeneous, consistently ideal solution of the Cu bath, calculations conducted for different elements to determine affinity for oxygen in the process, as well as actual concentration at the beginning of co-oxidation and points of theoretical curves representing the changes in bath composition in dependence of time. 5 ref. (C21b, P12; Cu, *O*)

70-C.* (Hungarian.) Reduction of Metallic Oxides by Means of Carbon Monoxide. Jozsef Weber. *Kohaszati Lapok*, v. 13, Feb-Mar. 1958, p. 122-130.

Mathematical functions expressing the changes in thermodynamic potentials in relation to time are used to investigate the reducibility of metallic oxides and the equilibrium relations of the reducing processes. 6 ref. (C26)

71-C.* (Hungarian.) Sulphuric Acid Leaching of the Carbonate Manganese Ore of "Urkut". Lajos Burnoczky. *Kohaszati Lapok*, v. 13, Feb-Mar. 1958, p. 143-145.

Method based on the use of dilute sulphuric acid (15-20%), followed by a neutralizing process to attain final pH value of 7. 9 ref. (C19a; Mn)

72-C.* (Hungarian.) Titanium-Dioxide Suitable for Producing Titanium Iron Obtained From Domestic Bauxite. Ballane and Marta Achs. *Kohaszati Lapok*, v. 13, Feb-Mar. 1958, p. 157-158.

Ti content of bauxite and bauxite sludges may be recovered from its sulphuric acid solution in the presence of any bivalent metal or metallic sulphate, and with a yield approximating 100%. (C19n; Ti)

73-C. (Book.) Research and Development in the Field of Thorium Chemistry and Metallurgy. v. 1. Preparation of Electrolytic Cell Feed for Production of Thorium Metal. Charles E. Fisher and James L. Wyatt. Horizons Inc. *U.S. Atomic Energy Commission*, SRO-11, 135 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $2.75.

System for cell feed preparation converts thorium nitrate to a basic carbonate via the reaction between the nitrate and sodium carbonate. Following suitable filtration and drying, the thorium oxycarbonate is converted directly to the chloride by reaction with carbon and chlorine, forming a cell feed containing 40 and 45% Th in a molten matrix of sodium and potassium chlorides. Product is suitable for conversion to AEC grade Th metal by electrolytic techniques. (C23; Th)

74-C. (Translation - ConBur.) Problem of the Iodine Method of Purification of Zirconium. K. D. Sinel'nikov, F. I. Busol and G. I. Stepanova. *Soviet Journal of Atomic Energy*, v. 4, Feb. 1958, p. 221-227.

Types of ores adaptable to pyritic and semi-pyritic smelting, "oxygen flash smelting process" and methods using insufflation of preheated air and recuperated heat. Processes, heat balances, composition of typical mattes. 8 ref. (C21; Cu)

76-C.* (Russian.) Effect of Aluminum Upon Anode During Electrolysis of Cryolite-Alumina. A. I. Belyaev and Firsanova. *Zhurnal Prikladnoi Khimii*, v. 31, no. 9, 1958, p. 1361-1366.

Al in bath has no appreciable effect on the anodes. (C23n; Al)

77-C. Preliminary Studies in Chlorinating Titaniferous Slags From Idaho Ilmenite. M. M. Barr, H. L. Gilbert and D. D. Harper. *U.S. Bureau of Mines Report of Investigations 5431*, 1958, 14 p.

(C19r; Ti, RM-q, RM-h)

78-C. Determination of Kerosene Entrainment Losses in the Solvent Extraction of a Leach Liquor. Christian M. Lapointe. *Dept. of Mines and Technical Surveys, Ottawa, Canada, Mines Branch Research Report, R25*, Sept. 23, 1958, 16 p. $.25.

Entrainment losses during solvent extraction of U. 6 ref. (C19n; U)

79-C. A Method for the Purification of Selenium. S. Nielson and R. J. Hirtage. *Electrochemical Society, Journal*, v. 106, Jan. 1959, p. 39-43.

Method is based on formation and decomposition of hydrogen selenide. Apparatus used is capable of producing about 10 g. per hr. of extremely high purity. 7 ref. (C1; Se)

80-C. Uranium Production in South Africa. Philip Rabone. *G. E. C. Journal*, v. 25, Oct. 1958, p. 193-200.

Extraction of U ore by acid leaching, separation of U by ion exchange and calcination to U_3O_8 for shipment. (C19n, C19s, U)

81-C. Continuous Casting, Impact Extrusion Spark Revolution in Aluminum Partmaking. *Steel*, V. 144, Jan. 12, 1959, p. 70-73.

Two-in-one production line processes Al pig into cans. Key to process is casting wheel that delivers 1/2-in. thick strip to rolling mill.

(C5q, G5, T10g; Al-b, 17-57)

82-C. (Russian.) Theory of Separation of Isotopes and Alloy Components by Passing Electric Current Through Liquid Metal. S. E. Blessler and G. E. Pikus. *Zhurnal Tekhnicheskoi Fiziki*, v. 28, Oct. 1958, p. 2282-2288.

(C6c, 14-60)

83-C.* High-Purity Metals in Commercial Quantities. R. A. King. *Metal Progress*, v. 75, Jan. 1959, p. 127-130.

The Consolidated Mining and Smelting Co. of Canada Ltd., long a producer of Pb

and Zn of 99.9% purity, has extended its operations to include the production of high-purity Sb, Cd, Ag, Bi, Sn and In. (C-general, S11; Pb-a, Zn-a, Sb-a, Cd-a, Ag-a, Bi-a, Sn-a, In-a)

84-C.* (French.) Behavior of Nitrogen in the Vacuum Sublimation of Calcium. Claude Decroly and Claude Den Tandt. *Revue de Metallurgie*, v. 55, Nov. 1958, p. 1009-1022.

Canadian calcium was purified by repeated sublimation in a vacuum at a constant temperature of 750° C. and at different condensation temperatures to study influence on nitrogen content of the purified metal. With optimum condensation temperature of 250 to 300° C., the final nitrogen content was less than 10 ppm 26 ref. (C27h, 2-61; Ca, *N*)

85-C.* Molybdenum and Tungsten Alloys. E. J. Sandford. *Alloy Metal Review*, v. 9, Dec. 1958, p. 2-8.

Cutting speed, transverse strength, casting, sintering, applications of sintered W alloys and hard metals. 18 ref. (C5, H15; Mo-b, W-b, *Co*, 6-70)

86-C.* Electrodeposition of High-Purity Chromium. F. E. Block, P. C. Good and G. Asai. *Electrochemical Society, Journal*, v. 106, Jan. 1959, p. 43-47.

Thick Cr deposits prepared by the electrolysis of aqueous chromic acid baths. Metal containing 0.0005% O, less than 0.002% N, and only traces of metallic impurities was obtained upon electrolysis of purified solutions at elevated temperatures. After melting and working into shape electrolytic Cr has tensile properties comparable to Cr prepared by refining commercial grade material by H treatment. 11 ref. (C23p; Cr-a)

87-C. Preparation of Magnesium Metal—a Literature Search. Earl W. Mautz. National Lead Co. of Ohio. *U.S. Atomic Energy Commission*, NLCO-754, Nov. 26, 1958, 41 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $1.25.

Approximately 250 literature references relating to reduction of Mg compounds, other than MgF_2, to produce Mg metal. References for the Mg-U system. (C-general, M24b; Mg, *U*)

88-C.* Tungsten Zone Melting by Electron Bombardment. R. G. Carlson. *Electrochemical Society, Journal*, v. 106, Jan. 1959, p. 49-52.

Refining of W in vacuum by floating zone method. Spectrographic analyses along the length of a purified W rod indicate that Mo may not be removed by zone refining, but rather by volatilization. X-ray diffraction studies indicate that W rods purified in this manner are single crystals and have a larger amount of ductility than that obtained in an equivalent sized polycrystalline material. 9 ref. (C28k, 1-73; W, *Mo*)

89-C. Recovery of Magnesium and HF From Magnesium Fluoride—a Literature Search. Earl W. Mautz. National Lead Co. of Ohio. Nov. 26, 1958. *U.S. Atomic Energy Commission*, NLCO-747, 30 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $1.

Some 200 literature references relating to the recovery of HF and Mg from MgF_2 as reported in AEC, patent and journal publications. Mg ores are treated with HF, reduced with CaC_2 to form Mg metal, with regeneration of the fluoride by H_2SO_4 for HF recycle. (C1p; Mg)

90-C.* (French.) Large-Scale Separation of Rare Earths. Bellevue Laboratory's Pilot Plant. Jean Loriers. *Nature*, Oct. 1958, p. 399-405.

Method based on ion exchange with multi-columnar plant. Process details, equipment. Examples of extraction of scandium, yttrium, lanthanum, neodymium and praseodymium oxides. (C19s, EG-g)

91-C.* (German.) Effect of Boundary Surface Active Materials Used as Additives in the Precipitation of Cadmium and Thallium. Wilhelm Roever. *Zeitschrift fur Erzbergbau and Metallhuttenwesen*, v. 11, Dec. 1958, p. 586-593.

New method for precipitation of Cd and Tl from an impure Zn lye, using small amounts, 10 to 30 mg. per liter, of surface active materials, sometimes together with organic protective colloids, for stabilizing the precipitated metals. 10 ref. (C27; Cd, Tl, AD)

92-C. (Russian.) Preparation of Hafnium Tetra-Chloride Double Phosphate. A. Sheka and B. A. Vostovitch. *Zhurnal Neorganicheskoi Khimii*, v. 3, no. 8, 1958, p. 1973-1976.

(C19r; Hf)

93-C.* The Preparation of Uranium Metal by the Electrolytic Reduction of Its Oxides. L. W. Niedrach and B. E. Dearing. *Electrochemical Society, Journal*, v. 105, June 1958, p. 353-358.

A bath containing MgF_2, BaF_2 and UF_4 is satisfactory as the solvent electrolyte. Any of the major U oxides, UO_3, U_3O_8, or UO_2, can be used as feed, but UO_3 is the most desirable for a production process. 10 ref. (C23; U)

94-C. Amalgam Process Regenerates Spent Pickling Solutions. H. Holn, E. Fitzer and G. Jangg. *Industrial Finishing (London)*, v. 11, Jan. 1959.

Removes powdered iron suitable for pressing and sintering in mercury electrolytic cells. (C29, A11d; Fe, 6)

95-C. Defining Uranium Concentrate Specifications. J. R. Nelli, W. C. Manser and D. S. Arnold. *Journal of Metals*, v. 11, Jan. 1959, p. 33-35.

Analysis of U purity, showing impurity concentrations and thermal neutron cross-sections of these concentrations. 15 ref. (C-general, P18j; U)

96-C. Problems in the Processing of Zirconium and Its Compounds. William A. DuPraw. Columbia National Corp. Paper from "First Conference on Analytical Chemistry in Nuclear Reactor Applications". *U.S. Atomic Energy Commission, TID-7555*, 1958, p. 138-140.

Before Zr sponge is acceptable for fabrication into usable forms for nuclear application, residual impurity elements having high neutron-capture cross sections, such as Hf, B and Cd, or those residual impurity elements that would contribute to possible corrosion failure must be removed from the process stream prior to the reduction of metal to reactor-grade sponge. Process involves the reduction of zirconium tetrachloride with Mg metal. (C28, C26; *Zr*, 6-74, *Hf, B, Cd*)

97-C. Solvent Extraction. J. C. White. Oak Ridge National Laboratory. Paper from "First Conference on Analytical Chemistry in Nuclear Technology". *U.S. Atomic Energy Commission, TID-7555*, 1958, p. 240-255.

Organo-nitrogen and organo-phosphorus compounds used as analytical reagents. Data show utility of amines in extracting mineral acids, organic acids, Po, PuO_2, Zr, Pa, Th, U, rare earths and fission products. (C19n, Po, Pu, Zr, Th, Pa, U, EG-g)

98-C. (Russian.) Reduction of Copper Oxide by Carbon. M. S. Kurchatov. *Zhurnal Fizicheskoi Khimii*, v. 32, no. 11, 1958, p. 2586-2593.

Graphite and carbon black used in high vacuum, with accumulation of gaseous reaction products. 10 ref. (C26, 1-73; Cu-b, C, NM-a34)

99-C.* (German.) Electrolytic Precipitation of Manganese on Mercury. G. Jangg, G. Zwerenz and H. Hohn. *Metall*, v. 13, Jan. 1959, p. 31-36.

Reduced power requirements attained high concentration of Mn salt, addition of ammonium sulphate and elevated temperature. 18 ref. (C23n; Mn)

100-C. Problems in the Processing of Raw Materials for Uranium. C. F. Coleman and K. B. Brown. Oak Ridge National Laboratory. Paper from "First Conference on Analytical Chemistry in Nuclear Reactor Applications". *U.S. Atomic Energy Commission, TID-7555*, 1958, p. 43-56.

Processes for the separation of U from ores and for the subsequent purification, concentration and conversion of U to U_3O_8 or other compounds. Types of reagents used in the solvent extraction procedure to remove U from acid leach solutions; anion exchange processing of clarified liquors. (C19n; U)

101-C. Problems in the Processing of Titanium and Its Compounds. W. E. Few. Cramet Inc. Paper from "First Conference on Analytical Chemistry in Nuclear Reactor Technology". *U.S. Atomic Energy Commission, TID-7555*, 1958, p. 141-157.

Industrial methods used in the production of Ti sponge, formation of Ti and alloy ingots from the sponge, and fabrication of mill products. Sampling procedures, tolerance limits for the principal impurities (O, H, N and C), methods of chemical analysis which are used to estimate impurities, and the deleterious effects caused by each impurity. 7 ref. (C-general, S11; Ti, 5-59, 6-74, 3-69)

102-C. (Translation—BISI, no. 1051.) Continuous Casting and Its Problems. G. Wilz and M. Petitdidier. *Revue de Metallurgie*, v. 55, May 1958, p. 486-494.

See item 284-C, 1958. (C5q, D9q)

103-C. (Translation—Brutcher, no. 4377.) Production of Carbon-Free Ferrochromium by Decarburization of High-Carbon Ferrochromium in Vacuum. S. V. Bezobrazov. Paper from "Problems of the Use of Vacuum in Metallurgy". Moscow, 1958, p. 155-162.

Production of carbon-free ferrochromium by oxidizing the carbon in high-carbon ferrochromium with the oxygen in chromium sesquioxide, chrome ore, quartzite,

and nickelous oxide. (C21, 1-73, 2-60, 2-61, 3-74, Fe, Cr, AD-n)

104-C. (Translation.) Influence of the Nature of the Gas Phase on the Anode Effect in the Electrolysis of Cryolite-Alumina Melts. A. I. Belyaev, E. A. Zhemchuzhina and A. D. Gerasimov. Paper from "Soviet Research in Fused Salts". Pt. 2. Consultants Bureau, Inc., New York, 1958, p. 147-151.

Effect of composition of melt and nature of gas phase on wetting as determined by measuring contact angles of cryolite-alumina and AlF_3 -NaF systems on carbon plate in atmospheres of argon, nitrogen, carbon dioxide and air. Mechanism of anode effect. (C23n; 2-60; Al)

105-C. (Translation.) Investigation of the Anode Process in Aluminum Bath. L. N. Antipin and A. N. Khudyakov. Paper from "Soviet Research in Fused Salts". Pt. 2. Consultants Bureau, Inc., New York, 1958, p. 161-166.

See item 276-L, 1957. (C23n; Al)

106-C. (Translation.) Variation of Current Efficiency With Current Density in the Electrolysis of Cryolite-Alumina Melts. L. N. Antipin and I. Nikerkorn. Paper from "Soviet Research in Fused Salts". Pt. 2. Consultants Bureau, Inc., New York, 1958, p. 167-172.

Compares experimental determinations with results from formulas relating current efficiency to various factors. 8 ref. (C23n; Al)

107-C. (Translation.) Solubility of Water and Magnesium Oxide in Fused Carnallite. Ya. E. Vilnyansky and N. P. Bakina. Paper from "Soviet Research in Fused Salts". Pt. 2. Consultants Bureau, Inc., New York, 1958, p. 173-177.

MgO insoluble in fused carnallite. Hydrogen present in molten carnallite was combined with oxygen in hydroxyl and not water molecules. 8 ref. (C23n, P12e; Mg)

108-C. (Translation.) Cathode Processes Occurring in the Electrodeposition of Thorium From Fused Electrolytes. M. V. Smirnov and L. D. Yushina. Paper from "Soviet Research in Fused Salts". Pt. 2. Consultants Bureau, Inc., New York, 1958, p. 193-200.

See item 59-C, 1957. (C23p; Th)

109-C. (Translation.) Dezincing of Sulfide-Oxide Melts by Blowing With a Carbon-Air Mixture. A. I. Okunev and V. A. Aglitsky. Paper from "Soviet Research in Fused Salts". Pt. 2. Consultants Bureau, Inc., New York, 1958, p. 260-263.

Blowing of sulphide oxide mattes under pilot plant conditions. Kinetics of process, air consumption, carbon consumption; rate of Zn removal. 8 ref. (C22g, C21, A11c, 1-66; Cu, *Zn*)

110-C.* Vacuum Metallurgy in Europe. A.M. Aksoy. *Metal Progress*, v. 75, Feb. 1959, p. 87-89.

Melting techniques, particularly vacuum degassing, have progressed rapidly since World War II. Though vacuum induction and arc melting have not developed as they have here, their potential is beginning to interest fabricators who need better and more dependable alloys. (C25, D8m, J-general, 1-73)

111-C.* (Rumanian.) Electrolytic Refining of Lead. A. Lupu and I. Crisan. *Revista de Chimie*, Sept. 1958, p. 490-495.

Laboratory study of possibilities of electrolytic "debismuthization" of a 2.6% Bi, 0.2% Cu lead using a solution of amidosulphonic acid as electrolyte. Under optimum conditions, compact, dense, adherent cathodic deposit of 99.999% Pb was obtained. 13 ref. (C23p; Pb, *Bi*)

112-C.* (German.) Selenium Preparation From Anode Mud Following Electrolytic Refinement and Purification of Copper. S. Loschau. *Zeitschrift fur Erzbergbau und Metallhuttenwesen*, v. 12, Jan. 1959, p. 21-27.

Roasting of anode mud, crushing and subsequent extraction with soda lye; neutralization of the extract with H_2SO_4 and cadmium precipitation from the extract by the addition of hydrochloric acid and passing through of SO_2. By dry distillation under N following removal of 0.1-0.2% As, a 99.99% pure Se was obtained. (C19n; Se, *Cu*)

113-C.* (German.) The Oxidation Maximum of Antimony in the Refining of Lead. Joachim Barthel. *Freiberger Forchungshefte*, v. B29, Oct. 1958, p. 5-66.

Oxidation behavior of Sb in Pb. Thermal analysis and equilibria of the systems $5PbO{\cdot}Sb_2O_3$ and oxides metallic phase. 28 ref. (C28j, M24c; Pb-a, *Sb*)

114-C.* (German.) Heterogeneous Equilibria in the System Zn-S-O and Their Significance for the Levitation Melting Process of A. Lange and J. Barthel. Gerhard Fischer. *Freiberger Forschungshefte*, v. B29, Oct. 1958, p. 69-149.

Thermodynamic evaluation of vapor pressure measurements at various temperatures provides an explanation of the volatilization of ZnS. Volatilization of Zn after oxidation

of the S together with thermal dissociation of ZnS are assumed. 31 ref. (C28, M24c, P12c; Zn, S, O, RM-n)

115-C.* (German.) Precipitation of Cadmium From Solutions of Zinc Sulphate. Klaus Hein. *Freiberger Forschungshefte*, v. B29, Oct. 1958, p. 151-214.

Cd precipitation with metallic Zn as a precipitant. Effects of stirring, temperature, ionic activity of H, increased surface area of precipitant, ionic concentration of Cd, Zn and Cu. 29 ref. (C27; Cd, *Zn, Cu*)

116-C.* (Polish.) Continuous Method of Alumina Extraction by Leaching Alumina Slag With Soda Solution. Karol Akerman, Bronislaw Zmudzinski, Seweryn Dietze and Bronislaw Sakala. *Archiwum Hutnictwa*, v. 3, no. 4, 1958, p. 287-304.

Extraction of alumina from slag obtained in process of melting and sintering. Leaching process recovered up to 75-90% of alumina. (C19n; Al)

117-C.* (Polish.) Method of Obtaining Aluminum Oxide by Leaching Alumina Slags With Soda Solution. Karol Akerman, Bronislaw Zmudzinski and Robert Godula. *Archiwum Hutnictwa*, v. 3, no. 4, 1958, p. 225-285.

Optimal conditions for leaching slag obtained by melting raw materials containing alumina with calcium sulphate or calcium carbonate in a shaft furnace or by sintering them in a rotary furnace. 12 ref. (C19n; Al)

118-C. Liquid-Solid Separation Factors in Hydrometallurgical Leach Circuit Design. R.C. Emmett and D.A. Dahlstrom. *Canadian Journal of Chemical Engineering*, v. 37, Feb. 1959, p. 3-8.

(C19n, 17-51)

119-C. (Russian.) Extraction of Sulphide Inclusions From Molten Slags by Means of an Electric Field. V.V. Khlynov and O.A. Esin. *Doklady Akademii Nauk, SSSR*, v. 123, Nov. 1958, p. 320-321.

Electro-capillary movements of liquid metallic drops used to extract sulphide inclusions from molten slags. At 1400° C., slag composition is CaO 15%; Al_2O_3 10%; SiO 43%; Fe 20%; Mg 10%; Ni 0.1-0.2%; Co 0.02%; S 0.15-0.02%. 8 ref. (C21, D11n; 9-69, RM-q, Fe, Mg, Ni, Co, S, Ca, O, Al, Si, NM-a34)

120-C. (Russian.) Precipitation of Metals During Electrolysis of Alloys in Presence of Concentrated Polarization. B.F. Markman and E.B. Gitman. *Ukrainskii Khimicheskii Journal*, v. 24, no. 5, 1958, p. 581-584.

Experiences with separation of Pb and Cd during electrolysis of their melted chlorides. (C23; Pb, Cd)

121-C.* Electrolytic Preparation of Titanium From Fused Salts. Pt. 2. Design of Laboratory Cells. Marshall B. Alpert, James A. Hamilton, Frank J. Schultz and William F. Sullivan. *Electrochemical Society, Journal*, v. 106, Feb. 1959, p. 142-144.

Design and function of externally heated laboratory cells, including single and double diaphragm types operating continuously. 7 ref. (C23p, 1-52; Ti)

122-C.* (German.) Distillatory Separation of Metals Under Reduced Pressure. Ludwig Muller. *Freiberger Forschungshefte*, v. B33, Dec. 1958, p. 3-159.

Data for the binary systems Sn-Zn, Pb-Zn, Sn-Bi, Pb-Sb. Distillation time and yield of refined metal depend on the method of distillation. 141 ref. (C22h; Sn, Pb, *Zn, Bi, Sb*)

123-C.* Studies on the Separation of the Rare Earths From Thorium in Sulphate Solutions, Using Cation Exchange Resins. D. C. Lewis and J. C. Ingles. *Canadian Dept. of Mines and Technical Surveys, Mines Branch*, R31, Oct. 6, 1958, 40 p.

Variables investigated were: sulphate concentration, nature of the counter-ion (i.e., the cation whose sulphate salt supplies the sulphate for complexing) and resin type. Separation was not quantitative but it was found possible to obtain reasonable recoveries of Th free of rare earths. 16 ref. (C19s; Th, *EG-g*)

124-C.* Reactive Metal Melting Furnace Eliminates Water Cooling Hazard. M. L. Torti and John L. Ham. *Steel*, v. 144, Mar. 9, 1959, p. 64-66.

Heavy skull maintained in the crucible acts as a heat sink to handle heat generated during melting and eliminates costly and complicated cooling systems. (C5h, W18s; Ti)

125-C. Trap for Removing Ferric Chloride From Titanium Tetrachloride. E. C. Perkins, H. Dolezal and R. S. Land. *U. S. Bureau of Mines, Report of Investigations* no. 5428, 1958, 4 p.

Rock-salt column is self-cleaning and will remove ferric chloride, other impurity chlorides and dust from gaseous Ti tetrachloride. Losses of Ti are low and the molten mixture is easy to handle. 8 ref. (C19r; Ti, *Fe, Cl*)

126-C. Gold Recovery Tests on Ore From the Blue Spec Gold Mine, Nullagine, W. A. H. R. Dunstan, E. Tasker and R. A. Hobson. *Australian Commonwealth Scientific and Industrial Research Organization, Ore-Dressing Investigations, Report,* no. 702, June 1958, 8 p.

Satisfactory recovery by amalgamation and cyanidation after grinding to -100 mesh. (C19p, C29; Au)

127-C. Process for Electrolytic Extraction of Titanium Metal From Titanium Carbide Anodes. Guy Ervin, Jr., Herbert F. G. Ueltz and Malcolm E. Washburn. *Electrochemical Society, Journal,* v. 106, Feb. 1959, p. 144-146.

High-purity Ti extracted electrolytically in fused halide baths and deposited as dendritic Ti metal. 15 ref. (C23p; Ti)

128-C. Large Scale Preparation of Ultra-Pure Germanium. J. M. Wilson. *Research Applied in Industry,* v. 12, Feb. 1959, p. 47-53.

12 ref. (C19r, C28k; Ge-a)

129-C. (German.) Electrolytic Refining of Lead by the Betts Process. Werner Bisert. *Neue Hutte,* v. 4, Jan. 1959, p. 29-35.

Factors influencing purity of end product. (C23p; Pb)

130-C.* (German.) Reduction of Iron Ore (FeO_3) by Carbon Monoxide in Two Stages. Edward Wicke, Kurt Hedden and Gero Lueth. *Stahl und Eisen,* v. 79, Feb. 5, 1959, p. 129-134.

The first stage consists of C separation. In the second stage the product is reduced to Fe by means of the C deposited by the decomposition of CO. 8 ref. (C26; Fe, RM-n)

131-C.* Production of Ferro-Manganese. E. J. Hancock. *Iron and Coal Trades Review,* v. 178, Jan. 23, 1959, p. 197-200.

Problems of smelting ferromanganese under Indian conditions. (C21; Fe, Mn, AD-n31)

132-C.* Techniques and Results of Zone Refining Some Metals. J. H. Wernick, D. Dorsi and J. J. Byrnes. *Electrochemical Society, Journal,* v. 106, Mar. 1959, p. 245-248.

Purification by floating zone refining of Ni, Ti and V with volatilization and for boat zone refining of Al and Au. 7 ref. (C28k; Ni, Ti, V, Al, Au)

133-C.* Effect and Control of Impurities in the Electrowinning of Zinc. G. T. Wever. *Journal of Metals,* v. 11, Feb. 1959, p. 130-134.

Control of Fe, Co, Ni, Cu, As, An, Ge, Sb, Se, Te, Cd, Pb, Cl, Fl and Mn which appear as impurities and cause trouble in electrolytic Zn plants. (C23n, 3-69; Zn, *Fe, Co, Ni, Cu, As, An, Ge, Sb, Se, Te, Cd, Pb, Mn*)

134-C.* Electron Bombardment Melting. Hugh R. Smith, Charles D'A. Hunt, and Charles W. Hanks. *Journal of Metals,* v. 11, Feb. 1959, p. 112-117.

The melt surface is exposed to high vacuum; the melt is cast in a noncontaminating water-cooled mold; it may be constantly observed visually and precisely controlled with regard to residence time, material addition and withdrawal; the melt can be held at any desired temperature—high superheats can be utilized to achieve reactions otherwise not possible. 9 ref. (C5k, 1-73; Al, Cb, Mo, Ta, Ti, Zr, EG-d)

135-C.* Zone Refining. Norman L. Parr. *New Scientist,* v. 5, Feb. 3, 1959, p. 290-292.

Zone refined Cu can be produced with only 100 parts of impurities per million; zone refined Sn with 10 parts of impurities per million; Fe 2000 parts per million; Ge less than 0.1 part per million; Al 20 parts per million and Si 1 part per million. (C28k; Cu, Sn, Ge, Fe, Al, Si)

136-C. (Translation—Brutcher no. 4436.) Reduction of Titanium and Silicon Dioxides With Magnesium at Normal Pressure. W. Rutkowski. *Prace Instytutow Ministerstwa Hutnictwa,* v. 8, no. 2, 1956, p. 85-88.

Possibility of producing Ti and Si powders of sufficient purity from Ti white and from silica by magnesio-thermal reduction. (C26; Ti, Si, *Mg*)

137-C. Ion-Exchange Separation of Metals by a Single-Pass Method. Richard T. Oliver and J. S. Fritz. Iowa State College. *U. S. Atomic Energy Commission ISC-1056,* 41 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Method consists of complexing each of the components in a mixture with a separate complexing agent at a pH sufficient to insure maximum co-ordination of the metals. The mixture is then passed through an ion-exchange resin which absorbs one species completely, allowing the other to be collected in the effluent. 109 ref. (C19s)

138-C.* (Hungarian.) Production of Super-Purity Aluminum by Volatilization of Its Sub-

fluoride. A. I. Gjeljajev. *Kohaszati Lapok*, v. 91, Sept. 1958, p. 420-422.

Process based on interaction of Al and its halides (AlF_3 and $AlCl_3$) taking place at elevated temperatures, resulting in creation of low-valence volatile compounds (AlF, AlCl). These dissociate at lower temperature into Al and its normal valence halides. (C1p; Al)

139-C.* (Polish.) Production of Metallic Manganese From Pharmaceutical Byproducts. Z. Kulinski, B. Paczula and K. Radzwicki. *Hutnik*, v. 25, Nov-Dec. 1958, p. 471-477.

Byproducts obtained in production of chloromycetin, Vitamin-C and nicotinic acid as raw materials for metallic Mn production. (C22, A11c; Mn)

140-C.* (Polish.) Dissociation of Iron Oxide. Wladyslaw Kuczewski. *Hutnik*, v. 25, Nov-Dec. 1958, p. 498-500.

Properties and behavior of iron ore between 1190 and 1420° C. (C22g; Fe)

141-C.* Vacuum Casting of Uranium. J. Stephenson. *Institute of Metals, Journal*, v. 87, Feb. 1959, p. 174-180.

Design of a furnace for melting and casting uranium under vacuum. Procedures used in the production of castings. (C5j; E12, W18a, 1-73)

142-C.* Experiences in Vacuum Melting Some Special Alloys. W. F. Randall and H. H. Scholefield. *Institute of Metals, Journal*, v. 87, Feb. 1959, p. 181-186.

Equipment, practical difficulties and benefits in vacuum melting alloys of Ni-Fe, Ni-Cr, Cu-Be and other types. (C5j, W18a, 1-73; Ni-b, Cu-b, *Be, Fe, Cr*)

143-C.* Heat-Resistant Aluminum. New Melt Saturation Process Results in "Ceramic Alloys". *Light Metal Age*, v. 17, Feb. 1959, p. 17.

"Melt-saturation" process produces Al filled with thorium silicate. (C5r, Q-general, 2-62; Al, *Si, Th*, SGA-h)

144-C. Acid Leaching of Uranium Ores. R. J. Woody and D. R. George. Paper from "Uranium Ore Processing". Addison-Wesley Publishing Co., Inc., Reading, Mass. 1958, p. 115-152.

Rate and degree of U extraction by acid leaching depends on acid concentration, degree of oxidation, leaching temperature and particle size. Aqueous leaching with agitation is preferred method. 27 ref. (C19n; U)

145-C. Carbonate Leaching of Uranium Dres. L. A. McClaine. Paper from "Uranium Ore Processing". Addison-Wesley Publishing Co., Inc., Reading, Mass. 1958, p. 153-171.

Carbonate leach solutions have several important advantages over acid leach solutions, including noncorrosive properties and relatively specific solvent ability for U and V. 33 ref. (C19n; U)

146-C. Liquid-Solids Separations. J. B. Rosenbaum and J. B. Clemmer. Paper from "Uranium Ore Processing". Addison-Wesley Publishing Co., Inc., Reading, Mass. 1958, p. 172-190.

Criteria for evaluating various flocculants used with uranium plant leach pulps. Practice in percolation leaching, countercurrent decantation washing in classifiers and thickeners and filtration are reviewed separately for alkaline and acid systems. 10 ref. (C19n; U)

147-C. Uranium Recovery by Ion Exchange. Albert F. Preuss and Robert Kunin. Paper from "Uranium Ore Processing". Addison-Wesley Publishing Co., Inc., Reading, Mass. 1958, p. 191-236.

Ion-exchange process is based on the ability of anion-exchange resins to extract U selectively from sulphuric acid or carbonate leach solutions. After the U is concentrated in the resin, it is displaced by a suitable salt solution to obtain a more highly concentrated, relatively pure, U liquor. This liquor is then treated with alkaline precipitants to yield a high-grade U cake. 55 ref. (C19s; U)

148-C. Uranium Recovery By Solvent Extraction. David A. Ellis. Paper from "Uranium Ore Processing". Addison-Wesley Publishing Co., Inc., Reading, Mass. 1958, p. 237-271.

Solvent extraction process involves two steps—extraction and stripping. The organic solvent is contacted with the liquor to be treated, and the U is transferred to the solvent. During stripping the loaded solvent is brought in contact with a suitable aqueous solution and the U is transferred from the organic solvent back to an aqueous phase. 68 ref. (C19a; U)

149-C. Examples of Uranium Milling Operations. R. P. Ehrlich. Paper from "Uranium Ore Processing". Addison-Wesley Publishing Co., Inc., Reading, Mass., 1958, p. 272-371.

Current practices in treating ores of all sorts, together with flowsheets and operating experience. (C-general; U)

150-C. Development of the Excer Process. Pt 4. Chloride System. I. R. Higgins, W. J. Neill and L. E. McNeese. Oak Ridge National Laboratory. *U. S. Atomic Energy Commission, ORNL-2490,* 51 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.

Recovery of U from a chloride system by anion exchange. Ore concentrate is dissolved in HCl, purified by anion exchange, electrolytically reduced to uranium tetrachloride and then precipitated as hydrated uranium tetrafluoride by the addition of HF. (C19s; U)

151-C.* The Practical Casting of Molybdenum. George H. Thuston. *Western Machinery and Steel World,* v. 50, Mar. 1959, p. 63-65.

Consumable electrode melting and centrifugal casting in a vacuum with pressure maintained in the range of 10-100 microns. Freedom from flaws and anisotropy resulting from purification during melting and controlled solidification. (C5h, E14, 1-73; Mo)

152-C.* (French.) Purification of Zirconium by Zone Melting. Jean-Paul Langeron, Pierre Lehr, Philippe Albert and Georges Chaudron. *Comptes Rendus,* v. 248, Jan. 5, 1959, p. 35-40.

In a vacuum or an inert gas atmosphere, a molten zone is produced in a Zr bar by electrical induction and moved along the whole bar. Impurities either evaporate or sublimate. 11 ref. C28k; Zr)

153-C.* Extraction of Thorium. J. H. Buddery, W. D. Jamrack and R. A. Wells. *Chemistry & Industry,* Feb. 21, 1959, p. 235-244.

Minerals, ore preparation, removal of rare earths and extraction. 13 ref. (C-general, A11a, B-general; Th)

154-C. Comparing Fixed and Moving Bed Ion Exchange Techniques. C. W. Hancher. *Engineering and Mining Journal,* v. 160, Mar. 1959, p. 80-83.

(C19s)

155-C. Large-Scale Preparation of Ultra-Pure Silicon. J. M. Wilson. *Research Applied in Industry,* v. 12, Mar. 1959, p. 91-96.

Extraction and refining processes. 16 ref. (C-general; Si-a)

156-C.* (German.) Chemical Treatment of Aluminum and Aluminum Alloy Melts. H. Eisenreich and M. G. Neu. *Aluminum,* v. 35, Mar. 1959, p. 131-135.

Factors determining properties of Al melts. Effects and chemistry of degassing, purification, grain refining and elimination of dross. 18 ref. (C5r; Al-b)

157-C.* (German.) Production of Titanium Sponge From $TiCl_4$ by Magnesium. Rudolf Holst and Rudolf Proft. *Neue Hutte,* v. 4, Feb. 1959, p. 106-109.

Reaction is $TiCl_4 + 2Mg \rightarrow 2MgCl_2$ as in the Kroll process. The vacuum or low-pressure method was developed because of the scarcity of inert gas. Distillation of the $MgCl_2$ is achieved in the same retort. 6 ref. (C26, C25, 1-73; Ti, 6-74)

158-C.* Direct-Chill Casting of Copper and Copper-Base Alloys. *Australasian Manufacturer,* v. 43, Feb. 21, 1959, p. 70-73.

Cost reduction by continuous casting brought about by new equipment and new techniques. (C5q; Cu, Cu-n, Cu-s)

159-C.* (French.) Preparation of Zirconium and Zirconium Alloys by Bomb Reductions. Claude Decroly, Jean Gerard and Denis Tytgat. *Revue de Metallurgie,* v. 56, Feb. 1959, p. 143-162.

Production of Zircaloy in the massive form by the reduction of zirconium tetrafluoride with Ca and Mg in the presence of alloying metals. (C26; Zr)

160-C. Nonferrous Extractive Metallurgy in Japan. Yoshiki Ogawa. *Journal of Metals,* v. 11, Mar. 1959, p. 175-177.

Processes, production and research. (C-general; EG-a38)

161-C. Anion-Exchange Studies With Actinium and Lanthanides in Nitrate Solutions. J. Danon. *Notas de Fisica,* v. 4, no. 15, 1958, p. 1-5.

12 ref. (C19s; Ac, EG-g)

162-C. (Russian.) Resistance Heaters for Zone Melting. N. F. Shvartsenau. *Zavodskaya Laboratoriya,* v. 25, no. 2, 1959, p. 232.

(C28k, 1-52)

163-C.* Shortcut to Sheet. F. L. Church. *Modern Metals,* v. 15, Mar. 1959, p. 30-36.

Molten Al continuously cast directly into $\frac{1}{4}$-in. thick reroll sheets. (C5q, F23; Al-b)

164-C.* Studies on the Extraction of Titanium Dioxide From Ilmenite. Sarju Prasad and Jai Beni Prasad Tripathi. *Indian Journal of Applied Chemistry*, v. 21, no. 4, 1958, p. 162-164.

Extraction by addition of sodium sulphate, carbon or calcium oxide to ilmenite and heating. 8 ref. (C19a; Ti)

165-C. (Book.) Uranium Ore Processing. John W. Clegg and Dennis D. Foley. 1958. 436 p. Addison-Wesley Publishing Co., Inc., Reading, Mass., $7.50.

Roasting and physical concentrations; separation of the pregnant leach liquor from the unwanted solid gangue; recovery of U from the solution by ion exchange and solvent extraction; U milling operations. Papers are abstracted separately. (C19, B-general; U)

166-C. (Book.) Process Chemistry. v. 2, Series 3. Progress in Nuclear Energy. F. R. Bruce, J. M. Fletcher and H. H. Hyman, Editors. 579 p. 1958. Pergamon Press Inc., 122 East 55th St., New York 22, N. Y. $17.50.

Uranium, Th, Ac, Ra extraction and refining; nuclear reactor fuel reprocessing; waste processing. (C-general, C19n, T11g; Ac, Ra, Th, U)

167-C.* Cathode Headbar for Zinc Electrolysis: Developments at Risdon, 1917-1957. John E. Charlesworth and John H. Bain. *Australasian Institute of Mining and Metallurgy, Proceedings*, no. 188, Dec. 1958, p. 27-54.

An assemble which, with the aid of argon arc welding and use of minimum additional Al, permits comparable headbar and sheet lives, combined with good electrical conduction throughout the life of the cathode. 7 ref. (C23n, Kld, 1-52; Zn, Al, 17-57)

168-C.* High Temperature Chlorination in a Fluidized Bed. Kermit B. Bengtson and L. N. Johanson. *Chemical Engineering Progress*, v. 55, Mar. 1959, p. 49-58.

Mg from olivine ore. 13 ref. (C19r, B15q, Mg)

169-C.* (Japanese.) Study of Vacuum Evaporation of Metals in Large Quantities: Aluminum Metals. Saburo Tabata and Minoru Iwata. *Osaka Industrial Research Institute, Bulletin*, v. 9, July 1958, p. 151-154.

New method of vacuum deposition of metals by using a TiC heater. (C22, 1-73)

170-C.* Equipment and Practice for Continuous Casting and Rolling by the Properzi Process. James B. Russell and Frank R. Nichols. *Institute of Metals, Journal*, v. 87, Mar. 1959, p. 209-219.

Construction and operation of the Properzi machine. Quality and economics of production of redraw rod from which Al electrical conductor wire is drawn. Physical and mechanical metallurgy of Properzi-made casting and rod and of wire drawn from it. 8 ref. (C5q, 1-52, F23; Al)

171-C.* Hazelett and Rotary Strip-Casting Machines for the Continuous Casting of Aluminum. R. D. Hamer. *Institute of Metals, Journal*, v. 87, Mar. 1959, p. 219-226.

Both machines are capable of producing metallurgically sound cast slab of commercial-purity Al, but the casting of Al alloys requires further investigation. The Hazelett machine has certain advantages for the production of large tonnages of wide sheet, while the RSC technique is suitable for smaller tonnages of narrow strip. 7 ref. (C5q, 1-52; Al, 4-53)

172-C. Bibliography on Extractive Metallurgy of Nickel and Cobalt, 1900-1928. Curtis A. Jones. *U. S. Bureau of Mines, Information Circular*, 7883, 1959, 33 p.

(C-general; Co, Ni)

173-C. (English.) Fundamental Researches on Smelting of Sulphide Ores. Pt. 14. Molten Copper Sulphide. Kingo Sudo. *Tohoku University, Science Reports of the Research Institutes*, v. 10A, no. 6, 1958, p. 435-452.

Behavior of molten copper sulphide at high temperature studied by measuring the equilibria of H_2S/H_2 gas mixtures. 36 ref. (C21b, P12; Cu)

174-C.* Liquid-Liquid Extraction Equilibrium Data of Cobalt Nitrate-Nickel Nitrate-Nitric Acid Solutions. E. J. Scharf and C. J. Geankoplis. *A.I.Ch.E. Journal*, v. 5, Mar. 1959, p. 76-79.

Normal butanol was found to be the best solvent for solvent extraction of Co and Ni from aqueous solutions. 12 ref. (C19n; Co, Ni)

175-C.* Zinc Blast-Furnace Operation. S. W. K. Morgan and J. Lumsden. *Journal of Metals*, v. 11, Apr. 1959, p. 270-275.

Treatment of complex Zn-Pb ores using the lead splash condenser. (C21a; Pb, Zn)

176-C.* (French.) Purity of Metals and Progress in Modern Metallurgy. G. Chaudron. *Aluminio*, v. 28, Mar. 1959, p. 109-114.

Production of high-purity Al by zone melting. Purity tests with radioactive tracers and by measurement of electrical conductivity at low temperatures. Changes in properties in high-purity metals are attributed to foreign atoms in the crystal lattice. 45 ref. (C28k, M26n; Al-a)

177-C. (German.) Methods for Separating Columbium and Tantalum. Harold Schaefer. *Nachrichten aus Chemie und Technik*, v. 7, Feb. 2, 1959, p. 153-160.
134 ref. (C28; Cb, Ta)

178-C. (German.) Separation of the Rare Earth Metals by Fractionized Crystallization. O. Smetana. *Osterreichische Chemiker-Zeitung*, v. 60, Feb. 1959, p. 44-52.
11 ref. (C28; EG-g)

179-C. (Japanese.) Fundamental Study on Chlorination of Titanium Slag. Sakae Yagi, Daizo Kunii, Takashi Yoshioka and Hidemi Umeyama. *University of Tokyo, Faculty of Engineering*, v. 17, Mar. 1959, p. 92-98.
(C19r)

180-C.* Vacuum-Melting of Metals. *Engineer*, v. 207, Apr. 17, 1959, p. 607-608.
Arc melting and induction melting furnaces now in operation at the Sheffield works of Jessop-Saville, Ltd., are used particularly for Ti and Zr, but also for improving characteristics of existing steels and developing new alloys. (C5h, C5j, D9s, 1-73; Ti, Zr)

181-C. New Methods of Preparing Polonium Metal. K. W. Bagnall, P. S. Robinson and M. A. A. Stewart. *United Kingdom Atomic Energy Authority*, AERE C/R 2517, Apr. 1958, 4 p.
Methods based on the action of aqueous ammonia on polonium hydroxide, and of anhydrous liquid ammonia on the hydroxide and some other polonium compounds; or the reduction of polonium hydroxide with hydrazine, hydroxylamine or sodium dithionite in alkaline solution and polonium tetrachloride with stannous chloride, titanous chloride or sodium dithionite in HCl solution. 7 ref. (C1; Po)

182-C.* (Italian.) Decoppering of Lead and Treatment of Copper-Bearing Byproducts in the San Gavino Monreale Foundry. A. Bianchini. *Metallurgia Italiana*, v. 51, Feb. 1959, p. 57-64.
Treatment of copper-bearing scums in an oscillating furnace with sodium carbonate and sodium (without addition of sulphur and litharge), flux-less conversion of matte, retreatment of copper-rich converter slags in an air furnace. 10 ref. (C21c, A11d; Pb, Cu)

183-C. Study of the Velocity of the Magnesium Reduction Process of Zirconium Production. F. G. Reshetnikov and E. N. Oblomeev. *Soviet Journal of Atomic Energy*, v. 4, Apr. 1958, p. 459-463.
(C1p, 1-59; Zr)

184-C.* (German.) Behavior of Iron Amalgam During Heat Treatments. Gerhard Jangg, Erich Fitzer, Otto Adlhart and Hans Hohn. *Zeitschrift fur Metallkunde*, v. 49, Nov. 1958, p. 557-562.
Extraction of Fe from the amalgam by oxidation. Increase of iron particle size caused by heat. 8 ref. (C29; Fe, *Hg*)

185-C.* Separation of Tantalum and Niobium. G. L. Miller. *Industrial Chemist*, v. 35, Apr. 1959, p. 175-182.
Review. (To be continued.) (C-general; Cb, Ta)

186-C. Volatilization of Tin Chloride From Bolivian Slimes. K. K. Kershner and A. A. Cochran. *U. S. Bureau of Mines, Report of Investigations 5459*, 1959, 12 p.
High percentages of the total Sn were expelled as chlorides. (C19r; Sn)

187-C. Electrodeposition of Titanium From Fused Chloride Baths Using $TiCl_4$ as a Feed Material. W. R. Opie and K. A. Svanstrom. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 253-256.
Results indicate that it is feasible to electrolyze $TiCl_4$ in a simple fused chloride cell to obtain metal of high purity. By confining the Ti values and reduction reaction to the vicinity of the cathode the bath can be kept comparatively free of reduced chlorides of Ti; thus a diaphragm is not required for operation. 23 ref. (C23; Ti)

188-C. Preparation of Two Lithium-Arsenic Compounds. R. E. Tate and F. W. Schonfeld. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 296-298.
LiAs and Li_3As formed by bomb reaction. Both compounds were coarsely crystalline and occurred as groups of acicular cyrstals radiating from nucleation centers. (C26; Li, As)

189-C. (German.) Evaporation in Zone Melting. Gunther Ziegler. *Zeitschrift fur Metallkunde*, v. 49, Sept. 1958, p. 491-494.

Evaporation coefficients and concentration curves for phosphorus in Si. 6 ref. (C28k; Si, *P*)

190-C.* (French.) Simple Analog Device for Studying an Ingot During Zone Melting. F. Bertein. *Journal de Physique et la Radium*, v. 19, Suppl. 12, Dec. 1958, p. 121A-123A.

Permits study of variations of solute concentration during successive refining operations. (C28k, 1-53)

191-C.* (German.) Preparation of High-Purity Metals by Amalgamation. G. Jangg. *Metall*, v. 13, May 1959, p. 407-411.

Refining by crystallization from an amalgam. Increase of concentration of metal salt solutions by reaction with amalgams. Electrolytic extraction with Hg anodes; preparation of high-purity Ti, Th, Zn, Cd and Fe. 26 ref. (C29, C23; Ti, Th, Zn, Cd, Fe)

192-C.* (Russian.) Titanium Oxide From Binary Mixtures by Means of Carbon. Zh. L. Vert and M. V. Kametsev. *Zhurnal Neorganicheskoi Khimii*, v. 4, no. 1, 1959, p. 17-22.

Interaction of double oxide of titanium with carbon at normal pressure begins at about 950° C. Reduction of TiO_2 proceeds gradually with formation of intermediate oxides of types $Ti_2O_3 \cdot 3\text{-}4\ TiO_2$, Ti_4O_7 and Ti_8OS and as it reaches 1800° C., forms solid solution of TiO-TiC with about the same content of oxygen and carbon. 12 ref. (C26; Ti, *C*)

193-C. Preparation and Properties of Uranium Monocarbide Castings. Arthur C. Secrest, Jr., Ellis L. Foster and Ronald F. Dickerson. Battelle Memorial Institute. *U. S. Atomic Energy Commission*, BMI-1309, Jan. 2, 1959, 16 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Arc melting appears to be the best method for preparing high-quality UC. Based on density, thermal conductivity and thermal cycling data, cast uranium monocarbide appears to have all the necessary requirements for use as a reactor fuel material. 5 ref. (C5h; U, NM-a35)

194-C. (Russian.) Refining of Tantalum From Columbium and Titanium Impurities by Ion Exhcange. O. V. Al'tshuler and E. A. Sobotina. *Zhurnal Neorganicheskoi Khimii*, v. 4, Jan. 1959, p. 28-32.

Method produces Ta of high purity. 5 ref. (C19s; Ta, *Cb, Ti*)

195-C.* (French.) Heat Treating and Melting Procedures in the Preparation of Nuclear Fuels. P. Thome. *Revue de Metallurgie*, v. 56, Mar. 1959, p. 288-294.

Types of vacuum furnaces distinguished primarily by the relative position of the retort and the vacuum chamber. Heat treating and arc casting furnaces used in a pilot plant with particular attention to the skull melting of uranium and uranium alloys. 29 ref. (C5h, J-general; U)

196-C.* (Hungarian.) Anode Resistance of Aluminum Cells. Imre Molnar. *Kohaszati Lapok*, v. 92, Feb-Mar. 1959, p. 76-81.

Data on voltage drop in current conducting elements of Al-electrolytic cells equipped with horizontal self-consuming anodes. 4 ref. (C23; Al)

197-C. New Process for Titanium. Fredric V. Schossberger. *Industrial and Engineering Chemistry*, v. 51, May 1959, p. 669-670.

Use of potassium chlorotitanate in the preparation of titanium tetrachloride, titanium dioxide and titanium metal. 14 ref. (C1; Ti)

198-C.* (German.) Hydrogen Content in Electrolytic Nickel. E. Raub and F. Sautter. *Metalloberflache*, v. 13, May 1959, p. 129-132.

Hydrogen content is influenced by the composition of electrolyte, pH value, temperature, cathodic current density and stirring. Ni-Tl and Ni-Zn alloys, deposited electrolytically, contain larger quantities of hydrogen as the content of Tl or Zn is increased. Hydrogen absorption is caused by lattice distortions. 9 ref. (C23p; Ni-b, *Tl, Zn, H*)

199-C.* (Hungarian.) Experiments With Exothermic Feeder Sleeves on Nonferrous Castings. Gyula Emod. *Kohaszati Lapok-Ontode*, v. 92, Feb-Mar. 1959, p. 90-95.

Use of exothermic feeder head is particularly useful for certain light metal and Cu alloys having a high degree of shrinkage during the cooling period. 8 ref. (C5n; Cu, EG-a39)

200-C. Physical Beneficiation of Low-Grade Uranium Ores. John N. Butler. Mackay School of Mines, University of Nevada. *U. S. Atomic Energy Commission*, RMO-2863. July 30, 1958, 134 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $2.75.

Methods investigated include flotation, wet and dry attritioning, magnetic separation and electrostatic separation. 51 ref. (B14; U)

209-C. (Russian.) Theory and Practice of Tin Refining. N. N. Murach. *Zhurnal Prikladnoi Khimii*, v. 32, Mar. 1959, p. 556-563.

Filtering of impure Sn under vacuum produces a metal of high purity. Fe is removed with Si forming an intermetallic FeSi. Further separation of liquid phases Sn-FeSi during solidification produces high-purity Sn. 6 ref. (C25; Sn-a, *Fe, Si*)

210-C. (Translation—ConBur.) Kinetics of the Liberation of Copper by the Diaphragm Method of Internal Electrolysis. A. K. Zhdanov, V. A. Khadeev and F. Mirzabekov. *Journal of Applied Chemistry of the USSR*, v. 31, Apr. 1958, p. 627-629.

(C23; Cu)

211-C.* D-C Casting of Copper and Copper Alloys. H. H. Sinason. *Precision Metal Molding*, v. 17, June 1959, p. 38, 84.

New mold designs and materials. Revised theories of heat exchange between mold interface and cooling water provide high surface and structural qualities in mill shapes and castings produced by a continuous direct chill process. (C5q; Cu)

212-C. Casting Unit Feature of Primco Set-Up. *Canadian Metalworking*, v. 22, June 1959, p. 32-33.

Direct chill casting of Al. Process and equipment. (C5q, 1-52; Al)

213-C. (Russian.) Elimination of Nonmetallic Inclusions in the Refining of Metals. A. G. Spasskii and N. S. Klyagina. *Liteinoe Proizvodstvo*, Apr. 1959, p. 30-32.

20 ref. (C5r; 9-69)

214-C.* (Russian.) Heat Balance of Aluminothermic Smelting in Producing Ferrotitanium. S. I. Suchilnikov and V. V. Melikhov. *Stal'*, v. 19, May 1959, p. 425-428.

Determination of the specific heat of this process, according to established dependence on temperature, and use of simplified calculations, permitted more accurate computations of heat losses. Preheating of the furnace shaft results in more complete recovery of Ti and reduces the consumption rate of Al. 5 ref. (C26; AD-n32, *Fe, Ti*)

215-C.* Thermodynamics and Kinetics in Vacuum Metallurgy. Thomas B. King. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 35-58.

Applications of thermodynamics in relation to gas-solid reactions, degassing of

solid metals and oxide reduction by solid carbon; oxidation reactions; metal-crucible reactions; gas-liquid reactions. 12 ref. (C5, C5m, C25, E25s, 1-73)

216-C.* Thermodynamics and Kinetics in Vacuum Induction Melting. A. M. Aksoy. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 59-78.

Purification in vacuum induction melting is attained through dissociation, deoxidation, degassification and volatization. Thermodynamic data are also given for desulphurization and the evaluation and control of melting. 22 ref. (C5j, 1-73)

217-C.* Thermodynamics and Kinetics in Vacuum Arc Melting. P. C. Rossin. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 79-97.

The three major reactions which take place within the melting zone are dissociation, deoxidation and degassification. The dissociation reaction applies primarily to the thermal dissociation of compounds of metal oxides, carbides, hydrides, sulphides and nitrides. (C5h, 1-73)

218-C.* Consumable Electrode Arc Melting of Non-Refractory Metals. James H. Johnson. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 153-161.

At the present time consumable vacuum arc melting offers the only suitable commerical method of producing Zr, Ti and Hf. (C5h, 1-73; Zr, Ti, Hf)

219-C.* Consumable Electrode Arc Melting of Refractory Metals. S. J. Noesen and R. M. Parke. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 162-171.

Process is able to consolidate large bodies of high-melting metals and combines melting with casting method which avoids the common ingot defects of center porosity and chemical segregation. Relative amount of purification taking place at different stages in the process was studied with 6-in. diameter Mo ingots. 4 ref. (C5h, 1-73; Mo, EG-d37)

220-C.* Skull and Permanent Electrode Melting. John L. Ham. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 172-185.

For the production of cast shapes from metals and alloys too reactive to be retained in existing crucible materials, skull melting is virtually the only method which can be used. The process permits the recycling of odd sizes of scrap and permits holding the liquid bath long enough to obtain samples for chemical analysis and to determine whether a certain addition should be made before the heat is poured. (C5k, 1-73)

221-C.* Induction Melting of Ingot Products. W. E. Jones. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 189-203.

Effect on high-temperature properties of vacuum induction melting of Udimet 500 and 52100 steel. Correlations exist between leak rates and pressures and the properties obtained in the metal. (C5j, D8m, 1-73, Q-general, 2-62; Ni-b, ST)

222-C.* Induction Melting of Cast Shapes. P. E. Beamer. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 204-217.

Investment casting techniques are utilized to form alloys which are currently used for high-temperature blading in "production gas turbines". This permits the direct conversion of vacuum melted alloys from the molten state to a semifinished or commercially usable part. Waspalloy, Udimet 500, Ni-base alloys such as GMR 235, Inco 713, Guy Alloy, M-252 and Fe-base alloys such as A-286, Discalloy, and M-308 have been vacuum investment cast successfully. (C5j, E15, 1-73; Ni-b, Fe-b)

223-C.* Electron Bombardment Melting Techniques. Hugh R. Smith, Jr. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 221-235.

The effect of electron beam melting upon the composition of various reactive metals is significantly different from changes occurring in other types of melting systems operating at higher pressures than is possible with electron beam melting. The metals processed have been purified by devolatization reactions to a greater extent than is possible in vacuum arc or conventional vacuum induction melting. 6 ref. (C5k)

224-C.* Degassing in the Liquid State. Max Auwarter. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 239-254.

Degassing during arc melting, levitation melting and induction melting. Vacuum stream degassing of steel. 14 ref. (C5h, C28, C5j, D9s, 1-73)

225-C.* Distillation of Metals Under Reduced Pressures. Hillary W. St. Clair. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 295-305.

Distillation is quite effective in separating metals of different volatility when the more volatile metal is present in greater or nearly equal proportions, but as it becomes depleted its activity and rate of diffusion decrease to a point where further removal by selective distillation becomes impracticable. The rate of distillation depends primarily on the rate at which thermal energy is transferred to the surface. (C22, 1-73)

226-C.* Refractory Metals. Ivor E. Campbell. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 337-349.

Applications of vacuum technology include metal production, oxide-carbide reduction, and hot wire reduction, consolidation by reduced pressure arc melting and consumable electrode melting and annealing. 4 ref. (C28, C1, C5h, 1-73; EG-d37)

227-C. The New Hayden Smelter: Its Unique Design Features. Ralph K. Johnson. *Journal of Metals*, v. 11, June 1959, p. 376-381.

(C21; Cu)

228-C. Leach-Precipitation-Flotation Process. M. W. Franz. *Journal of Metals*, v. 11, June 1959, p. 382-385.

LPF process results in the recovery of 2 lb. of Cu per ton of mill feed. Nonsulphide Cu minerals are tested by leaching with sulphuric acid and precipitation by sponge iron produced from pyrite concentrate. (C19n, B14h; Cu)

229-C. Survey of European Arc Melting. Helmut Gruber. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 138-152.

Examples of vacuum arc melting apparatus, electrode feed and control, typical European equipment and installations. 11 ref. (C5h, W18s, 1-73)

230-C.* Vacuum Arc Melting and Casting of Titanium. R. W. Huber, E. J. Chapin and I. R. Lane, Jr. *Foundry*, v. 87, June 1959, p. 88-93.

Operation of skull furnace and associated equipment. Structures of ingots cast in graphite molds. (To be continued.) 8 ref. (C5h, C5m, 1-73; Ti)

231-C.* Vacuum Arc Melting and Casting of Titanium. R. W. Huber, E. J. Chapin and I. R. Lane, Jr. *Foundry*, v. 87, July 1959, p. 86-90.

Ti melted and cast under direct vacuum conditions at a pressure of about 0.1 micron without the use of inert gas for arc stability has toughness in spite of the large grain size in the as-cast material. (C5h, E15, 1-73; Ti)

232-C.* (German.) Precipitation of Thorium by Electrolysis of Molten Salts. P. Drossback and F. Neumayr. *Zeitschrift fur Electrochemie. Berichte der Bundesgesellschaft fur Physikalische Chemie*, v. 63, no. 4, 1959, p. 516-520.

Electrolysis of molten $ThCl_4$ and $KThF_5$ as components of mixtures of other salts. Determination of the polarization voltage as a function of time. Voltage varies when the electrode rotates. (C23n; Th)

233-C.* (French.) Heterogeneous Catalysis as a Metallurgical Method. Jean A. Ternisien. *Metaux-Corrosion-Industries*, v. 34, Apr. 1959, p. 151-161.

Purification of Al and V with metallic elements and compounds as catalysts. Melting, boiling temperature, data on specific heat and vapor pressures for various elements and their fluorides, iodides, bromides and chlorides. 23 ref. (C28; Al, V)

234-C. (Hungarian.) Halide Metallurgy. Antal Aradi. *Kohaszati Lapok*, v. 14, May 1959, p. 216-220.

High-purity metals can be produced through their chlorides. Major problems arising are high volatility of chlorides at elevated temperatures, furnace design and heating. (C1p)

235-C.* Thermodynamic Principles in the Refining of Metals. F. D. Richardson. Paper from "Physical Chemistry of Metallic Solutions and Intermetallic Compounds", v. 2. Her Majesty's Stationery Office, London, 1959, 23 p.

Influence of concentration, other impurities and alloying elements on chemical potential of impurities in metal solutions. Use of gases, intermetallic compounds, alloys, oxides or sulfides as extracting phases in refining procedures. 33 ref. (C-general, D11, P12, 3-69; 14-68)

236-C.* (Ukrainian.) Formation of Chromium Carbides. T. Y. Kosolapov and G. V. Samsonev. *Dopovidi Akademii Nauk Ukrain'skoi R.S.R.*, no. 3, 1959, p. 298-300.

Optimum conditions for the formation of Cr_3C_2 and Cr_7C_3 by reduction of chromium oxide with soot in a hydrogen at-

mosphere. $Cr_{23}C_7$ can be obtained by this method. 5 ref. (C26; Cr, 14-68)

237-C. Commercial Production of Indium. B. G. Hunt, C. E. T. White and R. A. King. *Canadian Mining and Metallurgical Bulletin*, v. 52, June 1959, p. 359-63.

Recovery of In from anode slime by roasting the slime with sulphuric acid, leaching with water, purifying the leach solution, recovering the In by sponging with Zn or Al and refining electrolytically. (C19n, C23; In)

238-C. Production of Fusible Alloy Wire. *Wire Industry*, v. 26, June 1959, p. 575, 601.

Steps in the casting of heavy-gage fuse wire. (C5q; 4-61)

239-C.* (Russian.) Effect of Sulfur-Containing Compounds on Electrolytic Yield of Magnesium During Electrolysis of Carnallite. S. A. Pushkova. *Zhurnal Prikladnoi Khimii*, v. 22, May 1959, p. 1056-1060.

Sulfates and sulfides present in carnallite easily decompose under action of metallic Mg, chlorine and air and cause the precipitation of sulfur. Due to poor solubility of MgS in a chlorine solution part of the sulfides are removed with the residue. 6 ref. (C23p, 3-69; Mg, S)

240-C.* (German.) Application of Electrical Energy for the Production of Nonferrous Metals, Copper, Zinc, Lead and Tin. H. Schackmann. *World Power Conference, 11th Sectional Meeting, Transactions*, v. 7, no. B.5, 1958, p. 193-212.

Refining, remelting and alloying processes by means of arc furnaces, resistance arc furnaces and low-frequency induction furnaces. 10 ref. (C21d; Cu, Zn, Pb, Sn)

241-C. Process Pair Whittles Uranium Costs. *Chemical Week*, v. 85, July 11, 1959, p. 35-38.

Semicontinuous pulsed ion exchange system used together with an electrolytic reduction cell yields high-purity uranium at relatively low cost. (C19s, C23; U)

242-C. How Cross Section Affects Floating Zone Refining. *Iron Age*, v. 184, July 9, 1959, p. 102.

An increase in the diameter of the tubes used for melting produces a more stable molten zone without exceeding the maximum height. (C28k)

243-C. (Slovenian.) Extraction of Salts Formed by Carbamic Acid with Metals, From Solutions of a Low pH Number. Sergej Gomiscek. *Rudarsko-Metalurski Zbornik*, no. 1, 1959, p. 17-20.

Extraction of Fe, Co, Ni, V, Cu, As, Sb and Sn in the form of salts. 7 ref. (C19; Fe, Co, Ni, V, Cu, As, Sb, Sn)

244-C.* (Norwegian.) Preparation of Ferro-Alloys. H. Hagerup-Jenssen. *Kjemi, Bergvesen og Metallurgi*, v. 19, Mar. 1959, p. 9-15.

Production of ferrosilicon, ferrochromium, ferromanganese and ferrosilico-manganese from raw materials. (C-general; AD-n31, *Cr, Mn, Si*)

245-C.* Ram Reactor Provides Continuous Zirconium Production. W. W. Dunham, Jr., and R. D. Toomey. *Journal of Metals*, v. 11, July 1959, p. 438-440.

New process is built around continuous reduction of Zr tetrachloride and periodic compacting and withdrawal of the metal product in a form suitable for arc melting. The name ram reactor process comes from the hydraulic ram used to consolidate and push out the product. (C1p; Zr)

246-C.* Zirconium by Sodium Reduction. Weston Starratt. *Journal of Metals*, v. 11, July 1959, p. 441-443.

Production of reactor-grade Zr at the Ashtabula, Ohio, plant of Mallory-Sharon Metals Corp. Separation of Hf from Zr and removal of Fe by liquid-liquid extraction and the elimination of Al. No reduction is claimed to be cheaper than Mg reduction. (C26, C19n; Zr)

247-C. Thermal Conditions in the Bomb Reduction of Uf_4 to Metal. Kenneth O. Beatty, Jr., and Orville R. Magoteaux. National Lead Co. of Ohio. *U. S. Atomic Energy Commission*, NLCO-771, June 10, 1959, 37 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Preheating of the green salt-Mg charge is necessary to bring some portion of the charge to ignition temperature (about 900° F.) and all of the charge to an average temperature (about 400° F.) high enough to assure molten products. The temperature distribution in the charge as a result of preheating was predicted as a function of the thermal properties and dimensions of the charge and of the preheat time. (C1p; U, *Mg*)

248-C.* (German.) Preparation of Uranium and Thorium. G. Wirths. *Metall*, v. 13, July 1959, p. 621-625.

Leaching and reduction processes. Composition of end products. 15 ref. (C19, C26; U, Th)

249-C. (French.) Autoradiographic Control of the Separation of Uranium From Thorium in Zone Melting. Garin-Bonnet, H. Faraggi, J. Erler and J. F. Petit. *Les Memoires Scientifiques*, v. 56, June 1959, p. 14-18.

Nondestructive inspection by neutron autoradiography. (C28k, S11q; U, *Th*)

250-C. (German.) Present Stage of the Manufacture of Metals With High Melting Points. Pt. 2. R. Kieffer and F. Benesovsky. *Metall*, v. 13, July 1959, p. 652-655.

Preparation of Ta and Ta alloys and Cb and Cb alloys. 22 ref. (C-general; Ta, Cb)

251-C.* Consumable-Electrode Vacuum Remelting of High-Temperature Alloys. R. K. Pitler, E. E. Reynolds and W. W. Dyrkacz. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 378-387.

Beneficial results include lower gas contents, freedom from inclusions, improved forgeability, improved room and high-temperature ductility and fatigue strength. Process makes possible production of larger ingots of highly alloyed high-temperature materials than hitherto possible because of rapid cooling rate which minimizes segregation and refines ingot structure. (C5h, 1-73, Q-general, M27d; Ni-b, 5-59, SGA-h)

252-C.* Quality Aspects in Vacuum Arc Melting. Edward A. Loria. *Blast Furnace and Steel Plant*, v. 47, June 1959, p. 601-607.

Two prime purposes of vacuum arc melting or remelting are to improve mechanical properties that are segregation or structure-sensitive and improve soundness, particularly in large billet cross sections. Application of vacuum technique to a wide variety of alloys which cannot be melted or hot worked economically by conventional techniques. (C5h, D8m, 1-73)

253-C. Decontamination of Thorium-Uranium Alloys by Consumable Arc-Melting. R. E. Johnson and E. W. Murbach. Atomics International. *U. S. Atomic Energy Commission*, NAA-SR-3590, June 15, 1959, 15 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Consumable-electrode arc melting process as a means of decontamination is in general inferior to the nonconsumable arc melting process. The method is applicable only to the removal of the volatile fission products. When the temperature is taken high enough to remove other impurities, losses of vital metal become appreciable. It could, however, be used as one step in a decontamination process. (C5h, A11d, T11g, Th-b, *U*)

254-C. Separation of Beryllium From Aluminum by Differential Desulphatization. M. R. Seshadri and R. Mallikarjunan. *Indian Institute of Science, Journal*, v. 41, Apr. 1959, p. 7-13.

A study of the dissociation pressures of Al and Be sulphates indicates the feasibility of selective desulphatization of anhydrous Al sulphate from a mixture of the two metal sulphates. (C28; Be, Al)

255-C.* (English.) Thermodynamics of the Reactions Taking Place During the Oxidation Period of Copper Refining. Z. Horvath. *Acta Technica Academiae Scientiarum Hungaricae*, v. 25, no. 1-2, 1959, p. 159-186.

Thermodynamics of the oxidation of Sn, Zn, Pb, Fe, Ni, Sb, As, Cd and S. (C21, P12; Cu)

256-C.* The Preparation of High-Purity Uranium Metal by the Bomb Reduction of Uranium Tetrafluoride With Calcium. R. W. Kewish, R. J. Bard, J. P. Bertino, O. E. Fry, S. W. Hayter, F. J. Hill, B. L. Kelchner and A. W. Savage, Jr. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959. p. 425-429.

Massive high-purity uranium metal, containing very low concentrations of a number of light elements, is prepared on the 250-g, scale by bomb reduction of high-purity UF_4 with high-purity Ca in Ca oxides crucibles. (C1p; U, *Ca*)

257-C.* High-Purity Tantalum. R. F. Rolsten. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 472-476.

Pure Ta was prepared using the "iodide" process in a modified deBoer deposition bulb. Analyses and workability are used as criteria of purity. The condensed solid iodide phase was isolated and identified by chemical and X-ray powder-diffraction methods. 11 ref. (C1p; Ta)

258-C.* Iodide Columbium. R. F. Rolsten. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 478-483.

Iodide Cb prepared by the thermal decomposition of Cb iodide on an indirectly heated quartz surface. The metal was deposited on and easily removed from the quartz surface without contamination. Various commercial grades of Cb were used and, in all cases, the Cb deposited was considerably purer than the commercial material. 4 ref. (C1p; Cb)

259-C.* (French.) Separation of Zirconium and Hafnium. Saint-James. *Metaux Corrosion Industries*, v. 34, June 1959, p. 258-266.

Description of various processes such as the crystallization process starting from ZrF_6K_2; reduction of $ZrCl_4$ to $ZrCl_3$ followed by distillation; separation by organic solvents. Preparation of Zr by electrolysis of a salt bath containing ZrF_6K_2. 9 ref. (C-general; Zr, Hf)

260-C. (Book.) Uranium Production Technology. Charles D. Harrington and Archie E. Ruehle, Editors. 579 p. 1959. D. Van Nostrand Co., Inc., 120 Alexander St., Princeton, N. J. $17.50

Production of uranium compounds and metal of nuclear purity from uranium ore compounds. 24 ref. (C-general, A-general; U)

261-C.* Zone-Melting in Aluminum-Zinc, Aluminum-Copper-Zinc Alloys and Zinc. Katashi Masumoto and Tomo-o Sato. *National Research Institute for Metals, Transactions*, v. 1, no. 1, 1959, p. 73.

Effects of number of passes and length of molten zone on distribution of solute atoms along cylindrical specimens. (C28k; Al-b, *Cu, Zn,* Zn-a)

Electron bombardment zone melting apparatus. Preparation of high-purity tungsten crystals by floating zone refining. Ductility of zone melted metal. (C28k, 1-73; W)

273-C.* On the Purification of Tungsten by Electron Beam Refining. J. W. Pugh. Paper from "Proceedings of First Symposium on Electron-Beam Melting '. Alloyd Research Corp., Watertown, Mass., 1959, p. 89-93.

Electron beam zone melting apparatus. Ductility of pure tungsten single crystals. (C28k, Q27a; W-a, 14-61)

274-C. Preparation of Anhydrous Chlorides of Cerium and Thorium. R. Didchenko. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 401-402.

New method is based on the formation of a double salt or complex between cerium trichloride and pyridinium chloride and subsequent thermal decomposition of this salt in dry hydrogen chloride under reduced pressure. (C1p; Ce, Th)

275-C. Thermodynamic Treatment of Disproportionation Equilibria Involving Complex Ion Formation in Molten Salts. K. Grjotheim and J. M. Toguri. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 403-407.

Equilibrium between Ti metal, $TiCl_2$ and $TiCl_3$ in a solvent of molten metal chlorides. 8 ref. (C1p; Ti)

276-C. Separation of Rare Earths by Ion Exchange. J. E. Powell and F. H. Spedding. *Metalurgical Society of AIME, Transactions*, v. 215, June 1959, p. 457-463.

Use of chelating agents in the separation of rare earths by ion-exchange. Recent pilot-plant operations at the Ames Laboratory. 41 ref. (C19s; EG-g)

277-C. U^{233} Purification and Metal Production. J. P. Bertino and J. A. Kircher. Los Alamos Scientific Laboratory. *U. S. Atomic Energy Commission, LA-2245*, Jan. 29, 1959, 46 p. (Available from U. S Office of Technical Services, Washington 25, D. C.) $1.25.

U^{233} is chemically separated from nonradioactive contaminants by precipitation as $UO_4 \cdot xH_2O$, which is calcined to U_3O. This in turn is reduced to UO_2 and converted to UF_4. Pure metal is prepared by bomb reduction of the UF_4 with Ca as the reducing agent. (C6c, C1p; U)

278-C. (Russian.) Charging Blocks Refined From Alloy Turnings. V. Z. Zykov and S. M. Levinzon. *Metallurg*, July 1959, p. 33-34.

A higher quality alloy steel is produced when the turnings are melted into charging blocks and subsequently added to the furnace, rather than adding them as they come from the metalworking shop without processing. Refining was done in an electric arc and an induction furnace. (C5h, C5j, A11d; EG-a38)

279-C. (Italian.) Metallurgy of Aluminum. Giuseppe Barchiesi. *Fonderia*, v. 8, July 1959, p. 289-291.

Preparation and refining processes. (C-general; Al)

280-C.* Zone Refining of Molybdenum. J. A. Belk. *Journal of the Less Common Metals*, v. 1, Feb. 1959, p. 50-55.

The electron bombardment floating zone melting method. (C28k; Mo)

281-C.* Zone Melting of Refractory Metals Including Rhenium and Tungsten. G. A. Geach and F. O. Jones. *Journal of the Less Common Metals*, v. 1, Feb. 1959, p. 56-59.

Zone melting is an attractive method for preparing large crystals of the refractory metals which are difficult to handle by other crystal-growing methods. Two techniques are used—arc melting on a water-cooled Cu hearth and electron bombardment melting of a "floating zone" in a vertical bar. Arc melting techniques are more useful for zone refining although the zone melted bars are usually polycrystalline. 6 ref. (C28k; Re, W, EG-d37)

282-C.* Arc-Melting Processes for the Refractory Metals. A. R. Moss. *Journal of the Less Common Metals*, v. 1, Feb. 1959, p. 60-72.

Basic types of arc-melting furnaces. Factors in the selection of consumable or nonconsumable electrode processes. Mold design. 16 ref. (C5h, W18s; EG-d37)

283-C.* Electrolytic Copper Refining at High Current Densities. S. J. Wallden, S. T. Henriksson, P. G. Arbstedt and Th. Mioen. *Journal of Metals*, v. 11, Aug. 1959, p. 528-534.

Evidence points to the fact that minimum Cu refining costs can be achieved at higher current densities than are currently employed. Experiments conducted at current densities up to 500 amp. per sq.m. in specially constructed channel cells in Sweden. 6 ref. (C23p; Cu)

305-C.* (German.) Separation of Suspended Metals and Metallic Compounds From the Mansfeld Blast Furnace Slags. A. Lange and W. Lindenlaub. *Bergakademie*, v. 11, July 1959, p. 399-407.

Separation of Cu by means of gravity could not be achieved when Cu content was below 0.1% even at slag temperatures of 1400° C. without change of composition. Since the Cu is not in a state of dissociation, the separation cannot be attained electrolytically. 7 ref. (C28, W17g; RM-q)

306-C. (Russian.) Correlation Between Current Density and Conductance in the System Involving Carbon Electrode, Cryolite Bath, and Dissolved Aluminum. L. N. Antipin, S. F. Vazhenin and A. A. Sinyagov. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 48-52.

Measurement of the conductance between an outer electrode serving as an anode and an inner electrode without electrical charge, and conductance between the outer electrode and the graphite crucible serving as a cathode. 8 ref. (C23n; Al)

307-C. (Russian.) Influence of Aluminum on the Anode Effect in the Electrolysis of Cryolite-Alumina Baths. A. I. Belyaev and L. A. Firsonova. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 53-57.

Effect of Al in solution on current density. (C23n; Al)

308-C. (Russian.) Degassing of Aluminum-Silicon Alloys With the Help of a Flux. M. V. Sharov and O. I. Nikitaeva. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 58-62.

Effect of holding time at 700-750° C. and degassing under a flux on hydrogen content. (C5m, N15e, 3-67; Al-b, *Si, H*)

309-C. (Russian.) Thermochemistry of Molten Silicates of Lead. S. G. Bratchikov, O. A. Esin and I. T. Sryvalin. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 2, 1959, p. 32-37.

10 ref. (C21; Pb)

310-C. (Russian.) Effect of the Ratio of Additions $CuF_2 : MgF_2$ Present in the Cryolite Bath on the Solubility of Gamma and Alpha Al_2O_3. E. A. Zhemchuzhina and A. I. Belyaev. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 2, 1959, p. 56-60.

6 ref. (C23n; Al)

311-C. (Russian.) Losses of Magnesium During Electrolytic Preparation. E. A. Zhemchuzhina and A. J. Belyaev. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 2, 1959, p. 61-64.

Losses by chemical reaction with the molten $MgCl_2$ itself, reaction with NaCl and by oxidation in air. Effects of cathodic potential and bath composition. (C23n, 2-60; Mg, *Cl*)

312-C. (Russian.) Conditions for the Precipitation of Copper From Hydrometallurgical Solutions. I. N. Plaksin, N. A. Suvorouskaya and V. V. Shikhova. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 2, 1959, p. 69-73.

Cementation by the addition of Fe from diluted H_2SO_4 solutions. Effects of Fe, $CuSO_4$ and H_2SO_4 concentrations and of stirring. (C27; Cu)

313-C.* Electrolytic Purification of Uranium. J. E. Antill, D. S. Butler and E. Barnes. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 3-8.

Behavior of impurities in the purification of uranium by a soluble anode electrolysis technique. A diaphragm cell allows pure powder to be produced on a semicontinuous basis and be compacted without leaching. (C23, 3-69; U)

314-C.* Zone Melting of Uranium. J. E. Antill, E. Barnes and M. Gardner. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 9-18.

Experiments in a vertical furnace have shown that density differences between an impurity and uranium may be harnessed to increase the purification. Slow zone speed (1/4 in. per hr.) is necessary to remove soluble metallic impurities, while the nonmetallic elements, oxygen and carbon, separate at much faster speeds (3 in. per hr.). Zone melting applied to the removal of fission products from uranium shows most promise as a modified self-slagging process. (C28k; U)

315-C.* The Extraction Metallurgy of Thorium. J. H. Buddery. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 35-49.

Preferred methods are the reduction of thoria with Ca, the reduction of Th tetrafluoride with Ca in the presence of a booster, and fused salt electrolysis. The first method yields a very fine metal powder, the second a sponge, the last a crystalline powder. 21 ref. (C-general; Th)

316-C.* Thorium Arc Melting. A. H. Roberson. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 56-62.

Consumable electrode arc melting produces high-quality ingots that are more acceptable for atomic energy uses than metal melted in refractory crucibles. Sponge can be formed into electrodes by several methods. (C5h; Th)

317-C.* Induction Melting of Thorium. P. D. Corzine. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 63-65.

Beryllia remains the most useful material, not only for the containers themselves, but for slip linings and washes in crucibles and molds of graphite. Problems of segregation, subsurface gas and cracking in alloy melts together with a summary analysis of 16 75-lb. billets of a 5.4% U alloy. (C5j, W18h; Th-b, *U*)

318-C.* The Preparation of Metallic Plutonium. E. Grison. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". Pergamon Press, Inc., New York 22, 1959, p. 91-97.

Reduction of PuF_4 by Li, Ba and Ca. Preparation of Pu powder by the decomposition of the hydride PuH_2, which can be prepared by the action of hydrogen on the solid metal, at about 200° C. 7 ref. (C1p; Pu, *Li, Ba,* Ca)

319-C.* The Preparation of Plutonium-Aluminum and Other Plutonium Alloys. O. J. C. Runnalls. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 98-118.

Preparation by the direct reduction of Pu trifluoride and Pu dioxide. Pu trifluoride is reduced more rapidly at 900° C. than at 1125° C. with liquid Al, owing to the evolution of gaseous Al monofluoride at the lower temperature. Pu dioxide is reduced rapidly by an excess of liquid Al at 1200° C. in the presence of liquid cryolite, forming Pu-Al alloys with a Pu yield above 99%. 14 ref. (C26; Pu-b, *Al*)

320-C.* Zirconium Arc Melting. A. H. Roberson. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 121-136.

The extreme reactivity of molten Zr imposes many restrictions on conventional melting. Induction melting in graphite crucibles adds about 0.35% carbon to the metal. Commercial melting is carried out by consumable electrode arc melting in a water-cooled Cu crucible. Electrodes may be sponge or machine turnings pressed into briquettes or massive scrap welded into usable shapes. 8 ref. (C5h, W18h; Zr)

321-C.* The Extraction of Beryllium. R. G. Bellamy. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 169-180.

The chief commercial process is the extraction of Be hydroxide from beryl using sulphuric acid or a complex alkali fluoride roasting treatment for opening up the ore followed by the Mg reduction of Be fluoride prepared from the hydroxide. The low-temperature electrolysis of Be chloride offers a potentially purer product, but the production rate is low. 27 ref. (C19n, C26, C23; Be)

322-C.* Melting and Casting of Beryllium. A. Kaufmann. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 181-182.

A sound casting requires a clean, gas-free mold to avoid a scabby surface due to mold outgassing. Graphite is suitable, providing that it is first baked out in vacuum and is not exposed to moist air when not in use. Thickness of the graphite wall must be carefully chosen, since Be carbide will form if the mold becomes too hot, while cracking of the metal occurs if the cooling rate is excessive. (C5; Be)

323-C.* Ultrasonic Vibrations Refine Grain Size. D. H. Lane, J. W. Cunningham

and W. A. Tiller. *Metal Progress*, v. 76, Sept. 1959, p. 108-110.

Vibration during consumable-electrode melting refines ingot grain structure and prevents segregation by means of low-loss transmission of sound energy through the bottom of the mold. (C5h, 1-74; Fe-b)

324-C.* Metallurgical Extraction. Electrolytic Zinc Processes. Floyd S. Weimer, Guy T. Wever and Roland J. Lapee. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 174-225.

Leaching, filtering and purifying treatment for preparation of suitable electrolyte. Electrolyzing conditions and equipment. Polarization and overvoltage. Effect of impurities on electrolysis of Zn. 12 ref. (C19n, C23n, 3-69; Zn)

346-C.* Metallurgical Thermochemistry of Titanium. K. K. Kelly and Alla D. Mah. *U. S. Bureau of Mines, Report of Investigations* 5490, 1959, 48 p.

Extraction and refining processes. (C26, P12; Ti)

347-C.* (Russian.) Behavior of Silver Dissolved in Nitric Acid During the Electrolytic Refining of Copper. A. G. Syrovegin. *Izvestiya VUZ—Tsvetnaya Metallurgiya*, no. 4, 1959, p. 66-71.

The transition of Ag from the anode into the electrolyte is understood as an oxidation by NO_3 ions. Transport of Ag to the cathode is thought to be caused by reduction of Ag^+ by metallic Cu, and migration of Ag particles being in the state of suspension. The Ag content of the refined product can be reduced by decreasing the temperature, adding Cl-ions and the use of an anode diaphragm. 5 ref. (C23p, 2-61, 2-60; Cu, 9-51, *Ag*)

348-C.* (Russian.) Extraction of Gold and Arsenic From Ochreous Ores Resistant to Cyanidation. V. G. Ageenkov and N. V. Svistunov. *Izvestiya VUZ—Tsvetnaya Metallurgiya*, no. 4, 1959, p. 88-96.

The ores showing resistance to cyanidation are pretreated in a solution of caustic soda, extracting at the same time the As. Arsenic of extraction as a function of NaOH concentration, temperature and time of treatment. 5 ref. (C19, 2-60, 2-61, 3-67; Au, As)

349-C.* (Russian.) Processing of Sintered Nickel Oxide Ores in a Shaft Furnace With Preheated Blast. I. D. Reznik, A. I. Evdokimenko, I. I. Zaberezhnyi, B. P. Sherman, A. N. Kudrin, V. I. Serpov and L. K. Petrov. *Tsvetnye Metally*, no. 7, 1959, p. 30-36.

Effect of the blast temperature on the heating power of coke, composition of top-gas and costs. 5 ref. (C21a; Ni)

350-C. (Russian.) Chemical Stability of Molten Cryolyte. V. P. Mashovets and N. A. Novikava. *Izvestiya VUZ—Tsvetnaya Metallurgiya*, no. 4, 1959, p. 83-87.

13 ref. (C23n; Al)

351-C. (Russian.) Cyanidation of Gold Ores Containing Copper. A. S. Romanov. *Izvestiya VUZ—Tsvetnaya Metallurgiya*, no. 4, 1959, p. 106-111.

Dissociation constants of Cu-compounds; determination of Cu-cyanide in the solution; effect of Cu on cyanidation. 11 ref. (C19p, 2-60; Au, Cu)

352-C. (Translation—Brutcher no. 4688.) Mechanical Charging of Furnaces Used in Melting Ferro-Alloys. V. M. Grebenik, Ya. V. Dashevskii, L. D. Sokolov and V. A. Sharapov. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 68-72.

(C5f, W18s; Fe, AD-n32)

353-C.* Vacuum Metallurgy in the United States. A. E. Franks. Paper from "Progress in Vacuum Science and Technology". Pergamon Press, Inc., 122 E. 55th St., New York 22, 1959, p. 59-74.

Review of recent developments including induction melting of steels, nonferrous alloys and nuclear materials of high purity; consumable electrode melting Ti and Zr; and melting of high-temperature alloys and refractories by both methods. Vacuum processes for low-carbon ferrochrome, sintering of mixed carbides and vacuum stream degassing of steel. (C5h, C5j, C5m, D8m, D8s, 1-73; Ti, Zr)

354-C.* Electrodeposition Behavior of Trace Amounts of Copper. Richard C. DeGeiso and L. B. Rogers. *Electrochemical*

Society, Journal, v. 106, May 1959, p. 433-440.

Deposition onto inert electrodes takes place more readily than Nernst equation predicts. Method may prove suitable for separation of radio-Cu from radio-Zn and Ga. 23 ref. (C23p; Cu)

355-C.* Vacuum Melting and Degassing. J. Suiter. *Australian Institute of Metals, Journal*, v. 4, Aug. 1959, p. 95-102.

Melting and degassing of Fe, Ni and Co-base alloys; reactions in vacuum melting; vacuum melting equipment and processes; effect of vacuum treatment on mechanical properties. 6 ref. (C5k, C5m, 1-73, D8m, Q-general; Fe, Ni, Co)

356-C.* Processing Materials With Electron Bombardment. Alan Lawley. *Electronics*, v. 32, Sept. 4, 1959, p. 39-41.

Electron beams give metals better purity, high-temperature stability and strength. 16 ref. (C5k)

357-C.* Balances Design in Electrostatic Precipitation. R. L. Chamberlain. *Blast Furnace and Steel Plant*, v. 47, Oct. 1959, p. 1086-1089.

"Balanced-design" electrostatic precipitator achieves maximum reliable gas cleaning with a minimum of equipment and maintenance cost. A balance has to be maintained between capacity, efficiency and consistency or reliability of the precipitator. (C27, 1-52)

358-C. New Nickel Process on Stream. O. A. Lee. *Chemical Engineering*, Sept. 7, 1959, p. 145-152.

Extraction and concentration of Co and Ni ores. (C19n; Co, Ni)

359-C. (Russian.) Properties of Vanadium Prepared by Reduction With Carbon in a Vacuum. M. S. Makunin, A. Yu. Polyakov and A. M. Samarin. *Izvestiya Akademii Nauk SSSR, OTN, Metallurgiya i Toplivo*, no. 2, 1959, p. 35-39.

Reduction of compacts pressed from V_2O_3 and lampblack at 1300-1550° C. After this treatment the vanadium prepared still contains 1-2% carbon and 1-2% oxygen. After saturation with hydrogen, at 450-900° C., it can be again crushed to powder, pressed and subjected to another reduction treatment. Further refining is achieved by arc melting. (C25, C5h; V)

360-C.* Separation of the Lanthanons at Amalgam Cathodes. Pt. 3. Electrochemical Fractionation of the Lanthanons at a Lithium Amalgam Cathode. E. L. Onstott. *American Chemical Society, Journal*, v. 81, Sept. 5, 1959, p. 4451-4458.

Individual lanthanons electrolyzed at different rates. Effect of electrolyte composition. 18 ref. (C23, C29, 2-60; EG-g)

361-C.* Tungsten for Electric Lamp Filaments. D. J. Jones and A. Leach. *Metallurgia*, v. 60, July 1959, p. 7-11.

Extraction of tungstic acid from ores; decomposition to tungstic oxide and reduction to metal powder; compacting, sintering, swaging and wiredrawing; control of recrystallization and grain growth in filaments. 6 ref. (C19, C26, H10c, H14g, H15n, F28, N5; W)

362-C.* The Preparation and Properties of Niobium Obtained by the Iodide Method. D. M. Chizhikov and A. M. Grin'ko. *Academy of Sciences of the USSR, Chemical Technology Section, Proceedings*, v. 122-123, Sept-Dec. 1958, p. 121-122.

Columbium is purified by heating the metal powder with solid I_2, then reducing the CbI_3 by a hot Cb or tungsten filament. (C26; Cb)

363-C. (Russian.) Kinetics of the Reduction of Lead From a Melt of Its Silicates. L. G. Berezkina and D. M. Chizhikov. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo*, no. 2, 1959, p. 109-111.

The degree of reduction, achieved by blowing a current of CO against the melt surface, was tested by means of gamma irradiation. The reduction velocity is determined by the speed of diffusion toward the surface. 6 ref. (C26, 2-61, 3-67; Pb)

364-C.* (English.) Treatment of Uranium Ores. Pt. 1. Leaching of Uranium Ore From Matsuiwa Mine. Kingo Sudo and Akichi Kigoshi. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, Aug. 1959, p. 332-338.

Pressure oxidation leaching, sulphuric acid leaching and pressure and atmospheric oxidation leaching. (C19n; U)

365-C.* (German.) The Hydrometallurgical Process of Tetrahedrite Concentrates. Ferdinand Kadlec. *Freiberger Forschungshefte*, v. B34, May 1959, p. 5-16.

Leaching in high concentrated Na_2S solution; filtration. Electrolysis and vacuum distillation of Hg from the cathode metal. (C19n; Cu, Sb, Hg)

366-C.* (German.) Production of Alkaline Earth Metals, Mainly Magnesium, by Thermal Reduction. H. Seliger. *Freiberger Forschungshefte*, v. B34, May 1959, p. 38-79.

Thermal reduction by means of oxygen, Si, Al and carbides. Since the reaction takes place above the boiling point of the metals, separation is achieved by distillation and condensation in the solid or liquid state. (C26; EG-f)

367-C.* (German.) Selenium Production From Anodic Pulp. Siegbert Loschau. *Frieberger Forschungshefte*, v. B34, May 1959, p. 101-117.

Three phases in the electrowinning of Se are recovery from anodic pulp produced by the refining process of electrolytic Cu, refining and production of 99.995% pure Se. (C23n; Se-a)

368-C.* (German.) Heterogenious Equilibria in the Zn-S-O System and Their Impact on the Lange-Barthel Floating Zone Melting Process. G. Fischer. *Frieberger Forschungshefte*, v. B34, May 1959, p. 118-132.

New concentration process by means of zone melting. Zn volatilization occurs by sublimation and oxidation of ZnS and CO_2 gases. (C28k, B15; Zn)

369-C.* (German.) Melting of Nonferrous Metals in the Cupola. F. Paschke. *Giesserei Praxis*, no. 17, Sept. 10, 1959, p. 301-305.

Crucible melting furnaces with modern heat and fume collecting systems; melting Cu, Zn, Sn and Pb alloys in crucible melting cupolas arranged in line. (C5g; Cu, Zn, Sn, Pb)

370-C. (Russian.) Continuous Processing of Matte in a Converter. D. A. Diomidovskii, L. M. Shalygin, A. A. Gal'nbek and I. A. Yuzhaninov. *Tsvetnye Metally*, no. 2, 1959, p. 27-34.

(C21b; Cu)

371-C. (Russian.) Electrothermal Distillation of Zinc From Silver Containing Foam in the Ust'-Kamanogorsk Lead Plant. D. O. Averchenkov, D. S. Kopchenko, V. F. Pron'kin, V. A. Sidorovskii, I. I. Kershanskii and V. P. Ovcharenko. *Tsvetnye Metally*, no. 1, 1959, p. 33-40.

9 ref. (C22; Zn, Ag)

372-C. (Russian.) Autoclave Hydrometallurgical Processes With Copper-Nickel Ores. S. I. Sobol'. *Tsvetnye Metally*, no. 2, 1959, p. 34-40.

7 ref. (C19; Cu, Ni)

373-C. (Russian.) Hydrometallurgical Processing of Copper-Nickel Matte. V. P. Govorov. *Tsvetnye Metally*, no. 2, 1959, p. 41-46.

5 ref. (C19; Cu, Ni)

374-C. (Russian.) Preparation of Metallic Yttrium. L. A. Izhvanov and N. P. Vershinin. *Tsvetnye Metally*, no. 1, 1959, p. 44-47.

Reduction of yttrium fluoride by Ca. 4 ref. (C26; Y, Ca)

375-C. (Russian.) Dendritic Structure of Cathodic Nickel. T. V. Gran, K. I. Trukhina and N. N. Kulikova. *Tsvetnye Metally*, no. 2, 1959, p. 46-49.

Conditions favoring this undesirable phenomenon. (C23p, N12d, 9; Ni)

376-C. (Russian.) Automatic Controlled Processes in the Reduction of Titanium by Magnesium. A. G. Arkad'ev, V. A. P'yankov, Kh. L. Strelets and G. V. Forsblum. *Tsvetnye Metally*, no. 1, 1959, p. 53-62.

Preparation of Ti from its tetrachloride. 4 ref. (C26; Ti)

377-C. (Russian.) Manufacture of Cb-Ta Alloys by the Carbide Method. O. P. Kolchin and N. P. Chuveleva. *Tsvetnye Metally*, no. 2, 1959, p. 60-64.

Preparation of metallic Cb and Ta from a mixture of their oxides and carbides. (C21; Cb, Ta, 14-68)

378-C. (Russian.) Stripping of Starting Sheets in Vertical Position. O. V. Donskoi and V. V. Bure. *Tsvetnye Metally*, no. 1, 1959, p. 94-96.

Improvements in the removal of electrolytically refined Cu from the starting sheets. (C23p; Cu)

379-C. The Separation of Tantalum and Niobium. Pt. 2. G. L. Miller. *Industrial Chemist*, July 1959, p. 341-347.

Liquid-liquid separation methods. (To be continued.) (C19; Ta, Cb)

380-C. (Russian.) Factors Influencing the Process in the Converter Treatment of Copper and Copper-Nickel Mattes. M. V. Iolko. *Tsvetnye Metally*, no. 3, 1959, p. 19-22.

9 ref. (C21; Cu, *Ge*)

439-C. (Russian.) Practice and Consumption Figures of the Carbide Alloying Process. A. Ya. Nashel'skii. *Tsvetnye Metally*, no. 10, 1958, p. 81-82.
Preparation of a lead-calcium alloy by adding CaC_2 to a melt of Pb at 750-800° C. (C26; Pb-b, *Ca*, AD-n32, 14-68)

440-C.* An Electron Bombardment Furnace for the Production of Vacuum-Melted Metals. E. S. Candidus and J. C. Simons, Jr. Paper from "Fifth National Symposium on Vacuum Technology Transactions—1958". (American Vacuum Society, Inc.). Pergamon Press Inc., New York 22, 1959, p. 86-88.
Arcs and glow discharges which might hamper the melting operation or damage the electron source have been eliminated. Furnace design also permits the use of a relatively inexpensive pumping system. (C5k, 1-52, 1-73)

441-C.* Electron Bombardment Melting—a High Vacuum Technique Applied to Metallurgy. Hugh. R. Smith, Jr., Charles D'A Hunt and Charles W. Hanks. Paper from "Fifth National Symposium on Vacuum Technology Transactions—1958". (American Vacuum Society, Inc.). Pergamon Press Inc., New York 22, 1959, p. 164-167.
System parameters include correlation of high vacuum pumping with melting rate and degree of melt stock purification; effect of high vacuum and high temperature on the thermodynamics of metallurgical reactions; comparative results of the application of the technique, especially with regard to highly refractory metals. (C5k, 1-73, 2-62)

442-C.* Skull Furnace Design and Application. G. N. Facaros, D. R. Carnahan and L. M. Bianchi. Paper from "Fifth National Symposium on Vacuum Technology Transactions—1958". (American Vacuum Society, Inc.). Pergamon Press Inc., New York 22, 1959, p. 168-174.
Major components of a vacuum skull furnace and typical melting crucibles. Advantages are: no crucible contamination; a fast rate of casting; and vacuum purification. These make vacuum skull casting a practical production process. (C5k, 1-52, 1-73)

443-C. (Russian.) The Alkali Method of Smelting Lead. M. P. Smirnov and L. N. Kudryashova. *Tsvetnye Metally*, no. 9, 1958, p. 14-23.
Enriched lead ore is heated together with NaOH. 7 ref. (C21; Pb)

6 ref. (C21d; Pb)

447-C. (Russian.) Processing of Slags in an Electric Furnace. M. M. Lakernik and B. I. Slonimskii. *Tsvetnye Metally*, no. 9, 1958, p. 28-31.
Reductive heating with coke to win Cu, Pb, Zn and noble metals contained in the slag. (C21d; RM-q, Cu, Pb, Zn, Ag, Au)

448-C. (Russian.) Electrowinning of Titanium. Yu. I. Ostroushko, G. A. Meerson, G. F. Silina and R. B. Shtrapenina. *Tsvetnye Metally*, no. 12, 1958, p. 38-44.
12 ref. (C23n; Ti)

449-C. (Russian.) Effect of Titanium Chlorides Present on the Quality of Sponge Titanium. L. V. Biryukova and L. L. Neroslavskaya. *Tsvetnye Metally*, no. 11, 1958, p. 43-46.

Significance of $TiCl_3$ and $TiCl_2$ resulting from the reduction of $TiCl_4$. (C26, 2-61; Ti, 6-74)

450-C. (Russian.) Wetting Properties of Magnesium in the Reduction of Titanium. G. V. Forsblum and E. G. Goldelenok. *Tsvetnye Metally*, no. 9, 1958, p. 43-47.

Importance of wetting properties in the reduction from Ti tetrachloride. (C26; Ti)

451-C. (Russian.) Formation of Lower Chlorides and Titanium Shapes in the Reduction of $TiCl_4$ by Sodium. V. A. Shubin and V. A. Pazukhin. *Tsvetnye Metally*, no. 12, 1958, p. 44-50.

(C26; Ti)

452-C. (Russian.) Intensification of the Electrowinning of Aluminum With Equipment Being in Service. I. P. Gupalo and A. A. Kostyukov. *Tsvetnye Metally*, no, 11, 1958, p. 52-60.

4 ref. (C23n; Al)

453-C. (Russian.) Effects of CaF_2 and MgF_2 on the Conductivity of the System Carbon Electrode-Cryolite Bath-Molten Aluminum. L. N. Antipin and S. F. Vazhenin. *Tsvetnye Metally*, no. 12, 1958, p. 56-60.

9 ref. (C23n; Al)

454-C. (Russian.) Production of a Model Electric Field Simulating the Anode Field in the Electrowinning of Aluminum. M. A. Korobov and V. P. Mashovets. *Tsvetnye Metally*, no. 11, 1958, p. 60-66.

6 ref. (C23n; Al)

455-C. Continuous Dissolution of Uranium-Aluminum Fuels in a Trickle-Type Column Dissolver. J. C. Bresee, D. L. Foster and E. O. Nurmi. *Chemical Engineering Progress Symposium Series (Nuclear Engineering, Pt. 5.)*, v. 55, no. 22, 1959, p. 25-32.

Advantages of potentially high-capacity volume dissolver over the limited size batch dissolver for serving a solvent-extraction system. Effects of acid-feed rate and type of slugs (cast or extruded) upon discoloring rate and product concentration. (C19, A11d, T11g; U-b, *Al*)

456-C.* Conversion of Uranium Hexafluoride to Uranium Tetrafluoride. S. H. Smiley and D. C. Brater. *Chemical Engineering Progress Symposium Series (Nuclear Engineering, Pt. 7)*, v. 55, no. 27, 1959, p. 57-63.

Comparison of the hydrogen reduction process and the trichlorethylene process for converting uranium hexafluoride to uranium tetrafluoride. (C26; U)

457-C.* The Nitrophos Extraction Process for the Separation of Zirconium and Hafnium. Wayne H. Keller and Irwin S. Zonis. *Chemical Engineering Progress Symposium Series (Nuclear Engineering, Pt. 7)*, v. 55, no. 27, 1959, p. 107-112.

Reactor grade Zr produced by the Nitrophos (nitric acid-tributyl phosphate) extraction process. (C19, 3-69; Zr, Hf)

458-C.* (Japanese.) Production of Metallic Magnesium by the Reduction Method. Pt. 3. Effect of Some Additions and Calcining Temperature on Reduction of Dolomite by Fe-Si. Masao Ikeda. *Japan Institute of Metals*, v. 23, Aug. 1959, p. 437-441.

Additions of NaF, NaCl, $3NaF \cdot AlF_3$ and $CaCl_2$ decrease while CaF_2 and MgF_2 increase the Mg yield. Calcining temperature of about 1000° C. gives maximum yield. MgF_2 is better than CaF_2 as a dolomite briquette binder. 5 ref. (C26; Mg)

459-C. Sodium Reduction of Titanium Tetrachloride. Shiro Yoshizawa, Tomoyasu Hashino and Susumu Sakaguchi. *Kyoto University, Engineering Research Institute, Technical Reports*, v. 9, Mar. 1959, 11 p.

The reaction rate of the sodium reduction of Ti tetrachloride was controlled by diffusion of Ti tetrachloride through the solid product film formed on the surface of sodium; the activation energy was 6.04 k-cal. per mol. 8 ref. (C26; Ti)

460-C. (Hungarian.) Semicontinuous Casting of Aluminum. L. Tibor. *Kohaszati Lapok*, v. 92, Aug. 1959, p. 345-349.

SECTION D

FERROUS REDUCTION and REFINING

1-D.* New Processes in Iron and Steel. C. R. Wheeler. *Steel Review*, no. 3-6, Oct. 1958, p. 25-34.

The L-D, Kaldo and Rotor processes, new direct reduction processes, low-shaft furnace techniques and rotary furnaces processes. (D8, D10)

2-D. How to Make More Steel. *Metal Progress*, v. 74, Nov. 1958, p. 97-99.

Republic Steel increased production 40% by methods improvement without adding melting equipment. (D1, D5, F23, 1-52; ST)

3-D. Use of Oxygen in Electric Furnace Steelmaking. *National Cylinder Gas Information Report*, no. 16, Aug. 1958, 10 p.

Metallurgical, economic advantages, equipment required, operating procedure for use of O_2. (D5g; ST-f, O)

4-D. (German.) Automatic Regulation of Blast Furnaces. A. N. Makarow. *Neue Hutte*, v. 3, July 1958, p. 404-408.

(D1, W17g, 18-74)

5-D.* New Process Achieves Direct Reduction of Iron Ore. *Canadian Mining Journal*, v. 79, Aug. 1958, p. 78-80.

Strategic-Udy process can convert ore to steel in one continuous operation; is practical for low-volume production; allows utilization of cheap ores; is highly flexible. (D8j)

6-D.* Some Effects of Pressure on Consumable Electrode Arc Melting. J. W. Suiter. *Dept. of Mines and Technical Surveys, Mines Branch Research Report, Ottawa, Canada*, no. R1, May 30, 1958, 9 p. $.25.

Effects of varying the argon pressure in the range of 1×10^{-2} to 650 mm. Hg on the weight of metal melted per unit of energy dissipated when melting Ti and steel in a consumable electrode arc furnace. 4 ref. (D5g, C5h, W18s, 3-74; CN-g, Ti)

7-D.* Equilibrium Measurements Between Carbon-Saturated Mn-Fe-Si Melts and CaO-Al_2O_3-MnO-SiO_2 Slags. E. T. Turkdogan and R. A. Hancock. *Institution of Mining and Metallurgy, Bulletin*, no. 621, Aug. 1958, p. 573-600.

The variation of the slag metal, Si and Mn distribution ratios are related to the Fe content of the metal and the slag composition. Effects of Si and Fe on the solubility of graphite in molten Mn. 21 ref. (D11h, D11n)

8-D.* Refractories for the New Steelmaking Processes. J. H. Chesters. *Iron and Coal Trades Review*, v. 177, Aug. 8, 1958, p. 329-335.

Wear of refractory linings in Kaldo, L-D and Rotor steelmaking processes and in openhearths when using the oxygen lance. 9 ref. (D10, RM-h)

9-D.* Russian Continuous Converter—Tapping Spout Method of Steelmaking. R. Sewell. *Iron and Steel*, v. 31, Nov. 1958, p. 523-524.

Liquid pig iron is refined in a converter in the form of a 75-ft. long tapping spout. Refining achieved by top blowing with O_2. Production is 3-4 tons per min. (D3f, D9n; ST)

10-D.* Continuous Casting of High-Speed Steel. B. H. C. Waters, W. H. Pritchard, A. Braybrook and G. T. Harris. *Iron and Steel*

Institute, Journal, v. 190, Nov. 1958, p. 233-248.

Continuous-casting plant operated on a pilot scale for the production of high-speed and other alloy steels as 4-in. square cast billets. Types of billet fracture encountered in the operation; pouring and mold systems used to overcome them. 8 ref. (D9q; TS-m)

11-D.* The Oxidation Mechanism in the Open Hearth Furnace. A. L. Hodge. *Iron and Steel Engineer*. v. 35, Nov. 1958, p. 97-100.

Maximum openhearth production rates require a maximum amount of high-temperature heat in excess of bath temperature and maximum availability of chemical oxygen. (D2g, D11r)

12-D.* Quality Control in Specialty Steel Production. J. S. Pendeleton, Jr., and H. O. Beaver, Jr. *Metal Progress*, v. 74, Nov. 1958, p. 100-103.

Scrap, composition, temperature and design influence ingot quality. Control of these variables produces ingots with consistent properties from heat to heat. (D9, N12b; ST, 5-59, 9-69, 17-54)

13-D.* (French.) Selection of Nozzle Sizes and Pouring Speeds for Teeming of Flat, Rimmed Steel Ingots (Top Pouring). J. Leclerc and J. Goureau. *Revue de Metallurgie*, v. 55, Aug. 1958, p. 710-715.

Shop study of defects in 10 and 15-ton ingots as influenced by nozzle diameters, pouring speeds and temperatures, mold dimensions and ladle capacity. Formula for selection of nozzle diameters for ingots of any size and shape. (D9p; ST-d)

14-D. Furnace Lines, Operating Methods and Theory of Southern and Northern Blast Furnace Practice. John R. Hunt. *Engineering Sciences (U. S. Steel Corp.)*. v. 5, 1958, 36 p.

Comparison of differences in ratio of working volume to hearth area and other structural variations of blast furnaces due to different ore compositions. 24 ref. (D1, W17g, 17-51)

15-D. Phoenix-Lance Process. H. Th. Brandi. *Iron and Coal Trades Review*, v. 177, Sept. 5, 1958, p. 555-556. (From *Stahl und Eisen*, June 26, 1958.)

(D3f)

16-D. Fiftieth BISRA Steelmaking Conference. *Iron and Coal Trades Review*, v. 177, Sept. 12, 1958, p. 615-619.

Summaries of five papers on influence of refining, finishing and casting on steel quality. (D-general)

17-D. Openhearth Furnace Regenerators—a Survey of Theoretical and Experimental Work With Recommendations for the Calculation of Preheat. *Iron and Steel Institute, Journal*, v. 190, Nov. 1958, p. 254-271.

34 ref. (D2g, W18r)

18-D. The Vacuum-Lifter Process of the Dortmund-Horder Huttenunion AG. F. Harders. *Iron and Steel Institute, Journal*, v. 190, Nov. 1958, p. 306-311.

Molten steel is drawn up into a vacuum chamber mounted over the ladle. Degassing takes place, reducing O_2 and H_2 content, improving steel quality. (D9s, 1-73; ST-c)

19-D. New Developments in Steelmaking in Europe. D. L. McBride. *Society of Automotive Engineers*, Preprint no. 30C, 1958, 9 p.

Review of low-shaft blast furnaces, electric smelting, bessemer process, Kall-Do process, Oberhausen rotary furnace, 13 ref. (D3, D8n, D10)

20-D.* Research on the Use of Pure Oxygen in Refining Processes. Paul Metz. *Blast Furnace and Steel Plant*, v. 46, Nov. 1958, p. 1187-1191, 1223.

Industrial tests made with the OCP process; high metallic yield; high consumption of scrap; low consumption of oxygen; great speed of refining; dephosphorization with high final C contents; high degree of desulphurization; easy production of low-S and low-P steels; N_2 content of steel depending on the degree or purity of oxygen used in refining; high solubility of basic slag; oxygen content at the end of blowing equivalent to that of openhearth steels. (D3f, 1-65)

21-D.* Carbon Arc and Induction Melting. J. A. Edwards. *Iron & Steel*, v. 31, Sept. 1958, p. 449-451.

Techniques compared with reference to design of part to be cast, relative cost, control or reproducibility of results, versatility. (D5a, D6; C5h, C5j)

22-D.* The O.C.P. Process. Paul Metz. *Iron & Steel*, v. 31, Sept. 1958, p. 455-460.

Controlled blowing of oxygen and powdered lime makes it possible to obtain new basic bessemer steels with low N and P contents and with high degree of cold ductility. Pure oxygen is injected over surface of metal bath, and at the same time, either air, oxygen-enriched air or oxygen-steam mixture is blown in through converter bottom. 21 ref. (D3f, 1-65)

23-D.* Survey of Basic Bessemer Instrumentation. B. O. Smith. *Iron & Steel*, v. 31, Sept. 1958, p. 463-464.

Considerable reduction in blowing time likely to be achieved by use of oxygen-enriched air or oxygen-steam places a premium on reliable, rapid-acting instruments for operation and control of the process. Important process parameters are bath temperature and end-point determination. Radiation methods of measuring bath temperature are sufficiently accurate and reliable; methods based upon flame composition or flame opacity show inconsistent results. No direct method of end-point determination exists and there is a need for high-speed continously indicating instrument for bath analysis. 12 ref. (D3, S16a, S18, X9)

24-D.* (German.) Application of Oxygen During the Production of Unalloyed and Low-Alloyed Steels in the Basic Electric Furnace. Rolf Peters. *Neue Hutte*, v. 3, July 1958, p. 409-415.

Dependence of refining speed on amount of oxygen supply and carbon content of the molten unalloyed steel; absorption of oxygen by the molten metal and relationships between the amount of refined carbon, bath temperature and oxygen efficiency. Behavior of Mn, P and N in iron; furnace life; comparison of this process with the normal refining process. 9 ref. (D5g, 2-60)

Prevention of measuring errors due to wire deposits or embrittlement of Pt-Rh wires. Sensitivity of measuring instruments shown by immersion temperature curves. Mean temperature increase of the bath is dependent on the admission temperature and the heat supply. An improvement of steel quality and technological process results from observing the correct tapping and casting temperatures. 28 ref. (D2, X9q)

26-D.* (German.) Desulphurization of Iron Melts With Solid Limestone and Dolomite. Wilhelm Anton Fischer and Horst Spitzer. *Archiv fur das Eisenhuttenwesen*, v. 29, Sept. 1958, p. 535-542.

Equilibria between iron melts with 0.3% C up to carbon saturation and solid limestone or solid dolomite was investigated between 1200 and 1700° C., and equilibrium constants were determined. The activity of lime with respect to desulphurization at 1500 to 1700° C. seems to be equal both in limestone and in dolomite. 27 ref. (D11n; S)

27-D.* (Rumanian.) Desulphurizing Power of Blast Furnace Slag. Traian Tr. Negrescu. *Studii şi Cercetări de Metalurgie*, v. 1, July-Dec. 1956, p. 283-296.

Previous papers showed how to calculate the maximum quantity of sulphur which a molten silicon-lime-aluminum slag can absorb. Another series of experiments relating to the SiO_2-CaO-MgO system, at 1500° C., establishes a quantitative relation. The free lime in the $5CaO \cdot 8SiO_2$ entities combines with part of the sulphur of the metal bath to form $pCaO \cdot qS$ groups which contain less lime, the higher the temperature. Al does not take direct part in desulphurization, but favors its speed. Mg only serves to make part of the lime available. 6 ref. (D1, D11n)

36-D. (Polish.) Examination of Nonmetallic Inclusions in Steel. Juliusz Foryst. *Hutnik*, v. 25, July-Aug. 1958, p. 257-262.

Laboratory research in steel deoxidation by Fe-Mn-Si-Al deoxidisers with variable chemical constitution indicates favorable effect of growing ratio Mn:Si on deoxidation. Quantity of oxygen inclusions remaining in steel after deoxidation apparently depends on ratio Mn:Si; smallest amount of inclusions observed when ratio Mn:Si was 6:1. Results indicate that percentage of impurities in steel poured at low temperatures (1540-1570° C.) is considerably higher than in steel poured at higher temperatures (1590 - 1610° C.). The nitrogen soluble in a given steel in equilibrium represents the critical amount below which pores and segregations are avoided. 25 ref. (D9r, N12, 9-68, 2-60; ST, *C, Mn, Si, P, S, Cr, Mo, Ni, N*)

62-D.* (Japanese.) Vacuum Casting. M. Yamazoe. *Metals*, v. 28, Nov. 1958, p. 833-836.

Large steel ingots usually are subject to porosity, pinholes, blowholes, white spots and dislocations, which can be avoided by vacuum casting. Capacity of

vacuum pump should be 40,000 to about 4,000,000 liters per min., and hence a steam ejector, an oil ejector and mechanical booster are used. (D9s, 1-73; ST)

63-D.* (Rumanian.) Influence of Processing Upon the Nature and Amount of Nonmetallic Inclusions in Steel. Silvia Dascălu. *Studii si Cercetări de Metalurgie*, v. 3, no. 1, 1958, p. 39-52.

Speed of decarburization and duration of deoxidation have direct influence; therefore, composition of charge must be strictly controlled. Slags have only indirect influence. Quantity of deoxidizers and sequence of introduction also have influence. 9 ref. (D11j, D11r, D2; ST, *Mn*, 9-69)

64-D.* (Russian.) Influence of Blast Temperature on Dimensions of Oxidizing Zone in Blast Furnace. N. I. Vasil'chenko, V. I. Kotov and A. N. Nikitin. *Stal'*, v. 18, Oct. 1958, p. 869-874.

Increase in temperature and kinetic energy of blast with well-developed circulatory motion of coke at the tuyeres leads to enlargement of the combustion zone (without alteration of the oxygen zone). Modification of the factors which determine the smooth performance of the furnace alters sharply the size of the combustion and oxygen zones. Experiments conducted on blast furnace with 14 tuyeres of 180 mm. diameter. Furnace capacity 1000 tons of pig iron in 24 hr. (2.0-3.5% Si). 9 ref. (D1, D11j, 2-61)

65-D.* (Russian.) Life of Openhearth Refractory Lining When Using Oxygen. E. I. Koval'chuk and G. I. Popov. *Stal'*, v. 18, Oct. 1958, p. 890-893.

Use of oxygen somewhat reduces wear on refractories, however, continued efforts are required for improvement in design, quality and maintenance of furnace lining. Methods for lengthening refractory life include facing the regenerator walls with chrome magnesite, improving quality of free bricks by increasing their thickness and stability at temperatures of 1700° as well as deformation temperature under load. (D2g, W18r; RM-h)

66-D.* (Russian.) Improving the Structure of Rimming Steel Ingot Taps. A. M. Uzienko, I. A. Tkachenko and A. P. Varshavskii. *Stal'*, v. 18, Oct. 1958, p. 899-905.

Structure can be considerably improved by prolongation of the metal rim in the mold and the addition of glass or microgranite (for steels Ct 3kp killed by ferrosilicon). Cropping can be reduced 3-5% without any sacrifice of metal quality. 3 ref. (D9k, M27; ST)

67-D.* (Russian.) Properties of Sheet Made of Stainless Steel Killed by Aluminum. D. A. Litvinenko, A. I. Marinov and V. K. Barzii. *Stal'*, v. 18, Oct. 1958, p. 931-938.

Experiments show effectiveness of producing killed stainless steel, suitable for manufacture of VGV grade cold rolled sheet from undressed slabs by deoxidation of metal with Al shot. Al is poured into ingot molds from the top which results in better surface quality of sheet than is obtained by deoxidation of steel by Al in the ladle. Steel thus produced is used for auto parts and is free of defects of mechanical aging and lowering of plastic and drawing qualities. (D11r, Q-general; SS, *Al*, 4-53)

68-D.* (Russian.) Operation of Blast Furnace at 1.5 Atm. Pressure. L. Ya. Levin, I. A. Kuz'min, V. D. Kailov and A. B. Shur. *Stal'*, v. 18, Nov. 1958, p. 964-968.

Raising of blast furnace top pressure from 1.0 to 1.5 atm. gage increases productivity by 1.9% with simultaneous reduction of coke consumption rate and increase of blast temperature. Due to inadequate composition of the charge used there was no increase in the blast flow. Main factor accounting for reduction of specific coke consumption was increase of blast temperature from 950 to 1000°. (D1b)

69-D.* (Russian.) Semicontinuous Casting of Stainless Steel. M. S. Boichenko, O. T. Gavrilov and Yu. B. Kan. *Stal'*, v. 18, Nov. 1958, p. 983-987.

Casting of IKI8H9T steel slabs for production of cold rolled sheet resulted in satisfactory quality with reduced metal consumption. Surface quality of cold rolled sheet produced by this method is similar to that produced by usual method and meets the standard TU 3126-52. Mechanical and corrosion properties are satisfactory. (D9q; SS, 4-53)

70-D.* (Russian.) Heat Balance of Experimental Melt in Oxygen Blown Converter. P. Ya. Sorokin. *Stal'*, v. 18, Nov. 1958, p. 987-992.

Study of heat balance in 50-kg. laboratory converter shows that reason for high metal loss during burning is due to local overheating of metal resulting in evaporation of different elements. The

influence of this factor can be minimized by application of finely disintegrated bottom blowing and by addition of iron ore. Dilution of oxygen blast with steam for lowering localized temperatures in the zone of reduction will reduce metal loss. 9 ref. (D3, D11k)

71-D.* (Spanish.) Scrapless Manufacture of Steel in the Electric Arc Furnace. Guillermo Coll. *Instituto del Hierro y del Acero*, v. 11, July-Sept. 1958, p. 168-176.

Scarcity and high price of steel scrap in Spain inspired experimental work in manufacture of steel in furnace with basic lining, with pig iron and iron oxide as only raw materials. In view of good results, both metallurgical and economic, Araya plant of Ajuria y Urigoitia, S. A., now uses this method exclusively. Metallurgical details. (D5a)

Casting of tool and alloy constructional steel for bar and wire as well as low-alloy billets for extrusion of seamless pipe. Economics of continuous casting. (D9q; AY, CN, SS-e)

76-D.* (Czech.) Investigation of Influences Affecting the Fluctuation of Silicon Content in Basic Bessemer Pig Iron. Josef Lemfeld. *Hutnicke Listy*, v. 13, no. 8, 1958, p. 675-679.

At equivalent sulphur content per ton of iron the quantity of Si in basic bessemer pig iron depends on quantity of siliceous ores in the charge. The effect of Czech ores in reducing Si content of iron is probably due to their easy fusibility and formation of a slag of lower viscosity which passes through furnace more rapidly and results in lower furnace temperature. (D3a, D11n, 2-60; CI-a, Si)

77-D.* (Czech.) Vacuum Cast Steel. Zdenek Motloch. *Hutnicke Listy*, v. 13, Nov. 1958, p. 1037-1050.

Amount of liberated gas depends on casting velocity and oxygen content. With rimming steel, formation of blowholes was suppressed and a killed steel structure obtained. Partial elimination of flakes also achieved. 6 ref. (D9, 1-73; ST, *Cr, Ni*)

78-D.* (German.) Final Composition of Bath and Slag in Bessemer Process. Franz Weber, Theo Kootz and Karl-Heinz Obst. *Stahl und Eisen*, v. 78, Nov. 27, 1958, p. 1734-1745.

Variables influencing dephosphorization and final composition of metal and slag are phosphorus content, bath temperature, iron and lime content of slag, size of lime particles, silicic acid, magnesia content and oxygen concentration of blast. Activity in system $FeO-CaO-P_2O_5$. Desulphurization process in basic converter. Production experiments reveal that highest phosphorus and oxygen values in iron are obtained with small graded lime. (D3, D11n; *O, P*)

79-D.* (Russian.) Cooling Well of Blast Furnace. N. V. Krepyshev. *Metallurg*, v. 3, Nov. 1958, p. 3-9.

A major reason for disruption of continuity in blast furnace operations is poor material or design in construction of well and foundation. Well temperature at furnace axis reaches 800° and foundation 1100°, resulting in cracking of base cement. Air cooling beneath the foundation lowers and evens out temperature distribution; also makes it possible to use

thinner bottom lining. Air cooling has resulted in two-fold increase in life span of foundation. (D1, W17g, 17-51)

80-D.* (Russian.) Grading Blast Furnace Burden. M. A. Sukonnik. *Metallurg*, v. 3, Nov. 1958, p. 9-12.

Grading charging materials increased gas penetrability, made possible intensification of smelting with reduced coke consumption. Increased basicity of Krivoirozh ores multiplies fines, interferes with furnace operation due to canalization of burden resulting in greater coke consumption and lowered productivity. (D1a)

81-D.* (Russian.) Production of Chromium-Molybdenum Steel. V. P. Bondarev. *Metallurg*, v. 3, Nov. 1958, p. 13-15.

Production of large sections of rolled steel (180-250 mm. diameter) resulted in 30% rejections and expense coefficient of 2.37 due to gas blisters forming under surface. New technology used for steels 12 MKH and 15 XHM where steel is melted without preliminary reduction with Si in furnace has sharply reduced spoilage and lowered expense coefficient to 1.47. (D9, F23p; ST, *Cr, Mo*)

82-D.* (Russian.) Automatic Regulation of Openhearth Heat Regime. N. S. Skorik. *Metallurg*, v. 3, Nov. 1958, p. 18-25.

Furnaces are heated by mixture of coke and blast furnace gases enriched with oxygen. Automation of heat regime was introduced to meet more precise requirements of magnesite chrome operations with oxygen. Heat regulation extends to control of cooling system, amount of carburizers, oxygen, liquid metal as well as gas and air apparatus. Operations still to be automated are smoke fumes, heating of upper part of furnace and insuring maximum combustion of all fuels. (D2g, 18-74)

83-D.* (Russian.) Production of Semikilled Steel. D. A. Litvinenko, L. M. Efimov and V. K. Barzii. *Stal'*, v. 18, Oct. 1958, p. 885-890.

Production by additional deoxidation of rimming steel in a ladle or in molds, using Al and Si. Best results obtained by introduction of 340-400 g. of Al per ton for 08 killed steel and 150-200 g. per ton MCt 3 killed steel into stream of molten metal before its surface in the mold reaches the prefixed level. Experiments conducted in 185-ton openhearth. (D2, D11r; ST-c, *Al, Si*)

84-D.* The Distribution of Alloying Elements Between Molten Iron and Silver. G. Derge. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 15-17.

Distributions of Cu, Mn and S illustrate problems on liquid-metal interactions which can be examined by experiments described. 4 ref. (D11, P12, N14; Fe, *Ag, Cu, Mn, S*)

85-D.* The Carbon-Oxygen Equilibria in Liquid Iron. J. F. Elliott. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 37-41.

Analysis of available data on the Fe-O-C system in the vicinity of 1600° C. in graphical illustrations showing thermodynamic relationships for the reactions between carbon and oxygen. 8 ref. (D11r, P12; ST, *C, O*)

86-D.* The Alumina-Graphite Reaction in Liquid Iron and the Aluminum Deoxidation Constant in Steelmaking. J. Chipman and F. C. Langenberg. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 46-50.

Al_2O_3-saturated Al_2O_3 - SiO_2 - CaO slags were equilibrated with graphite-saturated Fe-C-Si-Al melts at 1600 and 1700° C., and the reaction Al_2O_3 (in slag) studied. 13 ref. (D11n, D11r; NM-k36, ST, *Al*)

87-D.* Oxide Slags—a Survey of Our Present Knowledge. F. D. Richardson. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 55-62.

Silicate structures, thermodynamic properties, solubilities of neutral metals, water in slags. 16 ref. (D11n; RM-q)

88-D.* Summary of Some Experimental Work on the Activity of Silica in Liquid Silicate Systems. L. Yang, C. L. McCabe and R. Miller. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 63-64.

Activity of silica in the liquids of the CaO-SiO_2 system at 1637° C. determined by the use of the Knudsen cell to measure the pressures of SiO and O_2 above the

melt and above pure cristobalite. 4 ref. (D11n; ST, *Si*)

89-D.* The Activity of Silica in Lime-Alumina-Silica Slags at 1600° C. F. C. Langenberg, H. Kaplan and J. Chipman. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 65-67.

Si distribution for graphite-saturated Fe-Si-C alloys in equilibrium with $CaO-Al_2O_3-SiO_2$ slags; composition of $CaO-Al_2O_3-SiO_2$ slags in equilibrium with alloys of constant Si content. (D11n; ST, *Si, Al, Ca*)

90-D.* Activities in Ternary Silicate Melts. F. D. Richardson. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 68-75.

Silicate phase diagrams and thermal data suggest that mixtures of two molten metasilicates behave nearly ideally (relative to the separate silicates) even when there are large differences between the sizes of the cations and heats of formation of the separate silicates. 26 ref. (D11n, P12; ST)

91-D.* Electrical Measurements on Oxides and Solid Cells at Temperatures of 1200 to 1800° C. W. A. Fischer. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 79-83.

Iron oxide-alumina system and other bivalent systems. 8 ref. (D11n, P12; ST, 14-68)

92-D.* The Action of Calcium Fluoride in Slags. T. Baak. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 84-86.

Calcium fluoride lowers melting point and decreases viscosity of slags. $CaO-CaF-SiO_2$ system discussed; practical applications. (D11n, 3-69; ST, *Si, Ca*)

93-D.* Formation and Destruction of Foams and Emulsions in Iron and Steelmaking. P. P. Kozakevitch. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 89-92.

Properties and applications of foams and emulsions. 7 ref. (D11n; ST)

94-D.* Kinetics of Metallurgical Reactions With Particular Reference to the Open Hearth. L. S. Darken. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 101-108.

Chemical kinetics at high temperatures where local equilibrium is developed. Heat requirement, bubble formation and growth, foaming, frothing, boundary layer in the slag at the slag-metal interface. 5 ref. (D11, D2d, P13h; ST)

95-D.* Theory of Degassing of the Open-Hearth Bath During Carbon Boil. P. Vallet. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 109-112.

Conclusions of W. Geller's theory and theory showing that the residual H_2 and N_2 are partially eliminated by the evolution of CO, which is generated in large quantities during the carbon reaction. 6 ref. (D2, D11h)

96-D.* Kinetic Factors in the Desulfurization of Pig Iron by Blast-Furnace Type Slags. J. C. Fulton and J. Chipman. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 113-116.

Experiments clarify the mechanism of sulphur transfer between liquid pig iron and blast-furnace type slags. With 6% Si in the metal to maintain equilibrium with SiO in the slag, the transfer rate is slightly affected by stirring rate. 11 ref. (D1, D11n; CI-a, *S, Si*)

97-D.* The Deoxidation of Iron Melts With Silicon. W. A. Fischer. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 117-122.

Deoxidation dependent on amount of Si added; temperature of the melt; size of the furnace; agitation of the melt; kind of crucible lining; inclusions formed during the different periods of time and in different crucibles during the course of the reaction. (D11r, 2-60; ST, *Si*)

98-D.* Electrochemical Nature of Sulfur Transfer in the System Carbon-Saturated-Iron-Slag. T. B. King and S. Ramachandran.

Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 125-135.

Investigation of the reaction by which sulphur is transferred from carbon-saturated iron to oxide slags. 9 ref. (D11n, P13; ST, *S, C*)

99-D.* Desulfurization and Dephosphorization of Carbon-Saturated Iron. C. E. A. Shanahan. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 136-141.

Data showing that the desulphurization rate by $CaO-SiO_2-Al_2O_3$ slags can be high and mechanisms account for the removal of phosphorus from hot metal in the presence of high carbon-concentration levels by oxygen blowing. (D11n; Fe, *C, S, P*)

100-D.* Effect of Temperature and Silica on the Dephosphorization of Iron With Lime. G. Tromel. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 142-146.

Activity of P_2O_5 grows with increasing SiO_2 content. (D11n, 2-61, 2-60; Fe, *Si*)

101-D.* Some Swedish Experiences of the Importance of Physical Chemistry for the Development of Process Metallurgy. B. Kalling. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 149-158.

Reduction of Fe ore, blast-furnace process, external desulphurization of pig iron, decarburization of solid pig iron, acid and basic openhearth process, deoxidation and tapping. 30 ref. (D11)

102-D.* Study of Slag-Metal Mixing Efficiency by Models. C. B. A. Shanahan. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 165-172.

Efficiency of mixing obtained by pouring the metal into the slag is much greater than that obtained either by simple gas blowing or by rabbling. The faster the amalgam is poured into the acid, the greater the efficiency of mixing. 4 ref. (D11n)

103-D.* Theoretical Study on the Solidification Progress of Ingots of Finite Dimensions. P. Vallet. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 194-199.

Verifies quantitatively the proposed equation, different adaptations, calculation of coefficient of the parabolic law of Lightfoot. Values obtained with ingots of different shapes and dimensions (prisms or spheres) when the metal is poured in sand molds agree. 7 ref. (D9, N12; ST)

104-D.* Effect of Mold Geometry on Vertical Solidification. C. W. Sherman. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 200-202.

Transverse solidification data for 0-9% tapered ingots of various sizes. Freezing time data. 8 ref. (D9, N12, 3-73; ST)

105-D.* Solidification of Stainless Steel Ingots. D. J. Carney and B. R. Queneau. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 209-213.

Based on premise that artificial nucleation of solidifying metals is possible, the addition of types of metallic powders to ferritic types of stainless steels produced a finer as-cast grain size. (D9, N2, N12; SS, AD-p, 35)

106-D.* On Segregation in Steel Castings. C. M. Adams, Jr. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 216-217.

Mechanical, chemical, thermal factors and segregation coefficient influence the degree, the direction and the average distance of solute migration during solidification, and affect segregation either by modifying mass transfer through the liquid or by causing local flow of solute-rich liquid. (D9, N12; ST, 9-69)

107-D.* Kinetic Problems in Steelmaking. C. Wagner. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 237-251.

Characteristics of metal-slag reactions, kinetics of transport-controlled reactions, exchange reactions involving radioactive isotopes, displacement reactions in quasi-binary systems, kinetics of

phase boundary reactions, local cell action, reduction of SiO_2, evolution of CO. 34 ref. (D11n, P12)

108-D.* Strategic-Udy Direct Iron Reduction Process. *Iron and Coal Trades Review*, v. 177, Dec. 19, 1958, p. 1463-1467.

Smelting technique utilizing a direct-fired rotary kiln for partial pre-reduction of iron ore before charging to an electric arc smelting furnace. To save thermal and electrical energy, the hot pre-reduced ore from the kiln is charged directly to the smelting zone of the furnace making it possible to control the reduction reaction with comparative ease. (D8j)

109-D.* Activity of Carbon in Liquid Iron-Carbon Solutions. A. Rist and J. Chipman. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 3-12.

Designed to yield the activity-composition relationship. Apparatus and experimental procedure, results, sources of error, data interpretation and thermodynamic calculations, comparison with data on austenite. 26 ref. (D11h, P12b; Fe, *C*)

110-D.* Activity of Carbon in Molten Fe-C Alloys at High Carbon Content—Progress Report. J. A. Cordier and P. P. Kozakevitch. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 13-14.

Measuring carbon activity at concentrations where difficulties are encountered with C deposition when using gas mixtures containing CO and CO_2 alone. (D11h, P12b; ST, *C*)

111-D.* Slag-Metal Reactions of Chromium in Carbon-Saturated Melts. C. W. McCoy and W. O. Philbrook. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 93-98.

Behavior of Cr in distributing itself between slag and metal under the low oxygen pressures that prevail for saturated Fe and for blast-furnace-type slags. Materials, apparatus, procedure and kinetics of Cr reduction. 15 ref. (D11n; *C*, Cr)

112-D.* Chemical Equilibrium in the Basic Bessemer Process. A. M. Decker. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 173-178.

Quantitative study of equilibrium between slag and metal at the end of the blow. Residual manganese, phosphorus, oxygen and sulphur content of the steel bath can be calculated if the slag analysis is known. 9 ref. (D11n, D3)

113-D.* Solidification of Steel Ingots. M. Tenenbaum. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 181-193.

Rimming steels, effect of gas information, solidification in big-end-up hot topped molds, ingot solidification, teeming. 6 ref. (D9, N12; ST)

114-D.* (German.) Behavior of Barium Sulphate in the Blast Furnace. Rolf Ebert and Georg von Struve. *Neue Hutte*, v. 3, Nov. 1958, p. 676-682.

Between 350 and 600° C., crystalline heavy spar is more subject to dust formation than other components of the charge. Above 600° C., barium sulphate is reduced to barium sulphide by the coke and furnace gas. A smaller quantity reacts with ferrous oxide and silica. The developing sulphur dioxide reacts with ferrous oxide forming iron sulphide. 16 ref. (D1a, D1g, D11; Ba, S)

115-D.* (Rumanian.) Structural and Thermodynamic Basis for the Reactions of Liquid Slags. Traian Tr. Negrescu. *Studii si Cercetari de Metalurgie*, v. 3, no. 2, 1958, p. 161-202.

Slag systems SiO_2-CaO-Al_2O (at 1500° C.) SiO_2-CaO-FeO (at 1500 and 1650° C.) SiO_2-CaO-MgO (at 1500° C.), SiO_2-CaO-MnO (at 1425° C.) and SiO_2-CaO-BaO (at 1500° C.). 13 ref. (D11n, 2-60, 2-61; Si, Ca, Al, Mg, Mn, Ba, O)

116-D. Vacuum Pouring Lowers Hydrogen Content of Large Forgings. *Powerfax*, v. 36, Winter 1958, p. 16-18.

Degassing process at Bethlehem Steel. (D9s, D9p, 1-73)

117-D. (Rumanian.) Utilization of Manganese Ores With Low Iron Content. D. Totoescu and A. Steclai. *Studii si Cercetari de Metalurgie*, v. 3, no. 1, 1958, p. 53-67.

Most of the ores of the region of Vascau-Moneasa used only for the extraction of the iron because Mn content is relatively small.

They cannot be treated in blast furnace. Purpose was to find a way of applying the Krupp-Renn process. 16 ref. (D8j; *Mn*)

118-D. (Russian.) Reduced Metal Expenditure in Casting Large Forging Ingots. V. A. Malyshev, A. F. Gorbachev and A. G. Papush. *Metallurg*, v. 3, Nov. 1958, p. 16-18.

Electric heating of ingot deadheads of carbon and alloy steels has largely eliminated porosity. Despite considerable reduction in size of ingot head quality of steel did not decline. (D9s)

119-D. (Russian.) Quality of Foundry Pig Iron Produced in Blast Furnace. L. I. Gol'denberg. *Stal'*, v. 18, Oct. 1958, p. 874-877.

Intensification of blast furnace process and raising the tapping temperature when smelting foundry pig irons have sharply increased contamination of melt by refining foam and resulted in deterioration of quality of cast product. In production of low-Si irons, with subsequent addition of 20% ferrosilicon when remelting in cupola, it is possible to reduce contamination. (D1, 2-61, 17-54)

120-D. (Russian.) Scrap Supply of Openhearth Furnaces. V. Sobolev. *Stal'*, v. 18, Oct. 1958, p. 950-951.

(D2a; RM-p)

121-D. (Russian.) Aging and Thermal Load of an Openhearth Furnace. E. A. Kapustin, V. A. Makovskii and G. D. Karpov. *Stal'*, v. 18, Oct. 1958, p. 952-956.

In connection with difficulties in estimating gradual changes in operation of openhearth, indexes are proposed for idling thermal load and active thermal load which makes possible comparison of relative heat economy and intensity of various furnaces. (D2h)

122-D. (Russian.) Smelting Ferrosilicon From Krivoy Rog Iron Ores. B. M. Nosovitskii, G. A. Panev and L. V. Brodetskii. *Stal'*, v. 18, Nov. 1958, p. 969-976.

Preventing irregular blast furnace performance and incrustation by eliminating from burden materials containing iron silicates, by increasing the circumferential flow of gases by selecting proper charging sequence and by periodically returning to smelting of ordinary pig iron. Increasing basicity of slag from 1.0 to 1.25 at the same time that magnesium oxide content is raised from 2.2 to 3.5% improves process of desulphurizing ferrosilicates in iron. 7 ref. (D1; AD-n31, Si)

123-D. (Russian.) Expediency of Smelting Ferrosilicon in Blast Furnace. Yu. S. Maksimov and Ya. S. Shchedrovitskii. *Stal'*, v. 18, Nov. 1958, p. 976-978.

Comparison of physicochemical and technico-economic conditions of ferrosilicon production in blast furnaces and in electric furnaces shows advantages of production by electrothermic process using closed-type electric furnaces. 6 ref. (D1, D5; AD-n31, Si)

124-D. (Russian.) Production of Various Grades of Steel in Top-Blowing Basic Converter Blowing. S. I. Lifshits. *Stal'*, v. 18, Nov. 1958, p. 979-983.

Rimming and killed steel used for crane rails produced by this process possess mechanical and technical properties equal to low-alloy openhearth steels. Further expansion of converter process will require investigation into intensification of desulphurization process which will make possible the use of pig with varying S and Mn contents. (D3, 1-65; ST-c, ST-d)

125-D. (Russian.) Stirring Openhearth Bath by Rotating Magnetic Field. G. A. Ostroumov. *Stal'*, v. 18, Nov. 1958, p. 999-1002.

Theoretical calculations show possibility of using three-phase industrial current for excitation of the rotating magnetic field (traveling field) for electromagnetic stirring. More effective stirring of melt through its full depth creates more even distribution of temperature and facilitates gas penetration. 5 ref. (D2g)

126-D.* Continuous Casting of Steel. G. Fenton. *Iron & Steel*, v. 31, Dec. 24, 1958, p. 610-621, 646.

Abstracts of papers presented at autumn meeting of Iron and Steel Institute. Casting equipment, procedure and operations, steels cast, properties of ingots and slabs of Canadian, British, Russian, Belgian, French and German installations. (D9q, 1-52, 18-67; ST)

127-D.* New Methods of Pig-Iron Manufacture. A. N. Pochwisnew. *Iron and Steel Institute, Journal*, v. 190, Dec. 1958, p. 337-338.

Current trends in Russia include blast enrichment by steam and oxygen, increased blast pressures and the construction of larger blast furnaces with extensive automation. Concluded that the blast furnace will continue to be the most practical means of producing pig iron in the forseeable future. (D1, 18-74; CI-a)

128-D.* The Imatra Thermit Hot-Topping Process. Pt. 1. Practice at the Imatra Works, Finland. A. I. Aitken, W. C. Fletcher and G. Fenton. *Iron and Steel Institute, Journal*, v. 190, Dec. 1958, p. 349-359.

Process differs from conventional hot topping in that the ingot is poured to a lower level in the hot top and, when solidification is nearly complete, a Thermit powder is added to remelt the metal solidified in the hot top and fill up the original pipe cavity. (D9p)

129-D.* Gas Utilization in the Reduction of Iron Oxides. G. St. Pierre. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 159-164.

Calculations of the quantity of reducing gas required to produce a given amount of free iron from its oxide. Gaseous reduction accomplished with mixtures of CO and H_2. 7 ref. (D11g)

130-D.* (Japanese.) Advantages of the 500-Kg. Vacuum Furnace. S. Ikeuchi. *Metals*, v. 28, Dec. 1958, p. 929-932.

Magnetic properties of 50% Ni-Fe (coercive force and rectangularity of hysteresis curve) improved. Also 50% Co, 2% V iron alloy, Supermalloy and Alperm. Heat resisting alloys improved in life and formability. (D8m, P16, Q23g; SS, TS, Ni-b, Fe)

131-D.* Petroleum Techniques for Steel. F. D. Hoffert, E. A. Kelly and A. M. Squires. *American Society of Mechanical Engineers*, Paper no. 58-A-158, 1958, 4 p.

Oil and natural gas serve as sources of the reducing hydrogen in the H-Iron process. Combination of H-Iron and electric furnaces offers many possibilities. Flow diagrams, operating techniques and costs. (D8j)

132-D.* (Polish.) Effect of Chemical Composition of Deoxidizer, Fe-Mn-Si-Al, on the Quantity and Chemical Composition of Nonmetallic Inclusions in Steel. J. Foryst, W. A. Mczedliszwili and A. M. Samarin. *Prace Instytutow Ministerstwa Hutnictwa*, v. 9, no. 4, 1957, p. 151-159.

With increase of Mn in the alloy Fe-Mn-Si-Al the quantity of oxide inclusions decreases; the smallest content of inclusions was obtained when Mn:Si = 6; two-stage deoxidizing by Mn-Si (Si:Al= 1:0.01)followed by Al. Increase of Mn in the deoxidizer is followed by a considerable reduction in SiO_2 in steel, it slightly decreases MnO, and, does not affect FeO. 9 ref. (D11r, 9-69; AD-r)

133-D. Twin-Strand Continuous Casting at Barrow. *Iron and Steel*, v. 31, Dec. 1958, p. 594.

Twin-strand plant at United Steel Co.'s Barrow plant produces billets from 2 to 4 in. sq. and slabs up to 12 by 4 in. in carbon steels containing between 0.05 and 0.85% C. (D9q; CN)

134-D. (French.) Control of Flame Direction in Openhearth Furnaces With Lean Gas Firing. L. Septier, G. Cohen de Lara, S. Terrat, R. Bovics and M. Faure. *Revue de Metallurgie*, v. 55, Oct. 1958, p. 993-1008.

Flame direction controlled successfully by regulation of the air flow. (D2h)

135-D. (German.) Technical and Economic Developments in the Low-Shaft Furnace Practice of the VEB Eisenwerke West in Calbe (Saale). Werner Schilling and Dieter Reimann. *Neue Hutte*, v. 3, Nov. 1958, p. 683-689.

Survey and composition of ores used; dimensions of ten furnaces. Increased economy by a higher hot blast temperature (850° C). 9 ref. (D8n, W17h; CI-a)

136-D. (German.) 100-Ton Openhearth Furnaces With Additional Tar Oil Heating. Friedrich Schafer. *Neue Hutte*, v. 3, Nov. 1958, p. 689-694.

Economic and practical consequences of the increased heat input. Installations for tar oil supply. 6 ref. (D2h, W18r; RM-k)

137-D.* (German.) Automatic Control of Basic Converter Heats. K. E. Mayer, H. Knuppel and A. Stumpf. *Stahl und Eisen*, v. 78, Nov. 13, 1958, p. 1670-1676.

Observations on the blowing process; automatic control instruments for converters recommended. 9 ref. (D3b, 18-74)

138-D.* (Hungarian.) Preventing Shrinkage Cavities by Means of Exothermic Sleeves. Gyula Csabalik. *Kohaszati Lapok*, v. 13, Feb-Mar. 1958, p. 118-122.

Thermit treatment of risers for steel ingots weighing 700 lb. Structure, grain size and calorific value of the thermit used. Starting temperature of thermit reaction and design of thermit lining, shape and location of shrinkage cavities, calculations on ingot yield and enrichment relationship in the riser. (D9k)

139-D.* (Hungarian.) Correlations Between Factors Affecting the Dimensions of Oxida-

tion Zone in Blast Furnaces Operated With Humidified Blast. Otto Farkas. *Kohaszati Lapok*, v. 13, Feb-Mar. 1958, p. 138-142.

Relation of combustion speed of coke to amount of steam investigated in laboratory and plant. Variation in kinetic energy of blast, in amount of gas produced, in kinetics of combustion reactions and their influence on the dimensions of the oxidation zone. 8 ref. (D1h)

140-D. (Book.) Physical Chemistry of Steelmaking. John F. Elliott, Ed. 257 p. 1958. Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York. $15.

Papers presented at a 1956 conference in Dedham, Mass. Covers liquid metals and properties of solutes in liquid iron and steel; equilibria of reactions in liquid iron and steel; behavior of metal oxides and components of iron and steelmaking slags; slag-metal equilibria in blast-furnace and steelmaking furnace systems; kinetics and slag-metal reactions; reaction rates in iron and steelmaking processes; application of fundamental data to process development and metallurgical problems in the steel industry; solidification of castings and ingots; research planning. Papers abstracted separately. (D11)

141-D. (Translation.) The Krupp-Renn Process in Germany. *Iron and Coal Trades Review*, v. 177, Nov. 21, 1958, p. 1223-1225. (*From Technische Mitteilungen Krupp*, v. 16, 1958.)

Operation of reconstructed plant at Salzgitter-Watenstedt. (D8j)

145-D. (Translation — Brutcher, 4416.) Inclusions in the Deoxidation of Steel With Silicon. W. A. Fischer and M. Wahlster. *Archiv fur das Eisenhuttenwesen*, v. 29, no. no. 1, 1958, p. 1-9.

See item 272-D, 1958. (D11r, D5; ST, 9-69, Si)

146-D. (Translation — Brutcher, 4424.) Preliminary Blowing of Hot Metal in Ladle With Oxygen-Steam Mixtures. Ya. A. Shneerov. Metallurg, Aug. 1958, p. 11-14.

See item 475-D, 1958. (D9m, D11r; CI-a)

147-D.* (French.) Gazal Process and Desulphurization of Thomas Pig. Pierre Zehringer. *Metaux-Corrosion-Industries*, v. 33, July-Aug. 1958, p. 293-304.

Origin of S in pig iron; influence on properties of steels. Desulphurizing agents, mechanism of reaction, Kalling and IRSID processes. Gazal process agitates molten metal in the ladle by means of gases (air, N or A) blown in through porous plugs cored into refractory lining of ladle bottom. Silicon carbide, graphite and alumina plugs and various desulphurizing agents were tried. Alumina plugs were most satisfactory, and they can also be used in degassing bronzes. Highest rate of desulphurization was obtained with slags containing about 87% sodium carbonate, 10% limestone flux and enough fluorspar to fluidify slag. 19 ref. (D11n, S)

148-D.* (Russian.) Remelting of Steels and Alloys in Arc-Vacuum Furnace to Reduce Contamination. G. N. Okorokov, A. Iu. Poliakov and A. M. Samariti. *Izvestiya Akademii Nauk SSSR*, May 1958, p. 69-72.

Remelting steel in vacuum furnace improves corrosion resistance, especially in low-carbon rust resisting steel. Remelting reduces the content of nonmetallic inclusions. (D8m, 9-69)

149-D.* (Russian.) Kinetic Effect of Burning Coke on the Size of Oxidizing Zone in Blast Furnaces. M. Ya. Ostroykhov. *Izvestiya Akademii Nauk SSSR*, June 1958, p. 3-6.

Acidic region is determined by blast energy; magnitude of reduction by carbon + carbon dioxide, and depends on the kinetics of the process, such as velocity of gas filtration and temperature. (D1, D11j; RM-j43)

150-D. Steel From the Electric Furnace. *Chicago Purchaser*, v. 37, Jan. 1959, p. 76-77.

Melting techniques; costs and applications. (D5)

151-D. Electric-Furnace Smelting of East Texas Iron Ores. H. Kenworthy and A. G. Starlipe. *U. S. Bureau of Mines Report of Investigations 5427*, 1958, 12 p.

Good recovery obtained from low-grade domestic Fe ores. (D8n; RM-n, Fe)

152-D. Experimental Investigation Into Primitive Iron-Smelting Technique. E. J. Wynne and R. F. Tylecote. *Iron and Steel Institute, Journal*, v. 190, Dec. 1958, p. 339-348.

A simple hearth furnace has been constructed for the production of Fe by the primitive method. Methods of charging the ore; effects of varying air flow, tuyere size, and ore and charcoal sizes. 21 ref. (D1, A2)

153-D.* Steelmaking Progress in Belgium and Luxemburg. A. Decker. *Metal Progress*, v. 75, Jan. 1959, p. 65-70.

Large furnace operating on fine coke with 15% moisture. OCP process injects a mixture of oxygen and lime powder through the mouth of a standard 30-ton basic converter. Slag poured off after about 14 min. when carbon is down to 0.7%. (D8n, D10; CI-a, ST)

154-D.* (Hungarian.) Blast Furnace With Elevated Pressure. Karoly Rethy. *Kohaszati Lapok*, v. 91, May-June 1958, p. 277-289.

Increasing blast furnace throat pressure decreases coke consumption, increases production, decreases volume of fires. Carbon content of pig-iron also increased. (D1a, 3-74)

155-D.* (Hungarian.) Production of Agglomerated Ore With Limestone, Fines and Sludges. Robert Forbath. *Kohaszati Lapok*, v. 91, May-June 1958, p. 241-250.

Agglomerated ores investigated to determine best ratios of components and sintering procedures. Use of agglomerated ores increased pig iron production, decreased coke consumption. (D1a, B16a; RM-n)

156-D. Vacuum-Melting of Steels. H. C. Child and G. T. Harris. *Iron and Steel Institute, Journal*, v. 190, Dec. 1958, p. 414-431.

Equipment used for vacuum induction and consumable-electrode vacuum-arc melting. Comparison of the average gas content of various types of alloys made by air-melted basic electric process, vacuum-induction process and vacuum-arc process. 22 ref. (D8m)

157-D.* (Hungarian.) Use of Pig-Iron With Low Manganese Content in the Open-hearth Furnace. Gellert Repasy. *Kohaszati Lapok*, v. 91, May-June 1958, p. 251-261.

Percent of Mn effectively utilized in steelmaking influenced by amount of Mn in pig iron and amount added in steelmaking. Effect of sulphur content. (D2a, 2-60; CI-a, *Mn, S*)

158-D.* (Hungarian.) Desulphurization of Pig-Iron Outside the Blast Furnace. Devenyi Janos. *Kohaszati Lapok*, v. 91, May-June 1958, p. 262-268.

Calcium injected into molten Fe with N gas under pressure removes 50-90% of S present. (D11n; Ca, N, S)

159-D.* (Hungarian.) Blast Furnace Practice With Steam-Enriched Blast. Gyorgy Schmidt. *Kohaszati Lapok*, v. 91, May-June 1958, p. 269-276.

Use of blast enriched by steam increases economy, decreases coke consumption of blast furnaces. (D1h)

160-D.* Duplexing Steel for Casting. Gordon J. Pride. *Foundry Trade Journal*, v. 106, Jan. 8, 1959, p. 45.

Cr-Mo steel, Mn steel, low-alloy Ni steels, ferrovanadium additions, austenitic steel, when ordered in small lots for uneconomical melting furnace load, handled by splitting heats or ladle mixing. (D9m; ST,*Mn, Cr, Mo, Ni, V*, AD-n, SS-e)

161-D.* Use of Self-Fluxing Sinter. J. S. McMahan. *Blast Furnace and Steel Plant*, v. 47, Jan. 1959, p. 51-54.

Blast furnace production increased 43%, coke consumption reduced 26%. No additional capital investment required. (D1a)

162-D.* (French.) Contribution to the Study of the Heating of Openhearth Furnaces. L. Septier. *Publication IRSID*, Series A, no. 184, Sept. 1958, 71 p.

Thermal efficiency of fuel and furnace; development of combustion; heat recuperation of gas and oil-fired furnaces; heat exchange in checkerwork; design factors in improvement of furnace performance. 12 ref. (D2, D11k)

163-D.* (Hungarian.) Metallurgy of High-Purity Iron Production. Bela Vecsey. *Kohaszati Lapok*, v. 13, no. 8, 1958, p. 357-361.

Swedish Armco iron melted in high vacuum furnace with hydrogen atmosphere. (D8m; Fe-a)

164-D.* (Russian.) Alteration of Blast Furnace Process When Using Flux Sinter. N. N. Babarykin and F. A. Yushin. *Stal'*, Dec. 1958, p. 1057-1065.

Improved performance when using fluxed sinter is explained by intensification of the process of reduction in the zone of moderate temperature and by decrease in dimensions of the burden softening zone. (D1a)

165-D.* (Russian.) Automatic Control of Blast Furnace Performance by Static Pressure Control. N. N. Chernov and P. G. Zhigulev. *Stal'*, Dec. 1958, p. 1071-1077.

Automatic control by over-all static pressure drop proved to be efficient only in case where the individual pressure drops at two basic furnace height zones are controlled and when regulators act on tap gas pressure and hot blast parameters. (D1, X12)

166-D.* (Russian.) Thermodynamics of the Dephosphorization of Liquid Iron by Ferrous-Calcium Slags. I. Yu. Kozhevnikov. *Stal'*, Dec. 1958, p. 1078-1088.

Product of the reaction is calcium phosphate which dissociates and forms ions when the concentration of phosphorus in the metal-slag system diminishes. (D11n, P)

167-D. Metallurgical Fuel Developments Main Lines of the Postwar Years. D. W. Gillings. *Metal Progress*, v. 75, Jan. 1959, p. 111-115.

Extensive blending of high-volatile coal with first-grade coking coal has enabled supplies of acceptable metallurgical coke to be maintained as needed in Europe. Many British openhearths have been converted to oil firing practice for some years, while the adoption of electric melting for producing plain steels results from efficient power generation from low-grade coal. (D-general; RM-j, RM-k, RM-n, 16-61)

168-D. Progress in German Steelmaking. H. W. Balster. *Metal Progress*, v. 75, Jan. 1959, p. 116-119.

Blast furnaces will be using high pressures and oxygen, openhearth, electric and converter melting methods are constantly improved and rolling mills are being mechanized. (D-general)

169-D. (Hungarian.) Effect of Agglomerated Ore on Blast Furnace Efficiency. Laszlo Marczis. *Kohaszati Lapok*, v. 91, May-June 1958, p. 236-240.

Experience in using both raw and agglomerated ores as feed for blast furnace. Amount of coke and CaCO, sequence of charging varied depending on type and quality of ore. (D1a; RM-n, RM-q, RM-j43)

170-D. (Hungarian.) New Blast Furnace Technology in Producing Ferromanganese. Kokai Istvan. *Kohaszati Lapok*, v. 91, May-June 1958, p. 290-293.

(D1; Mn, AD-n31)

171-D.* Solidification Characteristics of Continuously Cast Low-Carbon Steels. M. Tenenbaum, C. F. Schrader and L. Mair. *Iron and Steel Institute, Journal*, v. 191, Jan. 1959, p. 20-33.

Longitudinal sections of slabs illustrate structures of continuously cast killed, semi-killed and rimming steels. Typical macro-segregation curves; proposed mechanism for solidification of rimming steels. 10 ref. (D9q, M28h, N12; ST)

172-D.* Vacuum Pouring of Ingots for Heavy Forgings. J. H. Stoll. *Iron and Steel Institute, Journal*, v. 191, Jan. 1959, p. 67-80.

Melting steel in conventional electric arc furnaces and pouring into ingot molds contained in vacuum tanks. Operation of production units capable of producing 250-ton ingots. Effect of vacuum casting on the hydrogen content, cleanliness, susceptibility to flaking and mechanical properties of the forgings. (D9k, Q-general, 1-73; ST-f, 4-51)

173-D.* (English.) Refining Pig Iron by the Kall-Do Process. Bo Kalling and Folke Johansson. *Revue Universelle des Mines de la Metallurgie de la Mecanique*, v. 101, Dec. 1958, p. 455-466.

Detailed description and technology of the process using oxygen blown against the bath surface in a converter rotating about its longitudinal axis. 6 ref. (D10b)

174-D.* (English.) New Possibilities for the Improvement of Converter Methods. A. M. Samarin. *Revue Universelle des Mines de la Metallurgie de la Mecanique*, v. 101, Dec. 1958, p. 511-518.

Molten bessemer rail steel exposed to a vacuum of 5-10 mm. Hg for 12 to 14 min. showed a decrease of hydrogen of

approximately 2 to 2.5 times while the nitrogen decrease was 10-20% and the oxygen amount was 3 to 4 times. 9 ref. (D9s, 1-73; ST-g, CI-a)

175-D.* (English.) Rate of Operation of Openhearth Furnaces. R. W. Evans. *Revue Universelle des Mines de la Metallurgie de la Mecanique*, v. 101, Dec. 1958, p. 554-566.

Suggestions for improved openhearth practice; shortening of the process by increased fuel input, which makes necessary basic refractories; use of oxygen for decarburization; use of oxygen to assist combustion. Factors contributing to the output rate: furnace profile and design; design of burners. 11 ref. (D2, W18r)

With a roof of silica, use of oxygen is limited to the charging and melting period. To allow oxygen after slag formation, roofs of magnesite-chromite are necessary. With an oxygen enrichment of 25-30% the flame temperature rises by 100 to 150° C. 6 ref. (D2g, W18r)

177-D.* (English.) Continous Casting in the B.I.S.R.A. Experimental Plant. G. Fenton and J. Pearson. *Revue Universelle des Mines de la Metallurgie de la Mecanique*, v. 101, Dec. 1958, p. 623-633.

Ingot casting a 1/2-ton basic arc furnace. From a common type tundish nozzle or a heated nozzle the liquid steel passes to a mold, flexibly mounted on springs to avoid rupture of the cast skin, lubricated with rapeseed oil and water cooled. A dummy-bar is brought into the mold when casting is started. Casting speed is variable. (D9q; ST-c, CN, AY-b)

178-D.* (French.) New Refining Processes—Oxygen With Powdered Lime. B. Trentini and M. Allard. *Revue Universelle des Mines de la Metallurgie de la Mecanique*, v. 101, Dec. 1958, p. 494-500.

Melt with 3.57% C, 0.40% Si, 0.37% Mn, 1.80% P, 0.053% S refined in a basic converter by blowing an oxygen-powdered lime mixture against the bath surface. At the end of the first phase of process, the slag containing P_2O_5 is partly skimmed. In the second blowing phase, ore is added, then the slag is skimmed again. During the final blowing, a slag with high iron content that can be left in the converter develops. Steels with low P, S and N content obtained. 10 ref. (D3b; O, RM-q)

179-D.* (French.) New Research on Refining With Pure Oxygen. (Oxygen-Powdered Lime.) P. Metz. *Revue Universelle des Mines de la Metallurgie de la Mecanique*, v. 101, Dec. 1958, p. 501-511.

History. Description of the converter used for blowing with an oxygen-powdered lime mixture and of the control system. 24 ref. (D3b; O, RM-q)

217-D. (German.) Direct Reduction Processes Eliminate the Blast Furnace. Jacob Willems. *Stahl und Eisen*, v. 79, Jan. 22, 1959, p. 74-80.

Krupp Renn, RN, Leramie, Sturzelberg, Basset, Hoganas, Wiberg, Lurgi, Madaras, H-Iron, A.D. Little, Shipley, Onia and Stelling processes. 17 ref. (D8j)

218-D.* (German.) Use of Oxygen in Steelmaking. W.G. Woskoboinikow. *Neue Hutte*, v. 4, Jan. 1959, p. 10-17.

Various processes with oxygen enriched air and pure oxygen with powdered limestone. Influence of S and P in the pig iron, and FeO in the slag, on steel composition. (D3b; ST, S, P)

219-D.* (Russian.) Shrinkage Phenomena of Steel Ingots During Continuous Casting. V.S. Rutes and V.A. Leites. *Liteinoe Proizvodstvo*, Dec. 1958, p. 10-12.

Quantitative change of solid and liquid phases depending upon changing temperatures; change in cooling conditions; evolution of latent heat of crystallization; phase transformations cause shrinkage. (D9q, P10c, 2-61; ST, 4-59)

220-D.* International Low-Shaft Furnace. H. Malcor. *Iron and Coal Trades Review*, v. 177, Dec. 26, 1958, p. 1507-1515.

Experimental furnace at Ougree, Belgium, cannot consume large quantities of fine ore economically. (D8n, D1, W17h)

221-D.* Thermodynamic Studies of Metallurgical Reactions. L. A. Schwarzman. Paper from "Radioisotopes in Scientific Research". v. 1, Pergamon Press, New York, 1958, p. 609-625.

Distribution equilibria of elements between liquid Fe and slags of various compositions; determination of thermodynamic activity of elements dissolved in liquid Fe. 16 ref. (D11, P12, 1-59; Fe, 14-60, ST)

222-D.* (Russian.) How to Reduce Sulphur Content in Pig Iron During the Blast Furnace Process. I. I. Korobov. *Metallurg*, Jan. 1959, p. 7-9.

Temperature increased to 1300°C. or higher; improved tuyere efficiency; better regulation of slag temperature yields good results. (D1; CI-a, S)

223-D.* (Russian.) Cooling Blast Furnaces With Water Used for Slag Granulation. T. T. Nesterenko. *Metallurg*, Jan. 1959, p. 9-10.

Water is used subsequent to the granulation process. (D1h)

224-D.* (Russian.) Effect of Technological Factors on Structural Steel Quality. K. K. Prochorendo and N. P. Shchenkin. *Metallurg*, Jan. 1959, p. 11-14.

Quality can be affected by blisters, nonmetallic inclusions, cracks; ragging, which is a form of longitudinal cracks, occurring during forging. Remedies suggested in each case. (D-general, F-general; ST, 9)

225-D.* (Russian.) Desulphurization of Steel Made in Induction Furnace With Direct Current. O. A. Esin, S. I. Popel and S. G. Bratchikov. *Zhurnal Prikladnoi Khimii*, v. 31, no. 12, 1958, p. 1837-1842.

It is possible to desulphurize the metal by slag electrolysis. S content was reduced from 0.024% to 0.006%. 4 ref. (D6, D11n)

226-D. Augmenting Pig Iron Production at Houston. Carl Leinert. *Blast Furnace and Steel Plant*, v. 46, Sept. 1958, p. 953-956, 965.

Increased production with improved Fe analysis resulted with incorporated bedded, screened and sintered materials. (D1a, Fe, RM-n)

227-D. Steelmaking Reviewed. A. Noel Whiting. *British Chemical Engineering*, Feb. 1959, p. 98-99.

Notes on the conference at Liege sponsored by Centre National de Recherches Metallurgiques, the Groupement des Industries Siderurgiques Luxembourgeoises and the Groupement des Hauts Fourneaux et Acieries Belges. (D-general)

228-D. Progress in the Continuous Casting of Steel. *Engineers' Digest*, v. 20, Jan. 1959, p. 41-44.

History of continuous casting, survey of practice throughout the world. (D9q)

229-D. (German.) Automatic Charging of Low-Shaft Furnaces. Werner Schilling. *Neue Hutte*, v. 4, Jan. 1959, p. 22-28.

6 ref. (D1a, W17h)

230-D. (Russian.) Automation of Open-hearth Furnaces in USSR. V. Iu. Kaganov. *Stal'*, Jan. 1959, p. 16-24.

Automatic control systems for various stages of steelmaking; compares systems in various steel mills of USSR. 6 ref. (D-general, 18-74)

231-D.* Ironmaking Without Blast Furnaces. J. McKelvie. *British Chemical Engineering*, Feb. 1959, p. 70-74.

Low-shaft process, rotary kiln processes, sponge iron process, HyL process, fluidized bed and direct reduction processes. 27 ref. (D8)

232-D.* Measurement of the Relative Mobility of Cations in Mixtures of Oxide Melts. V. I. Malkin and L. A. Schwarzman. Paper from "Radioisotopes in Scientific Research". v. 1, Pergamon Press, New York, 1958, p. 539-548.

Measurement of the transference numbers of ions in mixtures of fused oxides gives information on the relative mobility of the ions, this information being important for extending our knowledge of the structure of liquid silicates, phosphates and similar systems close in composition to metallurgical slags. 10 ref. (D11n, 1-59; RM-q)

233-D.* (French.) Recarburization of Cast Iron and Steel by Blowing With Powdered Substances. Bernard Trentini, Michel Rossi and Albert Jacquin. *Fonderie*, no. 156, Jan. 1959, p. 25-39.

Melt is contained in a barrel-shaped ladle and powdered graphite, coke, charcoal or coal blown under the bath surface by compressed air. Effect of rate of power supply and time on recarburization. 10 ref. (D2f, D9m; CI, CN, *C*)

234-D.* (German.) Continuous Casting. Reinhold Baake and Harry Rosahl. *Neue Hutte*, v. 3, Dec. 1958, p. 740-746.

Continuous casting of 200 × 300-mm. sections. Plant uses stoppers and spouts of graphite fireclay and paraffin lubricated pulsating molds with adjustable walls. (D9q)

235-D.* (German.) Nitrogen Pick-Up in Converter Refining. Gerhard Naeser and Werner Scholz. *Stahl und Eisen*, v. 79, Feb. 5, 1959, p. 137-141.

Oxygen in the gas phase, or high content of ferrous oxide in melting process limits the velocity of N pick-up. Decrease in Fe surface stress by ferrous oxide enriches O, which delays the penetration of N. 9 ref. (D3b; *O, N*)

236-D.* Source of Nonmetallic Inclusion in Steel Ingot. T. Saito and R. Shimanuki. Paper from "Radioisotopes in Scientific Research". v. 1, Pergamon Press, New York, 1958, p. 362-374.

Radioisotopes CA^{45} as CaO and Zr^{95} as ZrO_2 were impregnated in the pouring refractories, which are the source of inclusions. Mild steel was melted and refined in a 150-kva. Heroult furnace, tapped into the tagged ladle and an ingot of about 90 kg. was obtained. Nonmetallic inclusions extracted from the ingot, ingot scum, slag and all other radioactive products were collected, weighed and counted. 5 ref. (D9p, 2-61, 1-59; Cn, 5-59, RM-h, 9-69, *Ca, Zr*)

237-D.* Assessment Trial of the Quality of Refractory Materials Used in a Casting Pit and the Distribution of Nonmetallic Inclusions in Steel by Means of Radioactive Tracers. Z. Bojarski, W. Orzeszko, S. Pawlowski, R. Wusatowski and Z. Ziolowski. Paper from "Radioisotopes in Scientific Research". v. 1, Pergamon Press, New York, 1958, p. 388-410.

Investigation of the distribution and amount of nonmetallic inclusions originating from refractories used in a casting pit by means of Fe^{59}. The radioisotope in the form of Fe_2O_3 was introduced into the fireclay batch used for brickmaking. 6 ref. (D9, 1-59; RM-h, 9-69)

238-D.* (Russian.) Semi-Continuous Casting of Cast Iron Pipes. A. D. Popov. *Liteinoe Proizvodstvo*, Jan. 1959, p. 5-8.

New machine casts pipe 150 mm.in diameter, 10 mm.thick and 4 m. long, as well as steel slabs 150 by 150 mm. in cross section. High rate of cooling results in a fine crystalline structure. (D9q, E14, 1-52; CI-b, 4-60)

239-D.* Continuous Casting of Steel in the USSR. M. S. Boichenko, V. S. Rutes, D. P. Evteev and B. N. Katomin. *Iron and Steel Institute, Journal,* v. 191, Feb. 1959, p. 109-121.

Design of pouring equipment, molds and secondary cooling facilities. Factors affecting quality, heat exchange and solidification of steel under continuous casting conditions. Outlook for process. (D9q)

240-D.* Continuous Casting at Barrow. Iain M. D. Halliday. *Iron and Steel Institute, Journal,* v. 191, Feb. 1959, p. 121-163.

Procedures for high-speed continuous casting of small sectioned steel billets, single and twin strand operation with manual or automatic control. Features of ladles, tundish, spray nozzles, pre-heat practice, metal temperature control, reciprocating mold, product, structure and quality. (D9q)

241-D.* The Behavior of Various Elements in Vacuum Steelmaking. G. M. Gill and G. Wesley Austin. *Iron and Steel Institute, Journal,* v. 191, Feb. 1959, p. 172-175.

Small-scale vacuum melting experiments in induction and arc furnaces to determine effects of vacuum melting on Si, Mn, Ni, Mo, Cu, Ti, W, Co, Sn, Pb, As, S and V content of iron and steel. 5 ref. (D8m; Fe, ST, Si, Mn, Cr, Ni, Mo, Cu, Ti, W, Co, Sn, Pb, As, S, V)

242-D.* (French.) Thermal Balance and Coke Consumption of Blast Furnaces. A. Poos and A. Decker. *Revue Universelle des Mines, de la Metallurgie, de la Mecanique,* v. 15, Jan. 1959, p. 19-32.

Top gas analysis in relation to amount of coke charge. 15 ref. (D11k, D1)

243-D.* (French.) Blast Furnace Operation With 95% Sintered Ore. A. Firket and J. Molderez. *Revue Universelle des Mines, de la Metallurgie, de la Mechanique,* v. 15, Feb. 1959, p. 93-106.

Permeability of the furnace charge measured in relation to blast pressure, heating power of the gas, formation of dust and its characteristics; quality of Fe and of the slag. 8 ref. (D1a, B16a)

244-D.* Air Melting Iron-Aluminum Alloys. Victor F. Zackay and William A. Goering. Digest from paper presented at National Meeting of A.I.M.E. *Metal Progress,* v. 75, Mar. 1959, p. 194-195.

Procedures which will produce air-melted alloys with tensile properties equal to vacuum melted products. (D6, D9, F23; Fe-b, *Al*)

245-D.* Effect of Nozzle Shape on Pouring Stream. R. E. Stoll and E. C. Rudolphy. Digest from paper presented at 41st A.I.M.E. Openhearth and Blast Furnace Conference. *Metal Progress,* v. 75, Mar. 1959, p. 208-210.

Development of a tapered nozzle for the intermediate pouring ladle which gives a much smoother, less turbulent stream than the standard straight-sided nozzle. (D9p, W18n; RM-h, 17-51)

246-D. (Book.) Surface Defects in Ingots and Their Products. 2nd Ed. Special Report no. 63. 58 p. 1958. Iron and Steel Institute, 4 Grosvenor Gardens, London, S.W.1, England. 25s.

Definition and illustration of defects and their usual causes. Surface defects present in ingots; defects in semifinished and finished products arising from ingot defects. Processing defects, defects in rolled steel strip arising from steel itself and from processing. (D9, F21, F23; ST, 9-68, 9-71)

247-D. (Translation.) Phoenix-Lance Steelmaking. H. Th. Brandi. *Journal of Metals,* v. 11, Feb. 1959, p. 118. (From *Stahl und Eisen,* June 26, 1958.)

254-D. (Translation—Brutcher no. 4363.) Effect of Melting Practice Upon Properties of Stainless Steel. R. S. Belyakov. Paper from "Problems of the Use of Vacuum in Metallurgy", Moscow, 1958, p. 35-38.

Production of 18-8 stainless steel in vacuum induction furnaces for lowest possible carbon contents. Final furnace pressure needed to impart to 18-8, free from any stabilizing additions, complete resistance to intergranular corrosion and high resistance to corrosion in boiling 50% nitric acid. (D8m; SS)

255-D.* (French.) Effect of Openhearth Process on Quantity and Nature of Nonmetallic Inclusions. Silvia Dascalu. *Revue de Metallurgie (Bucharest)*, v. 3, no. 3, 1958, p. 87-100.

Influence of decarbutization speed, refining time, carbon content, ratio of Mn to Si, FeO content and melting practice. (D2; ST, 9-69)

256-D.* (German.) Basic Differences in Steel Refining Processes. Werner Heischkeil and Theo Kootz. *Stahl und Eisen*, v. 79, Feb. 19, 1959, p. 205-210.

Bottom blowing of air in converter and openhearth refining produce different metallurgical reactions which are dependent on the nature of the air supply. Application of oxygen blowing to steelmaking. 10 ref. (D3b, D2g)

257-D.* (Hungarian.) Metallurgy of High-Purity Iron Production. Bela Vecsey. *Kohaszati Lapok*, v. 91, Sept. 1958, p. 406-409.

Production of pure Fe in coreless induction furnaces operated in vacuum; reduction with carbon and reduction by hydrogen in induction melting. 23 ref. (D6, 1-73; Fe-a)

258-D.* (Hungarian.) Electric Furnace Steelmaking. Laszlo Szoke. *Kohaszati Lapok*, v. 91, Sept. 1958, p. 427-433.

Vacuum melting processes; comparison with openhearth technique. 22 ref. (D5, 1-73)

259-D.* (Polish.) Effect of Blast Humidity Upon Blast Furnace Operation. Marian Folfasinski. *Hutnik*, v. 25, Nov-Dec. 1958, p. 464-466.

Blast furnace control by varying temperature and moisture of blast in relation to quality and quantity of pig iron production. (D1a)

260-D.* Principles of Blast Furnace Design and Application of High Top Pressure With Oxygen-Enriched Blast. A. K. Shaha. *Institution of Engineers (India), Journal*, v. 39, Dec. 1958, p. 396-419.

Saving of coke, and increase and economy in production of iron and steel, may be obtained by the introduction of high top pressure and a blast with constant moisture enriched by oxygen. (D1h, W17g, 3-74, 17-51)

261-D.* Vacuum Melting of Steels. H. C. Child and G. T. Harris. *Blast Furnace and Steel Plant*, v. 47, Mar. 1959, p. 281-290.

Vacuum induction and consumable-electrode vacuum arc processes and equipment. 11 ref. (D5a, D6, D8m, 1-52, 1-73)

262-D.* Iron by Direct Reduction. J. Grindrod. *Mining Magazine*, v. 100, Feb. 1959, p. 73-78.

Strategic-Udy process. (D8j)

263-D.* Petroleum Techniques for Steel. F. D. Hoffert, E. A. Kelly and A. M. Squires. *Mechanical Engineering*, v. 81, Jan. 1959, p. 27-30.

H-iron process utilizing oil or natural gas and fluidized beds. (D8j)

264-D.* Sponge Iron Production. J. Grindrod. *Mining Journal*, v. 252, Feb. 13, 1959, p. 173-174.

New direct reduction process, known as the Hyl process, which produces sponge from iron ore and natural gas or petroleum without coal or limestone. (D8j; Fe, 6-74)

265-D.* (French.) Carburization and Decarburization in Low-Frequency Induction Furnaces. M. E. Calamari. *Journal du Four Electrique*, v. 6, Dec. 1958, p. 225-228.

Experimental study established possibility of attaining temperatures high enough to produce all types of alloy steels in this kind of furnace; possibility of carburization and decarburization. Life of refractory linings is good. (D6; AY)

266-D. Static Control Provides Blast Furnace Automation. Neal J. Behne, H. C. Diener, Jr., and J. Raymond Erbe. *Iron and Steel Engineer*, v. 36, Feb. 1959, p. 127-138.

Automatic charging system for single-strip furnace. Advantages of magnetic core-type static control elements. (D1a, 18-74)

267-D. Development of the British Iron and Steel Industry. Peter Cameron. *Junior Institution of Engineers, Journal*, v. 69, Pt. 5, Feb. 1959, p. 142-156.

Modern plants and processes. (D-general)

268-D. Electric Furnaces to Gain in Direct Reduction of Ore. *Steel*, v. 144, March 16, 1959, p. 122, 125-126, 128.

Electric smelting, strategic-Udy and other non-blast furnace processes. (D5, D8)

269-D.* (French.) L. D. Process. D. Flament. *Metallurgie et la Construction Mecanique*, v. 91, Feb. 1959, p. 79-82.

Chemical composition of raw materials, steel, slag and dust compared with open-hearth practice. (D10a)

270-D.* (Polish.) Pig Iron Reduction by Low Shaft Furnaces. H. J. Lux. *Hutnik*, v. 25, Nov-Dec. 1958, p. 432-440.

Chemical composition of Fe ore, slag, and coke used in low-shaft furnace production; properties of pig iron and gas. (D8n)

271-D.* LD Steelmaking in Japan. Kaname Mochizuki. *Journal of Metals*, v. 11, Mar. 1959, p. 178-180.

Plant layout, crucible lining, charging and operation; range of product and future prospects. (D10a)

272-D.* Bessemerizing the Blast Furnace Bath. Kuro Kanamori. *Journal of Metals*, v. 11, Mar. 1959, p. 184-186.

Design of small experimental blast furnaces with special tuyere for blowing oxygen-enriched air and powdered materials directly into metal bath. Effect of bessemerizing on metal temperature, and on content of carbon, Si, S and Cr. (D1h; CI-a, *C, Si, Cr*)

273-D.* (Hungarian.) Economic Aspects of Blast Furnace Operations. Ferenc Gemes. *Kohaszati Lapok*, v. 91, Oct-Nov. 1958, p. 469-476.

Role of coke; evaluation of coke consumption data based on actual plant practice; utilization of blast furnace gas; relationship between CO_2 content of blast furnace gas and hearth area. (D1)

274-D.* (Hungarian.) Corrosive Effects of Flue Gas. Klara Mayr. *Kohaszati Lapok*, v. 91, Oct-Nov. 1958, p. 504-508.

Formation of sulphuric acid during blast furnace combustion; relationship between dew point of H_2SO_4 and the rate of corrosion. 13 ref. (D1, R6g)

275-D. (French.) Effect of Sinter Charges on the Blast Furnace Performance. J. S. McLean. Paper from "International Symposium on the Sintering of Iron Ores". v. 1 and 2. l'Institut de Recherches de la Siderurgie (IRSID), Paris, France, 1957, p. 507-518.

Increase of sinter ore in the charge is followed by increased output and reduced coke consumption. (D1a)

276-D. (French.) Sintered Ores Used in the Dorman Long Blast Furnace Co., Middlesbrough, England. J. H. Patchett. Paper from "International Symposium on the Sintering of Iron Ores". v. 1 and 2. l'Institut de Recherches de la Siderurgie (IRSID), Paris, France, 1957, p. 523-546.

Effect on the use of sintered ores on coke consumption, Si and S content in the iron and on the dust produced in smelting. (D1a, B16, 2-60; Fe, *Si, S*)

277-D. (German.) Automation in the Primary Industries, With Special Reference to the VEB Eisenwerke West, Calbe (Saale), East Germany. Kurt Walter. *Freiberger Forschungshefte*, v. B32, Dec. 1958, p. 5-53.

Automation applied to blast furnace charging and cowper stoves. 23 ref. (D1a, 18-74)

278-D. (German.) How to Eliminate the Disproportion Between Charging Speed and Production Speed of Low-Shaft Furnaces. Werner Schilling. *Freiberger Forschungshefte*, v. B32, Dec. 1958, p. 55-114.

Proposals for improvements in the design of automatic equipment. 10 ref. (D8n, W17h, 18-74, 17-51)

279-D. (German.) Heat Economy of the Low-Shaft Furnace and Furnace Developments in the German Democratic Republic. Gottfried Jacob. *Neue Hutte*, v. 4, Feb. 1959, p. 75-84.

Characteristics of the process and conditions of investigation; direct and indirect reduction with regard to special conditions existing in the low-shaft furnace; heat economy and thermal characteristics; conclusions. 23 ref. (D8n, W17h)

280-D. (Russian.) Accelerated Filling of Feeder Heads in Lamellar Ingots. G. A. Chikalenko and T. I. Oleshkevich. *Metallurg*, Feb. 1959, p. 11-13.

Strip rolled from lamellar ingots poured by use of feeder heads is of improved quality and the pouring time from a 135-ton ladle is reduced by 8-10 min. (D9p)

281-D.* (Russian.) Improvements in the Surface Quality of Rimming Steel Ingots. A. G. Nikolaev, Z. I. Ryabov, P. G. Chernogrud and D. K. Pugachev. *Stal'*, Feb. 1959, p. 123-124.

Results of lining rimming steel ingot molds with a 1-mm. thick cup (sleeve) of steel. The sleeve is dissolved by the molten boiling steel and forms no inclusions in the ingot. Use of such linings decreased scab formation and increased the subsequent strip rolling capacity by 30%. (D9k, 9-71, 5-59, ST-d)

282-D.* (Russian.) Production of Generator Steel in a 200-Ton Openhearth Furnace. V. F. Agapov and I. A. Tkachenko. *Stal'*, Feb. 1959, p. 125-128.

To decrease formation of cracks during ingot casting and scabs in subsequent rolling Mn content is limited to 0.25-0.40%. Insertion of a 1-mm. strip of steel in the ingot mold sharply reduced scab formation. (D9k, 2-60; Mn, 9-71)

283-D.* (Russian.) Quality Improvements in the Production of Transformer Steel. N. V. Keis, D. G. Zhukov and A. M. Khizhnichenko. *Stal'*, Feb. 1959, p. 130-131.

Use of moisture-free oxygen at 1570-1590° C. and vacuum treatment lead to considerable increase in yield of superior grade steels and reduce sharply the surface flaws of the slabs. (D9s, 1-73; SGA-n 9-71, ST)

284-D.* (Russian.) Influence of Magnesium on Steel Quality. I. A. Andreev and A. Ya. Borisov. *Stal'*, Feb. 1959, p. 131-136.

Magnesium additions sharply reduce the quantity and dimensions of nonmetallic inclusions in steel. Use of Mg or Ca as a constituent in complex deoxidizers is advisable. Reduction of Si impurities in low-Si steel. Special reference to control of the quantity of spinel in steels containing 1.5% Si. 6 ref. (D5c, 2-60; 9-69, AD-r31, ST, *Mg, Si*)

285-D.* Billets and Bessemers. H. McC. Lawrence. *Engineer and Foundryman*, v. 24, Feb. 1959, p. 43-47.

Design, construction and operation of a small melting plant. (D3, W18q)

286-D.* (German.) Degassing of Steel Used for Rolling and Forging. Fritz Harders, Helmut Knuppel and Karl Brotzmann. *Stahl und Eisen*, v. 79, Mar. 5, 1959, p. 267-272.

Process consists of ligting the melt by suction from the ladle into a vacuum vessel and repeating vacuum degassing until the hydrogen, nitrogen, oxygen and carbon content of the melt reach the desired level. (D9s, 1-73)

287-D.* (German.) Maintenance of High Temperature in Large-Scale Degassing of Steel. Helmut Knuppel, Karl Brotzmann, Karl Ruttiger and Arnulf Diener. *Stahl und Eisen*, v. 79, Mar. 5, 1959, p. 272-276.

Heat losses in degassing process and methods to reduce their effect by introducing supplementary heat to degassing vessel either by electric resistance or electric arc heating. (D9s)

288-D.* (German.) Steel Degassing by Circulation Method. Herbert Thielmann and Hermann Maas. *Stahl und Eisen*, v. 79, Mar. 5, 1959, p. 276-282.

Movable vessel has two pipes extending into the melt contained in the ladle. Suction produced by vacuum in the vessel, together with argon carrier gas introduced into one of the pipes, lifts the melt for degassing while the purified metal flows back into the ladle through the other pipe. 12 ref. (D9s)

289-D.* (German.) Refining Basic Pig Iron in the Trough of a Blast Furnace. Karl Ernst Mayer. *Stahl und Eisen*, v. 79, Mar. 5, 1959, p. 303-304.

Preliminary refining of pig iron, particularly reduction of Si, Mn and C attained by blowing oxygen through bottom of trough made of porous cement. (D1; *Si, Mn, C, O*)

290-D.* Developments in Blast Furnace Practice. T. P. Colclough. *NML Technical Journal*, v. 1, Feb. 1959, p. 59-67.

Crushing, sizing and sintering of ores. Use of high top pressure, self-fluxing sinter, high blast temperatures, steam additions and oxygen enrichment. 7 ref. (D1a, D1h, B16a; Fe, RM-n)

See item 68-D, 1959. (D1b)

304-D. (Translation.) Desulphurization of Renn "Luppen" in the Solid State. M. Wahlster and C. B. Schmidt. *Iron & Coal Trades Review,* v. 178, Feb. 29, 1959, p. 493-494. (From *Technische Mitteilungen Krupp,* v. 16, no. 2, 1958.)

Krupp-Renn process. (D8j)

305-D. (Translation-BWRA) A New Method of Producing Shaped Castings and Ingots Without Feeder Heads by Adding Electro-Slag Metal. G. S. Belous and D. A. Dudko. *Automaticheskaja Svarka,* v. 65, Aug. 1958, p. 32-34.

Molten electroslag metal, formed by fusing a thick electrode in a slag pool, is added to the top of a casting during crystallization. Current is supplied from a generator or a transformer with a flat volt-ampere characteristic. The current passes through the molten slag, which is a good conductor, and heats it to a temperature considerably above the melting point of steel. The metal electrode melts evenly, supplementing the crystallizing molten metal bath of the casting. Since metal is added continuously, homogeneity and absence of pipe in the casting are achieved. (D9k)

306-D.* Making and Treating Alloy Steel Plates. Pt. 1. R. Russell Fayles. *Industrial Heating,* v. 26, Mar. 1959, p. 515-516, 518, 520, 522.

Successful operations imply a sufficiently high carbon content at first test to permit a good heat workout prior to tapping. Slag oxide should attain levels of from 15 to 18% FeO with a lime-silica ratio above 2.8. Bath temperature should be controlled to avoid excessive pouring temperatures. (To be continued.) (D9; AY, 4-53)

307-D.* Dravo Gets American Rights to Swedish Steel Process. *Steel,* v. 144, Apr. 20, 1959, p. 92, 95.

Stora-Kaldo process using tilting, rotating oxygen converter. (D10b)

308-D. Fuel Efficiency in the Iron and Steel Industry. R. P. Towndrow. *Institute of Fuel, Journal,* v. 32, Mar. 1959, p. 106-109.

(D-general, A4, A11e)

309-D. Bessemers Used at Lorain to Make Leaded Steel. *Steel,* v. 144, Mar. 30, 1959, p. 82, 84.

Addition of Pb to melted free machining steel. (D3; ST, *Pb,* AD-q40)

310-D.* Defects in Steel: A Tentative Theory. T. F. Pearson. *Iron and Steel Institute, Journal,* v. 191, Mar. 1959, p. 219-232.

Statistical survey of the defects occurring in a total of over 1000 casts of basic semikilled plate steels. If the casts are classified according to the silica contents of their tapping slags, then the average defect values expressed quantitatively when plotted against the silica contents give rise to a characteristic and complex curve which shows a minimum average defect level at 13-14% silica. 8 ref. (D9; 9)

311-D.* Vacuum Treatment of Steel by the Bochumer Verein Stream Degassing Process. A. Tix, G. Bandel, W. Coupette and A. Sickbert. *Iron and Steel Institute, Journal,* v. 191, Mar. 1959, p. 260-265.

New degassing method reduces hydrogen content and thus produces flake-free forgings. The low total oxygen and inclusion content of the vacuum-treated steel leads to an improvement in toughness. The method can be applied to the degassing of large quantities of steel and production of small ingots of high-alloy steels. (D9s, 1-73)

312-D.* Vacuum-Induction Melting. F. N. Darmara, J. S. Huntington and E. S. Machlin. *Iron and Steel Institute, Journal,* v. 191, Mar. 1959, p. 266-275.

Basic principles of the process, with examples of improvements obtained in the physical properties of Waspaloy and 52100 steels. 13 ref. (D8m, C25, 1-69; Ni-b, AY)

313-D.* Principles of Heat Transfer in the Fuel Efficiency of Blast Furnace. B. I. Kitayev, Rajendra Kumar and S. G.

Mukherjee. *Indian Institute of Metals, Transactions*, v. 11, Dec. 1959, p. 3-20.

Mechanism of heat transfer, heat exchange zones, distribution of temperature and CO_2 concentration along height of blast furnace. Calculation of heat transfer coefficients. Effect of blast temperature and oxygen enrichment on coke consumption. 12 ref. (D1a, D1h, D11k)

A 70-80% desulphurization can be obtained with soda ash, 90% with caustic soda. (D11n)

315-D.* LD Operations at Aliquippa. D. R. Loughrey. *Journal of Metals*, v. 11, Apr. 1959, p. 256-260.

Evaluation of performance in producing low-nitrogen steel using scrap as cooling material. (D10)

316-D.* Electric Direct-Reduction Process Produces Steel or Pig Iron. Albert de Sy. *Journal of Metals*, v. 11, Apr. 1959, p. 265-269.

Use of a double-hearth, low-frequency induction furnace for the production of pig iron or steel. (D6, D8j)

317-D.* From Iron Ore to Steel in 35 Minutes. *Steel*, v. 144, Apr. 27, 1959, p. 100-101.

Madrigal process for producing steel in small batches. (D8j)

318-D.* Chemistry of the Open-Hearth Furnace. G. Husson. *Iron & Coal Trades Review*, v. 178, Apr. 3, 1959, p. 783-787.

Role of the slag in refining and deoxidizing. 14 ref. (D2, D11n, D11q)

319-D.* Steelmaking in Small Furnaces. T. A. Cosh. *Iron & Steel*, v. 32, Apr. 1959, p. 137-141.

Experimental preparation of carbon and alloy steels. (D8)

320-D.* (French.) Improvement in Production of Openhearth Furnaces Heated With Lean Gas by Injection of Compressed Gases Through Burners. L. Septier, S. Terrat, R. Kissel and J. Moreau. *Revue de Metallurgie*, v. 56, Feb. 1959, p. 179-202.

Output of openhearth furnaces fired by low-grade fuels can be increased at least 10% by injection of various compressed gases (air, both cold and preheated, water vapor and blast furnace gas) through gas burners. (D2)

321-D.* Vacuum Melting of Steels. Pt. 2. H. C. Child and G. T. Harris. *Blast Furnace and Steel Plant*, v. 47, Apr. 1959, p. 384-392, 398.

Induction and consumable-electrode arc processes produce steels with minimum of inclusions, higher mechanical, creep, fatigue and hot working properties than air melted metals. 22 ref. (D8m, Q-general; AY, SS)

322-D.* (German.) Degassing of Rimming Mild Steel by Vacuum Boiling and Solidification. Georg Henke and Walter Hess. *Stahl und Eisen*, v. 79, Apr. 2, 1959, p. 405-407.

New vacuum degassing process decreases segregation at center of ingot. Complete elimination of sulphur and partial reduction of phosphorus is achieved. Deep drawing properties of cold rolled strips are improved. (D9s, 1-73; ST-d)

323-D.* (German.) Degassing of Rimming Steel by Projecting a Jet of Molten Steel Through a Vacuum Tunnel. Hubert Hoff, Hermann-Josef Kopineck and Gustav Opfer. *Stahl und Eisen*, v. 79, Apr. 2, 1959, p. 408-410.

Rimming mild steel is teemed into small ingot molds of 5-8 tons capacity. This process is especially recommended for the preparation of sheet semiproducts. Steel is teemed into molds which are placed in vacuum directly under the ladle. (D9s, 1-73; ST-d)

324-D.* (German.) Measuring Technique for Steel Melt Degassing in Vacuum. Karl Brotzmann, Karl Ruettiger, Klaus Foerster and Robert Heinrich. *Stahl und Eisen*, v. 79, Apr. 2, 1959, p. 410-414.

Control of quantity, pressure and chemical composition of gas extracted. (D9s, 1-73)

325-D.* (German.) Vacuum Deoxidizing of Steel and Steel Alloys. Helmut Knueppel, Albrecht Drevermann and Franz Oesters. *Stahl und Eisen*, v. 79, Apr. 2, 1959, p. 414-419.

Deoxidizing in vacuum depends on the state of equilibrium and the rate of carbon-oxygen reactions. The speed of carbon-oxygen reaction depends on the product $[C] \cdot [O]$, on the pressure and on the surface of the melt. (D11r, 1-73)

326-D.* Segregation and Non-Metallic Inclusions. G. Reginald Bashforth. *British Steelmaker*, v. 25, Apr. 1959, p. 121-123, 128-129.

Use of hot faced insulating materials in feeder-head or hot top construction. Although the tendency for nonmetallic material to segregate can be reduced by correct mold and feeder-head design the best method is to reduce the nonmetallic content of the steel to a minimum. (D9k; 9-69)

327-D.* New Openhearth Practice Links Oxygen, Sprung Basic Roof. Oscar Pearson. *Iron Age*, v. 183, May 7, 1959, p. 98-100.

New practice averaged 368 heats per campaign and 342 tons per heat. (D2g, W18r)

328-D.* Pre-Treatment of Hot Metal. Borad Develops "Tower" Process. *Iron & Coal Trades Review*, v. 178, Apr. 17, 1959, p. 901-902.

Continuous iron pretreatment in an atmosphere of oxygen in a refractory tower. Silicon and phosphorus removal takes place. (D8n)

329-D.* (French.) The Place of the Heroult-Type Acid-Lined Electric Furnace in the Steel Foundry. Maurice Viallon. *Fonderie*, Feb. 1959, p. 57-62.

For economic, high hourly production of good-pouring carbon steels, the acid-lined electric furnace is superior to the old-style converter and basic electric furnace. (D5)

330-D.* (German.) Problems and Possibilities of Iron Ore Smelting. B. Marincek. *Elektro Waerme*, v. 17, Feb. 1959, p. 29-31.

Comparison of blast furnace and electric smelting, which uses about half the quantity, and almost any quality, of coal plus 2500 to 3000 kw-hr. per ton raw iron. This can be improved by pre-reducing. (D8n, D1)

331-D.* Automation's Taking Over in the Blast Furnace. J. E. Oram. *Steel*, v. 144, May 11, 1959, p. 152, 155.

Pushbutton, paper tape or punched card programing may be used; computers, given a charge material analysis, will determine the right amounts of raw materials to be put into the furnace. (D1, 18-74)

332-D.* (Italian.) Magnetite Reduction in the Blast Furnace. R. Zoja, L. Peraldo Bicelli and G. Gianasso. *Metallurgia Italiana*, v. 51, Mar. 1959, p. 89-93.

Samples of magnetite taken at various stages of the reduction process were tested microscopically and with Debeye-Scherrer diagrams. The magnetite core of the sample is surrounded by layers of magnetite plus wustite, wustite, iron plus wustite and iron, in the sequence given. With porous ores, the reduction by CO diffusion takes place. (D1)

333-D.* (Russian.) Reduction of Sulphur Content in Pig Iron. P. M. Matveev. *Metallurg*, Mar. 1959, p. 10.

Washing down the hearth of blast furnace with sulphur-free slag or other acid materials that remove lime deposits from hearth walls produces pig iron with reduced sulphur content. (D1; RM-q)

334-D.* (Russian.) Effect of Moisture in Combustion Gases and Hydrogen Content on Openhearth Steel. K. T. Kurochkin, B. A. Baum, A. S. Konovalov and V. V. Postyka. *Metallurg*, Mar. 1959, p. 16-19.

Gaseous atmosphere in the bath area of openhearth furnaces, formed by combustion products from the firing of mazut (fuel oil), is the basic source of hydrogen in openhearth steel. Water vapor in the working area of openhearth furnaces is practically unchanged when moisture content of the fuel is from 1 to 6%. (D2; RM-k)

335-D.* The Kaldo Oxygen Steelmaking Process—Its Metallurgy and Economics. T. Olaf Dormsjo and D. R. Berg. *Iron and Steel Engineer*, v. 36, Apr. 1959, p. 67-77.

Charging, blowing and tapping operations; oxygen consumption, sinter, scrap, ore and lime additions. Heat cycle and composition control in refining high and low-phosphorus pig irons. Steel quality, process economy. 6 ref. (D10b)

336-D.* Vacuum Pouring for Large Forging Production. Henry C. Bigge and Elliott A. Reid. *Iron and Steel Engineer*, v. 36, Apr. 1959, p. 128-141.

Vacuum pouring of low-alloy steel ingots; effect on hydrogen content, tensile ductility, cleanliness and flaking of heavy forgings. Degassing equipment. (D9s, D9p, 1-73)

337-D.* (Hungarian.) Influence of Blast Furnace Operations in Steelmaking. Pt. 2. Ferenc Gemes. *Kohaszati Lapok*, v. 91, Dec. 1958, p. 548-554.

Rate of Mn reduction related to the hearth load; optimum coke charge. (D1a)

338-D. Application of Monolithic Refractories in Steel Plant Equipment. G. D. Cobaugh and C. R. Hauth. *Industrial Heating*,

v. 26, Apr. 1959, p. 791-792, 794, 796, 798. (D-general, RM-h)

339-D. (French.) Direct Reduction of Iron in Norway. *Journal du Four Electrique*, Jan-Feb. 1959, p. 26-30. (D8j)

340-D.* Use of Oxygen in a Modified Tilting Furnace. A. Jackson. *Iron and Steel Institute, Journal*, v. 191, Apr. 1959, p. 337-342.

Operation of modified tilting furnace (Ajax); refractory replacement; lance life; gas cleaning equipment; waste heat boilers. (D2g, W18r, W18g)

341-D.* Removing Sulphur and Silicon From Hot Metal. *Metal Progress*, v. 75, May 1959, p. 91-94.

A "rotary reactor" is expected to supplement or replace some of today's steelmaking processes. Hot metal, arriving from a blast furnace, is poured into a rapidly rotating drum, and spreads over the inside wall in a thin layer. Strong alkalis, iron ore and oxygen are added to reduce sulphur and silicon to low values. (D8n; ST, S, *Si*)

342-D.* Metal Processing in Russia. Arthur B. Tesmen. *Metal Progress*, v. 75, May 1959, p. 106-108.

Continuous casting of steel, ultrasonic treatment of freezing metal and vacuum rolling are all receiving attention from Russian metallurgists. The first is on its way to success; the others are only in the laboratory stage, but have interesting possibilities. (D9q, D9k, F23, 1-73; ST)

343-D.* Vacuum Melting Stainless Steels and Alloys. Digest from "Quality Improvements in Stainless Steels and Superalloys by Vacuum Melting". W. W. Dyrkacz. Paper presented at Western Metal Congress, Los Angeles, Mar. 1959. *Metal Progress*, v. 75, May 1959, p. 138, 140-142, 144.

Two vacuum melting processes which have reached production status are induction melting and consumable electrode arc melting under vacuum or protective atmosphere. The induction process gives greater improvement in mechanical properties where these improvements are chemistry-sensitive. Consumable-electrode melting has advantage of improved mechanical properties, which are segregation or structure-sensitive, improved soundness, particularly in large billet cross-sections, and lower cost. (D8m, Q-general; SS, 9-69)

344-D.* From Iron Oxide to Metallic Iron. Arnulf Muan. *Mineral Industries*, v. 28, Apr. 1959, p. 1, 4-6, 8.

Review of some equilibrium and kinetic relations important in ironmaking. 8 ref. (D8j, D11r)

See item 78-D, 1959. (D3, D11n; O, P)

355-D. (Translation—ConBur) Deoxidizing Capacity of Carbon in Vacuum. A. M. Samarin and R. A. Karasev. *Academy of Sciences of the USSR, Proceedings, Physical Chemistry Section,* v. 119, Mar-Apr. 1959, p. 261-264.

Reactions between carbon and oxygen in liquid iron. 6 ref. (D11r, 1-73; C, O)

356-D.* Examining Continuous Steel Castings. C. Varga and J. Fodor. *Atomic World,* v. 10, Apr. 1959, p. 142-143.

A tungsten ball containing a radioactive marker is dropped into a continuous steel casting to find the lowest point where the inner metal is still molten. (D9q, N12, 1-59; ST, W)

357-D.* (German.) Vacuum Treatment of Openhearth Steel. Caspar Heinrich Pottgiesser, Hans-Jurgen Darmann and Albrecht Drevermann. *Stahl und Eisen,* v. 79, Apr. 16, 1959, p. 463-468.

Decrease in gas content and improvement of the purity degree of Ck35 and Ck45 steels. Average hydrogen content in liquid steel after vacuum treatment was considerably diminished. Average value of oxygen content of vacuum treated steel forgings amounts to 0.006% against 0.010% of untreated steel forgings. (D9s, 1-73; ST)

358-D.* (German.) Properties of Vacuum Treated Steels. Caspar Heinrich Pottgiesser, Adalbert Wicher and Ernst Klein. *Stahl und Eisen,* v. 79, Apr. 16, 1959, p. 468-472.

Comparison of several melts of Ck35 steel with and without vacuum treatment shows only slight and uniformly distributed nonmetallic inclusions in vacuum steel. After killing the steel with Al the variations of average Al content of each melt were small. A stronger growth of austenite grains was observed in Si-killed vacuum steels than in comparable untreated steels. Vacuum treated steels show good properties for deep drawing, cold pressing and machining. (D9s, Q-general; ST)

359-D.* (German.) Degassing by Pouring Molten Steel Through a Vacuum. Arthur Tix, Gerhard Bandel, Werner Coupette and Adolf Sickbert. *Stahl und Eisen,* v. 79, Apr. 16, 1959, p. 472-477.

Vacuum treated steel permits safe production of flake-free heavy forgings. Oxygen in vacuum cast ingots is both diminished and uniformly distributed. (D9s, 1-73; ST)

360-D.* (Russian.) High-Grade Steel From a Mixture of Bessemer and Electric Steels. V. Kyunche and Yan Dun. *Stal',* Mar. 1959, p. 215-221.

Manufacture of steel by means of duplexing Bessemer steel with electric furnace steel in a ladle results in 140% increase in the production of high-grade steel together with reduced costs. Nitrogen content was about 0.002-0.005% lower than in conventional electric steel. Best results are obtained with a ratio of 1.4-to-1 Bessemer to electric steel. 9 ref. (D7)

361-D.* (Russian.) Preliminary Deoxidation and the Hydrogen Content of Steel. M. A.

Druyan and V. M. Soifer. *Stal'*, Mar. 1959, p. 221-224.

Tapping of steel in rimming state from a furnace facilitates reduction of hydrogen content in the metal and improves mechanical properties of cast steel. Degassification using this procedure is very effective. 7 ref. (D2c, D9h; H)

362-D.* (Russian.) Vacuum Treatment of Bessemer Steel. A. M. Samarin, L. M. Novik and G. E. Tsukanov. *Stal'*, Mar. 1959, p. 231-238.

Vacuum treatment in a ladle sharply improves mechanical properties and extends acid Bessemer processes to low-phosphorus iron ores. Vacuum treatment for 14-15 min. produced a very deep degassification of the melt. (D8m, D9s)

363-D.* Equilibrium Between Sulphur in Molten Iron and H_2-H_2S Gas Mixture. Akira Adachi and Zen-ichiro Morita. *Osaka University, Technology Reports*, v. 8, Oct. 1958, p. 385-394.

The activity coefficient of sulphur in molten Fe decreases with the increase of its concentration. 15 ref. (D11n; S)

364-D.* Refining Pig-Iron With Pure Oxygen and Lime Powder. B. Trentini and M. Allard. *Iron & Coal Trades Review*, v. 178, May 8, 1959, p. 1073-1082.

Recent developments of IRSID-OLP process. 7 ref. (D8n)

365-D. (French.) Saint-Jacques Steelmills. *Aciers Fins & Speciaux*, no. 31, Mar. 1959, p. 87-92.

Equipment and layout at Monlucon, France. (D-general)

366-D. (French.) Pilot Operation of a Blast Furnace With 20-40 Coke and 10-50 Mm. Ore. A. Firket. *Revue Universelle des Mines*, v. 15, Mar. 1959, p. 140-153.

(D1)

367-D. (Russian.) Radiometric Control of Stock Line in a Blast Furnace. I. G. Polovchenko, G. A. Vasil'ev and V. I. Afranas'ev. *Stal'*, Mar. 1959, p. 204-205.

Use of radiometric control of blast furnace stock line rather than mechanical stock line indicators eliminates furnace overcharging. (D1a)

368-D.* (Hungarian.) Avoidance of Cracks in Ingot Casting. Jozsef Lantzky. *Kohaszati Lapok*, v. 92, Feb-Mar. 1959, p. 60-64.

Factors influencing the susceptibility of crack formation; mold temperature; casting speed; top and bottom pouring. 12 ref. (D9; 9-72, 5-59, ST)

369-D.* A Radioactive Tracer Study of Steel Surface Defects. T. W. Crosta. Paper from "Proceedings of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41". American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 193-206.

Investigation of hot top lining and refractory-type stool coatings as source of slag and surface defects on ingots and billets of AISI 1012 fully killed steel. Effect of hot top properties and pouring practice. (D2k, 1-59, D9p, W19c; CN-g, 4-52, 9-71)

370-D.* Engineering Thermochemistry of Oxygen Steelmaking Processes. W. O. Philbrook. Paper from "Proceedings of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41". American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 382-398.

Calculation of heat and material balances and oxygen requirements of basic oxygen processes. Effect of Si content of Fe on heat available for melting scrap. 20 ref. (D10, D11k)

371-D.* Comparison of Dephosphorization and Desulphurization in the Open Hearth Slag-Metal System and in the Oxygen Process Slag-Metal System. F. W. Luerssen. Paper from "Proceeding of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41". American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 398-411.

Distribution of sulphur and phosphorus between slag and metal phases for basic openhearth and oxygen processes. Equilibrium data. 7 ref. (D2b, D10, D11n)

372-D.* Manufacture of Sheet Steel for Porcelain Enameling. P. A. Reynolds. *Porcelain Enamel Institute, Proceedings*, v. 20, 1958, p. 4-7.

Composition, processing, characteristics. (D2, Q-general, L27, 2-60; ST-d, 4-53)

373-D.* Refining Liquid Pig Iron in Electric Arc Furnaces. R. Durrer and G. Heintze. *Iron and Steel Institute, Journal*, v. 192, May 1959, p. 13-25.

Trials using up to 70% total charge-weight of low and high phosphorus pig irons in 12 and 40-ton capacity arc furnaces, with ore as the main refining agent. Considerable increases in hourly output

of electric arc furnaces are possible by the "pig iron plus ore" process compared with all-scrap charging. 22 ref. (D5b)

374-D.* Recent Developments in Oxygen Steelmaking in North America. J. M. Gaines. *Iron and Steel Institute, Journal*, v. 192, May 1959, p. 55-60.

Most signigicant applications are evolution of a workable practice for open-hearth heats using oxygen through the roof; growth of the basic oxygen steel process; use of oxygen in electric arc furnaces; potentialities of oxygen enrichment to produce more hot metal from existing blast furnaces. 19 ref. (D1h, D2g, D5g, D8p)

375-D.* Vacuum Casting of Steel. J. Levaux and M. Nepper. *Iron and Steel Institute, Journal*, v. 192, May 1959, p. 77-80.

Vacuum casting in conjunction with the Perrin desulphurization process enables a steel of a very low sulphur, oxygen and hydrogen content to be obtained. The heat treatment of forgings made from ingots treated in this manner can be reduced to the minimum. Forgings do not flake and nonmetallic inclusions are few and dispersed in such a manner that the penetration of ultrasonics is very easy. (D9, 1-73, D11m, J-general; 4-51, ST)

376-D.* Defects in Low-Carbon Steel for Flat Rolled Products. I. A. Sirel. Paper from "Proceedings of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41". American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 143-162.

Defects on slabs and cold reduced sheets of rimmed, capped or killed steels. Causes of scabs, sponge and burned steel, ingot cracks, thermal cracks, pipe and slivers. (D9p, F21b, F23; ST, 4-52, 4-53, 5-59, 9-71)

377-D.* Use of Exothermic Ferromanganese. R. W. Farley. Paper from "Proceedings of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41". American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 162-174.

Ladle additions of exothermic Mn in steel production. Control achieved; efficiency of Mn recovery. (D9m; ST, AD-n32, *Mn*)

378-D.* A Study of Wall Erosion in Wide Slab Molds. R. W. Joseph and L. J. Trilli. Paper from "Proceedings of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41". American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 175-192.

Interface erosion in open-top mold used for casting low-carbon rimming steel ingots. Relation between degree of erosion and surface quality of ingots, slabs and cold rolled sheets. (D9k, W19c; CN-g, ST-d, 4-52, 4-53, 9-71)

379-D.* Effect of Nozzle Size on Pouring Rates and Slab Surface of Rimming Steels. A. T. Peters. Paper from "Proceedings of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41". American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 309-319.

Influence of lable-nozzle size on heat pouring time, pouring rate and surface defects of ingot slabs and sheets. (D9p; ST, 4-53, 5-59, 9-71)

380-D.* Carbon Black in Fuel Oil for Open Hearth Furnaces. E. H. Swett. Paper from "Proceedings of the 41st Conference Open Hearth Steel Committee of the Iron and Steel Division, v. 41". American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 324-337.

Effect of carbon additions on flame temperature, emissivity and furnace output. (D2h; RM-k, RM-m35)

381-D.* (Russian.) Improvement of Blast Furnace Performance With a Uniform Flux Agglomerate. S. K. Trekalo, N. M. Yakubtsiner and A. B. Shur. *Metallurg*, v. 4, Apr. 1959, p. 3-6.

Coarseness of flux agglomerate affects the coke consumption and consequent productivity. Too fine flux hinders the uniform distribution of the charge and hinders the penetration of the ascending gases through the charge column. (D1b; RM-q)

382-D.* One Hundred Years of Progress in Making Open Hearth and Other Steels in the United States. L. F. Reinartz. Paper from "Proceedings of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41". American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 4-57.

Early plants and their production. Development of Bessemer, Siemens Martin and basic openhearth processes. Trends in refractory use in openhearth design and construction; hot metal operation;

charging; tapping; fuels; oxygen injection; metallurgical control. Electric arc furnaces and L-D processes. 37 ref. (D-general, A2)

383-D.* Lukens Cement Hot-Top Practice. Robert L. Bunting, Jr. Paper from "Proceedings of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41". American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 338-347.

Production and use of cement hot-top in steel ingot casting. (D9k, W19c)

384-D.* Rapid Method of Bath Recarburization. Walter Mann and R. G. Waite. Paper from "Proceedings of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41". American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 347-351.

Air gun injectionof powdered graphite and carbon derivatives into openhearth bath. (D2f)

385-D.* Continuous Waste-Gas Analysis for Automatic Fuel Control in the Open Hearth Furnace. C. J. McElhaney and W. V. McNiece. Paper from "Proceedings of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41". American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 352-365.

Theory of combustion control. Continuous sampling and analyzing of oxygen in waste gases and automatic control of fuel. (D2h, X7j, X13f)

386-D.* Sponge Iron as a Source of Metallics in the Steel Industry. P. Ulf Gummeson. Paper from "Proceedings of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41". American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 366-381.

Use of sponge iron in charge of electric arc furnace, high frequency induction furnace and acid and basic openhearth furnaces. Influence on steel composition. 12 ref. (D2a, D5a, D6; Fe, 6-74)

387-D.* Experimental Hot Metal Pretreating Tower. J. M. Gaines and D. C. Hilty. Paper from "Proceedings of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41". American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 411-421.

Elimination of carbon and Si achieved by dropping molten Fe through oxygen atmosphere in refractory tower. 7 ref. (D1b, D10)

388-D.* Continuous Oxygen Analysis for Combustion Control in Open Hearth. E. W. Hunziker and J. W. Bain. Paper from "Proceedings of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41" American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 461-475.

Continuous waste gas analyzer and fuel control system. (D2h, X7j, X13f)

389-D.* (Russian.) Titanium Scrap Replaces Ferro-Titanium as an Addition Agent. Khryukina, M. G. Bryunetkin, E. I. Korablev and L. A. Kamkina. *Metallurg*, v. 4, Apr. 1959, p. 15-17.

Ti-containing scrap (turnings, fillings, strip trimmings) substituted as an addition agent in steels 30T and 18-40 KHGT (Cr-Mn-Ti) in preference to FeTi, increased the yield, decreased rejects and improved tensile strength, yield point and impact strength. (D2c, Q-general; AD-n32, RM-p, Ti, AY)

390-D.* (German.) Manufacture and Properties of LD-Steel. Helmut P. Weitzer and Hubert Hauttmann. *VDI-Zeitschrift*, v. 101, May 1, 1959, p. 514-520.

Refining process; effect of cold drawing on mechanical properties; fatigue resistance of weldments. 12 ref. (D10a, Q-general; CN-g, 7-51)

391-D.* (Russian.) Use of Silicon-Chromium Alloy Additions in Chromium Steels. V. E. Sokolov, B. I. D'yachkov, A. E. Sokolov and I. G. Fadeev. *Metallurg*, v. 4, Apr. 1959, p. 12-14.

In deoxidation and alloying of steels 15KH, 20 KH, (low Cr steels) 20KHN3A, 20KH2N4A (Cr-Ni alloys) SiCr successfully replaced the usual deoxidizing and alloying compounds FeSi and FeCr. This substitution considerably reduced the amount of addition agents for these steels. (D2c; AD-n32, AY, *Cr, Ni*)

392-D.* (Rumanian.) Nonmetallic Inclusions in Steel. Niculae Parau. *Metalurgia si Constructia de Masini*, v. 10, Nov. 1958, p. 947-952.

Types of nonmetallic inclusions and their origin; formation of oxides, sulphides and silicates during steelmaking.

Distribution, shape and size of inclusions; influence on crack initiation and mechanical properties of steel. 10 ref. (D2c, Q26, 9-69; ST)

393-D.* (Czech.) Desulphurization of Basic Openhearth Steel. Jiri Mocek. *Hutnicke Listy*, v. 14, May 1959, p. 405-409.

Ratio of the concentration-of-sulphur/activity-of-sulphur is influenced by the melt composition and the slag. Desulphurization is conditioned by the reactivity of slag and a slag composition which provides both fluidity and adequate basicity. 28 ref. (D11n, D2d)

394-D.* (German.) Vacuum Degassing. *Stahl und Eisen*, v. 79, Apr. 30, 1959, p. 634-638.

Critical analysis and literature review. 14 ref. (D9s, 1-73)

395-D. Ironmaking in Australia. S. Klemantaski. *Iron & Coal Trades Review*, v. 178, May 22, 1959, p. 1195-1199.

Blast furnace practice and the scope for research. (D1, A9)

396-D. Ingotrol--a System for Pouring Ingots of Uniform Size Automatically. W. A. Black. Paper from "Proceedings of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41". 428-D. (Translation—ConBur.) The Equilibrium Distribution of Sulphur Between Metal and Slag in Openhearth Furnaces. L. A. Shvartsman, A. I. Osipov, V. E. Surov, M. L. Sazonov, S. A. Telesov and A. M. Ofengenden. *Proceedings of the Academy of Sciences of the USSR,* v. 120-121, May-Aug. 1958, p. 89-91.
For successful desulphurization of steel it is essential to maintain the slag in such a state that a combination of favorable thermodynamic and kinetic condtions is insured. (D11n, D2d)

429-D.* (German.) Production of Pig Iron and Steel by the Direct Reduction of Iron Ore With Hard Coke in Shaft Furnaces. Mstislaw Kurtschatow and Svat Cernoch. *Bergakademie,* v. 11, Apr. 1959, p. 228-233.
Principles and technology of a new shaft furnace process where reduction of iron ore is achieved by the use of hard coke provided a separation between reduction and combustion process is maintained. 19 ref. (D8j, D8n)

430-D.* Use of Oxygen in a Modified Tilting Furnace. A. Jackson. *Iron & Steel,* v. 32, May 22, 1959, p. 254-268.
Problems involved in redesigning an all-basic furnace of a British mill for oxygen injection; instrumentation, controls, operating conditions. Ingot output is high compared to that of standard furnaces in plant, but improvements are needed to increase metallic yield, extend roof life and to design suitable lances. (D2g)

431-D.* The Use of Oxygen in a Modified Tilting Furnace. A. Jackson. *Iron & Steel,* v. 32, May 22, 1959, p. 268-270.
Results of one year's experience with a basic roof openhearth furnace with reference to refractory life, gas cleaning system, lance life, waste-heat boiler performance, sulphur removal, slag analyses, gases in steel and rejects. (D2g)

432-D.* The Use of Oxygen in Duplex and Stationary Openhearth Practice. Oscar Pearson. *Iron & Steel,* v. 32, May 22, 1959, p. 271-276.
Recent developments in use of oxygen in U. S. Steel Corp. furnaces include use of sprung, suspended basis roof with holddowns and vertical oxygen roof lancing. (D2g)

433-D.* Some Investigations on the Treatment of Molten Iron. W. J. B. Chater and J. A. Charles. *Iron & Steel,* v. 32, May 22, 1959, p. 276-280.
Iron pretreatment processes prior to steelmaking operations; ladle treatment

methods with normal methods of slagmaking material addition; pretreatment with powdered slagmaking materials; Borad tower pretreatment process. Treatment of foundry iron; desulphurization; increasing the carbon content of foundry melts; oxygen lancing in the cupola hearth. (D11m, E10a; AD-a)

434-D.* Practical Aspects of Pretreatment Processes. J. L. Harrison. *Iron & Steel*, v. 32, May 22, 1959, p. 281-284.

Desiliconization and dephosphorization in blast furnace runners, transfer ladles, Kaldo and Oberhausen rotors and active mixers. Removal of Cr as part of ladle pretreatment. (D11h, D10)

435-D.* Development and Present State of L-D Process. O. Cuscoleca and K. Rosner. *Iron & Steel*, v. 32, May 22, 1959, p. 284-296.

Flexibility of process and ability to produce high-purity steels regardless of pig iron analysis, with special reference to Austrian, American, West European and Asian plants. (D10a)

436-D.* Comments on the O.L.P. Process. B. Trentini, P. Vayssiere and M. Allard. *Iron & Steel*, v. 32, May 22, 1959, p. 286-288.

Oxygen-lime-powder process for refining high-phosphorus hot metal; factors controlling impurities in final steel; evolution of slag composition; phosphorus and sulphur problems. (D8n)

437-D.* Refining Liquid Pig Iron in Electric Arc Furnaces. R. Durrer and G. Heintze. *Iron & Steel*, v. 32, May 22, 1959, p. 289-294.

Full-scale tests were conducted in 12 and 40-ton arc furnaces in which charges contained large proportions of liquid pig iron, with ore being used as the refining agent. Rich ore fines are particularly suitable for this purpose. Proportion of steel obtained directly from ore can be considerably increased by additional reduction of ore fines by coke fines. (D5b).

438-D.* Further Experience With the Kaldo Process. B. Kalling and Folke Johansson. *Iron & Steel*, v. 32, May 22, 1959, p. 295-298.

Process control, steel yield, lining life, steel quality. Special fields of application include prerefining of pig iron for openhearth and electric furnaces and transformation of high-phosphorus pig iron into hematite cast iron. (D10b)

439-D. Recent Developments in Oxygen Steelmaking in North America. J. M. Gaines. *Iron & Steel*, v. 32, May 22, 1959, p. 252-254.

(D-general, D10)

440-D. Vacuum-Cast Steels; an Improved Engineering Material. *Precision Metal Molding*, v. 17, June 1959, p. 27.

Features of vacuum casting in a consumable-arc melting furnace. (D8m)

441-D.* (Russian.) Effective Use of Sinters and Briquettes of Iron Ore and Lime in Openhearth Furnaces. A. G. Derfel, Yu. G. Dubina, N. I. Myshenkov, S. L. Sologub, E. V. Tretyakov, V. I. Khipov, F. A. Cheknenko and Ya. A. Shneerov. *Stal*, v. 19, May 1959, p. 400-407.

Use of sinters and briquettes speeded up melting period by 40-45 min., increased productivity of a 370-ton furnace by 6-7%; aided dephosphorization and desulphurization capacity of slag and increased basicity during melting. Total content of FeO at the beginning of the melting period was reduced while FeO was increased at the conclusion of the melting period. 6 ref. (D2a, D11n; Fe, 6-73)

442-D.* (Russian.) Firing of Openhearth Furnaces With Natural Gas. B. N. Kurochkin, E. I. Simonov, L. A. Kalashnikov, L. K. Emets and V. D. Zelenskii. *Stal'*, v. 19, May 1959, p. 407-413.

Change-over from fuel oil to high-pressure (3 at. gage) natural gas fuel, carburized with liquid fuel up to about 30% of total fuel requirements, reduced fuel consumption while maintaining the same furnace productivity. (D2h, W18r)

443-D.* (Russian.) Quality of 13 Ton Ingots of 14KHGS Steel. V. K. Barzit, M. I. Vainshtok and V. P. Gamazov. *Stal'*, v. 19, May 1959, p. 456-459.

Nature of chemical heterogeneity of the ingot and distribution of nonmetallic inclusions, such as sulphides of Mn and Fe, complex compounds of silicates, nitrites and alumina, which affect the homogeneity of the steel in various parts of the ingot. (D-general; 5-59, SS, 9-69)

444-D.* (German.) Phosphorus-Oxygen Equilibrium Between Liquid Iron and Calcareous Phosphate Slag. Helmut Knueppel, Franz Oesters and Heinrich Gruss. *Archiv fur das Eisenhuttenwesen*, v. 30, May 1959, p. 253-265.

Equilibrium between Fe with P and O content and iron (II)-oxide-calcium-phosphate lime slag in a lime crucible is measured at 1600° C., while slags with 4% SiO_2 and MnO are added. 20 ref. (D11n)

445-D. (Russian.) Causes of Charge Hanging in a Blast Furnace Using Oxygen Enriched Blast. *Stal'*, May 1959, p. 292-296.

Main cause of charge hanging is due to the formation, above the tuyere level, of a layer of charge materials causing a poor gas penetration, (resulting from lowering of the slag formation zone) and the condensation vapors of SiO and SiO_2 compounds. Methods of eliminating hanging are suggested. 4 ref. (D1a)

446-D.* Deoxidation of Steel in Vacuum. A. M. Samarin. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 255-265.

Carbon is an effective deoxidizer of liquid metal in the production of steel and alloys in vacuum inducation furnaces. The interaction of molten metal with the furnace lining causes increased penetration of oxygen into the metal. The use of a deoxidizer such as hydrogen, as well as autocrucible furnaces, results in steels and alloys of very low oxygen content. 10 ref. (D6, 1-73; AD-r31)

447-D.* Effect of Liquid Steel Treatment in Vacuum on the Composition and Properties of Some Steels. A. M. Samarin. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 255-265.

Method of subjecting liquid steel produced in any steelmaking furnace to vacuum treatment in a ladle placed in a special chamber, or during casting in molds. Owing to the mixing of metal with slag, vacuum treatment of liquid steel in a ladle provides additional purification of steel from sulphur. 4 ref. (D9m, D9s, 1-73)

448-D.* Ferrous Base Alloys. A. M. Aksoy. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 309-325.

Comparison of the mechanical properties of air melted and vacuum melted Ni-Cr stainless steels. Vacuum melting techniques result in lower gas content, improved gas content, improved cleanliness, ingot structure relatively free from segregation and controlled composition. 14 ref. (D8m, Q-general; SS)

449-D. Steelmaking/U.S.A. Pt. 3. Leo F. Reinartz. *Journal of Metals*, v. 11, June 1959, p. 403-406.

Furnace developments; improvements during the last few decades in fuels; instrument control. (D-general, W18)

450-D. Instant Steel: Will It Revolutionize Metalworking. James Joseph. *Western Metalworking*, v. 17, June 1959, p. 37-40.

Madrigal "instant steel" process bypasses blast furnace, eliminates scrap and coke. (D8j)

451-D.* Selective Smelting of Lateritic Ores. Marvin J. Udy and Murray C. Udy. *Journal of Metals*, v. 11, May 1959, p. 311-314.

Application of Strategic-Udy smelting techniques to treatment of lateritic ores for production of ferronickel, chromium-iron and refined steel. (D8j, D8n; ST, *Ni, Cr*, AD-n32)

452-D.* Sponge Iron by the HYL Process. F. Weston Starratt. *Journal of Metals*, v. 11, May 1959, p. 315-318.

Rich Fe ore reduced in retorts by hot reformed natural gas. Control of carbon of sponge. Utilization of sponge iron in electric furnace steelmaking in Mexico. (D8j, D5a; Fe, 6-74)

453-D.* Nitrogen in Steels. Karl G. Speith and Hans vom Ende. *Journal of Metals*, v. 11, May 1959, p. 333-338.

Solubility of nitrogen; introduction, absorption and removal of nitrogen during melting and refining in openhearth and electric furnaces or in converters. Effect of processing conditions on nitrogen content. Influence of nitrogen content on properties of killed and rimming steels. 19 ref. (D2, D3, D5, N15; ST, *N*)

454-D. Steelmaking/U.S.A. Leo F. Reinartz. *Journal of Metals*, v. 11, May 1959, p. 329-333.

Historical account of working conditions, openhearth furnace operation and developments during last 80 years. (To be continued). (D2; A2, ST)

455-D.* The Role of High-Purity Oxygen in Metallurgical Processes. H. B. Emerick. *Blast Furnace and Steel Plant*, v. 47, May 1959, p. 463-477.

Metallurgical applications of high-purity tonnage oxygen in iron and steel operations. 26 ref. (D-general; O)

456-D.* Making Steel by the Stora-Kaldo Process. *Blast Furnace and Steel Plant*, v. 47, May 1959, p. 490-492, 495-497, 520-523.

Operation, characteristics, capabilities and limitations. Process compared with similar techniques. (D10b)

457-D.* (Hungarian.) Manufacture of Steel by the Rotor Process. I. Balsay. *Kohaszati Lapok*, v. 14, May 1959, p. 177-185.

Advantages claimed include high proportion of scrap iron, good heat economy and desulphurizing action. Current developments of the process. (D10c)

458-D.* (French.) Desulphurization of Cast Iron by the Blowing of Lime Powder According to the T.W.A. Process Developed by IRSID. B. Trentini, J. Raguin and M. Dannewald. *Revue de Metallurgie*, v. 56, May 1959, p. 487-507.

The T. W. A. process consists of blowing highly concentrated lime powder into a bath of molten iron through tuyeres fixed at the bottom of a tilting vessel. Effect of quantity of lime injected, initial sulphur and Si content of cast iron and thermal losses. 20 ref. (D3, D11n)

459-D.* Electric Arc Steelmaking Using Hot Metal Process. *Metallurgia*, v. 59, June 1959, p. 265-268.

Method of pre-refining molten pig iron so that the Si and phosphorus are removed without reduction of carbon. Comparison with other melting processes. (D5g, D8n)

460-D. Experience With Self-Fluxing Sinter at the Steel Company of Canada, Ltd. J. S. McMahan. *Blast Furnace and Steel Plant*, v. 47, July 1959, p. 695-705, 713.

Development of a self-fluxing sinter and blast furnace practice for self-fluxing sinter. (D1a)

461-D. Automation in Iron and Steel Making. J. E. Oram. *Blast Furnace and Steel Plant*, v. 47, July 1959, p. 716-724.

Aspects of automating blast furnace, openhearth, sintering plant and soaking pit processes. (D-general, 18-74)

484-D. (Russian.) Reducing the Feeder Head in Killed Steel. Ya. M. Levitasov, A. M. Ofengenden and V. I. Danich. *Metallurg*, June 1959, p. 16-19.

A blanket of Lunkerite (Al, Fe-Si, coke and slag compound) over the cast metal produced a porous incandescent crust of low heat conductivity. This blanket and improved feeder head design, together with a newly developed exothermic mixture for heating the lateral surface of the feeder head, reduced the size of the head. (D9k)

485-D.* (Russian.) Some Aspects of Side-Blowing in the Bessemer Process. L. K. Grakhov and V. A. Fuklev. *Liteinoe Proizvodstvo*, June 1959, p. 20-22.

Side blowing results in maximum utilization of oxygen and reduction of heat losses by escaping gases and radiation. It must, however, be carried out under conditions of intensive oxidation of carbon and removal of CO gas bubbles. 9 ref. (D3f)

486-D.* Predicting Minimum Materials Cost for Stainless Steels. D. C. Hilty, R. W. Taylor and R. H. Gillespie. *Journal of Metals*, v. 11, July 1959, p. 458-464.

Mathematical method of linear programming applied to stainless steelmaking using Type 430 as the example makes it possible to handle the numerous complex relations among the many variables of charge and practice to arrive at the optimum compromise to secure minimum cost of materials consistent with both the fundamental chemistry and the practical considerations controlling the melting process. 21 ref. (D-general, A4s; SS)

487-D.* (Russian.) Measurement of Hot Blast Temperature Drop in Blowpipes of Blast Furnaces. A. V. Chentsov, B. A. Feldman and S. V. Shavrin. *Stal'*, June 1959, p. 495-496.

Use of special thermocouples with an air outlet to reduce the heat transfer due to radiation from the thermocouple to the walls of the blowpipe. 6 ref. (D1, S16, X9q)

488-D.* (Russian.) Effect of Hot Blast Temperature on the Size of the Oxidation Zone in a Blast Furnace. A. F. Koval'. *Stal'*, June 1959, p. 497-500.

Experiments with a model blast furnace showed that an increase in the hot blast temperature always produces a higher hearth temperature. This causes the contraction of the combustion zone as a result of accelerated interaction of CO_2 and oxygen with the carbon of the coke. (D1h, 2-61)

489-D.* (Russian.) Natural Gas at High Pressures in Openhearth Furnaces. A. I. Urinskii. *Stal'*, June 1959, p. 504-508.

Use of natural gas at 10 atm. pressure instead of petroleum residue at 3 atm. pressure increases furnace productivity. (D2)

490-D.* (Russian.) Study of Parts in Gas-Fired Openhearth Furnaces While Feeding Compressed Air and Oxygen. S. M. Adon'ev, O. V. Filip'ev and E. V. Popova. *Stal'*, June 1959, p. 509-512.

Oscillographic studies of hydraulic models of various types of doghouses in openhearth furnaces, revealed flame characteristics, quality of fuel-air mixture, effect of excess air and additions of compressed air and oxygen. 10 ref. (D2g, W18r)

491-D.* (Russian.) Thermal Performance of Openhearth Furnace During the Blowing of Oxygen and Oxygen-Steam Mixtures Into the Molten Iron Bath. V. N. Cornfl'd, A. O. Voitov, V. I. Koshelev, A. F. Shorin and B. K. Dimov. *Stal'*, June 1959, p. 513-520.

Although the sooner blowing starts the more heat is absorbed by the metal in a given time, there exists a most favorable point at which to begin blowing. Unit consumption of fuel during the melting of low-carbon steel was reduced to 87 kg. per ton by improved selection of blowing time. 4 ref. (D2g)

492-D.* (Russian.) Thermal Problems in the Operation of Large Capacity Openhearth Furnaces. M. A. Glinkov and G. M. Glinkov. *Stal'*, June 1959, p. 568-572.

Conditions of heat exchange during the melting period are improved by enlarging the hearth area in the furnace and coordination of the simultaneous performance of both fuel parts (whether fired with mazut or high calorific value gas). 9 ref. (D2h)

493-D. Steelmaking—U. S. A. Leo F. Reinartz. *Journal of Metals*, v. 11, July 1959, p. 444-448.

History of electric steel and the L-D process. Future trends predicted. 37 ref. (D-general, D5, D10a, A2)

494-D. (Russian.) Primary Slag Formation in the Use of Fluxed Sinter in Blast Furnace. Yu. M. Potebnya and T. I. Litvinova. *Stal'*, June 1959, p. 485-494.

Investigation at the Metallurgical Institute of Drepropetrovsk shows that fluxed sinter, when used instead of raw Fe ore, completes primary slag formation above the furnace bosh and keeps the slag more stable. An increase in the basicity of the sinter contracts the slag formation area, thereby improving conditions for forced furnace performance. 13 ref. (D1b, RM-q)

History of Linz-Donawitz process of oxygen top blowing at pioneer Austrian plants. Vessel linings; properties of LD steels; experience in other countries; lime

powder injection; compacities and costs. 12 ref. (D10a)

509-D.* Preliminary Studies on the Evolution of Fumes From Iron at High Temperatures. E. T. Turkdogan and L. E. Leake. *Iron and Steel Institute, Journal*, v. 192, June 1959, p. 162-170.

Fume emission from molten iron and iron alloys when exposed to oxygen, air, carbon dioxide, oxygen-steam mixtures or ferrite oxide. Relationship between fume evolution and oxidation of carbon. X-ray and microscopic examination of fumes. Fume formation mechanisms. 10 ref. (D11j, N16n; Fe-b, *C*)

510-D. (Russian.) Pig Iron and Slag Temperatures During Smelting of Conversion Iron. I. S. Kulikov, G. A. Sokolov, I. I. Gul'tyai, V. M. Zudin and A. L. Galatonov. *Metallurg*, July 1959, p. 4-7.

Difference in temperature between the upper slag and the pig iron during tapping is an indication to some degree of a uniform blast furnace process. The more uniform the process is, the less will be the temperature differential. (D1, 2-61; RM-q)

511-D. (Russian.) Selection of Temperature for Tapping of Steel. Yu. G. Gurevich and O. F. Antropov. *Metallurg*, July 1959, p. 13-14.

Suggested temperature ranges for liquid steel in the ladle to secure optimum steel quality. The maximum temperature drop between the furnace and the ladle is 30-40° C. (D9n, 2-61; AY, CN)

512-D.* Low-Temperature High-Impact Steels. W. A. Koppi. Digest of "Some Aspects of Melting Low-Temperature High-Impact Steels". Paper Presented at the A.I.M.E. Electric Furnace Steel Conference, Pittsburgh, Dec. 1957. *Metal Progress*, v. 76, Aug. 1959, p. 188, 190.

To minimize inclusions in the production of clean steels, clean furnace bottoms, low FeO content in the final slag, a high residual Mn, proper deoxidation, a good refractory program and a well-adapted pouring practice are recommended. (D-general; CN, AY, 9-69)

513-D. Steel Strip From Ore Without Melting. *Metal Progress*, v. 76, Aug. 1959, p. 86.

New Republic process consists of three major steps. First, Fe ore is purified and then reduced to Fe powder. The powder is funneled between four rolls where it is compressed into a semisolid strip with sufficient "green" strength to hold together. The compacted strip is heated to 2200° F. in a furnace with a reducing atmosphere and is passed through a series of hot rolling mills. Hot rolling brings the compacted powder up to full density and gives hot rolled steel which has the same quality as conventionally made steels. (D8j)

514-D. Bubbling Helium Helps Degas Steel. *Steel*, v. 145, Aug. 17, 1959, p. 106, 110.

Vacuum degassing process with the gas injected into the ladle to increase turbulence. (D9s, 1-73)

515-D. (Polish.) Continuous Casting of Steel. Stanislaw Kawinski. *Przeglad Techniczny*, no. 19, May 1959, p. 8-9.

Equipment, speed and control in continuous casting of steel; Polish installations for continuous casting. (D9g)

516-D.* H-Iron. Nat Wood. *Western Metalworking*, v. 17, July 1959, p. 37-39.

Pilot plant bypasses blast furnace by reduction of iron ore fines with hydrogen in fluidized beds at low temperatures and elevated pressure. (D8j)

517-D.* (Italian.) Results Obtained in Manufacture of Steel With 6-Ton "D.V.H. Lincar" Basic-Lining, Naphtha-Heated Rotary Furnace. A. Bargone and E. A. Hanne. *Fonderia Italiana*, v. 8, Mar. 1959, p. 101-104.

Furnace design; operating and consumption data, and production costs relating to the manufacture of about 2000 tons of steel in 400 melts. Trial runs to determine possibility of producing pig iron by reduction of iron ores also gave satisfactory results. (D8p, W18b)

518-D.* Oxygen Desiliconizing Provides Hot-Metal Electric Steelmaking. H. W. A. Waring and Emrys Davies. *Journal of Metals*, v. 11, Aug. 1959, p. 515-517.

In place of the conventional duplex process a new process for pre-refining with oxygen produces a metal with sufficient carbon to make final decarburization in the arc furnace (using the oxygen lance) simple and rapid. (D5g)

519-D.* Oxygen Open-Hearth Practice in the USSR. *Journal of Metals*, v. 11, Aug. 1959, p. 521-523.

Direct oxidation of the bath with oxygen is used in making low-carbon steel grades

(less than 0.12% C). Oxygen is also injected into the bath during the refining period when converting phosphorus pig iron in tilting furnaces. (D2g)

520-D.* (English.) Research on the Activity of Components in Fundamental System in Iron Blast Furnace Slag. Pt. 1. Measurement of the Activity of Silica in the System of $CaO-SiO_2$ and $CaO-SiO_2-Al_2O_3$. Koji Sanbongi and Yasuo Omori. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, June 1959, p. 244-263.

Electromotive force at 1630° C. of double cell consisting of Fe-Si alloy electrode, $CaO-SiO_2$ or $CaO-SiO_2-Al_2O_3$ experimental slags, intermediate oxygen electrode, $CaO-SiO_2-Al_2O_3$ reference slag and Fe-Si alloy electrode. Calculation of activity of silica from emf values. 16 ref. (D11n)

521-D. U. S. Steel Reveals Pilot Facilities. *Journal of Metals*, v. 11, Aug. 1959, p. 510-511.

Consumable-electrode melting, vacuum stream degassing, oxygen steelmaking, direct reduction at U. S. Steel's South Chicago Works. (D-general, A9)

522-D. Revolution in Steel. *Luria Letter*, July 1959, 4 p.

Review of research trends, with special reference to oxygen in steelmaking. (D-general, A9)

523-D. Hopkins Process Upgrades Metals for Critical Uses. *Steel*, v. 145, Aug. 24, 1959, p. 94-95.

Electrodes are melted under a controlled slag, at a controlled rate, in a water-cooled mold. The molten slag blanket protects metal from the atmosphere. It keeps undesirable elements out of the metal, desirable ones in. The process eliminates inclusions and prevents segregation. (D5b)

524-D.* Vacuum Method Works in Ladle to Boost Degassing of Steel. *Iron Age*, v. 184, Aug. 13, 1959, p. 86-87.

Advantages of this method include efficient removal of hydrogen, oxygen and nitrogen; degassed steel can be poured into one or more molds; the ladle can be moved from one mold to another. (D9s, 1-73)

525-D.* Oxygen Methods of Steel Production. D. L. Bryant. *Castings*, v. 5, June 1959, p. 9, 11, 13, 15, 17.

L-D, Kaldo and Rotor processes. (D10)

526-D.* Ultrasonics Cuts Grain Growth During Casting of Forging Ingot. E. B. Wright, D. R. Carnahan and J. H. Kelley. *Iron Age*, v. 184, Aug. 6, 1959, p. 84-87.

Influence of ultrasonic vibration during vacuum arc casting on the macrostructure of forging steel ingots. (D9, 1-73, 1-74, M28h; ST, 5-59)

527-D.* Russian Steelmaking. *Iron and Steel Engineer*, v. 36, July 1959, p. 63-66.

Impressions on coking, sintering, blast furnace, openhearth and rolling mill operations in the Soviet Union. (D-general)

528-D. (German.) Influence of High Metallurgical Loads and Increased Solid Iron Charges on the Work of a Maerz Openhearth Furnace. Karl-Friedrich Ludemann. *Neue Nutte*, v. 4, Apr. 1959, p. 198-207.

Effects on capacity, decarbonization velocity and refining-process. 13 ref. (D2a)

529-D.* Determination of the Cerium Habit in Carbon Steel. R. H. Singleton. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 675-679.

Vacuum-refined carbon steel melts containing specified amounts of sulphur were exposed to various specified amounts of oxygen and nitrogen after which Ce was added. The resultant metal was examined metallographically, and samples were extracted electrolytically in an attempt to isolate inclusions. With the aid of these techniques, together with the metal compositional data, it was determined that the Ce habit was predominantly a cerium sulphide. 9 ref. (D11s, D6, 2-60, 1-73; CN, *Ce, S, O, N*, 9-69)

530-D. Degassed Die-Block Steel. *American Machinist*, v. 103, Aug. 24, 1959, p. 87.

Vacuum ladle-degassing differs from vacuum steam-degassing and vacuum arc-furnace degassing in that, after pouring, the filled ladle is placed in a vacuum chamber. (D9s, 1-73)

531-D.* (German.) Degassing Steel by the Vacuum Stream Degassing Method. W. Coupette. *Vakuum Technik*, v. 8, May 1959, p. 101-103.

An extremely rapid degassing process is guaranteed even at pressures of 1 torr or below, with the hydrogen content remaining within the required limits. This is achieved by the enlargement of the surface-contact area of the steel. In this way low pressures can be achieved with the same pumping capacity and more intensive forces can be activated for the metallurgical reactions. (D9s, 1-73)

532-D.* Applying the Digital Computer to Openhearth Operations. *Control Engineering*, v. 6, Aug. 1959, p. 94-100.

Integration of various procedures and control of variables. (D1, X14)

533-D.* Low Shaft Furnace Pilot Plant. *Indian and Eastern Engineer*, v. 101, Apr. 1959, p. 255-258.

Construction and flow diagrams for Jamshedpur plant in India. The low-shaft furnace process achieves reduction in effective height which widens the choice of raw materials and allows the utilization of furnace gas of high thermal value. (D8n, W17h)

534-D.* Continuous Casting. Development of a Horizontal Process for Cast Iron and Non-Ferrous Bar. Z. Stokowiec. *Iron & Steel*, v. 32, June 1959, p. 323-326, 332.

Influence of C, Si, P and Mn on microstructure and tensile strength of continuously cast iron bars. Importance of temperature and speed of withdrawal. Mechanism of solidification in vertical and horizontal processes. (To be concluded.) (D9q, N12, M27, Q27a; CI, *C, Si, P, Mn*)

569-D. (Russian.) Instrument Allowing Investigations on the Kinetics of Reactions. V. I. Korofich and V. K. Gruzinov. *Nauchnye Doklady Vysshei Shkoly— Metallurgiya,* no. 2, 1959, p. 250-251.

Control of metallurgical processes by exposing samples to bend stress and measuring changes in conductivity. (D-general, S18)

570-D.* Vacuum Degassing of Steel in the Ladle. *Foundry,* v. 87, Oct. 1959, p. 130.

Nature and effectiveness of process. Steel can be poured freely into several molds which need not be in a vacuum. Very slight heat loss results during degassing. (D9s, 1-73)

571-D.* (German.) Effects of Small Silicon Contents on the Equilibria of Carbon and Oxygen in Liquid Iron. Hermann Schenk and Karl Heinz Gerdom. *Archiv fur das Eisenhuttenwesen,* v. 30, Aug. 1959, p. 451-460.

Relationship between the carbon, Si and oxygen contents and the CO_2 content in the gaseous phase at 1600-1680° C. and under a SiO_2 saturated slag. CO_2 content of the $CO-CO_2$-gaseous phase as a function of the carbon present in the melt. 36 ref. (D11h, 2-60, 2-61; Fe, 14-60, *C, O, Si)*

572-D.* (German.) Equilibria Between an Iron Melt and a Phosphate Slag Containing Calcium. Gerhard Tromel and Hans Werner Fritze. *Archiv fur das Eisenhuttenwesen,* v. 30, Aug. 1959, p. 461-472.

Melting of Armco iron and slag additions in a calcium phosphate crucible and holding at 1550-1700° C. Correlation between slag composition and composition of melt. 10 ref. (D11n; Fe, 14-60)

573-D. Vacuum Melting at the Works of Jessop-Saville, Ltd. *Foundry Trade Journal,* v. 107, Sept. 17, 1959, p. 179-182.

Two methods adopted by Jessop-Saville, Ltd., Sheffield, are the consumable electrode arc melting and high-frequency induction melting processes. (D8m)

574-D. (German.) Distribution of Materials During Charging of a Blast Furnace. R. Baake. *Neue Hutte,* v. 4, Aug. 1959, p. 461.

Influence of charging on the distribution of ore and coke layers in the furnace. 18 ref. (D1a)

575-D. Removes 60% of Hydrogen From Steel in Ladle. *Chemical Processing,* v. 22, Oct. 1959, p. 80-81.

Vacuum degassing improves the quality of high-alloy steels for die-block and hot work die steel. (D9s)

576-D.* (Russian.) Melting of Low-Manganese Pig Iron. L. M. Freidin and L. Ya. Porthoi. *Stal',* July 1959, p. 587-589.

For successful melting in blast furnaces of the southern region pig iron poor in Mn, it is essential to improve the uniformity of the composition of the raw materials, especially of fluxes, and to introduce dolomite-limestone into the charge to obtain an active magnesium slag. (D1a)

577-D.* (Russian.) Alloying of Steel With Nitrogen by Means of Organic Agents. Pin'es and Zezulova. *Stal',* July 1959, p. 625-626.

Alloying is achieved by melting in an electric arc furnace and increasing the nitrogen content to tenths of 1%. The function of the nitrogen is to replace the deficient Ni, nitrogen entering into solid gamma-solution. 6 ref. (D5c; *N*)

578-D.* (Russian.) The Process of Formation of Outer Cracks in Ingots During Hot Deformation. I. T. Baruzdin. *Stal',* July 1959, p. 649-652.

Development of microfissures in ingots into large ones is related to teeming temperatures and rates. A reduced temperature will produce a denser structure and decrease the number and depth of surface microcracks. (D9r, 2-61; 5-59, 9-72)

579-D. Casting in Argon Lowers Ingot Inclusion Count. *Iron Age,* v. 184, Oct. 1, 1959, p. 73-75.

Method of blanketing molten metal with argon during teeming to avoid formation of inclusions. (D9p; 5-59, 9-69)

580-D. Will New Iron-Making Methods Cut Blast Furnace Operations? G. J. McManus. *Iron Age,* v. 184, Oct. 8, 1959, p. 114-117.

New methods include fluid beds, shaft furnaces, electric furnaces, kilns and retorts. (D8n)

581-D. Vacuum Process for Die-Block Steel. *Tooling & Production,* v. 25, Oct. 1959, p. 48.

Removal of hydrogen from molten steel after it is tapped from the furnace into the ladle. (D9s, 1-73; TS)

582-D.* (Polish.) Mechanism and Kinetics of the Reduction of Iron Ores. Emilian Iwanciw. *Archiwum Hutnictwa,* v. 4, no. 2, 1959, p. 133-159.

Reduction of Fe_2O_3 and natural magnetite in the presence of charcoal by $Co + CO_2$ at temperatures ranging from 700 to 1200° C. Effect of temperature on reduction rate. Computation of the activation energy of reduction. Effect of pressure. 20 ref. (D11g, D8j, 2-61, 3-74, P13a; RM-n, *Fe*)

583-D. Blast Furnace Is Updated With Nuclear Stock Gages. *Steel,* v. 145, Oct. 12, 1959, p. 120, 124.

Stock level in a blast furnace determined by radioactive sources and detectors built into the furnace well. (D1a, 1-59)

584-D. (Russian-Book.) Vacuum Treatment of Steel. N. D. Shadrina. 68 p. 1958. Izd-vo VTsSPS Profizdat, Moscow. (Available from Library of Congress, Washington, D.C.)

Review of the most commonly used methods of treating steel in a vacuum including vacuum treatment of the molten metal in the ladle before pouring, and vacuum treatment by the method of pouring metal from one ladle to another. (D9, 1-73)

585-D. (Translation—Brutcher no. 4683.) Kinetics of the Reduction of Iron Oxides Forming a Stratum by Hydrogen. S. T. Rostovtzev and A. P. Em. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya,* no. 2, 1959, p. 9-14.

Reduction process as a function of temperature, time and of the velocity of gas flow. (D11, 2-61, 3-67)

586-D. (Translation—Brutcher no. 4692.) Mechanism of the Reduction of Iron Oxides. S. T. Rostovtsev, L. N. Rudenko and V. K. Simonov. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya,* no. 2, 1959, p. 5-8.

Theoretical considerations on the reduction by CO or hydrogen. 5 ref. (D11g)

587-D. (Translation—Brutcher no. 4695.) Changes in the Amount of Oxide Inclusions Present in the Metal During the Openhearth Process. S. L. Levin and I. P. Kazachkov. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya,* no. 2, 1959, p. 43-47.

Effect of the speed of carbon oxidation during the second boiling process on the quantity and composition of oxide inclusions. Changes caused by deoxidizers and Al added. (D2; ST, 9-69)

588-D.* (French.) Determination and Recording of the Temperature in a Basic Bessemer Converter by Optical Pyrometry. J. Galey, L. Beaujard, P. Vallet, G. Urbain, J. Tordeax and P. Villette. *Revue de Metallurgie,* v. 51, July 1959, p. 69-99.

Description and use of the instrument. Melt temperature as a function of the initial temperature, the amount of air consumed in blowing and the composition of melt and slag. Cooling rates during solidification with and without addition of pure iron. Effects of carbon and phosphorus on nucleation during cooling. 10 ref. (D3, 1-65, S16a, P12, 2-60, N2g; ST, 14-60)

589-D.* (German.) The Low Shaft Furnace at Ougree Used as a Small Pilot Furnace. E. Bonnaure. *Stahl und Eisen,* v. 79, Aug. 6, 1959, p. 1105-1119.

The significance of the applied higher gaseous pressure at the top of the furnace, the specific coke rate, effects of grain size and lime flux. Gas and temperature conditions in the furnace; theoretical presentation of the critical coke rate; sinter composition analysis. (D8n)

590-D.* (German.) Nitrogen Used as an Alloying Element in the Production of Manganese-Vanadium Structural Steels in Openhearth Furnaces. H. Joachim Wiester, H. A. Vogels and H. Ulmer. *Stahl und Eisen,* v. 79, Aug. 6, 1959, p. 1120-1129.

Experiments with thick sheets proved that nitrogen used as an alloying element condiderably improves structural properties. Perfectly weldable steels with elongation limits from 35 to 45 kg.per sq. mm. were obtained with ST 52-3 steel with the addition of vanadium up to 0.27% and with nitrogen up to 0.025%. (D2c; *Mg, V, Ni,* SGB-s)

591-D.* A New Direct Iron Process in Relation to Ore and Steel Production. Horace Freeman. *Canadian Mining and Metallurgical Bulletin,* v. 52, Aug. 1959, p. 529-531.

Rotary kiln process. (D8j)

592-D.* An Outline of Exothermic Feeding. B. G. Pidermann. *Engineer and Foundryman,* v. 24, Apr. 1959, p. 97-103.

Methods of increasing production of castings and ingots per ton of metal melted by means of various types of exothermic compounds. (D9k, E23; ST)

593-D.* Oxygen in the Iron and Steel Industry. J. L. Harrison. *Engineer and Foundryman,* v. 24, Apr. 1959, p. 110-114.

Use of oxygen as an additive to solid, liquids and gaseous fuels and in electric arc furnaces. A smaller percentage of nitrogen in the blast, higher combustion temperature, increased melting rate and lower coke consumption are achieved. (D-general; O)

594-D.* Instant Steel—Will It Aid Maintenance? *Plant Engineering,* v. 13, July 1959, p. 92-95.

Madrigal process converts raw iron and alloys directly to steel in less than 40 min. Pulverized Fe ore is mixed with an "alloying" compound and is heated to about 3000° F. for 35 min. (D8j)

595-D.* Recent Trends in Iron and Steel Technology. B. R. Nijhawan. *Blast Furnace and Steel Plant,* v. 47, Oct, 1959, p. 1057-1060.

Advantages of using oxygen injection in steelmaking as achieved by different methods in various countries. Oxygen injection reduces nitrogen and phosphorus contents, improves the mechanical properties and reduces the tendency to work hardening and strain-age embrittlement. (D2g, D3f, D10)

596-D.* Use of Oxygen in Duplex and Stationary Open Hearth Practice. Oscar Pearson. *Blast Furnace and Steel Plant,* v. 47, Oct. 1959, p. 1063-1070.

Economic use of oxygen by varying the design of the openhearth furnaces to suit different methods. Types of furnaces considered are the openhearth furnace with suspended basic roof, modern stationary 380-ton openhearth furnace and 190-ton tilting furnace with oxygen roof lance. (D2g, W18r)

597-D.* Increased Production Obtained From Automatic Regulation of Blast Furnace. *Blast Furnace and Steel Plant,* v. 47, Oct. 1959, p. 1081-1082.

Hagan top pressure control system installed at Alan Wood Steel Co. controls the blast furnace top pressure automatically. This results in increased gas pressure and increased production without loss of additional burden particles as flue dust. (D1h, S18r)

598-D. Electric Melting Economics. J. G. Contant. *Blast Furnace and Steel Plant,* v. 47, Oct. 1959, p. 1073-1078.

Comparison with openhearth furnaces with respect to capital and production costs and output. (D5, D6, A4s)

599-D. Application of Data-Logging and Programming Techniques to Steel Mill Processes. R. W. Barmitz and G. E. Terwilliger. *IRE Transactions on Industrial Electronics,* July 1959, p. 24-31.

(D-general, X14j)

600-D.* A Review of Steelmaking Processes. T. P. Colclough. *Iron and Steel Institute, Journal,* v. 192, July 1959, p. 201-213.

Basic bessemer process, acid bessemer process, OH process and the hot metal process from the point of view of ingot yield by percentage of metals charged, byproducts, waste, radiation and other losses. (D-general)

601-D. (Russian.) Effect of Potassium Oxide on the Viscosity of the System CaO-SiO_2-Al_2O_3 With Special Reference to the Composition Ratio Corresponding to the Analysis of Prima.y Blast Furnace Slags. I. I. Gul'tyai, N. L. Zhilo, A. V. Rudneva, G. A. Sokolov and L. M. Tsylev. *Isvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo,* no. 2, 1959, p. 3-7.

Determination of the temperature at which various composition ratios show the same viscosity coefficient and also of their viscosity values at various temperatures. With the Al_2O_3 content kept constant, addition of K_2O caused increased viscosity and higher crystallization temperatures. 9 ref. (D11n)

602-D. (Russian.) Dephosphorization of Cast Iron Using Solid Additions. O. V. Travin and L. A. Shavartsmann. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo,* no. 2, 1959, p. 8-12.

To a cast iron melt containing 0.005-0737% phosphorus, pressed tablets containing CaO (50%) and Fe_2O_3 (50%) were added to study the transition of phosphorus from the melt into the tablets by means of the radioactive isotope P^{32}. Effects of time and temperature on dephosphorization. (D11n, 3-67, 2-61)

603-D.* Standard Steel's Vacuum Pouring Stream-Degassing Installation. *Industrial Heating*, v. 26, Sept. 1959, p. 1754-1756, 1758.

New facility allows production of low-hydrogen steel rings, shafts, pinions, gears and other forgings for critical high-stress applications in rotating machinery. (D9s, 1-73)

604-D.* New Electric Direct Reduction Process Produces Steel or Pig Iron. *Industrial Heating*, v. 26, Sept. 1959, p. 1772, 1774, 1776.

Use of special design double-hearth low-frequency induction furnace for the production of either rimming-type liquid steel or a carbon-rich alloy similar to pig iron by direct reduction of rich Fe ore through reaction with carbon. (D8j)

605-D.* Application of Special Refractory Materials in the Iron and Steel Industry. J. D. McCullough. *Iron and Steel Engineer*, v. 36, Sept. 1959, p. 172-178.

Gunned castable refractories for packing and building up linings of blast furnaces; roof materials for patching billet and slab furnaces. (D-general; RM-h)

606-D.* Nuclear Energy Applications for Steel Plant Operations. Patrick J. Selak and Rudolph Tietig, Jr. *Iron and Steel Engineer*, v. 36, Sept. 1959, p. 179-184.

Use of radioisotopes for automation, process and quality control. Isotopes are used to determine the characteristics of material movements and reactor kinetics. (D-general, 1-59)

607-D.* L-D Process for Making Basic Oxygen Steel. E. J. Prince. *Iron and Steel Engineer*, v. 36, Sept. 1959, p. 185-186.

Blowing of high-purity oxygen onto molten pig iron contained in a suitable refractory curcible. Sufficient Si, C, Mn and P dissolved in the molten pig acts as the fuel and combustion by the oxygen provides the heat necessary to melt scrap, metal and fluxes to a required tapping temperature. (D10a)

608-D.* Vacuum Degassing-in-Ladle Improves Alloy Steels. *Plant*, v. 20, Sept. 1959, p. 48-49.

Process removes hydrogen gas from molten metal and produces cleaner, stronger steel. (D9s, D9n, 1-73; AY)

609-D. Open Hearth Slag Handling. G. R. Morgan. *Iron and Steel Engineer*, v. 36, Oct. 1959, p. 129-132.

The handling and disposing of open-hearth slag previously a bottleneck to openhearth operations was eliminated by using tractor-trailer units to transport slag from the pit pouring tables to the dump site. (D2d; RM-q)

610-D. Regulation of Blast Furnace Pressure Gives Increased Iron Production. *Iron and Steel Engineer*, v. 36, Oct. 1959, p. 167.

Production gains are achieved by increasing the weight of gas per cubic foot within the furnace, thus permitting more oxygen to come into contact with the burden. Increased gas pressure is preferable to higher velocity, since this results in the loss of less burden particles as flue dust. (D1b, S18r)

611-D.* Further Experience With the Kaldo Process. Bo Kalling and Folke Johansson. *Iron and Steel Institute, Journal*, v. 192, Aug. 1959, p. 330-338.

Melting and refining by Kaldo process with particular reference to high-phosphorus pig iron, Fe losses in slag, Fe yield, desulphurization, composition and refractory life. 8 ref. (D10b)

612-D.* (English.) Activity of Components in Fundamental System of Iron Blast Furnace Slag. Pt. 2. Measurement of Activity of Alumina in the $CaO-SiO_2-Al_2O_3$ System. Koji Sanbongi and Yasuo Omori. *Tokoku University, Science Reports of the Research Institutes*, Series A, v. 11, Aug. 1959, p. 339-351.

Equation for the activity of alumina in a given slag. The e.m.f. is the calculated value obtained by measuring the e.m.f. of the $CaO-SiO_2-Al_2O_3$ cell at 1630° C. with the reference slags CaO 45.2%, SiO_2 2.2% and Al_2O_3 53.7%, respectively. (D1; RM-q)

613-D.* (Italian.) Use of Oxygen in Open-hearth Furnaces. M. Foresi and G. Massobrio. *Metallurgia Italiana*, v. 51, July 1959, p. 257-278.

Results obtained in existing six-furnace mill producing low-carbon steel with experimental introduction of oxygen techniques for decarburization and improvement of combustion. Limitations of use of oxygen with silica roof; trials with basic roof. (D2g)

614-D.* (Italian.) Report on the First Campaign of a New-Type All-Basic Open-hearth Furnace. M. Signora and G. Soddu. *Metallurgia Italiana*, v. 51, July 1959, p. 279-288.

Furnace with streamlined "over-hearth" (Marz-Boelens hearth furnace) and automatic controls was tapped 968 times during first campaign. Operating life, hourly output, flame characteristics and speed of repairs using prefabricated elements were all satisfactory; fuel consumption was normal. (D2, W18r)

615-D. Vacuum Arc Melting Method Upgrades Low-Alloy Steels. *Steel*, v. 145, Oct. 26, 1959, p. 179, 182.
(D5a, 1-73; AY)

616-D. (Russian.) Refinement of Steel in an Oxidizing Gas Current. S. I. Filippov, M. M. Klyuev and V. I. Simonov. Paper from "Production and Further Processing of Steel and Alloys. Collection of Papers, no. 38, Moscow Steel Institute". Metallurgizdat, Moscow, 1958, p. 64-78.

Effects of the velocity of gas current and temperature on decarburization. Velocity of the process depends on the supply of oxidizing gas and is not influenced by the quantity of carbon present in the metal. (D2, D3, 3-67)

617-D. (Russian.) Intensification of the Decarburization of Iron With a High Phosphorus Content During the Period of Melting. E. A. Turkebaev and G. N. Oiks. Paper from "Production and Further Processing of Steel and Alloys. Collection of Papers, no. 38, Moscow Steel Institute". Metallurgizdat, Moscow, 1958, p. 88-111.

By increasing the oxygen in the blast, the melting period in an openhearth furnace is shortened. Iron loss, dephosphorization and bath temperature as functions of the oxygen quantity used. 8 ref. (D2b, D11h)

618-D. (Russian.) Heat Absorption of the Melt in an Openhearth Furnace Used as a Basic Characteristic for the Regulation of Heat. G. M. Glinkov. Paper from "Production and Further Processing of Steel and Alloys. Collection of Papers, no. 38, Moscow Steel Institute". Metallurgizdat, Moscow, 1958, p. 112-133.

Thermodynamic calculations. 10 ref. (D2h, P12)

619-D. (Russian.) Heat Exchange in the Melt of an Electric Furnace at a Steady Flow of Supplied Heat. N. V. Okorokov and L. A. Mal'tsev. Paper from "Production and Further Processing of Steel and Alloys. Collection of Paper no. 38, Moscow Steel Institute". Metallurgizdat, Moscow, 1958, p. 173-184.

8 ref. (D5, E10r, C21d, P11k, 14-60)

620-D.* Vacuum Desulfurization of Liquid Iron Alloys. T. P. Floridis. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 870-871.

Sulphur can be removed from liquid Fe alloys by vacuum treatment. Desulphurization is enhanced by the presence of Si, carbon and Al, while all these elements increase the activity of sulphur dissolved in liquid Fe; the pronounced effect of Si indicates that probably a volatile Si sulphide is formed. 5 ref. (D11n, 1-73, 2-60; Fe-b, *Si*, *C*, *Al*, AD-a, 14-60)

621-D.* (Japanese.) The Desulphurization Product Resulting From Manganese. Pt. 3. Studies on the Desulphurization of Molten Pig Iron by Manganese. Kokichi Sano and Michio Inouye. *Tetsu to Hagane*, v. 45, Jan 1959, p. 9-15.

Desulphurization product is a slag composed of Mn, Fe and S, probably FeS or Fe-FeS dissolved in MnS. MnS equilibrium in C-saturated iron melts. 8 ref. (D11n; CI-a)

622-D.* (Japanese.) Ball Bearing Steel Made With a Vacuum Induction Furnace. Manabu Ueno and Hirooki Nakazima. *Tetsu to Hagane*, v. 45, May 1959, p. 506-510.

The gas contents and nonmetallic inclusions are very low in comparison with the air-melted steel. (D6, 1-73; SGA-c, ST, 9-69)

623-D.* (Japanese.) Operation of the Water-Colled Converter. Pt. 2. Study on a Permanent-Wall-Type Furnace With Forced Cooling. Ryozo Sato and Nofu Tabata. *Tetsu to Hagane*, v. 45, July 1959, p. 699-705.

Low-carbon, high-quality steel can be produced from various kinds of pig iron with the aid of pure oxygen blowing in a water-cooled converter. (D3b)

624-D.* (Japanese.) Special Features of Vacuum Ingot-Casting Process. Pt. 1. Comparison of Vacuum With Air-Cast Steel. Tonoya Suzuki and Toshihiko Asakuma. *Tetsu to Hagane*, v. 45, Aug. 1959, p. 793-799.

Oxidation of the pouring stream and surface of the steel is prevented, while scum and nonmetallic inclusions are floated by the violent boiling and bubbling. 13 ref. (D9p, 1-73)

625-D.* (Russian.) Melting 3KP Steel With Reduced Amounts of Manganese. A. I.

Vasil'ev and S. I. Bogachev. *Metallurg*, Aug. 1959, p. 13-14.

Melting, pouring and rolling with a Mn content of 0.25-0.35% as contrasted to the standard 0.40-0.60%. The quality of the steel's surface is as good as the standard steel while mechanical properties are improved. (D9p, 2-60, Q-general; ST, *Mn*)

626-D. Refractories Usage in Steelmaking Abroad. C. S. Hedley. *Refractories Journal*, v. 35, June 1959, p. 194-198, 200.

(D-general; RM-h)

627-D. (Japanese.) Oxygen Potential in Basic Openhearth Furnaces. Pt. 1. Takehiko Fujii. *Tetsu to Hagane*, v. 45, Aug. 1959, p. 788-793.

Kinetics of decarbonization in molten steel. 15 ref. (D2g)

628-D.* Effect of the Rate of Rise of Rimming Steel in Molds on the Surface Quality of Slabs. A. T. Peters. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 877-878.

Increases of nozzle sizes were generally followed by improvements of slab surface quality. Pouring rates are correlated with the metallurgical performance of steels. (D9p; ST, 4-52, 9-71)

629-D.* Die Steels Improved With New Vacuum Degassing Process. *Precision Metal Molding*, v. 17, Nov. 1959, p. 68-69.

Steel is skimmed to remove almost all the slag and then poured into a ladle. The molten steel, at about 3000° F., is then moved to a vacuum chamber. Both ladle and contents are placed in the chamber, which is then closed and sealed. The air is evacuated from the chamber and when the pressure has been sufficiently reduced, helium is bubbled through the melt. Helium acts as a scavenger to help remove dissolved hydrogen, nitrogen and oxygen. (D9s, 1-73)

630-D. The Use of Oxygen in Duplex and Stationary Open Hearth Practice. Oscar Pearson. *Blast Furnace and Steel Plant*, v. 47, Sept. 1959, p. 947-954, 961.

Equipment design and arrangement at No. 2 Open Hearth Shop, Gary Steel Works, U. S. Steel Corp. (D-general)

631-D. (Japanese.) A Study on the Dephosphorization Equilibrium in an LD Converter. Motozo Maeda, Kikuo Tajima and Eturo Homma. *Tetsu to Hagane*, v. 45, July 1959, p. 694-699.

Analysis of formulae. (D10a)

632-D. (Japanese.) Measurement of the Travel Time of Blast Furnace Burden by Means of Co^{60}. Arihiro Tominaga, Takeo Yatsuzuka, Shiro Shono and Jun Sawamura. *Tetsu to Hagane*, v. 45, July 1959, p. 689-694.

Measurements carried out by counting the radioactivity of samples taken from the molten pig iron on tapping with a scintillation counter. 8 ref. (D1, 1-59)

633-D. (Polish.) Desulphurization of Iron in a Basic Ladle. Tadeusz Hejnar and Stanislaw Pietrkiewicz. *Przeglad Odlewnictwa*, v. 9, May 1959, p. 153-160.

Desulphurization carried out with 1.5% $Na2CO_3$; procedures used in an acid ladle. (D11n; Fe)

634-D. Utilization of By-Product Fuels. R. W. Worley and R. H. Gherst. *Iron and Steel Engineer*, v. 36, Aug. 1959, p. 67-71.

Use of blast furnace and coke-oven gases as boiler and oven fuels. (D1; RM-m39)

635-D. (Polish.) Tendency of Hadfield Steel to Form Hot Cracks During Casting. Gabriel Kniaginin and Wladyslaw Longa. *Przeglad Odlewnictwa*, v. 9, July 1959, p. 197-206.

Chemical composition and method of melting influence the formation of cracks. (D9, 2-60; 9-72)

636-D.* Firing Open Hearth Furnaces With Burners Through the Roof. Andrew Labat-Camy. *Blast Furnace and Steel Plant*, v. 47, Sept. 1959, p. 965-969.

Thermal efficiency of openhearth furnace is much higher when novel technique of firing with groups of mobile burners entering through roof is used. (D2, W18r)

637-D.* Vacuum Stream Degassing Reaches Commercial Acceptance. K. C. Taylor. Paper from "Fifth National Symposium on Vacuum Technology Transactions—1958". (American Vacuum Society, Inc.). Pergamon Press Inc., New York 22, 1959, p. 185-191.

Review of the process as practiced today; metallurgical results; vacuum requirements for this process. (D9s, 1-73)

638-D.* Some Properties of Vacuum-Treated Bessemer Steel. A. M. Samarin. Paper from "Fifth National Symposium on Vacuum Technology Transactions—1958". (American Vacuum Society, Inc.). Pergamon Press Inc., New York 22, L 1959, p. 198-203.

Use of vacuum offers the possibility of reviving pneumatic methods of steel production; changes in oxygen and hydrogen content in Bessemer rail steel due to vacuum treatment; effect of vacuum treatment, composition, strain aging and normalization on impact value of Bessemer rail steel; evolution of gases from liquid steel during vacuum treatment. 9 ref. (D3f, 1-73)

639-D.* A Penny a Pound Knocks the H_2 Out of Steel. *Modern Castings*, v. 36, Nov. 1959, p. 45.

Ladle vacuum degassing by injecting the gas takes 12 min. to remove 60% of the hydrogen in a 75,000 lb. heat of electric furnace steel. (D9s, 1-73)

640-D.* Cast Low Alloy Steels Ductility and Toughness. John Zotos. *Modern Castings*, v. 36, Nov. 1959, p. 698-704.

Basic-electric arc furnace melting practice was employed to produce low sulphur and low phosphorus 1040, 4140, high Ni 4325, 4330 and high Si 4340 type steel castings. A decrease in the sulphur content resulted in a significant increase in the reduction in area, impact strength and elongation. A decrease in both the phosphorus and sulphur content also resulted in a significant improvement in ductility and impact resistance. 19 ref. (D5c, 2-60; ST, *P, S*)

641-D.* (French.) Cupola Metal in Openhearth Charges. S. T. Jazwinski. *Metallurgie et la Construction Mecanique*, v. 91, Sept. 1959, p. 631-639.

Fifty heats of two furnaces were charged with liquid metal from a hot blast cupola in proportions ranging from 16 to 50% of total charge. Optimum operating conditions were obtained with charge containing 40% cupola metal. (D2a, D8m)

642-D.* (Japanese.) Corrosion Mechanism in Refractories Used in a Zebra Roof in a Basic Openhearth Furnace. Takeo Ao and Takeji Oyama. *Tetsu to Hagane*, v. 45, Feb. 1959, p. 93-99.

Silica brick adjoining metal-encased unburned chrome-magnesia brick with relation to slagging reaction, interaction between the bricks and changes in the steel casing. Microscopy and chemical analysis of the minerological structure and content of the brick samples. (12n, W18r; RM-h)

SECTION E

FOUNDRY

1-E.* How to Test and Evaluate Core Oil. Rodney L. Boyes. *Modern Castings*, v. 34, Aug. 1958, p. 24-25.

Four tests consider baking time, tensile strength, bakeability, and cost per ton of core sand mix in evaluating the oil. (E18r; NM-h)

2-E.* Solidification and Risering of Gray Iron Castings. Clyde M. Adams, Jr., Merton C. Flemings and Howard F. Taylor. *Modern Castings*, v. 34, Aug. 1958, p. 31-41.

Shrinkage accompanying the cooling of gray iron is due to a chemical reaction; but size and location of the resulting voids which influence the movement of the casting surface are partially dependent on the following factors: size and shape of the casting, action of atmospheric or ferrostatic pressure, characteristics of molding material, and size, shape, location and thermal treatment of gates and risers. Expansion from graphite precipitation may accentuate solidification shrinkage. 11 ref. (E22q, E25n; CI-n)

3-E.* Effects of Foundry Variables Upon Porosity of 85-5-5-5 Bronze. Richard A. Flinn and Chester R. Mielke. *Modern Castings*, v. 34, Aug. 1958, p. 53-58.

Four important variables upon pressure tightness are: pouring temperature, moisture content of green sand, chilling, depth of machining. Pressure tightness decreases progressively when varying the pouring temperature from 1900-2300° F. Leakage increases slightly when moisture of dry sand is increased to 5.5% of max. Chilling decreased leak rate and shifted location of porous zone. Porosity increased with depth, with maximum porosity at the center. 6 ref. (E25n; Cu-s, 9-68)

4-E.* The Effect of Size of Scrap on the Tapping Temperature of a Cupola. N. H. Keyser and W. L. Kann, Jr. *Modern Castings*, v. 34, Aug. 1958, p. 59-60.

With coke charge and blast rate maintained at a fixed level, a change from light scrap, 1 in. or less thick, to heavy scrap, 1-4 in. thick, lowered tapping temperature 150° F. When blast rate was held constant, the tapping temperature could be maintained constant if the change from light scrap to heavy scrap was accompanied by a large increase in weight of coke charge. Graph shows effect of size and weight of cast scrap on tapping temperature and cost of coke for a particular 54-in. cupola operated with a blast rate of 4000 cu. ft. per min. (E10a; RM-p, 3-73)

5-E.* Shell Molding for Steel Castings. R. G. Powell and H. F. Taylor. *Modern Castings*, v. 34, Aug. 1958, p. 65-70.

Usual surface defects on low-carbon and low-alloy steel castings in shell molds can be eliminated with the use of chill-type shell molds which are made with forsterite or a blend of granulated limestone and silica sand. The chilling effect depends on the high conductivity of forsterite, endothermic dissociation of limestone plus the endothermic reaction of CO_2 with carbon from the resin binder. 6 ref. (E19c; CN-g, AY-b)

6-E.* The Use of Oil-Bentone Sand for Higher Quality Finish in Brass and Bronze Castings. O. E. Johnson. *Modern Castings*, v. 34, Aug. 1958, p. 77-79.

Compares use of bentonite-water bonded sand with oil-bentone bonded sand. Shrinkage becomes more visible when using oil-bentone sand, but can be corrected by changing the gating and risering. Green strength and mold hardness vary with amount of oil and bentone used and permeability decreases as mold hardness and quantity of oil increases. Permeability is not important with oil-bentone sand. Highly finished cast surfaces provide reduction in polishing, tumbling and other finishing costs. (E18r)

7-E.* Packing Characteristics of Typical Foundry Sands. L. J. Pedicini. *Modern Castings*, v. 34, Aug. 1958, p. 83-86.

Vibrated and rammed densities of 11 Subang-type dry sands. Rammed density changed when moisture and bentonite were added and number of rams varied. Density, hardness, green strength and permeability of sands having 5% western bentonite and 2% moisture with varied number of rams. Other sand packing characteristics compared for proper selection of raw sand for green-sand moldings. (E18r)

8-E. How Flame Washing Replaces Hand Grinds. *Canadian Metalworking*, v. 21, Oct. 1958, p. 68.

(E24; L10g)

9-E. (German.) Resin Core Binder K7 and Its Use. Gerhard Blumel. *Giessereitechnik*, v. 4, no. 8, 1958, p. 191-192.

(E21; NM-d, NM-f45)

10-E. (German.) Precision Investment Casting. Herbert Bode. *Giessereitechnik*, v. 4, no. 8, 1958, p. 197-200.

Metals suited for the process. Dies used in the manufacture of wax patterns and die materials such as steel, bismuth alloys. Machines and process for pattern casting; lifetime of dies. (E15)

11-E. (Japanese.) Sampling of Molding Sand. Pt. 1. Katumi Oshima, Akira Yoshida and Kiyokazu Sasaki. *Japan Foundrymen's Society, Journal*, v. 30, July 1958, p. 536-541.

New method of sampling green sand based on statistical concepts reduced casting defects due to sand variation. (E18r, S12h)

12-E. (Japanese.) Report on Investigation of Molding Sand Used in Europe and America. H. Tanimura and S. Mukae. *Japan Foundrymen's Society, Journal*, v. 30, Aug. 1958, p. 619-632.

(E18r; NMf-45)

13-E.* Malleable Iron Castings. *Automobile Engineer*, v. 48, Aug. 1958, p. 316-320.

English foundry produces automotive castings with close metallurgical control annealing with accuracy of ± 5° F., high production rate. (E11, T21; CI-s)

14-E.* Investment Casting With Frozen Mercury. *Engineering*, v. 186, Aug. 8, 1958, p. 177-178.

Use of frozen mercury in standard "lost-wax" casting operation permits highly accurate casting, with excellent surface finish. (E15, Hg)

15-E.* When Melting Aluminum. John J. Stobie. *Modern Metals*, v. 14, Nov. 1958, p. 40, 42, 45-46.

Requirements for sound melting practices; inherent characteristics of Al that influence melting and holding. Comparison of densities of die-casting alloys and some nonmetallic impurities; physical properties of pure Al. (E10; Al)

16-E.* (German.) Use of Calcium Carbide in the Cupola Furnace. Helmut Timmerbeil. *Giesserei*, v. 45, Aug. 28, 1958, p. 513-516.

Good results were obtained with a low-melting calcium carbide with 28% CaO in acid cold blast cupolas in the production of premelted iron for steel, malleable and gray iron castings. When 1.75 to 2% (of the weight of the Fe charge) calcium carbide is added, 20 to 50% of the coke can be spared; the sulphur in the Fe is lowered, furnace capacity increases; higher melting temperature improves carbonization. 9 ref. (E10a; CI, ST)

17-E.* (German.) Patterns and Core Boxes in Shell Molding. Walter Birke. *Giessereitechnik*, v. 4, no. 8, 1958, p. 179-187.

Materials for pattern plates and patterns such as Al, red brass, steel, cast iron. Formula for computing shrinkage allowance for different materials. Master

patterns of Al suggested because of accuracy. Patternmaking and fastening to the pattern plate, gating, design of pattern plates, molding machines, design of core boxes. 7 ref. (E16c, E17, E21; ST, CI, Cu-n)

18-E.* (German.) Pressure Cast Bearing Linings. Heinrich Backof. *Giessereitechnik*, v. 4, no. 8, 1958, p. 188-191.

The lining alloy is cast into the bearing box under pressure, using an adjustable core. Linings 2 mm. thick can be cast to size or with a minimum of finishing necessary. By pressure polishing with rollers, a perfect surface is established without destroying the casting skin, and strength of the lining is improved. (E-general, L10b, T7d, 3-74)

19-E.* (German.) Combined Melting Process for Producing Steel in the Foundry. S. J. Karmasin, W. M. Schestopal and J. L. Dodin. *Giessereitechnik*, v. 4, no. 8, p. 192-194.

Combination of a basic cupola furnace, an acid converter and an arc furnace with acid lining. Oxidation during melting in the cupola is retarded by proper atmospheres, oxidation of impurities in the converter takes place under optimal conditions, refining under an acid silica slag in the arc-type furnace where any quantity of steel used in production can be collected. (E10a, E10r, D3f; ST)

20-E.* (Dutch.) Influence of Heating on Strength of Sodium Silicate. H. G. Levelink. *Matalen*, v. 13, Sept. 30, 1958, p. 326-333.

Compressive strength after heating and also after subsequent cooling of bonded sand. Influence of rate of heating, duration of CO_2 treatment, powder additions, drying and the SiO_2 - Na_2O ratio of the sodium silicate. (To be continued.) (E18r)

21-E.* Economics of Precision Casting. R. G. Nicholas. *British Foundryman*, v. 51, Nov. 1958, p. 541-548.

Applications, tooling and costs of the Investment X, Mercast, Glascast, Shaw, Croning and Dietert processes. (E15, 1-52)

22-E. Towards Automation. G. C. B. Lamb. *British Foundryman*, v. 51, Nov. 1958, p. 549-559.

In molding, sand preparation, shakeout, and pouring, semi-automatic machines are a useful starting point for foundry not equipped to accept some of limitations imposed by fully automatic operation. (E11, 18-74)

23-E.* (Japanese.) Rapid Moisture Measurement of Foundry Sand by Means of Hot Blast Type Dryer. Kenji Hashimoto. *Nagoya Government Industrial Research Institute, Reports*, v. 7, Sept. 1958, p. 73-78.

The minimum time necessary for removing moisture was almost in proportion to a logarithm of moisture content. In a binder content from 4 to 16% the drying time depended only on moisture content. The drying time for coarser sand was shorter than for finer sand. Drying time was not dependent on the tempering time up to 150 hr. Critical moisture content appearing in the ordinary drying process at constant temperature not found in this experiment, since drying temperature was not constant in this method. (E18)

24-E. The Centrispinning Process as Applied to the Manufacture of High-Duty Components in High-Alloy Steels. A. E. Thornton. *British Foundryman*, v. 51, Nov. 1958, p. 559-569.

(E14; SS)

25-E. High-Strength Cast-Steel Chains. Maurice Flour. *Foundry Trade Journal*, v. 105, Oct. 30, 1958, p. 535-538.

Endless chains formed by casting connecting links around previously cast ones. Molding, pattern-making, casting procedures. (E16c, T7e; ST)

26-E. Plastics-Bonded Moulding Sand for Aluminium and Magnesium Castings. *Light Metals*, v. 21, Nov. 1958, p. 356-357.

(E19a, E18n; Al, Mg)

27-E.* Designing for Die Casting — Tolerances. Richard A. Parker. *Precision Metal Molding*, v. 16, Nov. 1958, p. 28, 50-51.

Factors influencing tolerances include shrinkage of the piece as it cools. While this can be calculated it will vary somewhat due to variations in section thickness and holes cast through the piece. Closer tolerances can be held with higher original tooling costs. (E13; 17-56)

28-E.* (German.) Trends in Pressure Casting in U.S.A. A. F. Bauer. *Aluminium*, v. 34, Nov. 1958, p. 647-648.

Because of improved quality, this method used increasingly for Zn, Al, Mg and brass alloys. For Al, it now surpasses production by sand or permanent mold casting. Parts up to 34 kg. in Al, and 90 kg. in Zn can be cast in machinery with closing pressures up to 2000 tons. (E13, A4; Al, Cu-n, Mg, Zn)

29-E.* (German.) Temperature Control in Pressure Die Casting. A. F. Bauer. *Aluminium*, v. 34, Nov. 1958, p. 648-651.

Over or underheating leads to lowered quality of products and increased wear of machinery. Measuring instruments (radiation bolometer recorder, contact pyrometer, thermochrome pencils, pocket radiation pyrometers) so far are inadequate and too expensive. (E13, S16, X9)

30-E.* (German.) Pressure Resistant Impregnation of Porous Castings. H. Schlegel. *Fertigungstechnik*, v. 8, no. 10, 1958, p. 460-461.

Cast iron component with fine porous structure is rendered pressure resistant by impregnation with synthetic resin. Process involves combined application of heat, vacuum, sealant and pressure. (E26)

31-E.* (German.) Progress in Production Methods for Precision Castings. A. Hohmann. *Giesserei-Praxis*, no. 19, Oct. 10, 1958, p. 383-387.

Comparative analysis of different systems based on concise description of procedures. (E15)

32-E.* (German.) Gaseous Porosity and Segregation in Sand Castings of Remelted Aluminum Alloys. Hans Reiniger. *Giesserei-Praxis*, no. 20, Oct. 25, 1958, p. 404-408.

Primary as well as remelted Al alloys release H which leaves typical pores in castings. Quantity of pores depends on the volume of H. As in other castable alloys, segregation appears also in remelted Al alloys. However, its appearance is insignificant and does not affect the quality. 12 ref. (E25q; Al-b, 9-68, 9-69)

33-E.* (German.) Origin of Pinholes in Steel Castings. Josef Pribyl. *Giesserei Technik*, v. 4, Sept. 1958, p. 216-222.

Pinholes originate from supercritical content of FeO in surface layers of castings. They are located in a zone (4-6 mm.) under entire casting surface or under greater part. Safety measures against creation of pinholes. 15 ref. (E25q, 9-68; ST)

34-E.* Some Developments in the Fettling of Steel Castings. Idris J. Thomas. *British Foundryman*, v. 51, Sept. 1958, p. 416-420.

Problems in trimming large steel castings. Removal of large risers with oxygen lance formed by packing mild steel tube with steel rods. Powder washing process in which an iron powder is introduced by compressed air into an oxygen-gas flame containing excess oxygen. Application of powder washing process to the removal of riser stub-ends, scabs, fins and adherent sand. Equipment for powder washing. (E24h, E24j; ST)

35-E.* Some Physical Factors Influencing Shrinkage and Porosity in Grey-Iron Castings. E. E. L. Nicholas and I. C. H. Hughes. *British Foundryman*, v. 51, Sept. 1958, p. 428-435.

Influence of mold rigidity, pouring temperature and inoculation upon porosity and associated defects arising from solidification volume changes in gray irons. Relation between porosity of castings and expensive dilation in green sand molds. Improvement in soundness of nodular graphite castings with the use of sufficiently rigid molds. Increase in shrinkage with inoculation and high pouring temperatures in green sand molds. Promotion of soundness with high pouring temperatures in rigid molds. 16 ref. (E25n, 2-60, 2-61; CI-n, CI-r)

36-E.* Modern Techniques for the Production of Heavy Steel Castings. C. J. Dadswell. *British Foundryman*, v. 51, Sept. 1958, p. 435-444.

European and American techniques. Production planing, patternmaking, molding, coremaking, mold and core materials, drying and closing molds, casting, feeding, cooling, head removal, heat treatment, machining. 4 ref. (E11; ST)

37-E.* A Shrinkage Test for Cast Iron. A. Wittmoser, H. A. Krall and L. Huetter. *Foundry*, v. 86, Nov. 1958, p. 74-78.

Development of test specimens. Significance of precipitated carbide in the eutectic solidification range on shrinkage behavior. Preparation of standard mold; pouring procedure; evaluation. Experimental results showing reproducibility of tests and effect of eutectic graphite value on shrinkage. 8 ref. (E25n, E11, 1-54, 2-60, 2-61; CI, 9-67)

38-E.* Shell Molding Solves Casting Problem. Edwin Bremer. *Foundry*, v. 86, Nov. 1958, p. 82-85.

Shell molding provides answer to control of porosity, surface appearance and dimensional tolerances in production of bronze and Al castings. (E16c; Al-b, Cu-s)

39-E.* Shrinkage Prevention in Bronze Castings. Clyde L. Frear. *Foundry*, v. 86, Nov. 1958, p. 96-101.

Casting design changes, location of risers and use of padding and chills to minimize or prevent shrinkage in bronze castings. Techniques for producing sound horizontal cylinders, sharp corners, and L, T or X-section castings. (E25n; Cu-s, 9-68)

40-E.* (French.) Foundry Practice in the Automobile Industry and Its Auxiliaries. Jean Fauquembergue. *Fonderie*, no. 153, Oct. 1958, p. 449-465.

Higher dimensional accuracy of molds, application of statistical methods of control, use of metallic molds for static and dynamic casting, progress in silica and molding and coremaking and some more recent methods of quality control. (E-general, T21)

41-E. Synthetic Resins for Shell Molding. R. V. Keen. *Adhesives & Resins*, v. 6, Nov. 1958, p. 132-137.

4 ref. (E19c)

42-E. Soundness of Grey and Nodular Iron Castings. A. G. Fuller. *British Cast Iron Research Association, Bulletin and Foundry Abstracts*, v. 14, Nov. 1958, p. 569-574.

Influence of composition variables; effect of variations in the solidification sequence of the iron; influence of the mold; production of sound castings by the application of feeders. 19 ref. (E25n; CI-n, CI-r)

43-E. Two Interesting Castings. An Account of the Production of a Heavy Planing Machine Side and of a Large Turbine Blade-Ring. N. Charlton and C. J. W. Hayhurst. *British Foundryman*, v. 51, Sept. 1958, p. 411-415.

(E11; CI)

44-E. Precision Sand Casting. J. S. Turnbull. *Foundry Trade Journal*, v. 105, Nov. 20, 1958, p. 621-631.

Paper presented at 1958 Conference on Technology of Engineering Manufacture, Institution of Mechanical Engineers. 9 ref. (E11; CI, ST)

45-E. Why Investment Castings? William H. Shuman. *Machine Design*, v. 30, Nov. 27, 1958, p. 99-101.

Advantages of investment castings are in flexibility of process in casting almost any shape and in broad alloy selection. When and where to specify investment castings. (E15)

46-E. Mercury Patterns for Precision Castings. Mercast Process in Operation at Crawley. *Metallurgia*, v. 58, Sept. 1958, p. 130-134.

(E15, E17; Hg, ST)

47-E. The Ideal Foundry Cupola. Thomas Lohr. *Wisconsin Engineer*, v. 63, Nov. 1958, p. 18-20, 55.

Combining hot blast and water cooling yields optimum results. (E10a)

48-E. (German.) Sealing of Porous Aluminum Castings by Impregnation. *Aluminium*, v. 34, Nov. 1958, p. 651-652.

Moguloid method using solution of colloidal metal powder. (E26; Al)

49-E. (German.) Riser Technique. J. Tanner. *Giesserei Praxis*, no. 20, Oct. 25, 1958, p. 409-410.

Effect of riser technique on elimination of cavitation in wheel castings. (E22q)

50-E. (German.) Chilled Gray Iron Castings. Gerhard Schwarz and Dieter Junghans. *Giessereitechnik*, v. 4, Sept. 1958, p. 225-233.

Summary of East German experience. (E11; CI, 5-66)

51-E. (Book-Russian.) Metallurgical Fundamentals in Casting Light Alloys. J. H. Fridlyandera and M. V. Tchukhrova. 423 p. 1958. Oborongiz, Moscow, USSR. 23 R, 90 K.

Papers dealing with heterogeneous microstructures in Al and Mg alloys; causes for cracks; means of elimination; structure modifications in light alloy castings; recommendations for achieving high-quality castings. (E-general; Al, Mg)

52-E. (Book-Russian.) Selected Works on Light Alloys. S. M. Voronov. 545 p. 1957. Oborongiz, Moscow, USSR. 22 R, 80 K.

Investigation of Al and Mg alloy castings; technology of making Mg pipe; heat treatment of light alloy castings. (E-general, J-general; Al-b, Mg-b)

53-E. (Translation—SLA, 58-1763.) New Methods for Treatment of Aluminum Melts. H. Kalpers. *Giesserei-Praxis*, v. 75, Aug. 10, 1957, p. 345-345.

See item 552-E, 1957, (E25s; Al)

54-E.* Feeding Systems for Permanent Mold Castings. D. Miller. *Foundry*, v. 86, Dec. 1958, p. 70-72.

Correct design of runners, risers and feeding systems for permanent molds can control shrinkage holes, shrinkage marks, cracking and the resultant effects of solidification shrinkage. (E12, E22, 9-68)

55-E.* Use of Oxygen in the Coal-Fired Furnace. J. B. Lapota. *Foundry*, v. 86, Dec. 1958, p. 84-85.

Advantages include reduced coal consumption, increased melting rate, better control of the metal bath temperature, reduced oxidation of the readily oxidized elements, improved slag and metal fluidity. (E10s)

56-E.* Gray Iron Chemistry.—How It Affects Casting Quality. Frank L. Arnold. *Foundry*, v. 86, Dec. 1958, p. 86-89.

Influence of C, Si, S, Mn and P on shrinkage, internal porosity, hot tearing, cold shuts and other defects. Strict control of metal charge and use of ladle additions recommended. (E25, 2-60; CI-n, 9-68; *C, Si, S, Mn, P*)

57-E.* (French.) Removal of Cores Bound With CO_2 and Sodium Silicate. Michel Jeancolas and Xavier Virolle. *Fonderie*, no. 154, Nov. 1958, p. 495-504.

Cores were easy to remove in copper parts up to 12.5 mm. thick, in aluminum parts, up to 7.5 mm. With mixtures of sawdust, molasses, graphite, mineral black, ferric oxide, mineral oil, commercial mixtures and core silicates, cores were removable up to approximately 25 mm. for light metal castings and 12 mm. for iron castings. (E21g; NM-f45)

58-E.* (French.) Influence of Fluxes on the Gas Porosity of Aluminum Alloy Castings. Bernard Chauvelier. *Fonderie*, no. 154, Nov. 1958, p. 505-514.

Samples taken during melting and casting; degassing effect of nitrogen. 6 ref. (E25s; Al-b, 9-68)

59-E. V-4 Motor Block Is Diecast in Aluminum. Jack C. Miske. *Foundry*, v. 86, p. 62-65.

Production line now in operation at Johnson Motors Div., Outboard Marine Corp. (E13, T21b; Al-b)

60-E. Automatic Molding System. Edwin Bremer. *Foundry*, v. 86, Dec. 1958, p. 118-124.

Four complete molds a minute are produced at the Brillon Iron Works Inc., Brillon, Wis. (E19, 18-74)

61-E. Die Casting Electrical Components. The Practice of Metropolitan-Vickers Electrical Co., Ltd., Manchester. *Machinery (London)*, v. 93, Nov. 26, 1958, p. 1245-1254. (E13, T1; 18-67)

62-E. Welding Repair. L. D. Richardson. *Modern Castings*, v. 34, Dec. 1958, p. 26-28, 54-55.

(E26, K1)

63-E.* (Russian.) Formation of Seams on Large and Heavy Castings. Ya. I. Medvedev. *Liteinoe Proizvodstvo*, Aug. 1958, p. 12-15.

Study of kinetics of filling mold and cooling process of metal and accompanying conditions. Use of lamillar-flow thermal method for calculating rate of mold filling. Aim of study to eliminate seams, gas bubbles and other defects. (E25n, 9-68, 9-71)

64-E.* (Russian.) Thermal Stress Reduction in Structures Cast in Green Molds. Ya. A. Smolyanitskii. *Liteinoe Proizvodstvo*, Aug. 1958, p. 16-18.

Thermal stresses in casting rise with increase in cooling rate. The cooling rate depends on the thermophysical

properties of the mold materials. The process of heat exchange between casting and mold is fully determined and regulated by the process of heat distribution in the mold. Green molds, by virtue of their higher moisture content, slow the cooling rate and lessen thermal stresses. (E19a, Q25p)

65-E.* (German.) Manufacture and Use of Centrifugal Iron Castings. Gerd Engler. *Giessereitechnik*, v. 4, Oct. 1958, p. 250-253.

Comparison with static castings shows finer grain, absence of gas bubbles and impurities in main bulk of material; much better physical properties. Manufacture of cast iron bushings. (E14; CI)

66-E.* (Russian.) Greater Precision in Large Iron Castings. S. E. Rozenfel'd and S. A. El'bert. *Liteinoe Proizvodstvo*, Oct. 1958, p. 1-4.

Major factors in variation of measurements are production of patterns, assembly of forms, shrinkage of mold. Variations in shrinkage caused by pliability of cores, the unevenness in cooling of different parts and other retarding factors. Formula for determining deviations in measurement taking into consideration four or more factors. Mechanization of assembly of complex forms increases precision. 5 ref. (E11; CI)

67-E.* (Russian.) Precision Casting of Large Steel Parts. V. K. Baradan'yants. *Liteinoe Proizvodstvo*, Oct. 1958, p. 4-6.

Precision investment casting makes possible pouring at 900-1500° and production of large, complex, thin-walled castings. With wax patterns practically no machining was required. Efforts to pour large steel castings in ceramic molds resulted in cracking. While investment casting has eliminated these shortcomings, it has not yet overcome formation of microcracks. (E15; ST)

68-E.* (Russian.) Automated Equipment for Shell Mold Casting. A. I. Korotkov. *Liteinoe Proizvodstvo*, Oct. 1958, p. 18-22.

NIITA Institute has perfected several automatic shell molding machines: a mechanized sand-resin mixer, a machine for preparation of shell mold semiforms, equipment for making shell cores and for knocking out castings. Also machine for regeneration of silica sand. To dispel gases and fumes work is now progressing on ventilation system with thermocouple and monometer controls. (E16c, 1-52, 18-74)

69-E.* (Russian.) New Theoretical Problems in Casting High Alloys. Yu. A. Nekhendzi. *Liteinoe Proizvodstvo*, Oct. 1958, p. 23-28.

Casting heat resistant alloys for use in gas turbines, airplanes, atomic energy installations and rockets. Technological conditions of casting are more important than proper selection of alloying elements. Most important are cooling rate and solidification. Tests made on gamma alloys with same carbon content (0.12 and 0.35%), 20% Cr and variable Ni content from 0 to 80%. 9 ref. (E-general; Fe-b, Ni-b, SGA-h)

70-E.* Use of Exothermic Feeding Compounds in the Production of Steel Castings. D. H. Snelson. *British Foundryman*, v. 51, Oct. 1958, p. 486-501.

Relationships between casting soundness and section of casting, volume, height and diameter of feeding head, thickness of exothermic lining and mode of solidification. Graphical system for calculation of head dimensions for efficient and economic exothermic feeding for plain carbon steel castings of simple shape. System for complex castings, influence of gating, pouring temperature and running distance on directional solidification. Properties of exothermic materials. 6 ref. (E22, E25, 3-73, 9-67; CN-g)

71-E.* Recent Advances in Magnesium Casting Alloy Technology. E. F. Emley. *British Foundryman*, v. 51, Oct. 1958, p. 501-527.

Reviews literature on influence of Zr, Zn, rare earth metals and Th on creep and tensile properties, grain size, microporosity, cracking, solidus temperature, weldability and founding characteristics of Mg alloys. Recent developments in melting, pouring, gating and running. Corrosion resistance and protective surface treatments; application of Mg castings. 117 ref. (E-general; Mg-b, *Zn, Zr, EG-g*, 11-65)

72-E.* (Japanese.) Production of Cast Iron With Steel Inserts. Effect of Casting Temperature and Surface Conditions. T. Usui and Y. Yamamoto. *Metropolitan Technical College, Memoirs*, no. 4, Mar. 1957, p. 13-28.

Behavior of metal plated, oil coated and rusted inserts compared with polished inserts. Effect of various diameters and volume ratios of the cores. (E-general, 2-61; CI, *ST, Ni*, 8-62)

73-E.* (Swedish.) Elutriator. Th. Wilkins. *Gjuteriet*, v. 48, Oct. 1958, p. 149-153.

Laboratory apparatus for separating silt and clay from foundry sand samples. (E18r, 1-53)

74-E. Study of Technique for Refinement of Cast Structures in Aluminum. Massachusetts Institute of Technology. *U. S. Office of Technical Services*, PB 131688, July 1955, 73 p. $2.25.

Rapid, accurate procedure for quantitatively measuring hydrogen in molten Al. Several methods of degassing compared. Effect of chilling castings of alloys 195 (1% Si), 220, 356 and Ternalloy 8. (E25s, S11r; Al-b, *H*)

75-E.* Kolcast Investment Castings Vacuum Melt and Vacuum Cast Alloys. F. W. Dischinger and M. Goldenberg. *Thompson Products Engineering Bulletin*, v. 3, Mar. 1958, p. 12-15.

Kolcast Industries uses both the frozen mercury process and a variation of the Lost Wax process to make production quantities of high-grade aircraft castings of Ti, Al and superalloys. (E15; Ti-b, Al-b)

76-E.* (Rumanian.) Pipe in Cast Iron. L. Sofroni and R. P. Todorov. *Studii si Cercetari de Metalurgie*, v. 3, no. 2, 1958, p. 131-149.

Volume of pipe was smaller as more graphite was precipitated during the eutectic transformation, a process governed mainly by the C and Si content. 13 ref. (E25n, 9-67, 2-60; CI-n, CI-r)

77-E. Cast Miniatures by the Ton. J. H. Cadieux. *Machine Design*, v. 30, Dec. 11, 1958, p. 27-28.

Cold sizing and automation are combined in a new investment casting technique. (E15, 18-74)

78-E. (Russian.) Formation of Shrinkage Cavities in Cast Iron. L. Sofroni and R. P. Todorov. *Revue de Métallurgie (Bucharest)*, v. 3, no. 2, 1958, p. 41-57.

In cooling, the volume changes of castings usually depend upon degree of graphitization in liquid or solid state. For reducing the size of cavities and surface shrinkage, it is necessary to change the quantity of eutectic graphite by corresponding selection of carbon and silica contents. 12 ref. (E25n; CI)

79-E. (Russian.) Use of Hot Blast Basic Cupola Furnace at Integrated Iron and Steel Works. S. I. Lebedev. *Stal'*, v. 18, Nov. 1958, p. 996-997.

(E10a, W18d)

80-E. (Swedish.) Gating of Valve Housings From Cast Steel. *Gjuteriet*, v. 48, Oct. 1958, p. 156-157.

(E22p; ST)

81-E.* Close Control Produces High-Property Aluminum Castings. Merton C. Flemings and Howard F. Taylor. *Foundry*, v. 87, Jan. 1959, p. 80-81.

Control requirements include strict attention to alloy analysis, melting variables, gating, sand and molding practices, chilling and risering and heat treatment; 356 Al alloy sand castings can be produced with guaranteed tensile strengths 50 to 100% greater and elongation as much as 700% greater than required by federal specification. 9 ref. (E11, Q-general; 5-60, Al-b)

82-E.* Casting High-Property Aluminum. Robert Herrman. *Foundry*, v. 87, Jan. 1959, p. 82-85.

Production of high-strength, high-ductility 356 alloy castings for use in aircraft and missiles. Sand preparation and molding, coremaking, castings cleaning and inspection, plaster molding. (E-general; Al-b)

83-E.* High Quality Aluminum Castings. William B Corcoran, Jr. *Foundry*, v. 87, Jan. 1959, p. 86-91.

Molding, melting, degassing and pouring methods for producing chilled Al alloy castings in 355 and 356 alloys which average as high as 45,000 psi. tensile strength, 32,000 psi. yield strength, and 7 to 8% elongation. (E11, Q-general, 5-60; Al-b)

84-E.* Economic Design of Light-Alloy Castings. P. A. Broadbent. *Foundry Trade Journal*, v. 105, Dec. 18, 1958, p. 737-744.

Special light-alloy foundry techniques, heat treatment and other processes, and the free-cutting properties of light alloys as related to design and costs of production. Test-bar specifications for a number of Al and Mg alloys in relation to strength and weight of castings, and to the cost of a machined casting in cast iron and various light alloys. (E-general; 5-60, 17-51, Al-b, Mg-b)

85-E.* Air Furnaces. K. H. Wright. *Iron & Steel*, v. 31, Dec. 24, 1958, p. 639-642.

General design, refractories, fuel, chemistry of melting, operation, charging, slagging, use of ferro-alloys and oxygen. (E10s, 1-56, 17-51; CI)

86-E.* Foundries Can Produce Their Own Cast Iron Directly From Ore. H. W. Lownie, Jr., and A. J. Stone. *Modern Castings*, v. 34, Jan. 1959, p. 47-54.

Direct-reduction processes replace the conventional cupola facilities and other melting auxiliaries. Costs, advantages and disadvantages. (E10b; CI)

87-E.* Some Foundry Problems in the Development of a New Marine Propeller Alloy. A. J. Smith. *Modern Castings*, v. 34, Jan. 1959, p. 55-70.

Material, melting, molding, refractories, fluxes, gas and feeding as applied to Ni-Al bronze. Comparison of engineering properties and service performances of Mn bronze propeller alloy and Ni-Al bronze. 10 ref. (E-general, T22h; Cu-s, *Ni, Mn, Al*)

88-E. Aero-Metallurgical Engineering Production in Australia. L. J. Stone. *Australasian Engineer*, v. 50, Oct. 7, 1958, p. 49-55.

Investment casting applied to turbine blade production. 5 ref. (E15, T7h, 17-57)

89-E. Hollow Die Casting Process. *Australasian Manufacturer*, v. 43, Nov. 8, 1958, p. 54-58.

Metal is forced into the cavity under pressure and excess withdrawn under a partial vacuum. The die cavity can also be evacuated immediately before the metal is injected. (E13)

90-E. Aluminum Diecasting and Permanent Mold Foundry. *Foundry*, v. 87, Jan. 1959, p. 64-69.

Modern casting facility at Ford Motor Co.'s Sheffield, Ala., plant converts molten Al received from nearby Reynolds reduction plant into 67 different parts for use in engines and transmissions. (E13, E12, T21b)

91-E. Quality Control in the Foundry. W. K. Bock. *Foundry*, v. 87, Jan. 1959, p. 70-73.

Application of statistical techniques. (E-general, S12)

92-E. What Foundrymen Should Know About Casting Design. John B. Caine. *Foundry*, v. 87, Jan. 1959, p. 74-79.

Effects of design on the mechanical properties of castings. Proper design also bears an important relationship to castability of the part. (E-general, 17-51)

93-E. What Car Builders Want in Automotive Castings. D. S. Harder. *Foundry*, v. 87, Jan. 1959, p. 114-116, 118.

Use of permanent mold casting and die casting processes permits closer tolerances and lower costs. (E13, E12, T21, 17-55)

94-E. Notes on the History of Patternmaking. L. Faulkner. *Foundry Trade Journal*, v. 105, Dec. 25, 1958, p. 771-774.

Patternmaking from the Bronze Age to the present. (E17, A2)

95-E. Economic Design of Light-Alloy Castings. P. A. Broadbent. *Machinery Market*, Dec. 11, 1958, p. 23-24, 28.

(E-general; 5, 17-51, Al, Mg)

96-E. New Molds for Non-Ferrous Castings. John Starr. *Pacific Factory*, v. 90, Nov. 1958, p. 20-21, 52.

Green sand molds cast Al and Mg castings with 0.05 to 0.005-in. tolerances and high strength. (E19a; Al, Mg)

97-E.* (Hungarian.) Influence of Magnesium on Eutectoid Transformation Temperature of Cast Iron. Ferenc Varga and Janos Vereskoi. *Kohaszati Lapok-Ontode*, v. 9, Feb-Mar. 1958, p. 37-41.

How Mg influences shape of graphite grains in gray cast iron. Tests to determine the temperatures of austenitic transformation as affected by different Mg alloys. Effect of these alloys on tensile strength of castings. 6 ref. (E25a, N8s; CI-r, *Mg*, AD-p36)

98-E. (Book-German.) Foundry Dictionary. A. Schulenburg. 748 p. Fachverlag Schiele & Schoen GmbH, (1) Berlin SW 61, Margrafenstr. 11, Germany. DM 58.

5000 foundry terms; 1000 literature references. (E-general, 11-67)

99-E. (Book-German.) Foundry Handbook 1959. Fachverlag Schiele & Schoen GmbH, (1) Berlin SW 61, Markgrafenstr. 11, Germany. DM 5.

Methods of gating, alloying, inserting parts in castings; instructions on use of chills; light metal casting with permanent molds; use of calcium carbide in the cupola. (E-general)

100-E. (Translation.) Grain Refining Light Alloys. H. Kessler. *Metal Industry*, v. 93, Dec. 12, 1958, p. 489-490. (From *Metall.*)

Effects of particle size of grain-refining additions on microstructure; suggests finer grinding. (E25q, M27c; Al-b, AD-p35)

101-E.* (German.) Aluminum Sand Castings of Improved Precision. Rolf Held. *Giessereitechnik*, v. 4, Nov. 1958, p. 294-297.
Complete mold for a crankcase assemblied from blocks of a mixture of waterglass and dry quartz sand, such as used for the cores, and CO_2 treated. (E19, E21, T21c; Al-b, NM-f45)

102-E.* (Italian.) Impregnation of Castings. Giuseppe Barchesi. *Fonderia*, v. 7, Sept. 1958, p. 411-416.
Elimination of porosity; procedures; impregnating agents for ferrous and some nonferrous materials. (E26)

103-E.* (Japanese.) Sampling of Molding Sand. Pt. 2. K. Oshima, A. Yoshida and K. Sasaki. *Japan Foundrymen's Society, Journal*, v. 30, Oct. 1958, p. 779-785.
New method for dry sand. Properties of mulled sands in relation to mulling time. Fluctuation in mullers and error variance of sampling, reduction and analysis. (E18r)

104-E.* (Japanese.) Relation Between Gas Pressure in Mold Cavity and Permeability. Mototaka Mutaguchi. *Japan Foundrymen's Society, Journal*, v. 30, Oct. 1958, p. 786-792.
Maximum gas pressure is proportional to the thickness of sand mold and inversely proportional to the permeability and total surface area of the cavity in lower pressure, and beyond a critical pressure the square of the maximum pressure is proportional to the same elements. (E19, W19g, P10m)

105-E. Automatic Molding Line. Robert H. Herrmann. *Foundry*, v. 87, Feb. 1959, p. 72-75.
At American-Standard Corp., Baltimore, Md., an automatic line turns out a 6600-lb. poured mold (including flasks, sand and casting) every 45 sec. The line produces sinks and wash basins. (E19; CI)

106-E. Now They're Casting Photos. Robert H. Herrmann. *Foundry*, v. 87, Feb. 1959, p. 78-80.
Process involves the use of conventional photographic methods to produce a master pattern mold from which an unlimited number of production wax patterns can be produced. These patterns, in turn, are used to make investment molds into which almost any castable metal can be poured to produce cast duplicates of the original pattern. (E15)

107-E. Nonferrous Foundry Uses Sand and Metal Molds. Robert H. Herrmann. *Foundry*, v. 87, Feb. 1959, p. 94-97.
Foundry operations at B.F. & S. Bronze Foundry Co., Brooklyn, N. Y., in the fabrication of die-cast Zn parts and permanent mold Al castings. (E12, E13, W19g; Zn, Al)

108-E. Control of Die Casting Quality Standards. H. K. Barton. *Machinery (London)*, v. 93, Dec. 31, 1958, p. 1531-1540.
Control of quality of die castings through operator's close supervision of the casting machine; careful design and lubrication of ejector pins. (E13, 1-52)

109-E. Properties of Some Foundry Sands Found in the Auckland Area. E. D. Burt and A. P. Neyland. *New Zealand Dept. of Scientific and Industrial Research, Information Series no. 20*, 1958, p. 5-19.
11 ref. (E18r)

110-E. (Dutch.) Cupola Furnace Practice. *Gieterij-Centrum Berichten*, v. 6, Nov. 1958, p. 64-66.
(E10a)

111-E. (French.) Standard Melting Charts for Nonferrous Alloys. *Journal d'Informations Techniques des Industries de la Fonderie*, Aug. 1958, p. 1-3.
Posted near furnaces, charts provide information in chronological order on make-up of charges, special treatments, pouring. (E10)

112-E. (German.) Plastics Used in Foundry Practice. Ludwig Kolb. *Giessereitechnik*, v. 4, Nov. 1958, p. 283-285.
(E-general; NM-d)

113-E. (German.) Cast Iron Permanent Molds for Gray Iron and Malleable Casting. Horst Hoffmeister. *Giessereitechnik*, v. 4, Nov. 1958, p. 290-291.
(E12, W19g; CI-n, CI-s)

114-E. (Japanese.) Various Treatments of Cast Iron Melt Containing Molybdenum and Copper. T. Otstani, M. Maruyama and Y. Tokunaga. *Japan Foundrymen's Society, Journal*, v. 30, Oct. 1958, p. 792-798.
Influence of inoculation with Fe-Si and Ca-Si, vacuum melting, $Fe_3\Phi_4$ additive and Mg treatment on Mo-Cu iron. (E25q, N8q, 1-73; CI, *Cu, Mo, Mg, Si*, AD-p)

115-E. (Japanese.) Air Setting. K. Tanaka. *Japan Foundrymen's Society, Journal*, v. 30, Oct. 1958, p. 811-816.
Bimders for foundry sands. (E18n)

116-E. (Swedish.) Better and Cheaper Melting. *Gjuteriet*, v. 48, Nov. 1958, p. 171-174.

Proposals concerning cupola practice. (E10a, W18d)

117-E. (Swedish.) Casting Defects and Their Causes. J. Drachmann. *Gjuteriet*, v. 48, Nov. 1958, p. 175-180.

Reasons for sand inclusions, slag and salt inclusions. Defects caused by mold paint particles, metal drops or premature solidification. (E11,9)

118-E.* Mechanized Molding Line Is Fast and Flexible. *Foundry*, v. 86, Sept. 1958, p. 62-65.

Automatic molding machines with efficient system of core delivery, mold handling, pouring and shakeout permit high rate of casting production. (E19a, W19f; CI, 18-74)

119-E.* Gray Iron Chilling Practice. Verne Pulsifer. *Foundry*, v. 86, Sept. 1958, p. 66-72.

Main factors in obtaining desired chill depth are C and Si content of cast metal, and grade and thickness of chilling material. (E22r, N8f; Fe, 2-60)

120-E.* Shrinkage Prevention in Bronze Castings. Clyde L. Frear. *Foundry*, v. 86, Sept. 1958, p. 73-77.

Correct heating and riser systems in feeding simple-shaped sections. (To be continued.) 3 ref. (E22, E25n; Cu-s, 9-74)

121-E.* Thickness of Precoat for Investment Castings. Donald J. Kenny and Paul A. Rutt. *Foundry*, v. 87, Feb. 1959, p. 82-85.

Thickness of precoating slurries used in investment casting is a function only of viscosity, not of composition, aging, drying time or the drying temperatures. (E15)

122-E.* Properties of Copper-Base Alloy Castings. F. Hudson, D. R. Wood and J. F. Gregg. *Foundry*, v. 87, Feb. 1959, p. 86-93.

Effects of casting section on properties of 88-10-2, 86-7-5-2 and 85-5-5-5 gunmetal, with and without Ni additions. (E-general, Q-general, 17-51, 2-60; Cu-b, *Ni*)

123-E.* Automatic Diecasting of Small Zinc Parts. Irwin Lubalin. *Foundry*, v. 87, Feb. 1959, p. 148, 150, 152-153.

New concept in die casting is the ability to run single-cavity dies at high rates of speed. Elimination of multiple-cavity dies means lower initial die cost, lower inspection costs and better tolerances from one part to the next. Improved thermal balance of the die results in fewer defects such as blisters, blows, soldering. (E13; Zn)

124-E.* Improving Aluminum-Magnesium Casting Alloys. H. Kessler. *Metal Industry*, v. 94, Jan. 2, 1959, p. 3-5.

Grain refining of Al-Mg alloys containing Ti and B by means of carbon tetrachloride introduced into metal melt with Cl or N as carrier gases. Effect of grain refinement on mechanical properties of castings. 7 ref. (E25q, Q-general; Al-b, Mg, *Ti*, *B*, AD-p35)

125-E.* Design of Die-Castings. Pt. 9. Converting Sand-Cast Parts to Die-Casting. H. K. Barton. *Metal Industry*, v. 94, Jan. 2, 1959, p. 7-9.

Suggested changes in wall thickness and other dimensions of castings to facilitate conversions from sand-cast to die-cast parts. (To be concluded.) (E13, 17-51)

126-E.* (Hungarian.) Introduction of Sodium Silicate Bonded Molding Materials in Foundry Practice. Lajos Hajdu. *Kohaszati Lapok-Ontode*, v. 91, May-June 1958, p. 110-117.

CO_2 process for making molds, use of alcohol as a catalyst, air drying, advantages of method. (E18n, NM-f45)

127-E.* (Hungarian.) Pouring Large Crankcase Castings for Diesel Automotive Vehicles of Light Metal Alloys. Bela Rosner and Albin Buzansky. *Kohaszati Lapok-Ontode*, v. 91, May-June 1958, p. 122-123.

Al-Si-Mg alloy cast in sand, pressurized feeders; 0.03-0.06% Na added to ladle before pouring. Casting heat treated in electric furnace, quenched and aged for 12 hr. (E11, T21b; Al-b)

128-E.* Casting and Coining Produce Small, Precision Parts. J. H. Cadieux. *Foundry*, v. 87, Feb. 1959, p. 102.

New precision forming process, known as Minicast, combines basic advantages of investment casting with advantages of coining or cold forming. Parts up to 1 cu.in. in size can be produced in difficult-to-machine metals such as high-alloy

steels, toolsteels, superalloys and stainless steels, as well as low-alloy steels. All commercial nonferrous metals except Mg alloys and high Zn-Cu alloys can be formed by the process. (E15, G3n; AY, SS, TS)

129-E.* (German.) High-Conductivity Castings of Copper and Copper Alloys. Ernst Brunhuber. *Giesserei*, v. 46, Jan. 1959, p. 2-8.

Influence of composition on electric conductivity. Castings are prepared in two melting processes providing double dehydration and refinement by oxidation. Deoxidation accomplished by addition of Cd, Zn, Ca, Mg or Li, with or without Be. (E10, P15g, 2-60; Cu, 5)

130-E.* Special Tool Steel Increases Die-Casting Die Life. *Modern Machine Shop*, v. 31, Feb. 1959, p. 150, 152.

Use of Potomac M with L-XX (T-1) high-speed steel inserts which accurately shape the rotor ends. (E13, W19n, W11q; TS, *Cr*, *V*)

131-E.* Refractory Shells Aid Investment Casters. E. M. Broad. *Steel*, v. 144, Jan. 26, 1959, p. 72-75.

Refractory shell molds formed on wax patterns by dipping liquid binder and applying coarse dry refractory, and repeating until enough layers have been applied to develop coat 1/4 to 1/2 in. thick. Advantages of process. (E15, E19)

132-E.* (French.) Additions of Ferro-Silico-Zirconium to Liquid Gray Iron. Pierre Detrez. *Fonderie*, Aug. 1958, p. 374-384.

Metallurgical study, mechanical properties, recommended practice. Treatment in ladle with granulated additions of Fe-Si-Zr of 0.1 to 0.6% results in good Si content in castings; causes shrinkage cavities when addition exceeds 0.3-0.4%. Combined action of Si and Zr produces calmed bath, Zr acting chiefly on O, N and S, in order listed. Tensile strength is increased, modulus of elasticity decreases, hardness is not appreciably affected, some porosity is noted. 12 ref. (E25, Q-general; CI-n, AD-n, Fe, Si, Zr)

133-E.* (Hungarian.) Air Heater Tubes Manufactured of Alloyed Cast Iron. A. Mocsy. *Kohaszati Lapok-Ontode*, v. 9, no. 8, 1958, p. 177-183.

Composition 4-6% Si, 2.5-3.5% Cr and 0.1-0.4% Ti provides heat resistance at 900 to 950° C. Cold wind used in cupola containing ferro-alloys. 5 ref. (E10a; CI-q, *Si*, Cr, Ti, 4-60)

134-E.* (Hungarian.) Continuous Production of Large Diesel Engine Crank Cases of Light Metal by Core Molding. M. Solti. *Kohaszati Lapok-Ontode*, v. 9, n. 8, 1958, p. 183-193.

Molding technique applied in producing Al alloy castings of engines, including chilled housings for main journal bearings. 4 ref. (E19, T21b; Al-b, *Si*, *Fe*, *Mg*, *Mn*, 5-60)

135-E.* Gating for Production of High-Duty Iron Castings. L. Clarke. *British Foundryman*, v. 41, Dec. 1958, p. 607-615.

Spacing of patterns is considered relative to box type, comfortable pouring and adequate weighing; problems of warping and escape of gas; metal flow on mold and core sections; turbulence and metal temperature. (E22p; CI)

136-E.* Slope Casting Test Results on Some Established and Experimental Magnesium Casting Alloys. D. J. Whitehead. *Light Metals*, v. 21, Dec. 1958, p. 391-395.

Tensile properties obtained in slope castings in Z5Z, RZ5, TZ6, TZ3, TZ4, TZ5, Z3Z, A8 and AZ61 alloys. Properties of Mg-Zn-Zr alloys fall as Zn content is reduced from 6% and a similar decrease occurs with solution treated Mg-Al-Zn-Mn alloys as the combined Al and Zn content is lowered from about 10%. (E-general; Q-general, Mg-b, *Al*, *Zn*, *Mn*, *Zr*, 2-60)

137-E. New Pressure Die-Casting Machine. *Light Metals* v. 22, Jan. 1959, p. 12.

Unit is hydraulic and semi-automatic in operation, being constructed to produce large, high-quality Mg and Al castings at a fast rate. (E13, 1-52; Al-b, Mg-b)

138-E. Hollow Pressure-Die Castings. *Light Metals*, v. 22, Jan. 1959, p. 29.

Die casting of Al alloys. (E13; Al-b)

139-E. Production and Fabrication of Nickel Alloys. *Metallurgia*, v. 58, Dec. 1958, p. 291-294.

Melting, rolling and extrusion operations at Henry Wiggin and Co. Ltd., Hereford, England. (E-general, F-general; Ni)

140-E. Diecastings and Stampings Are Compared. H. K. Barton. *Metalworking Production*, v. 102, Dec. 26, 1958, p. 2260-2262.

(E15, G3)

141-E. From Ore to Castings—Reynolds-Ford at Muscle Shoals. *Precision Metal Molding*, v. 16, Dec. 1958, p. 35-37, 48.

Transfer of molten Al from the Reynolds Metal Co.'s reduction plant to the Ford Motor Co. foundry renders ingot casting and remelting unnecessary. (E-general, A5a, W18n; Al, 14-60)

142-E. (Hungarian.) Shell Molding Process in the Iron and Steel Foundry in Kobanya. Gyula Banky. *Kohaszati Lapok-Ontode*, v. 91, May-June 1958, p. 118-122.

(E19c)

143-E. (Hungarian.) Types of Feeding Heads Used in Steel Founding. Pal Nemeth, Ivan Lipovetz and Ferenc Varga. *Kohaszati Lapok-Ontode*, v. 91, May-June 1958, p. 124-128.

Ferrostatic pressure head, air pressure head, and gas pressure head containing an agent within the head which forms gas due to heat of molten metal and additional pressure of nitrogen gas fed in. Methods of slowing solidification rate. (E22n; ST)

144-E.* Effects of Mould Rigidity, Moulding Sand Properties and Pouring Temperature on the Soundness of Unfed Grey Iron Castings. K. E. L. Nicholas. *British Cast Iron Research Assoc., Journal* v. 7, Dec. 1958, p. 446-475.

Changes in volume of mold cavity and casting size resulting from variations in pouring temperature, mold rigidity and moisture and cold dust content of green molding sands. Relation of top surface shrinkage with casting expansion. Comparison of soundness of flake and nodular graphite castings produced in green sand, dry sand, CO_2 process and cement sand molds. (E11, E25n, P10c, 2-62; CI-n, CI-r)

145-E.* Solidification and Risering of Grey-Iron Castings. Clyde M. Adams, Merton C. Flemings and Howard F. Taylor. *British Foundryman*, v. 41, Dec. 1958, p. 625-636.

Fundamental variables for determining shrinkage in gray iron. Size and location of voids resulting are dependent on size and shape of the casting, action of atmospheric or ferrostatic pressure, characteristics of the molding material and size, shape, location and thermal treatment of gates and risers. 11 ref. (E25n, E22; CI-n)

146-E.* (Hungarian.) Production of Malleable Cast Iron. Elek Chapo. *Kohaszati Lapok-Ontode*, v. 9, July 1958, p. 152-163.

Composition of melt, tensile strength of castings, melting facilities, heat treatment methods and equipment, economic aspects in Hungarian industry. 20 ref. (E11, J-general, 1-52; CI-s)

147-E.* (Russian.) The Eutectic State of Magnesium Iron and Its Importance in Technology and Quality. I. F. Kurtov, N. P. Chichagova and V. A. Zakharov. *Liteinoe Proizvodstvo*, Nov. 1958, p. 3-4.

Castings of eutectoid iron result in concentration of blowholes and porosity during solidification. These defects have been combatted with use of deadheads. Proper selection of carbon-silicon ratio in the charge with further addition of Si as modifier helps reduce porosity. Correct modification of magnesium eutectoid iron is best accomplished by continuous automatic regulation of the process. (E25q, 2-60, 18-74; CI-r, *Mg*, Si, 9-68)

148-E.* (Russian.) Desulphurization of Cast Iron With Magnesium. E. S. Mil'man, L. V. Il'icheva and M. A. Studnits. *Liteinoe Proizvodstov*, Nov. 1958, p. 15-17.

Investigation with radioactive isotopes shows that Mg forms stable compounds with the S which can only be decomposed at very high temperatures after which S reappears in the pig iron at 70% of original volume. To insure full desulphurization it is essential that the slag be completely removed from the liquid iron. Failure to do so will result in reappearance of S when iron is reheated to 1500° because of the thermodynamic instability of magnesium sulphite at high temperatures. 6 ref. (E10, D11n, 1-59; CI, *Mg*, *S*)

149-E. The Effect of Heat on the Properties of Compacted Moulding Materials. J. L. Evans and J. White. *British Foundryman*, v. 41, Dec. 1958, p. 615-625.

High hot strength in a sand is developed as a result of a sintering process involving the clay bond. The peak of the hot strength curve represents the temperature at which the increased sintering, which

takes place as the temperature rises, is offset by liquid formation and softening of the bond. (E19, E18n)

150-E. Ingot Mould Production. *Iron and Steel*, v. 32, Jan. 1959, p. 25-26.
New plant of the Brightside Foundry and Engineering Co. Ltd. at Ecclesfield, England, produces ingot molds weighing up to 15 tons. (E-general, W19c, 18-67; ST)

151-E. (French.) Permanent Mold Castings for Tension Tests of Light Metal Alloys. Andre Tatur. *Fonderie*, no. 155, Dec. 1958, p. 566-576.
Risk of cracking has been eliminated by carefully designed pouring basins and sprues which make it possible to preserve the cast skin of the samples. No subsequent machining is required. 9 ref. (E12, S12h; EG-a39, 5-63)

152-E. (French.) Manufacture and Properties of Ferrous Alloy Foundry Products. J. Goffart. *Industrie-Anzeiger*, Sept. 12, 1958, p. 26-27.
(E25; CI)

153-E. (German.) Molding Operations for Gray Iron and Steel Cast Seamless Welding Rods. J. Tanner. *Giesserei-Praxis*, Nov. 10, 1958, p. 429-430.
(E19, W29h; CI-n, ST, 5-60)

154-E. (German.) Economical Casting Resulting From Proper Molding Practices. Max Wernicke. *Giesserei-Praxis*, Nov. 25, 1958, p. 445-446.
Practical hints for numbering of molds and cores and handling of molds, cores and patterns. (E19)

155-E. (German.) High-Strength Castings. Hans Reininger. *Giesserei-Praxis*, Dec. 24, 1958, p. 469-473.
Influence of pouring temperature on strength of Mg alloys. Gating practice that avoids defects. (E22, E23, 2-61; Mg-b, SGB-a)

156-E. (German.) Cupola Process Controlled From a Central Cab. Alfred Rexroth. *Giesserei*, v. 46, Jan. 1959, p. 8-11.
(E10a)

157-E. (Russian.) Cast Iron With Nitrogen, Hydrogen and Oxygen. L. I. Levi. *Liteinoe Proizvodstvo*, Nov. 1958, p. 20-23.
H, N and O interact in solid as well as molten iron. Lowering temperature during pouring increases oxygen content of iron. Melting in vacuum with graphite lining results in remarkable change of chemical composition. Iron becomes strongly saturated with C and Si content is decreased. Cast iron absorbs oxygen in quantities depending on length of exposure to air and on its graphite structure. 10 ref. (E25s, E23, E10, 1-73, 2-61; CI, *Si, H, N, O*)

158-E. (Russian.) Equipment for Die Casting Steel Under Vacuum. V. M. Belov and S. A. Kazennov. *Liteinoe Proizvodstvo*, Nov. 1958, p. 7-8.
Vacuum die-casting machine with horizontal compression chamber. The press form is installed in vacuum compartment and is joined with a reservoir which is kept under continuous vacuum. Air from form mold cavities is withdrawn through ventilation canals. (E13, 1-52, 1-73; ST)

159-E. How to Make Shell Molding Pay. *Iron Age*, v. 183, Feb. 5, 1959, p. 96.
(E19c)

160-E. Design of Die-Casting. Pt. 9. Converting Sand-Cast Parts to Die-Casting. H. K. Barton. *Metal Industry*, v. 94, Jan. 9, p. 29-30.
(E13, 17-51)

161-E. Castings Do It Better for Aircraft Industry. *Modern Metals*, v. 35, Feb. 1959, p. 29-32.
High quality Al casting at American Brake Shoe. (E-general; Al-b)

162-E. Interrelation Between Stress Concentration and Castability. J. B. Caine. *Modern Metals*, v. 35, Feb. 1959, p. 101-104.
Relationship between shapes designed to minimim stress concentration, maximum load-carrying ability and castability of such shapes. 6 ref. (E-general, 17-51)

163-E.* Dimensioning of Sand Casting Risers. Harish D. Merchant. *Modern Castings*, v. 35, Feb. 1959, p. 73-86.
General equation for risers expressed in graphic form which is convenient to use, provided the values of the parameters of the equation are known. These are the solidification shrinkage at pouring temperature, the ratio of height to diameter of riser and number of risers required. 24 ref. (E22q; CI, ST)

164-E.* Mold Material Effect on Cooling Rate and Physical Properties of Cast Metals. *Modern Castings*, v. 35, Feb. 1959, p. 86-100.

Effect on the physical properties of various cast irons when cast into molds made in typical molding sands at various ramming densities; effect when using other types of molding materials of varying thermal properties. Increased coarseness of grain size and increased mold density increases tensile strength in all cases, when other variables are equal. 10 ref. (E19, E25n, Q27a; CI)

165-E.* (Dutch.) Pouring Times for Sand Casting. J. S. Abcouwer. *Metalen*, v. 14, Jan. 15, 1959, p. 2-6.

Formulas and graphs for different weights, wall thicknesses and thermal conditions. 6 ref. (E11, E23)

166-E.* From Gravity Die-Casting to Shell Moulding. D. Miller. *British Foundryman*, v. 52, Jan. 1959, p. 2-3.

Pattern equipment and procedures used in shell molding, shell core blowing and closing shell molds in the production of small brass castings. Economics. (E19c; Cu-n)

167-E.* Investment Casting—Recent Experiences and Improved Techniques. D.F.B. Tedds. *British Foundryman*, v. 52, Jan. 1959, p. 10-17.

Distortion in wax patterns and control with plaster fixtures. Improvements in method of applying primary coating; production of cored passages using water soluble cores; control of mold temperature and metal pouring time; vacuum casting and refractory shell techniques. (E15, 1-73)

168-E.* Non-Ferrous Alloys. Arthur Logan. Paper from "Modern Foundry Practice". 3rd Ed. Philosophical Library, Inc., New York, 1959, p. 84-124.

Equilibrium diagram for Cu-Sn systems. Melting practices for bronze. Effects of casting temperature, repeated melting, degassing, fluxing, grain refinement, Pb, Fe, Zn, S, P, Ni, Al, Si or Bi on soundness and mechanical properties of bronze castings. Foundry characteristics of Al bronze, Ni bronze and high-tensile brass. (E-general, M24b, Q-general, 3-69; Cu-s, Cu-n)

169-E.* Aluminum Alloys. Arthur Logan. Paper from "Modern Foundry Practice". 3rd Ed. Philosophical Library, Inc., New York, 1959, p. 125-141.

Composition and properties of Al casting alloys; melting practice, degassing, grain refining, modification; effect of Cu, Mg, Fe and Si on properties of alloys. (E25, E10, Q-general, 3-69; Al-b)

170-E.* Pattern Equipment. F.G. Butters, A. Marshall, R.C. Perkins and D.B. Orr. Paper from "Modern Foundry Practice". 3rd Ed. Philosophical Library, Inc., New York, p. 180-216.

Materials used, layout of pattern equipment, types of patterns for production of light, medium and heavy castings. (E17)

171-E.* Moulds and Mould-Making. James Timbrell. Paper from "Modern Foundry Practice". 3rd Ed. Philosophical Library, Inc., New York, 1959, p. 268-318.

Ramming and pattern stripping procedures; denting; running systems; mold closing; feeders; chills; ladles; pouring basins; cover cores; stripping plates; precautions in pouring and other considerations in molding and casting with sand. Pit molds and loam molding. (E19a, E19b)

172-E.* Cores and Core Making. F.H. Hoult. Paper from "Modern Foundry Practice". 3rd Ed. Philosophical Library, Inc. New York, 1959, p. 319-361.

Core sand practice; making green sand, dry sand, CO_2 process, loam, shell and resin bonded cores. Core blowing machines, types of core stoves, core handling. (E21g, E21h)

173-E.* Moulding Machines. E.D. Howard. Paper from "Modern Foundry Practice". 3rd Ed. Philosophical Library, Inc., New York, 1959, p. 362-393.

Straight draw machines, equipment for snap flask and pop-off flask and stack molding; squeeze rollover, jolt squeeze and sand sling machines. (E19a, 1-52)

174-E.* Modern Moulding Developments. J.L. Rice. Paper from "Modern Foundry Practice". 3rd Ed. Philosophical Library, Inc., New York, 1959, p. 394-415.

Patterns, molding equipment and sand mixes for CO_2 process and shell molding. Dimensional tolerances and advantages. (E19b, E19c)

175-E.* Fettling Practice. W.G. Morgan and J.E.O. Little. Paper from "Modern Foundry Practice". 3rd Ed. Philosophical Library, Inc., New York, p. 416-438.

Fettling operations including brushing, hydraulic cleaning, blasting, tumbling, chipping, grinding, sawing, flame-cutting and pickling. (E24, L10, G22g, G17h)

176-E. Foundry Clays. J.J. Marais. *British Foundryman*, v. 52, Jan. 1959, p. 4-9.

General properties of kaolinites, illites and montmorillomites, in relation to foundry work and their applications. Methods of identifying clays. (E18n, E18r; NM-f45)

177-E. Hydraulics Boost Die Casting Process. L.W. Haisen. *Die Casting Engineer*, v. 2, Dec. 1958, p. 8-10.

Problem of increasing casting speed in relation to closing the die, inserting the core, making the shot, die opening and ejection. (E13, 1-70)

178-E. Carbon-Dioxide Process for Moulds and Cores. *Foundry Trade Journal*, v. 106, Jan. 29, 1959, p. 125-126.

Advantages and disadvantages summarized. (E18)

179-E. Production of Electrical Components. *Machinery (London)*, v. 94, Jan. 28, 1959, p. 207-215.

Pressure and gravity die casting of Al and gravity die casting of Al bronze and brass alloys at Metropolitan-Vickers Electrical Co., Ltd., Manchester, England. (E13, T1; Al-b, Cu-n, Cu-s)

180-E. Moulding Sands and Dressings. A. Tipper. Paper from "Modern Foundry Practice". 3rd Ed. Philosophical Library, Inc., New York, 1959, p. 217-267. (E18)

181-E. Foundry Mechanization. John Gardom and C.C. Patterson. Paper from "Modern Foundry Practice". 3rd Ed. Philosophical Library, Inc., New York, p. 439-454.

Mechanical handling equipment. (E-general, W12)

182-E. Design Change + Shell Mold Casting = Savings. *Precision Metal Molding*, v. 17, Jan. 1959, p. 46-47.

Advantages of shell mold casting include greater accuracy; cores and mold components are rigid; smaller holes can be cored than in sand; thin-wall sections. (E16e, 17-51)

183-E. Low Cost Miniature Castings. *Precision Metal Molding*, v. 17, Jan. 1959, p. 59.

With the "Minicast" process the part is first cast as a rather conventional investment casting and is then coined to secure the required dimensional accuracy and flatness. (E15, G3n)

184-E. (Japanese.) Some Investigation on Cerium Treated Cast Iron. Masao Homma, Akira Minato, Hiroshi Meguro and Yosuhiko Abe. *Japan Foundrymen's Society, Journal*, v. 30, Dec. 1958, p. 947-953.

Effects of Ce on macro and microstructure of hypoeutectic and eutectic cast iron, inoculation and chill effects and production of malleable high-Si cast iron. Ce has effect of producing white cast iron by deoxidation. Graphitization is accelerated and high-Si malleable cast iron is much improved in its mechanical properties. (E25q, N8s; CI-p, CI-s)

185-E.* (German.) New Process for the Magnesium Treatment of Cast Iron. Werner Jahnig. *Freiberger Forschungshefte*, no. B31, 1958, p. 173-187.

Mg addition to melts of low-P and low-S cast iron by feeding a rod of Mg alloy under the bath surface, across a sealed opening near the bottom of the ladle. 5 ref. (E25q; CI-r, AD-p36, *Mg*)

186-E.* (German.) Centrifugal Casting of Cu Alloys. Joachim Muller and Eva-Maria Pettinger. *Freiberger Forschungshefte*, no. B31, 1958, p. 315-342.

Experimental casting of bushings in a Cu mold in a casting machine with air cooling. Effects of rotation speed, pouring conditions and different types of wash on quality of castings. (E14, T7d, 2-60, 3-67; Cu-b, 17-57)

187-E.* (Japanese.) Effects of Calcium on Cast Iron Melted Under Vacuum. Masuteru Maruyama and Hiroyuki Chida. *Japan Foundrymen's Society, Journal*, v. 30, Nov. 1958, p. 880-886.

Graphitization effect due to Ca is powerful and spherodization in low-carbon iron is better, with less Si, whereas graphitization in high-carbon iron is better with more Si. (E25q, N8s; CI, *Ca*, Si)

188-E.* (German.) Methods of Avoiding Defects in Castings. H. Kron. *Giesserei-Praxis*, Jan. 10, 1959, p. 15-19.

Causes of blowholes, cold shuts, cavitation, rough surfaces, cracks and segregation related to possible remedies. (E-general; 5, 9)

189-E.* (German.) Casting of Zinc Alloys. Karl Kramer. *Giesserei-Praxis*, Jan. 10, 1959, p. 10-15.

Die casting, permanent mold casting and composite castings of Z-430 alloy. (E13, E12; Zn-b)

190-E.* (German.) Gas Absorption, Gas Determination and Methods for Degassing Aluminum Alloys. A. Hohmann. *Giesserei-Praxis*, Jan. 10, 1959, p. 8-9.

Chemical and physical means for avoiding gas absorption during melting. (E25s, E10; Al-b)

191-E.* (German.) Production of High-Strength Castings. Hans Reininger. *Giesserei-Praxis*, Jan. 10, 1959, p. 3-8.

Tensile strength, elongation and hardness of AZG alloy in relation to pouring, degassing, refining, desulphurization and addition agents. (E-general, Q-general; Mg-b, 5-60, AD-q40)

192-E.* (German.) Compound Castings of Wear Resisting Materials. Hans Reininger. *Giesserei-Praxis*, Jan. 25, 1959, p. 30-31.

Compound casting method by which wear resistant surfaces and portions of harder material are added to castings of a softer base material. (E11; AD-q40, SGA-m)

193-E.* (Japanese.) Study on Bimetal Castings. Tsunemitsu Muraki. *Japan Foundrymen's Society, Journal*, v. 30, Dec. 1958, p. 959-967.

Adhesion mechanism between molten cast iron and steel, covered with oxide film. Cast iron and steel are stuck together and heated at 950 to about 1150°C. in argon gas atmosphere. Reduction and dissolution of oxide film and pressure welding takes place, CO gas being released. Intermetallic diffusion, Fe-ion from steel to cast iron and carbon from cast iron to steel, occurs, which makes the adhesion complete. 15 ref. (E-general; ST, *CI*)

194-E. Do You Ask, "Which Core Process"? W.B. Bishop. *Canadian Metalworking*, v. 22, Feb. 1959, p. 22, 24, 26.

Advantages and disadvantages of various processes. (E21)

195-E. Die Casting Under Reduced Atmospheric Pressure. *Precision Metal Molding*, v. 17, Feb. 1959, p. 30-31.

Vacuum system evacuates the shot sleeve and the die cavity through the pouring hole after the metal has been ladled. Continued withdrawal of vapors from the chamber is made during actual injection of the metal. (E13, 1-73)

196-E. Electron Beam Melting. *Precision Metal Molding*, v. 17, Feb. 1959, p. 32.

Heating mechanism is a high-voltage electron bombardment, in which an electron gun serves as the cathode and the melt stock as the anode. Material to be melted can be in any form and not necessarily compacted as with arc melting. (E10b)

197-E. (German.) Molding and Casting of Crankshafts. Walter Feicke and Georg Arand. *Freiberger Forschungshefte*, no. B31, 1958, p. 109-128.

Survey on materials and foundry practice. 31 ref. (E23, T7j; CI-n, CI-s, ST, 5-60)

198-E. (German.) Importance of Sprue and Flow Off Shapes in Iron Casting. Gerhard Gertz. *Freiberger Forschungshefte*, no. B31, 1958, p. 161-172.

16 ref. (E22; CI)

199-E. (German.) Die Casting and Permanent Mold Casting Machines. Werner Bahr. *Freiberger Forschungshefte*, no. B31, 1958, p. 289-313.

(E12, E13, 1-52)

200-E.* (Swedish.) Pressure Rightness of Copper Alloy Castings With Phosphorus as Affected by Shape Effects in Microporosity. Tore Malmberg. *Gjuteriet*, V. 48, Dec. 1958, p. 191-194.

Wedge and dumb-bell shaped test pieces were cast using various molding sands to study the influence of molding material on pressure tightness. Tight castings were obtained with green quartz sand and aluminum oxide added to dry sand. Pressure tightness is decreased by branch-shaped pores. (E25q, M27; Cu-b, *P*)

201-E.* Trends in Production of Castings in Aluminum Alloys. A. P. Fenn. *Metallurgia*, v. 59, Feb. 1959, p. 63-66.

Trend from sand casting to gravity die casting, and from gravity die casting to pressure die casting. Technical and economic considerations. (E11, E13; Al-b)

202-E.* (German.) Measurement of Thermal Cracking Susceptibility of Light Metals With Special Reference to Magnesium Alloys. K.E.

Mann. *Giesserei*, v. 45, Dec. 18, 1958, p. 761-765.

Mg-Al alloys increase in susceptibility up to 1% Al content, then decrease. Si additions give similar results. Fine-grained structure improved resistance. Hexachloroethane additions reduce grain size if content of Mn, Cu and Si is low. (E25n; Mg-b, Al, AD-p35, *Si, Mn, Cu*)

203-E.* (German.) Shrinkage and Dimensional Accuracy in Die Castings. Tomonobu Kanno and Torazo Uehara. *Giesserei*, v. 45, Dec. 18, 1958, p. 765-775.

Theoretical formulas for shrinkage derived from linear coefficients of thermal expansion for ASTM S12, SC54 and SC84 Al alloys. Shrinkage is reduced by increasing mold temperature. (E13, P10c; 17-55, 5-61, Al-b)

204-E.* (Japanese.) Flow of Aluminum and Its Alloys in Sand Molds. Goro Ohira and Mahito Koizumi. *Japan Foundrymen's Society, Journal*, v. 30, Nov. 1958, p. 897-904.

Behavior of pure metal, eutectic alloys (Al-Si, Al-Cu) and alloys of wide solidification range. (E25p, E11; Al-b, Cu, Si)

205-E.* (Russian.) Utilization of Low-Silicon Cast Iron. N.A. Barinov. *Liteinoe Proizvodstvo*, Dec. 1958, p. 3-6.

Various types of cast iron in regard to fluidity, mechanical properties, heat stability, sulphur content and gas inclusions. (E-general, Q-general, 3-60, 3-69; CI, *C, Mn, Si*)

206-E.* (Russian.) Steel Melting Technology for Profile Steel Casting. N.N. Dobrokhotov. *Liteinoe Proizvodstvo*, Dec. 1958, p. 8-9.

After melting add slags, lime, and heat steel above liquid temperature; discharge out of openhearth furnace in a boiling state; deoxidize and alloy with cold ferro-alloys added to the ladle. 4 ref. (E10, D2c; ST, RM-q, 5)

207-E.* Vacuum Die Casting of Aluminum and Zinc Alloys. J. P. Moehling, Jr. *Industrial Gas*, v. 37, Feb. 1959, p. 13-16.

Process eliminates porosity, provides better density, hardness and finish; is adaptable to automation. (E13, 1-73; Al-b, Mg-b, Zn-b)

208-E. Role of the Metallurgist in the Production and Usage of Austenitic Manganese Steel Castings. B. Needleman. *South African Institute of Mining and Metallurgy*, v. 59, Dec. 1958, p. 229-257.

Necessity for good control over casting temperature. Emphasis is placed on actual hardness figure of cold warked surface rather than lower hardness figure as given by the conventional Brinell machine using 3,000 Kg and a 10-mm.ball. (E-general, Q29, 2-61; ST, *Mn*, 5-60)

209-E. (Dutch.) Pouring Times for Sand Castings. J. S. Abcouwer. *Metalen*, v. 14, Jan. 31, 1959, p. 18-21.

Computations for cast iron and some nonferrous metal castings of various wall thicknesses. 6 ref. (E23; 5-60)

210-E. (Dutch.) Cupola Control. Pt. 4. *Gieterij-Centrum Berichten*, v. 7, Jan. 1959, p. 7-8.

Charge level is controlled by means of iron rod protruding from furnace sidewall which sinks as the level subsides. Charge can also be controlled by photo-electric cells. (E10a)

211-E. (French.) Flame Cutting Equipment for Cleaning Castings. *Journal d'Informations Techniques des Industries de la Fonderie*, no. 101, Nov-Dec. 1958, p. 12-13. (E24h, G22g, 1-52)

212-E. (German.) British Improvement in the Croning Process and Future Applications. A. N. Wormleighton, *Giesserei*, v. 45, Dec. 18, 1958, p. 775-777.

Croning process installation and typical products of the Phosphor-Bronze Co., Birmingham, England. (E16c)

213-E.* (French.) Dimensional Stability of Light Metal Castings. Henry Garnier and Jean-Jacques Desherault. *Fonderie*, no. 156, Jan. 1959, p. 13-20.

Dimensional changes due to residual stress. Effect of aging, heat treatment and various quenching media on dimensional stability. (E25, Q25, P10d, 2-64; Al-b, EG-a39, 5)

214-E. (French.) Statistical Control in the Production of Steel Castings. Pierre Destable. *Metallurgie et la Construction Mecanique*, v. 91, Jan. 1959, p. 19-26.

Statistical methods for control of C, Si, Mn and Cr contents. (E25, S12, 2-60; ST, *C, Si, Mn, Cr*, 5-60)

215-E.* (German.) Progress in the Foundry Industry During the First Six Months of 1958. Paul A. Heller. *Stahl und Eisen*, v. 79, Feb. 5, 1959, p. 156-162.

Melting techniques; new casting alloys; molding and cleaning practices. 93 ref. (E-general)

216-E.* (Japanese.) Metal Flow and Solidification of Aluminum in Casting Grates. Goro Ohira and Mahito Koizumi. *Japan Foundrymen's Society, Journal,* v. 30, Dec. 1958, p. 967-973.

Pouring, current flow and solidification process observed by the electromagnetic oscillograph. (E23, E25n; Al-b)

217-E.* (Russian.) Inoculation of Cast Iron With Liquid Iron-Magnesium Alloy. A. A. Ryzhikov and S. I. Ryabuchin. *Liteinoe Proizvodstvo,* Jan. 1959, p. 9-10.

Recommended procedure is to partially fill the ladle with liquid cast iron, charge 0.4% Mg and 0.4% FeSi, fill the balance with liquid cast iron, rotate the ladle 180° and discharge the metal into the cupola. After holding the metal for 20 min. to 1320°C. the metal is cast into forms. 4 ref. (E25q, E25s; CI-r, AD-p36, 14-60, *Fe, Si, Mg*)

218-E.* (Russian.) High Melting-Point Alloy for Nodular Cast Iron Inoculation. P. I. Stepin. *Liteinoe Proizvodstvo,* Jan. 1959, p. 10-11.

A ternary diagram of Mg-Si-Fe shows that the best alloying combination for use as an inoculant, and possessing both high Mg content and high melting point, is composed of 11% Mg, 35% Si, 11% Cu or Ni and 43% Fe. (E25q; AD-p36, CI-r, *Mg, Si, Cu, Ni, Fe*)

219-E.* (Russian.) Properties of Cast Iron Inoculated With Magnesium. G. A. Pisarenko, S. G. Guterman and P. V. Gubchevskii. *Liteinoe Proizvodstvo,* Jan. 1959, p. 12-13.

Cast iron with spheroidal graphite, obtained as a result of treatment with Mg has higher mechanical properties, even if unannealed. Still better properties result from Mg-FeSi treatment. (E25q, Q-general; CI-r, AD-p36, *Mg,* Si)

220-E.* (Russian.) Effect of Sulphur on Mechanical Properties of Inoculated Malleable Iron. A. S. Suprun. *Liteinoe Proizvodstvo,* Jan. 1959, p. 13-14.

Addition of Al to malleable Fe with high S content increases tensile strength, ductility and elongation, and changes considerably sulphur's effect upon mechanical properties. In addition, the annealing cycle is shortened. (E25q, Q27a; CI-s, AD-p36, *Al, S*)

221-E.* (Russian.) New Methods for Studying Flowability of Metals and Formation of Shrinkage Cavities. I. Chikel'. *Liteinoe Proizvodstvo,* Jan. 1959, p. 27-32.

Two kinds of test pieces for observing flowability of liquid metal and for studying shrinkage behavior. Influence of casting shape and wall thickness on structure; effects on pouring time, feeding time and casting temperature on concentration and deconcentration of shrinkage cavities. 16 ref. (E25p, P10c; CI, 14-60, 9-67)

222-E.* (German.) Casting and Properties of Components for Semi-Assembled Crankshafts. Gerhart Tschorn. *Giessereitechnik,* v. 5, Jan. 1959, p. 4-9.

Melting, molding and pouring processes, heat treatment of steel castings. (E-general, Q-general, T7j, 2-64; SS, 5-60)

223-E. (German.) Principles of Casting Design. Heinz Lucas. *Giessereitechnik,* v. 5, Jan. 1959, p. 19-25.

Basic design requirements related to gating and risering. (E17, E22, 17-51)

224-E.* (German.) Magnesite Risers. Horst Riess. *Giessereitechnik,* v. 5, Jan. 1959, p. 25-26.

Mixture of magnesite, lye and sawdust or wood shavings is used, packed solidly into sheet metal forms. (E22q)

225-E.* (Russian.) Use of Exothermic Feeding Compounds in the Production of Nodular Cast Iron. N. I. Klochev and A. M. Sucharev. *Liteinoe Proizvodstvo,* Jan. 1959, p. 11-12.

Exothermic mixes (Feedex) must have good heat conductivity, high ignition temperature and combustion rate; excellent molding properties; good stability as it reaches ignition temperature; combustion products should have low heat conductivity and not enter into reaction with the metal. Typical analysis of an exothermic mix for Mg inoculated cast iron. (E25q, E25n; CI-r, AD-p36)

226-E.* Centrifugal Casting Applied to Grey Iron. L. McIntosh. *Castings,* v. 5, Jan. 1959, p. 7-17.

Quality control of castings, mold speeds, centrifugal casting machines. (E14; CI-n)

227-E. (Italian.) Use of Ferro-Alloys Makes It Possible for Small Iron Foundries to Meet Customer Specifications. *Fonderia,* v. 7, Dec. 1958, p. 533-536.

Effects of alloying on composition and properties of castings; form and composition of ferro-alloys; additions in furnace and in ladle. (E-general, 2-60; AD-n31, Fe, 5-60)

228-E. (Italian.) Elektron Foundry Practice. Giuseppe Barchiesi. *Fonderia*, v. 7, Dec. 1958, p. 537-542.
Care and use of crucibles; melting; alloying additions; preparation of cores and molds; molding and chill casting; repair of defective castings; Cr plating in alkaline solution. (E-general; Mg-b)

229-E.* Investment Casting in US and UK: Pt. 1. H. P. Gray. and A. Dunlop. *Foundry Trade Journal*, v. 106, Feb. 19, 1959, p. 203-209.
Detailed developments of the original process, and Investment X, Mercast, Glascast and Shaw processes. 19 ref. (E15)

230-E.* (German.) Melting Plain Carbon and Alloy Steels in Low-Frequency Induction Crucible Furnaces. Dieter Hartman. *Giesserei*, v. 46, Jan. 15, 1959, p. 25-29.
Remelting and refining processes; furnace systems; advantages for the steel foundry. 6 ref. (E10p, 1-69; AY, CN)

231-E.* (German.) Economics of Exothermic Feeding Compounds. Leo Remmeke. *Giesserei*, v. 46, Jan. 15, 1959, p. 34-37.
Savings realized by use of exothermic compounds in preventing formation of shrinkage cavities as the metal contracts on cooling. (E23, E25n, 9-67)

232-E.* (German.) Pinholes in Steel Castings. Fritz Brunn. *Giessereitechnik*, v. 4, Dec. 1958, p. 307-310.
Pinholes in the form of blowholes a few tenths of an inch under the skin of the casting are analyzed in relation to incidence, causes and possible remedies. 5 ref. (E-general; 5-60, ST, 9-68)

233-E.* (German.) Magnesium Inoculated, Spheroidal Graphite Cast Iron and Its Application in Pipelines. Georg Haensel. *Gas, Wasser, Warme*, v. 13, Jan. 1959, p. 8-20.
Preparation by inoculation of powdered Mg into the melt by lance in a stream of nitrogen. Mechanical properties are improved by heat treatment. (E25q, T26r, 2-64; CI-r, *Mg*, AD-p36)

234-E. How to Mechanize the Smaller Foundry. Henry W. Zimnawoda. *Foundry*, v. 87, Mar. 1959, p. 82-89.
Mechanization applied to molding practice. (E19, 18-74)

235-E. Modern Diecasting Plant Designed for Future Expansion. *Foundry*, v. 87, Mar. 1959, p. 93-95.
Melting and die casting practice at Rockwell Mfg. Co., Pittsburgh. (E13)

236-E. (French.) Safety Measures in Foundry Operations. J. Leonard. *Fonderie Belge*, v. 28, Dec. 1958, p. 376-378.
(E-general, A7p)

237-E. (German.) New Trends in Pattern and Mold Making. Franz Rossberger. *Giesserei*, v. 46, Jan. 15, 1959, p. 30-34.
(E19, E17)

238-E. (German.) Invertible Molding Plates Increase Productivity. Fritz Naumann. *Giessereitechnik*, v. 5, Jan. 1959, p. 10-12.
Invertible molding plates are used to produce both upper and lower halves of the mold of symmetrical castings in the small and medium-size ranges. Molding plates may be made of metals or plastics, but calcined gypsum is usually preferred. (E17)

239-E. (Russian.) New Non-Searching Facing Material for Foundry Molds. P. V. Chernogorov, Yu. P. V. Bobrov. *Liteinoe Proizvodstvo*, Jan. 1959, p. 4-5.
Limestone slag, in place of talcum powder, sprinkled on mold surfaces, produces cleaner castings. (E11, E25)

240-E.* (German.) Production of High-Quality Sand Castings From Remelted Aluminum Alloys. Hans Reininger. *Giesserei-Praxis*, no. 4, Feb. 25, 1959, p. 61-68.
Attention must be paid to casting temperature, cooling rate and systematic gating. (E11, E25; Al-b)

241-E. (Book.) Modern Foundry Practice. 3rd Ed. E. D. Howard, Editor. 464 p. 1959. Philosophical Library, Inc., 15 East 40th St., New York 16, N. Y. $15.
Sections on ferrous metals, nonferrous alloys, heat treatment, melting furnace, pattern equipment, molding sands, molding, molding equipment, coremaking, fettling practice. Papers separately abstracted. (E-general)

242-E.* Shell Moulding for Steel. *Iron and Steel*, v. 32, Feb. 1959, p. 45-48.
Shell molding technique provides carbon, low-alloy and stainless steel castings of good finish and accuracy in dimensional tolerance (E16c; SS, CN, AY)

243-E.* Miniature Investment Castings. *Precision Metal Molding*, v. 17, Mar. 1959, p. 33-35.

Castings are produced in Al, stainless steel, BeCu, silicon brass, toolsteel, alloy steel and carbon steel. (E15; ST, Al, Cu-b, *Be*, Cu-n, Si)

244-E.* (Hungarian.) Increasing the Life of Ingot Molds. Arisztid Kralik. *Kohaszati Lapok-Ontode*, v. 91, Sept. 1958, p. 205-215.

Factors influencing life time include composition of metal, shape of molds, direction of pouring, cooling rate and temperature preceding pouring. 11 ref. (E23, W19c)

245-E.* Development of a Marine-Propeller Alloy. A. J. Smith. *Foundry Trade Journal*, v. 106, Mar. 5, 1959, p. 265-267.

Casting practice for Ni-Al bronze; properties and performance of the castings. (E11, A-general, T22h; Cu-s, *Al*, *Ni*)

246-E.* Production of Investment Castings for Commercial Applications. *Machinery (London)*, v. 94, Mar. 4, 1959, p. 484-492.

Techniques employed by P. I. Castings, Ltd., in manufacturing a wide range of castings. (E15)

247-E.* (Rumanian.) Effect of Aluminum on the Microstructure of Cast Iron With Laminar or Nodular Graphite. Traian Dumitrescu, Maria Solacolu-Nicolaid and Alfred Kathrein. *Studii si Cercetari de Metalurgie*, v. 3, no. 4, 1958, p. 417-438.

Graphitization; ferrite formation; development of epsilon-phase; hardness as influenced by Al content. 11 ref. (E25q, M27, 2-60; CI, *Al*)

248-E.* Resin and Sand Economy, and Surface Finish in Shell Molds. R. S. Jackson and W. W. Glick. *British Foundryman*, v. 52, Feb. 1959, p. 53-60.

Effect of sand composition and resin content on cold strength of shell molds and surface finish of phosphor bronze test castings. Comparison of silica, zircon and olivine sand mixes. Use of precoated sand, reclaimed sand and pickup agents. Economics. (E19c, E16c; Cu-s)

249-E.* Effect of Mold Material on the Cooling Rate and Physical Properties of Cast Metals. *British Foundryman*, v. 52, Feb. 1959, p. 66-79.

Effect of molding materials and ramming densities on cooling rate of cast iron and the resulting microstructure and tensile properties. Mold materials, including normal sand, resin bonded sand, silicon carbide, oil sand, graphite, sodium silicate-bonded sand. Zircon, olivine and cement bonded sand. Variations with inoculation; changes in ratio of volume to surface area, superheating and carbon equivalent. 10 ref. (E19, E11, E25q, Q27a; CI)

250-E.* Running and Gating of Copper-Alloy Castings. W. W. Glick, R. S. Jackson and R. W. Ruddle. *British Foundryman*, v. 52, Feb. 1959, p. 90-107.

Assessement of single-gate systems, horizontal multiple-gate systems and vertical-gate systems for castings of phosphor bronze, leaded gunmetal, aluminum bronze and high-tensile brass. Comparison between flow of Cu alloys through channels in shell molds and in green sand molds. Practical recommendations for running and gating of Cu alloys differing in susceptibility to formation of dross. 17 ref. (E11, E22p; Cu-b, Cu-s, *Al*, *P*, Cu-n)

251-E.* Why and How to Use Magnesium Castings. Jerry Singleton. *Modern Castings*, v. 35, Mar. 1959, p. 39-41.

Sand casting and die casting; mechanical properties of castings. (E11, E13, Q-general; Mg-b, 5)

252-E.* Why and How to Use Investment Castings. R. R. Miller. *Modern Castings*, v. 35, Mar. 1959, p. 42-44.

Principles of investment casting; mechanical properties of castings. (E15, Q-general; 5-62)

253-E.* Factors Influencing Soundness of Gray Iron Castings. A Review of Some Recent British Work. I. C. H. Hughes, K. E. L. Nicholas, A. G. Fuller and T. J. Szajda. *Modern Castings*, v. 35, Mar. 1959, p. 73-89.

General expansion of the casting during solidification is associated with the formation of shrinkage defects. Casting expansion is promoted by mold cavity volume changes, which are more pronounced in softer molds and are dependent upon pouring temperature and molding sand type and properties. 28 ref. (E25n, P10c; CI-n, CI-r)

254-E.* (French.) Chill Cast Aluminum-Bronze. Melting Loss Due to Oxidation. *Journal d'Informations Techniques des Industries de la Fonderie*, Oct. 1958, p. 7-9.

Oxidation being a surface phenomenon, loss can be reduced by reducing volume to surface ratio of metal charge, by using melting furnaces of proper design and holding furnaces of size conducive to reduction of holding time and of exposed surface of molten metal, and by avoiding, insofar as possible, breaking of oxide film when removing molten metal from holding furnace with ladle. (E10, R1h; Cu-s, *Al*)

255-E.* (Italian.) Effects of Heat Treatment on the Properties of a Defective 13% Cr Steel Casting. Piero Virdis. *Fonderia Italiana*, v. 7, Dec. 1958, p. 497-500.

Specimens of material used in two-ton casting with structural abnormalities (segregation of ferrite and carbides) and undesirable mechanical properties subjected to various treatments. Corrective hardening and tempering conditions permit reclamation of casting. (E26, 2-64; SS, *Cr*, 9-69)

256-E.* General Motors Describes Centrasteel. W. B. Larson, C. F. Joseph, F. J. Webberle and R. F. Thomson. *Modern Metals*, v. 35, Mar. 1959, p. 47-52, 134.

New steel-like material having a compacted type of graphite in the as-cast condition is produced by inoculation with boron and tellurium of a low-carbon, high-silicon base composition. (E25q, Q-general; AD-p36, *B, Te*, CI, ST)

257-E.* (Rumanian.) Effect of Modification on Contraction of Cast Iron. L. Sofroni and C. Cosneanu. *Studii si Cercetari de Metalurgie*, v. 3, no. 4, 1958, p. 439-450.

Cast iron melt modified with ferrosilicon and alternately with Mg, was cast to study contraction behavior. Contraction is influenced by the quantity of modifying agent and its carbon equivalent. (E25n, 2-60; AD-p, CI, *Si, Mg*)

258-E.* Castings: 354 to the Ounce. Robert H. Herrman. *Foundry*, v. 87, Apr. 1959, p. 183-184, 186.

Investment casting of small stainless steel bomb vanes. (E15, T2k; SS)

259-E.* Ceramic Shell Casting Method Employs Conventional Investment Tooling. *Western Metalworking*, v. 17, Mar. 1959, p. 60-61.

New precision casting process which combines the benefits of lost wax investment casting with ceramic shell molding. (E15, E16c; SGA-h)

260-E.* (German.) Significance of Induction Furnaces for Foundries. Karl-Heinz Brokmeier. *Giesserei*, v. 46, Mar. 12, 1959, p. 129-136.

Remelting techniques; bath motion; automatic cleaning; vacuum melting. (E10r, W18a)

261-E.* (German.) Melting Losses With a Charge of Brass Scrap Containing 50% Chips. Manfred Stammler. *Giesserei*, v. 46, Mar. 12, 1959, p. 138-139.

Tests with alloy MS 58 indicate that a slow stirring in of brass chips enables a reduction of melting loss by about 6%. (E10, B23; Cu-n)

262-E.* (Hungarian.) Formation and Presence of Silica Inclusions in Cast Iron. Gyula Nandori. *Kohaszati Lapok-Ontode*, v. 91, Oct-Nov. 1958, p. 225-235.

Influence of Mn content on proportion of submicroscopic silica inclusions. 23 ref. (E25q, 2-60; CI, *Mn*, 9-69)

263-E.* (Hungarian.) Modern Nonferrous Melting Processes and Equipment. Janos Payer and Janos Imre. *Kohaszati Lapok-Ontode*, v. 91, Oct-Nov. 1958, p. 252-258.

British methods and equipment for melting relatively small quantities of nonferrous alloys and scrap metals. (E10, W18; EG-a38)

264-E. (Russian.) Technological Improvements in the Production of Castings for Metalworking Equipment. I. A. Onufriev. *Liteinoe Proizvodstvo*, Feb. 1959, p. 16-23.

Casting practices, patternmaking, casting molds and core design. (E-general, W19)

265-E.* Some Factors Influencing the Production and Control of Quality of Aluminum-Alloy Die Castings. R. R. Woodward and H. J. Proffitt. *British Foundryman*, v. 52, Mar. 1959, p. 119-126.

Techniques to reduce riser proportions by the application of progressive-feeding methods employing the principles of directional solidification, and the automation of die operation. (E13, E25; Al-b, 5-61)

266-E.* (German.) Susceptibility to Hot Tearing and Mechanical Properties of Al-An-Mg Casting Alloys. W. Patterson and S. Engler. *Aluminum*, v. 35, Mar. 1959, p. 124-130.

Hot tearing of Al alloys with 0-10% Zn and 0-10% Mg and effects of Ti, Fe and Cu additions. High strength and good elongation are combined with low susceptibility to hot tearing at 6-7% Zn and 0.3-0.5% Mg. 16 ref. (E25q, Q-general, 2-60; Al-b, Zn, Mg, 9-71)

267-E.* (German.) Shrinkage Cavities in Gray Cast Iron. Joseph Czikel and Harald Koechling. *Freiberger Forschungshefte*, v. B30-2, 1958, p. 12-21.

Shrinkage holes seldom appear in most eutectic alloys. Undereutectic and overeutectic alloys are more susceptible to cavity formation. 17 ref. (E25n, CI-n, 9-67)

268-E.* (German.) Defects in Castings. Gustav Nickell. *Freiberger Forschungshefte*, v. B30-2, 1958, p. 58-83.

Segregation and shrinkage holes can be avoided by fast and uniform solidification. Formation of pinholes may be prevented by keeping the casting uncovered during solidification. 43 ref. (E25q; 9-68, 9-69)

269-E.* (German.) Oxidizing Agents in the Melting of Copper Alloys. Ernst Brunhuber. *Giesserei*, v. 46, Feb. 14, 1959, p. 86-92.

Hydrogen unsoundness of Cu castings eliminated by oxygen enrichment supplied by air or oxygen injection; treatment by an oxidizing flame in fuel-fired furnaces; or addition of oxygen compounds. 7 ref. (E25s, E10; AD-s, Cu-b, 5-60, 9-68)

270-E.* (German.) Inoculation by Magnesium Alloys (Zinc and Aluminum) Compared With Magnesium Metal to Produce Nodular Cast Iron. Hans Grossmann. *Giessereitecnik*, v. 5, Feb. 1959, p. 48-52.

Trace additions of Mg to cast iron cause spheroidal nodulization of the graphite and thus improve ductility. Use of Mg containing 5-6% Al and 2-3% Zn produces no difference in effect than pure Mg. Effects of ferrosilicon inoculation, cooling rate and annealing on hardness, tensile properties, grain structure and nodulization. 18 ref. (E25q, 2-60; CI-n, Mg-b, *Al*, *Zn*, AD-p36)

271-E.* Practical Application of Reinforced Epoxy Resins for Foundry Use. H. A. Burton. *British Foundryman*, v. 52, Mar. 1959, p. 127-136.

Application of epoxy resins to manufacture strong void-free pattern equipment; vacuum-bag molding and vacuum-drawing process. (E17; NM-d, 17-57)

272-E.* Lost Wax Investment Casting. *Australasian Manufacturer* v. 43, Feb. 21, 1959, p. 60-69.

New injection machine, furnace and refractory. (E15, 1-52)

273-E.* Using the Sealed Ladle. W. E. Braidwood. *Engineer and Foundryman*, v. 24, Feb. 1959, p. 38-42.

cupola practice in the preparation of nodular cast iron. (E10a, CI-r)

274-E.* Causes and Effects of Die Casting Porosity. H. K. Barton. *Machinery (London)*, v. 94, Mar. 25, 1959, p. 673-684.

Behavior and flow of metal when it is injected into dies, and the manner in which air bubbles can form and cause porosity to varying degrees. 18 ref. (E13; Al-b, Zn-b, 5-61, 9-68)

275-E.* How Melting Practice Affects Casting Quality. H. K. Barton. *Metalworking Production*, v. 103, Mar. 27, 1959, p. 542-545.

Reduction of cost of zinc die casting by conservation of metal. (To be continued.) (H13; Zn-b, 17-53)

276-E.* (Dutch.) Melting of G-Al-Si 13 Alloy. H. Boswinkel. *Metalen*, v. 14, Feb. 1959, p. 50-56.

Effects of modifiers composed of 33% NaCl and 67% NaF, casting processes, casting temperatures and wall thicknesses on the tensile strength and elongation of the cast metal. (E10, Q27a; Al-b, *Si*, 5)

277-E. (German.) Experiments Using Permanent Molds for Casting Gray Iron. Gerhard Schwarz and Dieter Junghans. *Giessereitechnik*, v. 5, Feb. 1959, p. 35-46.

Design of permanent molds for castings with thin walls; applications of permanent mold technique. (E12, 17-51; CI-n)

278-E. (German.) Sweating Due to Flaws in the Mold. Josef Czikel. *Giessereitechnik*, v. 5, Feb. 1959, p. 47.

Sweating in a cast iron ship propeller due to lifting of the cement mold by the liquid metal. (E25; CI)

279-E.* Gray Iron Permanent Molding. H. U. McClelland. *Modern Castings*, v. 35, Apr. 1959, p. 88-90.

Development of technique, design and fabrication of mold, metallurgy and dimensional tolerances of gray iron castings produced in permanent molds. (E12; CI-n)

280-E.* Hot Cracking Test for Light Metal Casting Alloys. E. J. Gamber. *Modern Castings*, v. 35, Apr. 1959, p. 99-103.

Test castings in shape of thin elongated channel sections with short upright ends

which vary in fillet radii and length to provide for wide range of hot cracking susceptibility. Relative hot cracking rating for various commercial Al and Mg casting alloys. 4 ref. (E25n, 1-54, 9-72; Al-b, Mg-b)

281-E.* (German.) Absorption of Gas From Combustion Gases During the Melting of Light Metal Alloys. Claude Mascre and Andre Lefebvre. *Giesserei*, v. 46, Mar. 26, 1959, p. 153-159.

Below a critical surface temperature of 930-950°C. the melt (Al with 8% Cu, 4% Si) releases gas, but above this temperature the absorption on the surface and through the crucible becomes very great due to the reaction $2Al + 3H_2O$ $Al_2O_3 + 6H$. Suggested remedies. 7 ref. (E25s, E10r; Al-b)

282-E.* Exercise in Pattern Duplication. *Foundry Trade Journal*, v. 106, Apr. 2, 1959, p. 377-384.

Replacement of wooden patterns by epoxy patterns in development of castings for aircraft (E17; NM-d)

283-E.* (Dutch.) Practical Control in Melting G-Al-Si-13 Alloy. H. Boswinkel. *Metalen*, v. 14, Mar. 14, 1959, p. 64-69.

Factors influencing degree of modification, such as composition of modifier and setting time. Fracture surface of samples is determined by degree of modification and gas content. (E25; Al-b, *Si*)

284-E.* (German.) Conditions for the Formation of Spheroidal Graphite in Cast Iron. B. S. Milman. *Bergakademie*, v. 11, Jan. 1959, p. 26-27.

The main conditions are increase of surface tension and undercooling, effected by Mg. Al and Ca disturb nodulizing because there is no undercooling. (E25q; CI, AD-p36, *Mg*)

285-E. Mechanized Shellmolding in an American Foundry. *Foundry Trade Journal*, v. 106, Mar. 26, 1959, p. 352-355.

Evinrude Motor's foundry at Milwaukee (E19c, W19, 18-67, 18-74)

286-E. Fixing Patterns on Plates and Boards. *Foundry Trade Journal*, v. 106, Apr. 2, 1959, p. 385-386.

(E17)

287-E. (German.) Penetration of Metal in Sand Cores. K. Fursund. *Giesserei*, v. 46, Mar. 26, 1959, p. 159-164.

Influence of molding sand and additions and of steel pressure and temperature on penetration. 4 ref. (E11; ST)

288-E. (German.) Rationalization and Mechanization of Foundries. T. Klingenstein. *Metall*, v. 13, Apr. 1959, p. 309-313.

(E-general, 18-74)

289-E. (Italian.) Infrared Drying and Its Applications in Foundries. P. G. Lanino. *Fonderia*, v. 8, Feb. 1958, p. 41-46.

(E-general, W4k)

290-E. (Japanese.) Effects of Several Molding Materials on Sand Adherence to Steel Casts. Susumu Minowa. *Nagoya Government Industrial Research Institute, Reports*, v. 7, June 1958, p. 406-411.

Reaction of sand, bentonite, zircon, iron oxide, chromium oxide and lead oxide with molten steel. 4 ref. (E18r, E25n, ST, 14-60)

291-E.* Metal-Handling Practice for Diecasting. Pt. 2. Ladling Gives Way to Automatic Pouring. *Metalworking Production*, v. 103, Apr. 3, 1959, p. 595-599.

New techniques and equipment. (E13, E23, W19b, 1-52)

292-E.* Effect of Carbon, Silicon and Other Factors on the Shrinkage Behavior of Gray Cast Iron. T. J. Szajda. *British Cast Iron Research Assoc., Journal*, v. 7, Feb. 1959, p. 567-603.

High and low-phosphorus irons containing 2.2 to 4.5% C and 0.5 to 4.0% Si cast in green sand molds. Relation of eutectic graphite, carbon equivalent, carbon, Si and phosphorus with internal porosity, surface shrinkage and increase in volume of mold cavity. 9 ref. (E25n, P10c; CI-n, *C, Si*, P)

293-E.* Influence of Mold Rigidity, Pouring Temperature and Metal Composition Upon the Soundness of Fed Nodular and Flake Graphite Iron Castings. K. E. L. Nicholas. *British Cast Iron Research Assoc., Journal*, v. 7, Feb. 1959, p. 605-623.

Comparison of mold and casting dimensions for green sand, dry sand and cement-sand molds. Relationship between casting expansion and quantity of feed metal required as measured by volume of feed head pipe. 11 ref. (E11, E25n; CI-r, CI-n)

294-E.* (German.) Treatment of Melts in Foundry Practice. R. S. Meisenheim. *Giesserei-Praxis*, Mar. 25, 1959, p. 99-101.

Degassing of Al by chlorine and nitrogen and deoxidation of Cu alloys in relation to quality of castings. (E25s; Al, Cu)

295-E.* (German.) Water-Cooled Cupolas. *Giesserei-Praxis,* Mar. 25, 1959, p. 101-102.

Water cooling has a considerable effect upon the ratio of Mn while the degree of acidity in slag can be reduced by 30% with the CaO content being increased correspondingly. (E10a)

296-E.* (German.) Use of Calcium in Cupolas. *Giesserei-Praxis,* Mar. 25, 1959, p. 102.

"Foundry carbide" is a secondary fuel in cupola operations. Its effect results from melting at 1650-1680° C. and its burning in oxygen blast. (E10a)

297-E.* How Science Serves Canadian Foundries. Pt. 2. S. L. Gertsman. *Canadian Metalworking,* v. 22, Apr. 1959, p. 26-28.

Research in magnesium foundry practice; development of Mg alloy ZK61-T6; study of effects of prolonged heating on Ni bronze; investigations of hot tearing and pressure tightness of Cu alloys. 10 ref. (E-general, Q-general, 2-62; Cu-b, Cu-s, *Ni,* Mg-b, 9-71)

298-E.* (German.) Die Casting Practice. H. Kron. *Giesserei-Praxis,* Apr. 10, 1959, p. 115-117.

Hot chamber and cold chamber processes. (E13)

299-E.* (French.) Manufacture of Melting Pots for Lead. *Journal des Informations Techniques des Industries de la Fonderie,* no. 103, Feb. 1959, p. 20-21.

Cupola charge composition for cast iron containing Cr and Mn used for lead pots. Calsichrome or rechrom additions to the melt in the ladle; molding and treatment of castings. (E10a, W18h; CI, *Cr, Mn*)

300-E.* (German.) Change of Hydrogen Content in Refining the Approximately Eutectic Aluminum-Silicon Alloys. W. Manchen and W. Fischer. *Metall,* v. 13, Mar. 1959, p. 184-188.

In refining approximately eutectic Al-Si alloys at 650° C. hydrogen content decreases despite quantity of sodium being added provided the hydrogen content in unrefined material is higher. 11 ref. (E10; Al-b, *Si, Na, H*)

301-E.* (French.) Measurement of Oxidation Loss by Chemical Analysis. *Fonderie,* no. 158, Mar. 1959, p. 149-150.

A method is proposed to calculate losses in melting, transformation and fabrication. (E10)

302-E.* (German.) High-Conductivity Copper Castings. E. Brunhuber. *Radex-Rundschau,* no. 7, 1958, p. 361-369.

Maximum electrical conductivity is obtained with the double melting process for removal of hydrogen and refining by oxidation. 4 ref. (E10, P15g; Cu-b, 5-60)

303-E.* (Russian.) Inoculation of Cast Iron by the Addition of Liquid Steel. M. M. Turbovskii. *Liteinoe Proizvodstvo,* Mar. 1959, p. 4-7.

Process results in improved mechanical properties. 10 ref. (E25q; CI-n)

304-E.* (Russian.) Sources of Sulphur Saturation in Metallic-Mold Surfaces. Yu. L. Litvakovskaya and Yu. P. Bardachev. *Liteinoe Proizvodstvo,* Mar. 1959, p. 29-30.

Sulphur migrates into the surface of metallic molds from the cast metal during the use of the mold. An effective means to prevent saturation in chills is to lower their temperatures while in use, or by the application of dyes, pigments or paints. (E23, W19; S)

305-E.* (Russian.) Graphite Formation Mechanism in Magnesium Cast Iron. K. I. Vashchenko, R. P. Todorov and G. I. Koshovnik. *Liteinoe Proizvodstvo,* Mar. 1959, p. 34-39.

Spheroidal graphite forms in cast iron containing Mg equally well by direct precipitation in the eutectic crystallization as by the decomposition of cementite. 18 ref. (N8s, N12q)

306-E. Investment Castings in the US and UK. Pt. 2. *Foundry Trade Journal,* v. 106, Apr. 9, 1959, p. 409-417.

Review of papers from the European Investment Casters' Congress, 1958, dealing with U. S. specifications, low alloy and stainless steel castings. (E15, S22; AY-n, SS, 5-62)

307-E. (Dutch.) Foundry Practice. *Gieterij-Centrum Berichten,* v. 7, Mar. 1959, p. 16-17.

Control of cupola melting process by automatic detection of Fe temperature. (E10a, S16; Fe)

308-E. (French.) Principles of the Cupola Process. *Journal des Informations Techniques des Industries de la Fonderie*, no. 103, Feb. 1959, p. 1-7.

Melting temperature; coke combustion; temperature distribution; melting equilibrium; iron temperature; quantity of blast air. (E10a)

309-E. (French.) The Label "Alufran". *Journal des Informations Techniques des Industries de la Fonderie*, no. 103, Feb. 1959, p. 9-12.

Specifications; sand and permanent mold casting processes. (E11, E12; Al-b)

310-E.* (French.) Gassing of Molten Alloys by Air and Combustion Gases. Claude Mascre and Andre Lefebre. *Fonderie*, no. 158, Mar. 1959, p. 125-132.

Below the critical temperature degassing is faster than gassing by humid atmosphere or combustion gases diffusing through graphite crucible. Gassing by air and combustion gases is faster than natural degassing. 7 ref. (E25s; Al-b)

311-E.* Metal-Handling Practice for Diecasting. Pt. 3. How to Handle Magnesium Alloys. H. K. Barton. *Metalworking Production*, v. 103, Apr. 24, 1959, p. 727-730.

Pouring technique and equipment which minimize oxidation and provide automatic metering. (Concluded.) (E13, E23, W19b; Mg-b)

312-E.* New High-Magnesium Alloy for Plunging. *Union Carbide Metals Review*, v. 2, no. 2, Spring 1959, p. 6-7.

Technique consists of plunging the Mg alloy into a ladle of Fe. The method almost doubles Mg recovery by preventing burning of floating Mg. (E26q; CI-r, Mg-b, 17-57)

313-E.* (Hungarian.) Production of Gray Iron Castings Using Cast Iron Molds. Bela Bodnar. *Kohaszati Lapok-Ontode*, v. 91, Dec. 1958, p. 274-276.

Preheating of molds to 100 to 150° C. which are then arranged in tilted position to facilitate escape of gases. (E10, W19g; CI-n)

314-E.* What Is "High-Quality" Cast Iron? John Obrebski. *American Machinist*, v. 103, May 4, 1959, p. 104-107.

Melting, inoculation, alloying, heat treatment, composition, properties. (E-general, J-general; CI-n)

315-E.* Die Casting of Metals Under Vacuum. H. K. Barton. *Machinery (London)*, v. 94, Apr. 29, 1959, p. 967-979.

Application of vacuum in various types of permanent mold casting. (E12, E13, W19, 1-73)

316-E.* Brown-Coal Char as a Fuel for Foundry Cupolas. D. G. Evans, R. S. Higgins and G. L. Kennedy. *British Foundryman*, v. 52, Apr. 1959, p. 171-183.

Melting trials in experimental and commerical cupolas. Melting rate, stack-gas composition and temperatures; heat balances. Combustion behavior of char. 9 ref. (E10a, RM-j42, CI)

317-E.* Making Precision Castings for Commerical Applications. Examples of Components Produced by P. I. Castings (Altrincham), Ltd. *Machinery (London)*, v. 94, May 6, 1959, p. 1027-1034.

Picast process. (E15)

318-E. Cast Outboard Motor Crankshafts. Shell Moulding Technique Adopted. *Metallurgia*, v. 59, Apr. 1959, p. 174-175.

(E16c, E19c, 1-52; ST)

319-E. (German.) Cupola Control. Fritz Kretzschmer. *Giesserei*, v. 46, Apr. 23, 1959, p. 239-240.

(E10a)

320-E. (Pamphlet.) Bibliography on Shell Molding. 26 p. 1959. Engineering Societies Library, 29 West 39th St., New York 18. $2.

Selected list of 200 references to books, reports and articles published from 1952-1958. (E16c)

321-E. (Book-French.) Handbook for Cupola Practice. 2nd Edition. Francois Danis. 35 p. 1959. Editions Techniques des Industries de la Fonderie, 12 Ave. Raphael, Paris (16 eme). 900 F + 120 F postage.

Cupolas for the melting of gray cast iron, for steel casting, malleable casting and continuous melting. (E10a, W18d)

322-E.* (Book-Russian.) Compendium for the Foundry Industry. S. Ya. Golovin. 230 p. 1955. Gosudarstvennoe Nauchno-Tekhnicheskoe Izdatel'stvo Mashinostroitel'noi Literatury, Moscow. $1.

Basic technical information for the ferrous and nonferrous foundry industry; fireproof and insulating materials; furnace and cupola charging; foundry molds, flasks, core boxes, molding materials and patterns; manual and machine molding. 48 ref. (E-general)

323-E.* Timing of Expansion Scab Formation. J. E. Haller. *Modern Castings*, v. 35, May 1959, p. 65-68.

Tests showed that one type of scabs and/or buckles occurred because of sand expansion, and occurred either at the time the mold was filling or while the metal was still in a liquid state. (E25n; CI, 9-71)

324-E.* Deoxidation Defects in Steel Castings. R. A. Flinn and L. H. Van Vlack. *Modern Castings*, v. 35, May 1959, p. 93-97.

Essential feature of the defect, corundum, originates in the metal as a result of deoxidation with Al. 5 ref. (E25; ST, 9-69)

325-E.* Porosity, Inclusions and Pinholes in Malleable Castings. C. A. Sanders. *Modern Castings*, v. 35, May 1959, p. 103-111.

Hot sand and brittle sand are the most common sources of inclusions that may create pinhole porosity in production malleable foundries. 75 ref. (E11, E18; CI-s, 9-68, 9-69)

326-E.* Designing for Aluminum Die Casting. *Precision Metal Molding*, v. 17, May 1959, p. 39-40.

Advantages of die casting; rules for designing. (E13, 17-51)

327-E.* Designing for Zinc Die Castings. *Precision Metal Molding*, v. 17, May 1959, p. 41-43.

Checklist of general principles. (E13; Zn, 17-51)

328-E.* Designing for Investment Casting. *Precision Metal Molding*, v. 17, May 1959, p. 50-55.

Advantages of investment casting; list of design pointers. (E15, 17-51)

329-e.* Designing for Plaster Mold Casting. W. J. Prestel. *Precision Metal Molding*, v. 17, May 1959, p. 64, 66.

Advantages, techniques. (E16a, 17-51)

330-E. An American Looks at European Foundries. C. A. Sanders. *Foundry Trade Journal*, v. 106, May 7, 1959, p. 525-533.

331-E. (Russian.) Effect of One-Time and Semi-Permanent Molds on Quality of Cast Ingot Molds. N. I. Pavlovtseva. *Stal'*, Mar. 1959, p. 275-281.

Causes of decreased life and durability of ingot molds cast in semi-permanent molds. (E12, W19c; CI)

332-E.* (Hungarian.) New Methods for Producing Improved Quality Steel. Pt. 1. Alexander Mihajlovics Samarin. *Kohaszati Lapok*, v. 92, Feb-Mar. 1959, p. 49-54.

Remelting stainless steel and ball bearing steel in induction-type vacuum furnaces to reduce impurities, particularly oxygen, nitrogen and sulphur, and to improve structural and application properties. (E10, 1-69, 3-69; SS, *O, N, S*)

333-E.* (German.) Hardness and Structure Control in the Casting of Slides for Machine Tools. Kurt Wullenweber. *Giesserei*, v. 46, May 7, 1959, p. 265-274.

Effect of cooling conditions as given by various molding materials and wall thicknesses on hardness and structure. (E25q, Q29n, N8h; CI)

334-E.* (Hungarian.) Alloying Compounds for Producing Nodular Cast Iron. Nandor Hajto and Ferenc Varga. *Kohaszati Lapok-Ontode*, v. 92, Feb-Mar. 1959, p. 42-56.

Use of alloying compounds containing Al, Mn and Mg in correct proportions to obtain nodular cast iron with pearlitic structure. Heat treating methods and their influence on final macrostructure. (E-general, M28, J-general; CI-r, *Al, Mn, Mg, AD-p*)

335-E.* (Hungarian.) Shell Molding in an Iron and Steel Foundry. Otto Racz and Lajos Kalman. *Kohaszati Lapok-Ontode*, v. 92, Feb-Mar. 1959, p. 84-89.

Motor cycle engine cylinders are cast in a highly mechanized process using blowing machines for cores and shells. (E16c; Fe, ST)

336-E.* (Portuguese.) Production of Acicular Cast Iron Crankshafts. L. A. de Lacerda and C. Guimaraes. *Instituto de Pesquisas Tecnologicas*, Publication no. 592, 1959, p. 91-109.

Experimental casting of Javelin and Willys crankshafts; effects of Ni and Mo additions, patterns, molds; heat treatment and machining. 8 ref. (E-general, 2-60, T7j; CI-n, *Ni, Mo*)

337-E. (Hungarian.) Effect of Gating and Riser Systems on Quality of Nonferrous Casting. Karoly Marechal. *Kohaszati Lapok-Ontode*, v. 92, Feb-Mar. 1959, p. 96-100.

Evaluation of various gating and riser designs and resulting heat concentrations in brass and bronze castings. (E22; Cu-n, Cu-s)

338-E. (Swedish.) Control of the Level in Cupolas by Gamma-Rays. K. A. Fredriksson. *Gjuteniet*, v. 49, no. 4, 1959, p. 105.
(E10a, S14e)

339-E.* (German.) New Centrifugal Casting Processes. Hugo Dettela. *Industrie-Anzeiger*, v. 81, May 12, 1959, p. 581-583.
Solidification mechanism. Comparison of centrifugal castings and sand castings with reference to mechanical properties. Effect of wall thickness of permanent molds on formation of perfect cast surfaces. Factors influencing solidification direction in centrifugal casting in sand molds. 10 ref. (E14, Q-general, E25n; CI)

340-E.* (German.) New Centrifugal Casting Processes. Hugo Dettela. *Industrie-Anzeiger*, v. 81, May 15, 1959, p. 595-597.
Manufacture of large cylindrical parts from stainless and heat resistant steel. Flaw elimination by control of pouring temperature and pouring velocity, r.p.m. of mold, mold temperature and balancing the mold to avoid vibrations. (E14; SGA-h, SS)

341-E.* (Portuguese.) Manufacture of Free-Machining Carbon Steels With Galena Additions. Vincente Mazzarella. *Instituto de Pesquisas Techologicas*, Publication no. 591, 1959, p. 149-157.
Difficulties attendant on the use of finely powdered galena additions in melts weighing more the 20 kg. Experimental melts in a 20-kg. induction furnace and one-ton electric furnace produced steels with assimilation of between 22 and 56% of coarse galena powder additions. A 45% assimilation was obtained in one melt alloyed with metallic lead. (E-general, 2-60; Pb, RM-h, SGA-k, CN)

342-E.* Solidification of Various Metals in Ingot and Sand Molds. William S. Pellini. Paper from "Proceedings of the 41st Conference National Open Hearth Steel Committee of the Iron and Steel Division, v. 41". American Institute of Mining, Metallurgical, and Petroleum Engineers, New York, 1958, p. 93-142.
Temperature distribution during solidification of gray and nodular irons, carbon steel, stainless steel, Al alloys, Pb, Cu, brass, bronze and Monel in chill and sand molds. Effect of superheat, composition, thermal properties of mold wall and feeding characteristics. 26 ref. (E25n; CN, CI, Al-b, Pb, SS, Cu-n, Cu-s, Ni)

343-E.* (German.) Effect of Ladle Additions on Cast Iron. Wilhelm Patterson. *Giesserei*, v. 46, May 21, 1959, p. 289-301.
Effect on "degree of normality", tensile strength, hardness and distribution of graphite types and ledeburite. 26 ref. (E25, Q-general, 2-60; CI)

344-E.* (German.) Choice of Melting Process for Malleable Castings in the Construction of Agricultural Equipment. M. M. Turbowski. *Giesserei-Praxis*, no. 9, May 10, 1959, p. 168-169.
A considerable decrease in carbon content and improvement in mechanical properties is observed in the melting of malleable pig iron in a cupola with oxygen refining in the forehearth. (E10a, T3; CI-s)

345-E.* (German.) Procedures and Equipment for the Degassing of Molten Metal. Klaus Herfurth. *Giessereitechnik*, v. 5, Mar. 1959, p. 73-77.
Degassing by means of hexachloroethane, salt-bath, argon and hydrogen, electrolysis and filtering. 22 ref. (E25s; 14-60)

346-E.* (German.) Precision Casting With Frozen Mercury Patterns. Han Allendorf. *Giessereitechnik*, v. 5, Mar. 1959, p. 78-81.
Mercast process achieves high accuracy in precision investment casting. The main difficulty results from low working temperatures. 5 ref. (E15; 14-60)

347-E.* (Polish.) Pressure Feeding of Steel Castings. Stanislaw Teodor Jazwinski. *Archiwum Hutnictwa*, v. 4, no. 1, 1959, p. 45-62.
Investigation of shape and position of shrinkage cavities in gravity and atmospheric feeder heads to evaluate the advantages of pressure exerted in the feeder head on the efficiency of feeding and on the quality of castings produced. 4 ref. (E23; ST)

348-E. (German.) Graphs for the Determination of Charge Compositions for Cupolas. Franz Hickel. *Giesserei*, v. 46, May 21, 1959, p. 301-304.
(E10a)

349-E. (German.) Steel Casting. A. Heuvers. *VDI-Zeitschrift*, v. 101, May 11, 1959, p. 561-567.
Survey of casting methods. Directions for elimination of flaws, cleaning, welding, heat treatment and testing. 5 ref. (E-general, J-general, K-general; ST, 5-60)

350-E.* (German.) Changes in the Hydrogen Content Produced by the Modification of Almost Eutectic Aluminum-Silicon Alloys. Wolfgang Fischer. *Bergakademie*, v. 11, Mar. 1959, p. 193.

The hydrogen content of Si is lowered by the addition of Na as a modifier. Decrease in hydrogen content reaches 0.4 ccm. $H_2/100_g$ of metal. The hydrogen content depends on the quantity of Na. When the modification effect is canceled by a long setting time, a second Na addition again causes the structural change without increasing the hydrogen content. (E25q; Al-b, *Si, H*)

351-E.* Some Experiences in the Manufacture of Steel Castings for High-Pressure Turbine Components. G. L. Hancock and J. Taylor. *British Foundryman*, v. 42, May 1959, p. 246-254.

Review of foundry practice with special reference to modifications in the method of running and feeding. Improvement in creep properties which can be attained by not adding Al to steel for deoxidation purposes. (E-general, Q3; CN)

352-E.* Ductile Iron Production in Basic Direct-Arc Furnace. C. R. Isleib. *Modern Castings*, v. 35, June 1959, p. 61-66.

Advantages and procedure for this method of melting. Properties of iron produced by this process. (E10r; CI-r)

353-E.* Hypereutectic Aluminum-Silicon Alloy. Rolf Kissling and Oldrich Tichy. *Modern Castings*, v. 35, June 1959, p. 67-72.

Recently developed effective method of refining this alloy with phosphorus improved machinability. Mechanical, physical and thermal properties. 22 ref. (E-general, Q-general; Al-b, *Si*)

354-E.* Proper Gating Through Use of Cobalt-60. A. J. Karam. *Modern Castings*, v. 35, June 1959, p. 73-78.

Various machine part castings improved by proper feeding and gating, determined by radiographic inspections. (E22p, 1-59)

355-E.* Mottling in Heavy Section White Iron Castings. C. R. Loper, Jr., and R. W. Heine. *Modern Castings*, v. 35, June 1959, p. 100-104.

Determined curves showing maximum and minimum carbon and Si content which yields white and gray fractures respectively. Effects of water vapor and addition of Bi at varied temperatures. 17 ref. (E25q, 2-60; CI-p, *C, Si, Bi*)

356-E.* (German.) Some Operations Involved in the Casting of Heavy Metals in Permanent Molds. H. Kron. *Giesserei-Praxis*, no. 10, May 25, 1959, p. 183-191.

Special reference to spot test allowing the determination of the component element of alloys of unknown composition. (E12, S11a; Cu-b, Pb)

357-E. Selection of Die Casting Lubricants. William C. Kennedy and Edward A. Day. *Die Casting Engineer*, v. 3, June 1959, p. 7-9.

(E13; NM-h)

358-E. Vacuum-Melted Metals. *Electrical Review*, v. 164, May 8, 1959, p. 877-878.

Technique for processing new alloys. (E10, 1-73)

359-E. Ford's Unique Casting Plant Uses Molten Aluminum From Reynolds. *Industrial Heating*, v. 26, May 1959, p. 932, 934, 936, 938, 942, 944, 1041.

Ford's Engine and Foundry Division Plant in Sheffield, Ala., utilizes molten metal that is delivered from an outside supplier direct to the plant's holding furnaces. (E-general; Al)

360-E. Vacuum Melting of Metals. *Metallurgia*, v. 59, May 1959, p. 241-244.

Processes and equipment at a new plant installed for Wm. Jessop and Sons Ltd., Sheffield, England. (E10, 1-73)

361-E. (German.) Preparation of Work in a Modern Foundry. E. A. Hohmann. *Giesserei-Praxis*, no. 10, May 25, 1959, p. 192-194.

(E-general, A5b)

362-E. (Japanese.) Length of the Inoculation Effect. Kaoru Sato and Harutoshi Yamamoto. *Japan Foundrymen's Society, Journal*, v. 31, Jan. 1959, p. 20-25.

Effective duration of inoculation of cast iron with 0.25 to 0.30% Ca-Si in a large ladle. The improvement in mechanical properties due to inoculation is almost lost after 15 min. and, thereafter, still continues to decline, even if the melt is held at constant temperature. (E25q; CI, AD-p36, *Ca, Si*)

363-E. (Japanese.) Segregation in Aluminum and Aluminum Alloy Castings. Kazuo Yasuda. *Japan Foundrymen's Society, Journal*, v. 31, Jan. 1959, p. 31-40.

Relation between size of castings and shape of segregation studied by determining the segregation at various widths of

the wedge-shaped section of samples. Influence of pouring temperature and mold material on the shape of segregations. (E25n; Al-b, 9-69)

364-E. Automatic Diecasting of Small Zinc Parts. *Australasian Manufacturer*, v. 44, May 16, 1959, p. 54, 56-58, 61. (E13; Zn)

365-E. How to Choose—Investment Casting or Sintered Powder. Lloyd E. Raymond. *Product Engineering (Design Issue)*, v. 30, June 8, 1959, p. 86-87.

Applications, cost, geometry and tolerances required for small mechanical parts are factors. (E15, H15, 17-57)

366-E.* (Japanese.) Study on Scab Formation in Natural Sand Molds. U. Harada, K. Nishiyama and T. Kubota. *Japan Foundrymen's Society, Journal*, v. 31, Mar. 1959, p. 186-193.

Pouring was stopped at various stages during casting. Scab is mainly caused by expansion of the foundry sand and external pressure on the mold surface with the defect being aggravated by thermal stresses on the mold surface. (E25, E23)

367-E.* (Japanese.) Effect of Moisture Content in Sand Molds on Gray Iron Castings. Kaoru Katoh and Shigeaki Kita. *Japan Foundrymen's Society, Journal*, v. 31, Mar. 1959, p. 194-202.

Castability is good when moisture content is 4%, except when smooth surfaces are required. Mechanical properties are good with moisture content in the range 2-4%. Shrinkage cavities and pipe appear with higher moisture content. (E25p, E25q, E19, 9-67; CI-n)

368-E. (Japanese.) Quality Improvements of Aluminum Die Castings. H. Asada, J. Wada and T. Kanno. *Light Metals*, v. 9, Jan. 1959, p. 28-40.

Effects of casting conditions on mechanical properties; relationship between microstructure and strength. Mechanical properties of the die-cast tensile specimens were markedly affected by casting temperature and injection pressure but not by the die temperature. (E13, Q-general; 5-61, Al)

369-E. (Book-German.) Casting of Aluminum in Sand Molds and Permanent Molds. 6th Ed. Roland Irmann. 302 p. 1959. Aluminium-Verlag GmbH, Dusseldorf, Germany.

Effects of melt preparation and solidification mechanism on quality of castings; melting techniques and treatment of melts; cleaning, repair and testing of castings; heat treatment; design. 390 ref. (E-general; Al)

370-E. (Book.) Exploring Patternmaking and Foundry. Harvey D. Miner and John G. Miller. 206 p. 1959. D. Van Nostrand Co., Inc., 120 Alexander St., Princeton, N. J.

Basic operations, use of various tools and processes. (E17)

371-E. (Russian.) Improved Methods in Casting Tractor Crankshafts. I. B. Gel'perin. *Liteinoe Proizvodstvo*, Apr. 1959, p. 16-19.

Cast iron melted in cupola and transformed into pearlitic and ferritic malleable iron suitable for casting in green sand molds. Cast iron can also be melted in electric furnaces or made by duplex method, inoculated and treated to become pearlitic and ferritic cast iron and adopted for precision casting. (E-general, T7j; CI-s)

372-E. (Russian.) Experience in Using Openhearth Pig Iron in the Cupola Process. Mishukov. *Liteinoe Proizvodstvo*, May 1959, p. 5-7.

The use of openhearth pig iron in a melting cupola reduces the charging time about 15%, increases the chemical activity of slag, mainly at the expense of somewhat increased amount of MnO and decreased amount of FeO. (E10a; CI-n)

373-E. (Russian.) Minimizing Nonmetallic Inclusions in Magnesium Cast Iron. V. I. Soldatenko and M. I. Rotenberg. *Liteinoe Proizvodstvo*, May 1959, p. 7-8.

Cleaning molten gray cast iron from slag (at 1450-1460° C.), addition of 0.35% Mg, followed by further cleaning and addition of 25-30% of gray cast iron with the simultaneous introduction of 0.3-0.6% Si into the ladle, considerably reduces nonmetallic inclusions in Mg cast iron. 5 ref. (E10; 9-69, CI-q, *Mg*)

374-E. (Russian.) Elimination of Inclusions in Magnesium Iron. X. M. Korolev. *Liteinoe Proizvodstvo*, May 1959, p. 17-18.

Use of cryolite in Mg iron (up to 1%) eliminated nonmetallic inclusions and black spots in castings and produced homogeneous castings. Following heat treatment castings possessed excellent tensile strength. (E10, Q-general; 9-69, CI-q)

375-E. (Russian.) Application of Boron Chloride During Casting of Magnesium Alloys. D. A. Kuznetsov and A. I. Malakhov. *Liteinoe Proizvodstvo*, May 1959, p. 32.

Substituting BCl_2 for BF_3 to prevent oxidation during pouring showed that the solid solution formed on the surface of the castings prevents the interaction of Mg with oxygen, nitrogen or water vapor. 10 ref. (E23, R1h; Mg-b)

376-E. (Russian.) Structure Refinement and Elimination of Cracks in Magnesium Alloy Castings. V. S. Astaulov, A. D. Klimov and A. S. Astaulova. *Liteinoe Proizvodstvo*, May 1959, p. 33-34.

Susceptibility of Mg alloy castings to cracking depends upon the alloy structure and its crystallization mechanism. Cracking can be controlled by structure refinement during crystallization, treating it with proper fluxes, inoculation and other mechanical methods. (E10, E25q, N12; Mg-b)

377-E. (Russian.) Decarburization Layer in Precision Investment Castings. O. V. Stupishina. *Liteinoe Proizvodstvo*, May 1959, p. 36-38.

Decarburization is mainly caused by Si in the casting mold. The casting's surface has a layer of more concentrated carbon which reacts with Si. Decarburization layer is reduced as the mold temperature and the casting temperature are decreased and as the cooling rate is increased. 5 ref. (E15; CI)

378-E.* (French.) Casting Squirrel Cage Rotors. Lucien Martin. *Fonderie*, no. 159, Apr. 1959, p. 159-175.

An A5 Al alloy proved most suitable for casting rotors. Melting practice, metallurgical control, pouring methods; influence of Fe, Si and Cu impurities on electrical conductivity. (E-general, P15g, 3-69, W11q; Al-b)

379-E.* (French.) Impregnation of Castings After Anodization Prior to Coloring. Henry Garnier. *Revue de l'Aluminium*, v. 36, Mar. 1959, p. 349-350.

Defects in coloring are derived from imperfections such as porosity. Remedies are suggested with special reference to neutralizing the castings after anodizing and closing the pores before buffing by an impregnation with bakelite effected under vacuum and then under pressure. (E26, L19)

380-E. (Russian.) Methods of Heating Cupola Blast. A. M. Katsnel'son. *Liteinoe Proizvodstvo*, Apr. 1959, p. 3-8.

Utilization of heat from cupola gases and blast furnace gases to attain a melting temperature of 1500° C. and an air temperature of 400-500° C. Temperature and metal yield depend on the coke consumption. (E10a)

381-E. (Russian.) Heating Cupola Blast. A. P. Komarov. *Liteinoe Proizvodstvo*, Apr. 1959, p. 8-9.

A fin-type recuperator installed in the cupola shaft utilizes the heat of cupola gases to preheat blast air. (E10a)

382-E. (Russian.) Features of Cupola Operations With Partial Withdrawal of Gases Through the Hearth and Forehearth. L. M. Marienbakh and Yu. S. Sukharchuk. *Liteinoe Proizvodstvo*, Apr. 1959, p. 9-10.

Withdrawal of 15-20% of combustion products through the hearth and forehearth produced an accelerated activity of the nonmetallic charge. This caused an expansion of the coke burning zone, creating a temperature to superheat the cast iron. This process reduces the heat losses during tapping. Metal's temperature is increased by 50-80° C. 7 ref. (E10a)

383-E. (Russian.) Vapor Cooling Systems for Cupolas. S. M. Andon'ev and O. V. Filip'ev. *Liteinoe Proizvodstvo*, Apr. 1959, p. 14-15.

Evaporative cooling of a cupola housing, where the heat absorbed by water is utilized to vaporize the water (steam making) is more economical than water cooling. (E10a, W18d)

384-E. (Russian.) Automatic Line for Shaking, Cooling and Cleaning Castings. G. Z. Lipovetskii and I. P. Burtsev. *Liteinoe Proizvodstvo*, Apr. 1959, p. 19-20.

(E24)

385-E. (Russian.) Formation of Spheroidal Graphite in Cast Iron. S. Ya. Kolodnyi. *Liteinoe Proizvodstvo*, May 1959, p. 34-36.

14 ref. (E25q; CI-r)

386-E. (Russian.) Continuous Breaking of Pouring Gates and Feeder Heads From Castings. N. V. Potekushin. *Liteinoe Proizvodstvo*, May 1959, p. 40.

A drum with continuous mechanical motion in place of manual labor designed to break away pouring gates and feeder heads from steel castings. (E24; ST)

387-E. (Russian.) Pressure Die Casting of Brass Fittings for Steam and Water Lines. N. I. Domcharev. *Liteinoe Proizvodstvo*, May 1959, p. 41.

Pressure die casting produced improved and cheaper brass steam and plumbing fittings than previously employed sand castings. (E13, T6a; Cu-n)

388-E. (Russian.) A Universal Flux for Aluminum-Silicon Alloys. M. Ya. Telis. *Liteinoe Proizvodstvo*, May 1959, p. 42.

Flux consists of cryolite as a refining reagent, NaF as a modifier and KCl or NaCl to reduce the melting temperature. (E10; Al-b, *Si*, RM-q)

389-E. Making Epoxy Coreboxes From Patterns. John MacClarence. *Foundry*, v. 87, June 1959, p. 98-99.

(E17, W19g)

390-E.* Cupola Botting Materials and Their Relation to Casting Defects. A. D. Morgan. *B.C.I.R.A. Journal*, v. 7, Apr. 1959, p. 638-643.

Composition and properties of botting mixtures used in 26 English foundries. Slag and dross in castings resulting from use of botting clays with low fusion temperature. Recommended mixtures. 10 ref. (E10a, W18e; CI, 9-69)

391-E.* Ceramic Mold Process Offers Improved Casting Properties. Ronald Greenwood. *Foundry*, v. 87, June 1959, p. 84-87.

Surface finish, tolerances and metallurgical properties of carbon and alloy steel castings produced in ceramic molds. Molding procedures and equipment. (E16, E19; CN, AY, NMf)

392-E.* Causes and Mechanics of the Scum Defect. G. J. Vingas and J. B. Caine. *Foundry*, v. 87, June 1959, p. 94-97.

Scum material on steel castings identified by petrographic and chemical analyses as eutectics of manganosite, silica and alumina. Mechanism of scum formation and its prevention. (E11; ST, 5-60, 9-69, 9-71)

393-E.* (Spanish.) Nodular Iron. Pt. 2. Manufacture. Francisco Radriguez-Yufera. *Instituto del Hierro y del Acero*, v. 12, Jan-Mar. 1959, p. 28-45.

Mechanism of graphitization and spheroidization; thermodynamic nature of spheroidization; atomic and crystal structure of graphite; production of nodular iron, inoculants, cooling phenomena, heat treatment; structures and mechanical properties of variously treated melts. 10 ref. (To be continued.) (E25q, M26, Q-general; CI-r)

394-E.* Pressure Tightness of 85-5-5-5 Bronze. Richard A. Flinn and Chester R. Mielke. *Modern Castings*, v. 36, July 1959, p. 35-42.

Measurement of the thermal gradients during solidification to provide a quantitative evaluation of different risering and chilling combinations. Pressure-tight castings were obtained in 2-in. square bar sections when the thermal gradient exceeded 60° F. per in. By the use of tapered chills it was possible to attain this gradient in bars up to 9 in. in length. (E25r, E22q, E22r; 9-68, Cu-s)

395-E.* Pinhole Occurrence in Malleable Castings. D. R. Jones and R. E. Grim. *Modern Castings*, v. 36, July 1959, p. 47-50.

Pinholes are often caused by the evolution of water vapor from certain clay bonds in green sand molds when heated above 212° F. by molten iron. (E25n, 9-68; CI-s)

396-E.* Tin Effect on Structure and Properties of Flake and Nodular Graphite Cast Irons. E. C. Ellwood. *Modern Castings*, v. 36, July 1959, p. 73-80.

Sn has a marked effect in eliminating ferrite from the matrix of both gray and nodular irons. At the same time, in larger amounts than required to promote a completely pearlitic matrix, Sn does not lead to the formation of massive cementite. In amounts sufficient to give a substantially pearlitic matrix in gray iron it does not have any detrimental effect on the mechanical properties. 5 ref. (E25q, 2-60; CI-n, CI-*r*, AD-p, *Sn*)

397-E.* Cyclic Permanent Mold Operation, Some Thermal Aspects. C. L. Goodwin and H. Y. Hunsicker. *Modern Castings*, v. 36, July 1959, p. 81-85.

Influence of mold section and casting section thickness and operating rate on mold temperatures and time required for solidification of Al castings in permanent molds. (E12, 3-73; Al)

398-E.* (Italian.) Aluminum Alloy Castings With Controlled Properties. *Alluminio Nuova Metallurgia*, v. 28, no. 4, 1959, p. 189-190.

Foundry practice, heat treatment and mechanical properties of Duralite, G-AC3FGN.UNI 3046 alloy. (E-general, J-general, Q-general; Al-b)

399-E.* (French.) Manufacture and Service Life of Parts for Marine Diesel Engines. Francois Danis. *Fonderie*, no.160, May 1959, p. 209-220.

Wear of alloyed and unalloyed cast iron sleeves, cylinder heads, pistons and piston

rings. Effect of phosphorus content on wear resistance, preparation of charge, alloy additions, pouring, gating and risering on the production of parts. 14 ref. (E-general, Q9n, T22h, 2-60, CI-q, *P*)

400-E.* (French.) Defects in A-U5 GT Castings. *Journal des Informations Techniques des Industries de la Fonderie*, no. 105 May 1959, p. 15-16.

Microporosity is caused by incorrect gating and riser design; dark spots result from absorption of heat treating salts and subsequent oxidation in porous areas. Heat treatment of castings is recommended. (E22p, E22q, J27; Al-b, 5, 9-68)

401-E.* (German.) Use of Permanent Molds in Steel Casting. Rudolf Graichen. *Giesserei Technik*, v. 5, May 1959, p. 131-134.

Economies achieved by use of permanent molds in preference to sand molds. (E11, E12; ST)

402-E.* (German.) Development and Application of New Casting Processes. Helmut Oppermann. *Giesserei Technik*, v. 5, May 1959, p. 141-145.

Advantages and disadvantages in the application of sand, pressure, centrifugal and chill casting processes. (E11, E12, E13, E14)

403-E.* (German.) Defects in Castings Caused by Chaplets Can Be Avoided. Walter Goeschel. *Giesserei Technik*, v. 5, May 1959, p. 150-152.

Many defects in medium and heavy castings result from an improper attachment of the core. Various methods of core fastening and types of chaplets. (E22; 9)

404-E. Method of Obtaining Castability and Maximum Field Service From Cast Products. J. W. Beckham. *Modern Castings*, v. 36, July 1959, p. 43-46.

Relation between foundry practice and casting design. (E-general, E25p, 17-51)

410-E. (German.) Casting of Roller Shells. *Giesserei-Praxis*, no. 12, June 25, 1959, p. 221-223.

Rigging directions for aluminum bronze. (E22; Cu-b, *Al*)

411-E. (Translation—Brutcher No. 4518.) Desulfurization of Liquid Cupola Iron by Magnesium. B. S. Mil'man. *Liteinoe Proizvodstvo*, v. 9, Nov. 1958, p. 15-17.

See item 148-E, 1959. (E10, D11n, 1-59; CI, *Mg, Si*)

412-E.* (Russian.) Casting Nodular Cast Iron Crankshafts. M. I. Rotenberg and V. I. Soldatenko. *Liteinoe Proizvodstvo*, June 1959, p. 1-4.

Since the top and bottom of the shafts vary in their ferritic content and graphite structure, it is essential to heat treat them to obtain satisfactory macrostructure and mechanical properties. Black spots on the shafts can be remedied by melting the cast iron in basic electric furnaces, reducing sulphur content to 0.002-0.008% and excluding the possibility of formation of MgS. (E25q, 2-64, E10r, T7j; CN-p, 9-71)

413-E.* (Russian.) Some Factors Affecting the Quality of Alloy Cast Iron Crankshafts. M. G. Kvasman, A. M. Zav'yalov and A. A. Tunik. *Liteinoe Proizvodstvo*, June 1959, p. 4-5.

Defects in the ridge of the hollow center of crankshafts are determined by casting properties of the iron (such as shrinkage and fluidity), by pouring temperature and chemical composition. Defects are prevented when the amount of carbon and silica and the sum total of C

and Si are kept in the lower limits. Avoiding overheating during the melting period and limiting the amount of inoculant (ferrosilicon) to 0.8-1% prevents the formation of graphite with a dendritic orientation. (E25p, T7j, 2-60, 2-61; AD-p36, Fe, Si, AD-n31, CI-q)

414-E.* (Russian.) Hydrodynamic State of Metal and Its Effect on the Macrostructure of Centrifugal Castings. *Liteinoe Proizvodstvo,* June 1959, p. 22-27.

During the crystallization of castings in rotating molds, there are various instances of hydrodynamic state of the liquid metal, and this bears a relationship to the macrostructure of the centrifugal casting. 6 ref. (E14, N12, M28h, CI)

415-E.* (Russian.) Basic Features of Centrifugal Castings. B. I. Loshkarev. *Liteinoe Proizvodstvo,* June 1959, p. 27-32.

To obtain homogeneity of structure, chemical composition and mechanical properties, the rotation of the mold must be coordinated with the conditions affecting cooling. Rotation rate and cooling conditions are dependent on physical properties of the molten metal, such as heat conductivity, oxidation, and the susceptibility to segregation. 16 ref. (E14, E25q)

416-E.* (Russian.) Defects in Hollow Centrifugal Castings Caused by Gas Evolution. L. S. Konstantinov. *Liteinoe Proizvodstvo,* June 1959, p. 32-35.

Gaseous inclusions such as screen-like blisters in thin-walled tubes, honeycomb defects in thick-walled pipes and surface hollows of various depths. (E14; 5-65, 4-60, 9-69, 9-71)

417-E.* (Russian.) Unequal Wall Thickness of Centrifugally Cast Pipes. B. D. Khakhalin, A. N. Smolyakov and B. A. Iskra. *Liteinoe Proizvodstvo,* June 1959, p. 35-37.

Pipes cast in sand molds, depending on their inclined position, have comparatively small differences in wall thickness. Casting in a metal mold produces a more uneven wall due to inadequate feeding of the molten metal. (E14, E11, E12, 9-71)

418-E.* Effects of Vacuum Melting on Gas Content and Metal Structure of Cast Nickel-Base Alloys. C. M. Hammond and R. A. Flinn. Paper from "High Temperature Materials". John Wiley & Sons, New York 16, 1959, p. 345-363.

Stress-rupture properties, microstructure and cracking behavior of Guy, Inco 700 and GMR 235 alloys in terms of residual nitrogen and trace elements. Thermochemical reactions affecting gas content and removal of nongaseous minor elements. 7 ref. (E10, 1-73, M27, Q3q, Q26, 3-69; Ni-b, *N,* SGA-h)

419-E.* (German.) Induction Melting. *Giesserei,* v. 46, June 1959, p. 148.

Quality of cast iron in relation to melting and inoculation temperature and concentration; changes in mechanical properties following CaSi inoculation. (E10r, 1-69, E25q, Q-general; CI, AD-p36, Ca, Si)

420-E.* Aluminum-Rich Zinc-Base Alloys for Permanent Mold Castings. E. Belkin. *Foundry,* v. 87, Aug. 1959, p. 70-74.

Composition is 50-65% Zn, 50-35% Al and 1-5% Cu. Alloy showed a high fludity and accurately reproduced the mold details. Corrosion resistance is good. 11 ref. (E12, R-general; Zn-b, *Al, Cu*)

421-E.* (Italian.) New Process for the Production of Quality Cast Iron. Albert de Sy. *Fonderia,* v. 8, June 1959, p. 243-246.

Two-chamber-type induction furnace produces cast iron or alloy steel. (E10r, D6, W18a; CI, AY)

To develop new foundling methods for Mn-V-Mo age hardenable austenitic

steels, castings were poured at 2800° F. A gating system with a choke at the sprue base, an enlarged runner bar and an ingate entering the riser, were used. Precautions should be taken in choosing the gating and riser dimension. Sand mixtures differing from conventional mixtures were required to prevent mold-metal reactions. A 145,000 psi tensile strength, 110,000 psi yield strength, and 12% elongation were attained with an aging treatment of 8 hr. at 1300° F. (E-general, Q27a, 2-65; SS-e, *Mn, V, Mo*)

465-E.* (Czech.) Possibilities of Calculation of Internal Chills in Steel Castings. J. Kavka. *Slevarenstvi*, v. 7, Feb. 1959, p. 49-53.

Internal chilling depends on metal structure, surface conditions, temperature differentials and thermal conductivity. (E22r; ST)

466-E.* (Czech.) Pouring of White Cast Iron in Metallic Molds. K. Stransky. *Slevarenstvi*, v. 7, Feb. 1959, p. 53-57.

To increase graphitization rapid chilling is introduced. Tear formation is avoided by preheating the mold. Effect of pouring into metallic mold and heat treatment before malleablizing on the course of graphitization and on reduction of malleablizing time. (E23, J23b, N8s; CI-p)

467-E.* (Czech.) Study of Melting Process in the Cupola From the Viewpoint of Slag Quality and Its Effect on Cast Iron Properties. Ivan Pavlik. *Slevarenstvi*, v. 7, Mar. 1959, p. 121-126.

Effects of different slags on the structure and mechanical properties of cast iron investigated in an experimental cupola with cooled melting zone and blast preheating at 500 C. Properties of acid melted cast iron do not materially differ from those of basic melted material. (E10a; RM-q, CI)

468-E.* (Czech.) Production of Large Castings With 13% Chromium Steel. F. Maran. *Slevarenstvi*, v. 7, May 1959, p. 175-179.

Disadvantages encountered in melting processes using 13% Cr steel include shrinkage phenomena, tearing, cracking and formation of oxide films. Elimination of defects is achieved by controlled cooling of the casting in the mold, high pouring velocity and use of nitrogen as a protective atmosphere. (E10, E25n; SS, *Cr*, 9-71)

469-E.* (Czech.) Melting of Steel in Arc Furnaces With Acid Linings. Jan Plachy. *Slevarenstvi*, v. 7, June 1959, p. 213-215.

Melting techniques and casting procedures. Melting of steel in arc furnaces with acid linings increased steel production from 24 to 31 tons per 24 hr. (E10r; ST)

Control of C, Si, Mn, S and P in cast iron. Determination of mold-filling capacity and the tendency to form shrinkage cavities. (E10, E11, 9-67; CI, 14-60, *C, Si, Mn, S, P*)

477-E.* (Polish.) Oxidation Losses in Liquid Aluminum and Aluminum Alloys. S. Balicki and J. Leitl. *Prace Instytutow Hutniczych,* v. 11, no. 2, 1959, p. 71-74.

X-ray analysis of oxidation losses of Al and Al-Zn, Al-Cu, and Al-Mg alloys (with alloying content up to 12%) during remelting at 700-900° C. Oxidation rate of Al-Zn and Al-Cu alloys was practically equal to that of Al. 7 ref. (E25q; Al, 14-60)

478-E. Improved Casting Properties From Ceramic Mold Process. *Australasian Manufacturer,* v. 44, Aug. 1, 1959, p. 44-49. (E16)

479-E. Core Practice in an Israelian Foundry. Joshua Pelleg. *Foundry,* v. 87, Sept. 1959, p. 156, 158, 160, 162. (E21g)

480-E. Packaged Foundries. Survey of the Hallsworth Automatic Molding System. H. B. Hallsworth, R. D. Mills and Peter Spear. *Iron & Steel,* v. 32, June 1959, p. 335-337.

(To be concluded.) (E19, 1-52)

481-E. (Dutch.) Foundry Pilot Plant and Laboratory Equipment. *Gieterij-Centrum Berichten,* no. 4, July-Aug. 1959, p. 37-40.

At the Gieterij-Centrum, Delft, Holland. (E-general, 1-53, A9j)

482-E. (Italian.) How to Improve the Quality of Investment Castings. G. Postogna. *Fonderia Italiana,* v. 8, Apr. 1959, p. 135-138.

Recent developments in the lost wax process. (E15)

483-E. (Booklet.) Casting Aluminum. C. P. Talbott. 31 p. 1959. Reynolds Metals Co., Richmond 18, Va.

Sand, permanent mold and pressure die casting. (E11, E12, E13; Al)

484-E. (Translation.) Casting With Sand Molds Produced Under High Pressures. V. M. Krivosheyev. *Engineers' Digest,* v. 20, July 1959, p. 280-281. (From *Liteinoe Proizvodstvo,* no. 5, 1959, p. 15-16.)

Castings of more accurate dimensions and improved surface finish are produced with a reduction in metal wastage. (E11)

485-E. (Translation—Brutcher no. 4633.) Resistance of Cast Steel to Hot Tearing and Ways of Improving It. N. S. Kreshchanovskii and M. P. Demin. *Liteinoe Proizvodstvo,* July 1958, p. 17-21.

See item 746-E, 1958. (E25q, 9-72; ST, Ti, AD-p)

486-E.* What Makes Cast Iron High-Quality? John Obrebski. *Metalworking Production,* v. 103, Aug. 7, 1959, p. 1203-1206.

Desirable structure and properties; influence of alloying elements on mechanical properties, microstructure and sensitivity to chilling. Cupola control and ladle inoculation; evaluation of castings; heat treatment. (E25q, Q-general, M27d, 2-60; CI)

487-E. (Russian.) Porosity of Mg-Al-Zn Alloys. M. V. Sharov and E. L. Bibkov. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya,* no. 1, 1959, p. 63-67.

Effects of composition ratio, hydrogen content and cooling conditions on the porosity of castings. 4 ref. (E25, 2-60, 2-61; Mg-b, *Al,* Zn, 9-68)

488-E.* (German.) Use of Gaseous Agents in the Melting of Copper and Copper Alloys. J. Muller and W. Buchen. *Giesserei,* v. 46, Aug. 1959, p. 497-508.

Chlorine and nitrogen as refining agents in Cu melts. Physical and chemical processes taking place after the chlorine and nitrogen additions. Improvements in quality result from use of the additives. (E25; Cu, AD-p35)

489-E.* (German.) Theoretical and Practical Aspects of Melting With Carbide Additives. W. Haas. *Giesserei-Technik,* v. 5, July 1959, p. 200-204.

Use of carbide additions in basic cupolas results in improved desulphurization, increased temperature range, higher output. Attention must be paid to regulation of air flow to assure an oxidizing

atmosphere, adjusted coke-air ratio and speciric carbide compositions. (E10a; AD-a)

490-E. BCIRA Work in Progress. *Foundry Trade Journal*, v. 107, Aug. 27, 1959, p. 69-76.

Items currently under investigation are shrinkage and porosity; white and chilled cast iron; foundry sands; cast iron for steam engineering; malleable iron; ingot-molds and bottom-plates; gases in cast iron. (E-general, A9)

491-E. How Hoover Produce Their New Cleaner. Peter Trippe. *Metalworking Production*, v. 103, Aug. 21, 1959, p. 1267-1270.

Cleaning die castings. (E24h, 5-61)

492-E.* Permanent Molds Can Handle Short Runs Too. W. A. Hamilton. *Product Engineering (Design Issue)*, v. 30, Aug. 31, 1959, p. 40-41.

Advantages which lower the break-even point are less process variables, standardization, better mechanical and weldability properties. (E12)

493-E.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Zinc-Base Alloy Castings. J. C. Fox. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 423-452.

Die casting machines and dies. Effect of alloying elements and impurities on properties of Zn die casting alloys. Influence of aging treatments and temperature on mechanical properties. Finishing and application of die castings. Casting Zn alloy dies for forming operations on variety of metals. 22 ref. (E13, E11, Q-general, 2-60, 2-61, 2-65, Zn-b, *Al, Cu, Mg*, 5-61)

494-E.* Ceramic Mold Technique Produces Accurate, High Quality Castings. Howard Simmons. *Western Metalworking*, v. 17, Aug. 1959, p. 39-42.

Advantages of ceramic molding for casting small lots of carbon and stainless steels. (E16; ST, SS)

495-E.* Principles of Gating. J. F. Wallace and E. B. Evans. *Foundry*, v. 87, Oct. 1959, p. 74-81.

Basic features of gating. Effects on pouring rate, fluidity, oxide skin formation, turbulence and sand erosion. 23 ref. (E22p)

496-E.* Vacuum Casting. R. H. Herrmann. *Foundry*, v. 87, Oct. 1959, p. 82-83.

Preparation of vacuum melted heat; vacuum investment-casting; cleaning and testing of vacuum-produced castings. (E15, E24, 1-73)

497-E.* Economical Casting of Ductile Iron. C. W. Gilchrist. *Foundry*, v. 87, Oct. 1959, p. 84-88.

Casting without risers by means of rigid molds, rapid pouring, gating into thin sections and correct metal composition. Effects on gross and interdendritic shrinkage. (E-general, P10c; CI-r)

498-E.* (German.) Influence of Various Mold Washes on the Surface Quality of Semi-finished Products. Arno Hensel. *Freiberger Forschungshefte*, v. B-36, May 1959, p. 48-62.

Influence of holding time of the coke and preheating time in furnace on the crack sensitivity of semifinished products. The time ratio of preheating and casting is analyzed with respect to surface quality; requirements, advantages and disadvantages of mold washes. (E19)

499-E.* (German.) Preparation of Cathode Core Materials for Long Life Tubes. Karl Kaiser, Gerhard Pupke and Felix Jablonski. *Neue Hutte*, v. 4, Aug. 1959, p. 484-493.

Preparation by melting Ni cathode sheet in an induction furnace. Contamination is avoided by a layer of liquid glass or an atmosphere of city gas, hydrogen or nitrogen, or by use of a magnesite-lined crucible. Vacuum degassing; effect of process on purity. 6 ref. (E10, T1j, 2-66; Ni)

500-E.* (Japanese.) Improvement of High Silicon Cast Iron. M. Okamoto, T. Fujii and K. Majima. *Japan Foundrymen's Society, Journal*, v. 31, July 1959, p. 637-645.

Mechanical properties as influenced by C, B, Ti, Ni, Cd and Mg additions. (E25q, 2-60; CI, Si, C, B, Ti, Ni, Cd, *Mg*)

501-E.* (Russian.) Properties of Molten Fluxes for the Melting and Purification of Aluminum. N. I. Grafas and A. I. Belyaev. *Izvestiya VUZ—Tsvetnaya Metallurgiya*, no. 4, 1959, p. 72-81.

Effects of interfacial surface tension between flux and alumina and between the flux and the liquid Al on metal loss in melting and on purification of the melt from Al_2O_3 and gases. 28 ref. (E25r, P13h; Al, 14-60)

502-E.* The Casting Fluidity of Some Foundry Alloys. C. J. Cooksey, V. Kondic and J. Wilcock. *British Foundryman*, v. 52, Sept. 1959, p. 381-386.

Effect of superheat and impurities on the fluidity of high and commercial purity Al and An, Al-Si and Al-Cu alloys, cast iron, 60-40 brass. Relation of solidification mechanism to casting fluidity. (E25p, Al-b; Zn, *Cu*, CI, Cu-n)

503-E.* An Examination of Methods Used to Improve the Surface Finish of Shell-Molded Low-Carbon Steel Castings. D. B. James and J. M. Middleton. *British Foundryman*, v. 52, Sept. 1959, p. 387-395.

Effects of inorganic additions on shell molds and resins; Zircon-sand and olivine-sand shell molds; sodium silicate bonded shells; surface carburization. 4 ref. (E16c; CN)

504-E.* Investment Casting as Compared With Other Foundry Processes. L. N. Hocking. *British Foundryman*, v. 52, Sept. 1959, p. 395-400.

Limitations and merits of pressure and gravity die-casting; sand and plaster casting; CO_2 process; shell molding in relation to investment casting. (E15, E11, E16c, E16a)

505-E.* Surface Shrinkage Defects in Light-Sectioned Grey-Iron Castings. A. G. Fuller. *British Foundryman*, v. 52, Sept. 1959, p. 400-409.

Influence of composition, pouring temperature, casting and gating design and eutectic cell count sinking. Fundamental controlling factors are eutectic nucleation, metal-temperature conditions in mold. 11 ref. (E23, P10c, 2-60, 2-61; CI-n, 9-71)

506-E. Some Practical Considerations in Molding an 18-Ton Housing Bed in Green Sand. Harold Haynes. *British Foundryman*, v. 52, Sept. 1959, p. 409-412.

Weight of metal required; stress and strain on various parts of mold; lifting pressure; size, positions and number of runners and risers required. (E19a)

507-E. Selection of Die Casting Lubricants. Pt. 2. W. C. Kennedy and E. A. Day. *Die Casting Engineer*, v. 3, Sept. 1959, p. 15-17.

Defects caused by release agents; lubrication of toggles, wedges, core mechanisms, ejector pins, plunger tips and shot sleeves. (E13; NM-h)

508-E.* (Pamphlet.) Rigging Design of a Typical High Strength, High Ductility Aluminum Alloy Casting. Merton C. Flemings, Patrick J. Norton and Howard F. Taylor. 25 p. n.d. Massachusetts Institute of Technology, Cambridge, Mass.

Mechanical properties of unchilled 195 and 356 alloy aircraft castings can be improved substantially by careful chilling techniques. 4 ref. (E22s; Al-b)

509-E.* (Pamphlet.) Study of Techniques for Refinement of Cast Structures in Magnesium. 97 p. n.d. Massachusetts Institute of Technology, Cambridge, Mass.

Even with controlled conditions of gas elimination and temperature gradient during freezing, mechanical properties of Mg castings cannot equal those of forged metal. This is due to favorable anisotropy in wrought and extruded Mg, which condition cannot be obtained in casting alloys. Sb does not increase tensile properties or alter aging characteristics of these alloys. (E25, 2-60; Mg-b, *Sb*)

510-E.* (Japanese.) Vacuum Melting of Chromium Cast Iron. Masao Kikuchi. *Japan Foundrymen's Society, Journal*, v. 31, July 1959, p. 645-651.

The microstructure and mechanical properties of cast iron are affected by vacuum melting and the Cr, C and Si content. In both melting in a vacuum and atmosphere, tensile strengths of cast iron were increased with decrease of carbon equivalent value; for the same carbon equivalent value the tensile strength of vacuum melted cast iron was always about 5 kg./mm.^{2} higher than that of atmosphere melted cast iron. (E10, E25q; CI, *Cr*, *C*, *Si*)

511-E.* Centrifugal Castings. *Machine Design*, v. 31, Oct. 15, 1959, p. 156-160.

Design and application for cast cylindrical parts; which alloys to use and where to use them. (E14; CN, AY, SS, Cu-b, Ni-b)

512-E.* Ductile Iron Quality Control. S. F. Levy. *Modern Castings*, v. 36, Oct. 1959, p. 38-41.

Casting ductile iron and sample test procedure. Mold and core design, material composition control, melting and heat treat practice. (E25p, E25q; CI-s)

513-E.* Continuous Carbon Injection. J. E. Wilson and R. C. Shnay. *Modern Castings*, v. 36, Oct. 1959, p. 55-60.

Carbon content of gray iron melted in acid cupola controlled by injecting electric furnace grade graphite through a hollow graphite lance into the melt. Graphite powder seived to size, blown by low pressure dry N_2. (E10a; CI-n, C, 2-60)

514-E.* Structural Variables Influencing Mechanical Properties of High Strength Cast Steels. M. C. Flemings, R. Green and H. F. Taylor. *Modern Castings*, v. 36, Oct. 1959, p. 84-98.

Effect of solidification variables on structure and mechanical properties of high-strength cast steel. Cooling rates and thermal gradients during solidification of modified 4330 alloy. (E25n, N12b, Q27a, 2-61; AY-b)

515-E. Mold Cost as Affected by New Metal Casting Methods. J. A. Kavanagh. *Society of Plastics Engineers, 14th Annual Technical Conference*, v. 4, 1958, p. 665-669.

Shaw process of investment precision casting using a nonexpendable ceramic mold. (E15)

516-E. New Look in Steel Castings. W. H. Dunn. *Modern Castings*, v. 36, Oct. 1959, p. 30-32.

Steel casting by shell-molding or ceramic casting for high strength in thin wall sections. Alloys can be cast which formerly were only wrought. (E19c; ST-b)

517-E. Foundry Designing for Steel Castings. Alfred B. Steck. *Modern Castings*, v. 36, Oct. 1959, p. 103-104.

Requirements of foundry practice for minimizing casting defects, as hot tears and cracking, in both thick and thin sections. (E10b, E19, 5-60, 9-72, 17-51)

518-E.* (German.) Structural Parts Produced From Die Cast Nonferrous Metals. F. Lutz. *Industrie-Anzeiger*, v. 81, Sept. 8, 1959, p. 27-29.

Pressure casting of Zn, Al, Mg, Cu, Pb and Sn and their alloys is considered as the most convenient fabrication technique. Principal advantages are uniformity, precision in tolerance of cast parts and continuous production. (E13; Zn, Cu, Mg, Al, Pb, Sn)

519-E.* (German.) Copper Foundry Practice. E. Brunnhuber. *Maschinenmarkt*, v. 65, Aug. 1959, p. 34-39.

Strength characteristics, elongation, hardness, electrical conductivity, pressure tightness; influence of wall thickness on tensile strength and elongation of leaded red brass; micro and macro-shrinkage of Cu binary alloys. (E25q, Q27a, P15g; Cu)

520-E.* (German.) Properties of Alloy Cast Iron. A. Gabriel. *Industrie-Anzeiger*, v. 81, Sept. 8, 1959, p. 20-21.

Melting additives increase the tensile strength of cast iron up to as high as 70-90 kg. per sq. mm. Improved strength and elongation are achieved by addition of laminated graphite and by means of spheroidal formation of graphite. (E25q, Q27a; CI)

521-E.* (Japanese.) Properties of Nodular Cast Iron. Tsuneo Momose and Tohru Izu. *Japan Foundrymen's Society, Journal*, v. 31, Aug. 1959, p. 707-711.

Microstructure and mechanical properties are dependent upon the amount of Mg, Sb and Ti present. (E25q, M27, 2-60; CI-r, *Mg, Sb, Ti*)

522-E.* Gas Porosity in Aluminum Alloys. *Foundry Trade Journal*, v. 107, Oct. 1, 1959, p. 247-248.

Tensile strength, wear resistance and pressure tightness of castings are affected by gas porosity which occurs as a rssult of moisture entrapment during melting and casting. Precautions suggested are minimizing the gas absorption and degassing the molten metal with dry helium, argon or nitrogen. (E25s; Al-b, 5-60, 9-68)

523-E.* Plastics Patterns. *Foundry Trade Journal*, v. 107, Oct. 8, 1959, p. 289-290.

Material, equipment and procedure of making plastic patterns. (E17; NM-d)

524-E.* Production of Slugs and Forging Blanks. *Metal Treatment and Drop Forging*, v. 26, Sept. 1959, p. 331-332.

Use of an automatic die casting displacement-type machine. Method is economical and reduces scrap as compared with conventional shearing and die casting methods. (E13, 5-59)

525-E.* Thin Magnesium Castings Fill the Bill. A. J. Iler. *Modern Metals*, v. 15, Oct. 1959, p. 54-58.

Foundry techniques for production of thin Mg alloy castings. It is possible to form parts having less rigidity and weight than their wrought counterparts. (E11, T24; Mg-b, 5, 17-57)

526-E.* (German.) Properties of AZG Magnesium Sand Casting Alloy. H. Reininger. *Giesserei Praxis*, no. 16, Aug. 25, 1959, p. 281-286.

Pourability, strength and hardness of Mg alloy castings from purified and unpurified melts. The pourability and mold filling properties of purified melts were found to be remarkably superior as compared with unpurified metal. The difference is especially detectable at low casting temperatures. Increasing the setting time increases the pourability at temperatures up to 860° C. At higher temperatures no influence was observed. (E11, E25p; Mg)

527-E.* (German.) Die Casting. H. Kron. *Giesserei Praxis*, no. 16, Aug. 25, 1959, p. 286-291.

Strength properties and influence of wall thickness in Al, Mg and Cu alloys. Porosity decreased while strength increased in proportion to increases in wall thickness. (E13; Al, Mg, Cu, 9-68)

528-E.* Metallurgy of Die Cast Aluminum Alloys. Walter Bonsack. *Precision Metal Molding*, v. 17, Nov. 1959, p. 60-63.

Since die casting dies are rigid, they demand alloys which have the least possible shrinkage and are free from hot cracking. The Al-Si alloys fulfill these requirements best of all. Cu additions to these alloys in ranges up to 4% give quite good castability. Also in general use are 13% Si alloys and 10% Si, 0.5% Mg alloys. New alloys also being die cast are the high Si alloys with up to 25% Si. (E13; Al-b, *Si, Mg*)

529-E.* (German.) Surface Defects in Precision Investment Castings. E. Gunter Nickel. *Giesserei*, v. 46, Sept. 10, 1959, p. 528-532.

Principal defects include tolerance errors, tool-caused defects, flaws caused by casting aggregates, forming and casting defects, defects caused by mechanical influences at the working stage of the castings, heat treatment and the parent material. (E15; 9-71)

530-E. Gas—Foe or Friend of the Foundryman? N. L. Bush. *Castings*, v. 5, Sept. 1959, p. 13-35.

Detrimental effects of oxygen in foundry work. Beneficial results obtained by converting cupola melted Fe into steel by oxygen injection in the ladle. (E25)

531-E. Investment Casting in Shell Molds. Pt. 1. Silicate Shells. Paul E. Schlinkmann. *Precision Metal Molding*, v. 17, Nov. 1959, p. 66-67, 103-104.

Use of ceramic shell molds. (E16)

532-E. (Polish.) Production of a Spheroidal Graphite Cast Iron in a Sealed Ladle. Alojzy Jankowski, Jerzy Piaskowski and Jozef Kumor. *Przeglad Odlewnictwa*, v. 9, Apr. 1959, p. 89-93.

Spheroidal graphite cast iron is produced by the introduction of Mg or scrap into the ladle. (E25g; CI-r, *Mg*, AD-p36)

533-E. (Polish.) Cupolas With Automated Control and Regulation. W. S. Mysowski. *Przeglad Odlewnictwa*, v. 9, Apr. 1959, p. 94-97.

Automation based on temperature control, chemical analysis and weight control of blast mixture. (E10a; 18-74, ST)

534-E. (Polish.) Development Trends of the Cupola Process. Zbigniew Tyszko. *Przeglad Odlewnictwa*, v. 9, May 1959, p. 134-142.

Design of cupolas and use of fuel. (E10a, W18d; ST)

535-E. Manufacture of Waveguide Parts by Investment Casting From Frozen-Mercury Patterns. H. H. Scholefield, H. H. Green and R. E. Gossett. *Institute of Electrical Engineers, Proceedings*, v. 106, July 1959, p. 431-434.

Capabilities of process for production of cast parts. (E15, T1)

536-E. (Polish.) Casting Steel Flanged Armatures. Josef Pribyl. *Przeglad Odlewnictwa*, v. 9, June 1959, p. 165-168.

Feeding and gating techniques. (E22; ST)

537-E. (Polish.) Exothermic Materials Used in Feeders. Kazimierz Korecki and Tadeusz Welkens. *Przeglad Odlewnictwa*, v. 9, July 1959, p. 218-224. (E23)

538-E.* Shell Molding Developments in the Automotive Industry. H. C. Grant. *Modern Castings*, v. 36, Nov. 1959, p. 641-652.

Benefits to foundries, machine-shop and product engineer include high yield, ease of machining and accurate designing of the castings. (E16c; CI, 17-51)

539-E.* Indirect Arc Electric Furnace Production of Ductile Iron. L. Miller.

Modern Castings, v. 36, Nov. 1959, p. 653-660.

Furnace heats in a rocking-type electric furnace over a period of time. Composition and properties of the metal; chemistry control; plunger ladle advantages. (E10r; CI-r)

540-E.* Acid Cupola Melting for Ductile Iron. H. E. Henderson. *Modern Castings*, v. 36, Nov. 1959, p. 661-668.

Carbon pick-up, ladle additions, composition control, stabilizing elements in a shell mold cupola. (E10a; CI-r)

541-E.* Basic Cupola Melting of Ductile Iron. J. T. Williams. *Modern Castings*, v. 36, Nov. 1959, p. 669-670.

Slagging techniques, metal charge used, required basicity, slag analysis and advantages as compared to the acid cupola. (E10a; CI-r)

542-E.* Ramming, Superheat and Alloys (Type of Metal) Effects on Metal Penetration. G. J. Vingas. *Modern Castings*, v. 36, Nov. 1959, p. 671-675.

Penetration as influenced by metal mass, sand mass, superheat, metal flow, washes and veining in Al, brass, gray iron, steel and Wood's metal. (E19, E18; CI-n, Al, Cu-n, ST, Bi-b)

543-E.* Comparison of X-Ray Quality and Tensile Properties in Cast High Strength Steel. H. R. Larson, H. W. Lloyd and F. B. Herlihy. *Modern Castings*, v. 36, Nov. 1959, p. 676-684.

Microshrinkage is correlated with ductility and strength by radiographic examination of castings. (E25n, Q27a, S13e, Q23p; ST, 5-60)

544-E.* Application of Theory in Understanding Fluidity of Metals. J. E. Niesse, M. C. Flemings and H. F. Taylor. *Modern Castings*, v. 36, Nov. 1959, p. 685-697.

Data on fluidity of Sn, Sn-Pb, Al-Sn alloys and low-carbon steels employing heat flow and fluid flow relationships. 19 ref. (E25p; Sn, Sn-b, Al-b, CN-g)

545-E.* High Quality Structural 17-4 PH Castings. W. R. Roser and K. E. Kuschell. *Society of Automotive Engineers, Preprint* no. 104V, 1959, 6 p.

Low ductility of 17-PH castings, due to microshrinkage and dendritic-shaped ferrite, may be increased by control of the mold cooling rate, gating methods, chemical composition, foundry practices and heat treatment. (E22, E25, Q23p, 2-64; SS, 5-60, SGB-s)

546-E.* Modifying the Structure of Cast-Iron by Additions of Tin. W. E. Hoare. *Tin and Its Uses*, no. 47, Summer 1959, p. 4-8.

Evidence shows that the old belief that the presence of Sn in gray cast iron is detrimental to the microstructure and mechanical properties is mistaken. Data show that small additions of Sn often improve properties of the cast iron. (E25; AD-p, Sn)

547-E.* (German.) Casting of Magnesium Alloys in Sands Containing Waterglass. J. Nitsche. *Giesserei-Technik*, v. 5, Aug. 1959, p. 243-248.

Difficulties encountered in molding were premature reactions between the waterglass binder and the oxidizing protective additives. A new kind of waterglass of 37-40° Baumé is used with CO_2 and air. (E19c, E18; Mg-b)

548-E. Pattern Engineering. P. B. Croom. *Modern Castings*, v. 36, Nov. 1959, p. 38-41.

General instructions regarding formation of patternmaking team, pattern types, molding problems and core boxes. (E17)

549-E. Casting Design—a Modern Art. Alan R. Moore. *Modern Castings*, v. 36, Nov. 1959, p. 46-48.

Stress analysis, surface finish, grain structure, casting shape and mode of solidification in relation to well-designed castings. (E-general, 17-51)

550-E. (French.) Service Life of Permanent Molds From Nonferrous Metals. *Journal d'Informations Techniques des Industries de la Fonderie*, no. 109, Oct. 1959, p. 5.

(E12)

551-E. A Review of Modern Developments in Cupola Practice. H. J. Leyshon. *British Foundryman*, v. 52, Oct. 1959, p. 451-458.

Modern developments in hot blast, basic-lined cupola and water-cooled cupolas; oxygen enrichment of the cupola blast. (E10a)

552-E. Primer on Shell Molding. James J. Silk. *Modern Castings*, v. 36, Sept. 1959, p. 48-50, 136.

Recommended composition mixtures. (E16c)

553-E.* Some Observations on the Occurrence of Rust Staining on Copper-Base Alloys. G. W. Brown and C. B. Searles. *British Foundryman*, v. 52, Oct. 1959, p. 442-444.

Causes of the formation of rust stains on Cu-base alloys, both as well-defined isolated areas and as an over-all "bloom." Rust staining is due to the presence of free iron particles, either as grit or fines, and can seldom be attributed to oxide inclusions in the metal. (E25q; Cu-b)

554-E.* Radioactive Tracer Investigation of Inclusions in Alloy-Steel Castings. P. W. Clark and D. H. Houseman. *British Foundryman*, v. 52, Oct. 1959, p. 445-450.

Role of zircon mold materials in producing inclusions in alloy steel castings. Painted and unpainted radioactive zircon sands were used to determine the depth of penetration into the casting. (E19, 1-59; AY, 9-69)

See item 374-E, 1959. (E10, Q-general; 9-69, CI-q)

581-E. (Translation—Brutcher no. 4702.) Melting of Laboratory Specimens in a Vacuum or an Inert Atmosphere Without a Crucible. A. A. Fogel'. *Izvestiya Akademii Nauk SSSR, OTN, Metallurgiya i Toplivo*, no. 2, 1959, p. 24-34.

The specimen is induction melted while suspended in an electromagnetic field. It assumes the shape of a sphere, the diameter of which is typical for each metal and composition. 4 ref. (E10b, 1-60, 1-73)

SECTION F

PRIMARY MECHANICAL WORKING

1-F.* (German.) Manufacture and Properties of Aluminum Wire. H. D. Feldmann. *Draht*, v. 9, Oct. 1959, p. 392-398.

Strength of drawn wire from 99.5% Al increased by Si and Fe (as admissible impurities totaling 0.5%). Influence of casting, rolling and extruding. Distribution of stresses in wiredrawing. (To be continued.) (F28, Q-general; Al, Si, Fe, 2-60, 3-70)

2-F. (Polish.) Forward Slip and the No-Slip Angle in the Rolling of Low-Carbon Steel. Zygmunt Wusatowski and Franciszek Kunert. *Archiwum Hutnictwa*, v. 3, no. 3, 1958, p. 181-199.

8 ref. (F23; CN-g)

3-F.* (French.) Reheating of Ingots for Slabbing Mill in a Battery of Pit Furnaces. J. Leclerc and J. Goureau. *Revue de Metallurgie*, v. 55, Aug. 1958, p. 697-709.

Interval between pouring of ingot, during which cooling occurs, and charging of pits, as well as weight and dimensions of ingot, are principal factors in establishing a mean soaking time that will produce material of proper temperature, and hence rollability, for slabbing rolls. However, because of other variables, heating scheduling and control should not be left to furnace tenders, but should be in charge of supervisory personnel capable of taking all factors into account. (F21b, W20g; ST, 5-59)

4-F.* Behind the Scenes With Foil. J. H. Williams. *Paper, Film and Foil Converter*, v. 32, Nov. 1958, p. 32-35.

Quality controlled production of Al foil. Gage, finish, properties, metallurgical characteristics. (F23q, W23; Al, 4-56)

5-F. Automatic Numerical Data Logging and Processing in the Steel Industry. R. M. Sills and G. E. Terwilliger. *Iron and Steel Engineer*, v. 35, Nov. 1958, p. 101-109.

Types of systems, terminology, components, analog and digital computers, input, storage and output devices. Application of system to cold strip mill and electrolytic tinning line. (F23q, L17, X14j, X14k, 1-52)

6-F. Feed Mechanism for Wire-Forming Machine. Karl W. Nittel. *Machinery (London)*, v. 93, Nov. 12, 1958, p. 1116.

(F28, 1-52)

7-F. Production Forming of Natural Uranium Metal. John A. Fellows. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1433, 1958, 18 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Types and origins of normal U metal; primary hot forming; forging of dingots; gamma extrusion of dingot metal; secondary hot forming; warm finishing; heat treatment of U. 35 ref. (F-general, J-general; U)

8-F.* (Rumanian.) Rolling Thin Sheets of Refractory Steel. R. Miculescu. *Studii şi Cercetări de Metalurgie*, v. 1, July-Dec. 1956, p. 339-348.

It was found possible to roll thin sheets of high-alloy austenitic (Cr, Ni and Ti) by applying reduction regimes identical with those for rolling thin sheets of ordinary carbon steel. 6 ref. (F23; SS-e)

9-F. Progress in Wire Drawing. *Mechanical World*, v. 138, Nov. 1958, p. 498-504.

Die design, drawing speeds, drawing machines, heat treatment. (F28, J-general)

10-F. How to Select Materials for Rotary Swaging. Lloyd A. Whiting. *Metalworking*, v. 14, Dec. 1958, p. 10-13.

(F25; SS, AL-b, Ni-b, Cu-b, CN-g, U, Ti, Zr, Re, W)

11-F. Spring Wire Gets a Lift. *Steel*, v. 143, Dec. 11, 1958, p. 70-71.

Produced by cross extrusion, it shows a substantial increase in service. (F24b, T7c; AY, SS, 4-61)

12-F. Profile-Rolling for Economy, Finish, Strength and Uniformity. Donald McNary and Kempton A. Whiting. *Tooling & Production*, v. 24, Dec. 1958, p. 50-52.

Cold rolling is suggested where difficult-to-work materials, close tolerances, high surface finish, sharp corners, thin sections, complex radii or intricate angles are involved. (F23, 1-67, 4-57)

13-F. (Polish.) Forming Railroad Rails in Existing Rolling Mills. Michal Musial. *Hutnik*, v. 25, July-Aug. 1958, p. 291-295.

Comparison of Polish rolling mills of older type. (F23, T23q)

14-F.* (French.) Heating Operations in the Hot and Cold Working of Zirconium. D. Whitwham, J. Boghen and J. Herenguel. Paper from "Symposium on Special Problems in Metallurgy", Presses Universitaires de France, Paris, France, 1958, p. 79-88.

For hot working, heating in salt bath is given preference to heating in air. In salt bath no oxides can form and the heating time is shorter. In a gas or oil heated furnace there is danger of hydrogen contamination. 7 ref. (F21b, J2j, 1-66, 1-67; Zr-a, Zr-b)

15-F.* (German.) Technology of Forming. Pt. 1. W. Engelhardt. *Fertigungstechnik*, v. 8, Aug. 1958, p. 356-361.

Six stages in fabrication of metals: (1) preparation of material; (2) primary mechanical working and casting; (3) secondary deformation in the solid state; (4) separation cutting, boring, machining; (5) heat treatment, hardening, annealing, stress-relieving; (6) joining of materials or parts (soldering, welding, bonding.) Various processes of cold deformation classified. (To be continued.) (F-general, G-general, J-general, K-general)

16-F.* (German.) Surface Temperature of Upsetting Tools and Dies During Forging of Steel and Pantal in Cylindrical Shape. Gunter Beck. *Werkstattstechnik und Maschinenbau*, v. 48, Oct. 1958, p. 561-567.

Methods for estimating in advance the temperatures of tools and forgings during the process. (F22, 2-61; ST, Al-b, 4-60)

17-F.* (German.) Forging of Heat Resistant Metals. A. H. Wain and I. R. Rait. *Werkstattstechnik und Maschinenbau*, v. 48, Oct. 1958, p. 567-568.

Forging of Ti and other heat resistant metals and alloys based on Cr, Mn and Ni. (F22; Cr-b, Mn-b, Ni-b, SGA-h)

18-F.* (German.) Fundamentals of Static-Dynamic Forging and Some Characteristics of the Process. P. Stancovic. *Werkstattstechnik und Maschinenbau*, v. 48, Oct. 1958, p. 568-569.

Test machine which incorporates independently operated members for exerting static pressure and dynamic impact simultaneously in controlled relationship to each other. (F22, 1-52)

19-F.* (Polish.) Elongation and Spread in Hot Rolling of Low-Carbon Steel. Zygmunt Wusatowski and Bronislaw Hoderny. *Archiwum Hutnictwa*, v. 3, no. 3, 1958, p. 161-179.

Rolling experiments with drafts of 50 to 90% performed to determine elongation, spread, forward slip, rolling velocity, pressure and torque of rolling. Formulas are derived to determine the coefficients of spread and elongation as a function of the draft coefficient. 7 ref. (F23; CN-g)

20-F.* Drop Forgings to Suit the Final Machining. Otto Kienzle. *Metal Treatment and Drop Forging*, v. 25, Aug. 1958, p. 315-321.

Forging must have uniformity of hardness, toughness and other qualities demanded by necessary finish-machining processes. Optimum tolerances and machining allowances vary according to method of machining. Drop forged items with cold pressed surfaces will already

possess finished accuracy in certain dimensions. 7 ref. (F22n; ST, 17-55)

21-F.* To Correct Extrusion Dies. H. D. Flicker. *Modern Metals*, v. 14, Aug. 1958, p. 38-42.

Fundamentals of extrusion flow with techniques of correcting the malfunctions of dies and of related equipment and operations. (F24, W24n; Al, 17-55)

22-F.* (Czech.) Industrial Use of Information About Internal Crack Formation in Large Forgings. Stanislav Burda and Michal Bakala. *Hutnicke Listy*, v. 13, no. 9, 1958, p. 786-795.

Summarizes statements published since 1919 concerning causes of internal cracks in forging. Influence of cooling methods on occurrence of cracks. Ultrasonic inspection; welding internal cracks by forging. 23 ref. (F22, Q26q, 2-61; ST)

23-F. (German.) Charts for Finding the Conditions of Minimum Cut-Off Waste in Cold Rolling of Nonferrous Sheet. O. Emicke. *Metall*, v. 12, Nov. 1958, p. 990-991.

(F23, 1-67; EG-a38)

24-F. Cold Working of Extruded Zircaloy Tubing. N. R. Gardner and P. Loewenstein. Nuclear Metals Inc. U. S. Atomic Energy Commission, NMI-1194, Apr. 30, 1958, 55 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.

High frictional terms associated with cold drawing demand a satisfactory lubricant. Since even slight metal-to-metal contact between clean Zr and the tools will result in pickup on the die and scoring of the tube, it is imperative to introduce a continuous and reliable barrier layer. The most reliable technique involves the use of a conversion coating and a soap lubricant. (F26r, F24; 4-60, Zr-b)

25-F. (Translation—Brutcher, 4395.) Increased Forging Temperatures for Structural Steels 25 and 43N. M. P. Braun, N. I. Kon and E. I. Mirovskii. *Metallovedenie i Obrabotka Metallov*, Oct. 1958, p. 41-46.

Forging with a 2-ton steam hammer at 1150, 1200, 1250, 1280 and 1300° C. Raising the forging temperature from 1150 to 1300° C. increased the grain size. Large grain is easily reduced with plastic deformation and subsequent heat treatment. Forging temperature for stock prior to deformation can be raised to 1270 - 1280° C. for 25 STL and 1250 - 1260° C. for 43N steel. (F22, F21b, M27c, J-general; ST)

26-F. (Translation—SLA, ASLIB-GB41.) Automation of a 12-Roller Reversing Cold Rolling Mill. Herbert Schmale. *Stahl und Eisen*, v. 76, Dec. 13, 1956, p. 1698-1700.

32-F. Here Are Two Shortcuts for Complex Parts. *Steel*, v. 143, Dec. 22, 1958, p. 64-66.

Metal gathering and flotrusion extend limits of hot upsetting and tube redrawing with improved one-piece shapes resulting. (F22j, F26r)

33-F.* (German.) Cold Extrusion of Steel. Heinz Eberspaecher. *Werkstatt und Betrieb*, v. 91, Oct. 1958, p. 605-608.

Influence of nonmetallic coatings on the cold extrusion behavior of steel blanks as a result of reduced friction between

external part surfaces and tools. Several pretreating processes, such as cold upsetting; different methods of heat treatment. Influence of extrusion speed on power requirements. Some ideas regarding materials and design of cold extrusion dies. (F24, 1-67; ST)

34-F.* (Russian.) Production of Tubes With Internal Plastic Coating. S. A. Grinberg. *Stal'*, v. 18, Nov. 1958, p. 1018-1020.

Production of plastic-lined tubes by polymerizing welding without drawing gives great saving in valuable alloy steels. Has many advantages over latter in protection against corrosion by aggressive acids. Use of Ti, Ni, Nb, Mo and Cr only slowed corrosion and often contaminated the liquids flowing through the tubes. However, vinyl is completely resistant to corrosion by all acids, alkali and salt solutions. (F26p, L26p, R-general, 2-60; ST)

35-F. (Czech.) Rolling Theory. Frantisek Wiesner. *Hutnicke Listy*, v. 13, Nov. 1958, p. 987-990.

14 ref. (F23)

36-F.* Forging and Heat Treating Practices for Armco 17-7 PH Stainless Steel. W. J. Davison. *Metal Treating*, v. 9, Nov-Dec. 1958, p. 6-8.

Designing forging procedures, solution, transformation, aging and conditioning treatments. Effect of amount of hot upsetting on the ductility of Armco 17-7 PH. (F22, J-general; SS)

37-F.* (Czech.) Rolling Thick Steel Sheets Clad on One Side With Stainless Steels. Milan Zidek, Bohumil Glatz and K. Gottwalda. *Hutnicke Listy*, v. 13, no. 8, 1958, p. 679-687.

Casting compound ingots from carbon and stainless steels; pre-rolling in blooming mill; optimum conditions for rolling; relation between reduction of face metal and clad material. Effect of sheet thickness and finish rolling temperature; calculation of initial slab sizes. 12 ref. (F23, 2-61, 3-73; CN, SS, 4-53, 8-66)

38-F.* Combined Hot Forging and Cold Forming. *Metalworking Production*, v. 102, Dec. 19, 1958, p. 2220-2221.

Combined method, with zinc phosphate lubrication as a key step, uses less material, low-carbon steel. Heat treatment is more simple, machining reduced. (F22m)

39-F.* How to Design Stainless Steel Extrusions. Pt. 1. Process Characteristics. Richard E. Paret. *Machine Design*, v. 31, Jan. 8, 1959, p. 114-117.

Advantages in specifying extrusions include: great freedom of section design; reduction and elimination of machining operations; production of integral complex shapes; economical small production runs when demand does not justify rolling. Mechanical properties of extruded parts are superior to those of cast parts and roughly comparable to those of forged parts. (F24, 17-51; SS)

40-F.* Experiments in the Cold Extrusion of Rods of Non-Circular Section. W. Johnson. *Mechanics and Physics of Solids, Journal*, v. 7, Nov. 1958, p. 37-44.

Effects of section shape and punch speed on the necessary extrusion load and on the nature of the flow of metal within extruded pure Pb and Te-Pb rods. 5 ref. (F24; Pb-a, Te-a, 4-55)

41-F.* The Die Is the Key. Fred G. Schuler. *Precision Metal Molding*, v. 16, Dec. 1958, p. 30-31.

Properties and applications of extruded shapes in 1100, 3003, 6061, 6062 and 6463 Al alloys. Check list indicates requisites for effective die design. (F24, W24n; Al-b)

42-F. Manufacture of Welded Steel Tube. J. Gosse. *Australian Welding Journal*, v. 2, Oct. 1958, p. 50-55.

Cold formed welded carbon steel tubing; welded stainless steel tubing. (F26p; CN, SS)

43-F. Graphical Method for Determination of Parameters for Steel Wire Drawing. Bron. Kunda. *Wire Industry*, v. 25, Dec. 1958, p. 1139-1142.

(F23; ST)

48-F.* What the Designer Should Know About Production. Pt. 4. Hot Forging. R. B. Boswell. *Machinery*, v. 65, Jan. 1959, p. 131-139.

Forging presses, furnaces, dies and tools; application and design of forged parts; tolerances; metallurgical considerations. 5 ref. (F22, 1-66, 17-55)

49-F.* (German.) Properties and Manufacture of Aluminum Wire. Pt. 2. Heinz D. Feldmann. *Draht*, v. 9, Nov. 1958, p. 461-463.

Influence of die form and drawing velocity. Good lubrication very important, both liquid and solid lubricants employed. (To be continued.) (F28; Al-b, 18-73)

50-F.* (German.) Influence of Rolling Conditions on the Properties of Low-Carbon Hot Rolled Strip. Pt. 2. Mechanical Properties and Structures. Winfrid Dahl and Werner Lueg. *Stahl und Eisen*, v. 78, Dec. 11, 1958, p. 1793-1798.

Hot rolled strip of basic converter steel was cold rolled in several steps with intermediate annealing and strength and structure tested. Strip that was hot rolled at temperatures above the A_3 point showed higher strength and finer grain than material rolled at lower temperatures. Strength in transverse direction found to be higher than in longitudinal direction. 10 ref. (F23, 1-66, 1-67, 2-61; CN-g, 4-53)

51-F.* (German.) Drawing of Titanium Rods. Werner Lueg and Paul Funke, Jr. *Stahl und Eisen*, v. 78, Dec. 11, 1958, p. 1816-1822.

Determination of the most favorable drawing conditions and parameters by experimentally drawing rods from forged Ti-150. Structural transformations, especially formation of twin crystals. 21 ref. (F27, Q24b, Q29; Ti, 4-55)

52-F.* (German.) Residual Stress in Steel Wires Influenced by Redrawing and Straightening. Hans Buhler and Georg Altmeyer. *Stahl und Eisen*, v. 78, Dec. 11, 1958, p. 1822-1827.

By redrawing with a section reduction of 1.3% a stress relief of 35% was established by straightening; with 1.3% increase in section, the extreme fiber stress was reduced to 50%. Annealing for 1 hr. gave 22% stress relief for 300° C., 60% for 400° C., and 78-87% for 500° C. 19 ref. (F28h, J1, Q25h; ST)

53-F.* Theory and Experiment of Press Forging Axisymmetric Parts of Aluminum and Lead. S. Kobayashi, R. Herzog, J. T. Lapsley, Jr., and E. G. Thomsen. *American Society of Mechanical Engineers*, Paper no. 58-A-154, 1958, 9 p.

Mechanics of finishing in a press-forging operation. The idealized deformation mechanism assumed in a simplified theory of axisymmetric press forging yields forging pressures which are in good agreement with experiments on commercially pure Pb and Al. 18 ref. (F22; Pb, Al)

54-F. Grease for Hot Spots. *Southern Power & Industry*, v. 76, Nov. 1958, p. 54, 56, 58, 60.

Lubricating parts of crane stripper and soaking pit cranes. (F21a, W12q, 18-73)

55-F.* (Hungarian.) Distribution of Deformation Resistance Along the Arc Under Pressure. Sandor Geleji. *Kohaszati Lapok*, v. 13, Feb-Mar. 1958, p. 70-72.

Calculations on behavior of steel in rolling. Method developed for hot rolling but, with slight alterations, can also be adopted for cold rolling. (F23, 1-66; ST)

56-F.* (Hungarian.) Some Important Factors Affecting the Heating of Steel. Daniel Dioszegi. *Kohaszati Lapok*, v. 13, Feb-Mar. 1958, p. 80-85.

Factors influencing actual behavior of steel heated in furnaces as compared to theoretical calculations based on adiabatic conditions. The rate of heat transfer is different at various temperature ranges of the work. Continuous countercurrent

furnaces provide better heating conditions but are more difficult to compute in advance. 600° C. found to be the limit above which the admissible heating speed is usually dependent upon furnace capacity only. 9 ref. (F21b, P11k; ST)

57-F.* (Hungarian.) Determining the Power Requirements of Roller-Type Sheet Metal Straightening Machines. Sandor Geleji and Gyorgy Devenyi. *Kohaszati Lapok*, v. 13, Feb-Mar. 1958, p. 111-117.

Practical method for calculating power requirements by assuming an average condition of waviness in the sheets and determining bending effort needed to straighten the sheets by letting them pass between rollers. 9 ref. (F29r, W23c)

58-F. (Translation — BISI, 889.) Design and Operational Results of a Modern Continuous Train Rolling Medium Strip. Herbert Severing. *Stahl und Eisen*, Feb. 20, 1958, p. 205-214.

See item 126-F, 1958. (F23, 1-61, W23c)

59-F. (German.) New Theory of Rolling. A. Geleji. *Acta Technica Academiae Scientiarum Hungaricae*, v. 19, 1957, p. 199-240.

Determination of forces of deformation in cold and hot rolling. Broadening forward slip and bending of cross-sections vertical to the longitudinal axis are important factors. Graphs comparing calculated and tested pattern of deformation resistance of cold and hot rolled Al. 19 ref. (F23; Al-b)

60-F. (Japanese.) Effect of Properties of Aluminum Slab Produced by Continuous Casting on Surface Patterns of Sheet. T. Morinaga and T. Takahashi. *Japan Foundrymen's Society, Journal*, v. 30, Oct. 1958, p. 803-810.

Causes of the patterns are structure of Fe, method of rolling, heat treatment and presence of Si as an impurity. (F23, C5q, 2-64, 3-69; Al, *Si*, 4-53, 9-71)

61-F. (Polish.) Defects in Raw Steel and Their Effect on Quality of Wire. Zygmunt Steininger. *Hutnik*, v. 25, Sept. 1958, p. 340-346.

(F28; ST, 9)

62-F. (Ukranian.) D. C. Electrical Contact Heating for Turning. F. Ya. Zagabura. *Dopovidi Akademii Nauk Ukrainskoi RSR*, no. 8, 1958, p. 841-844.

Lines do not appear on the worked surface as is the case if heating is done by alternating current. (F21b, G17a)

63-F.* (French.) Phenomenon of "Superworking" in Extruding. J. Herenguel and P. Lelong. *Revue de Metallurgie*, v. 55, Nov. 1958, p. 1057-1064.

In the process of extrusion, certain zones within a block of Zl are exposed to a strong deformation by shear (superworking), causing phases usually considered as insoluble to disperse in the same manner as if they had been dissolved and reprecipitated in a fine state of division. (F24, N5f, 3-68)

64-F.* L-D Steels in Wire Manufacture. A. Legat and E. Fogy. *Wire Industry*, v. 26, Jan. 1959, p. 52, 53, 64.

Properties, annealing, thread rolling, rope wire manufacture, time-temperature-transformation range, wire for welding electrodes. (F28, G12, D10d, T7g; SS)

65-F.* (French.) Manufacture of Seamless Steel Tube by the Stiefel Process. J. Verdickt. *Technique Moderne*, v. 50, Sept. 1958, p. 395-401.

Starting material, process details, equipment. (F26s, W23h, ST)

66-F.* (Hungarian.) Lubrication Problems of High-Speed Wire Drawing. Lajos Mankher. *Kohaszati Lapok*, v. 13, no. 8, 1958, p. 374-379.

Metallic soaps, cooling of drums and utilization of hydroxide layers as lubricant carriers, cooling of wire and drums, use of metallic soaps as lubricants. 9 ref. (F28; NM-h)

67-F.* Static-Dynamic Forging. Principles and Some Characteristics. P. Stankovic. *Metal Treatment and Drop Forging*, v. 25, Dec. 1958, p. 489-494.

Static-dynamic action gives good flow of the material in both the direction of the force action and in the perpendicular which is a great advantage when forging in dies. Comparative results obtained by static only, dynamic only, and combined static-dynamic actions, together with results obtained by static-dynamic forging at various speeds. (F22)

68-F. Automated Forge Shop Saves GM 25%. *Steel*, v. 144, Jan. 9, 1959, p. 76-77.

Automatic techniques at GM's Saginaw Steering Gear Division in the hot forging of propellor shaft assemblies. (F22, 18-74, T7j)

69-F.* (German.) Properties and Production of Aluminum Wire. H. D. Feldman. *Aluminium*, v. 35, Jan. 1959, p. 13-20.

Factors affecting Al wiredrawing process, defects, equipment, die lubricants and die design. 7 ref. (F28, 1-52; Al)

70-F.* (Russian.) Causes of Flaws in Corners of Billets of Rimming Steels Occurring During Rolling. S. V. Makaev. *Metallurg*, v. 3, Dec. 1958, p. 32.
Conveying time from furnace to rolling stand and stresses affect the magnitude of the flaws. (F23; ST, 4-52, 9, 3-66, 3-67)

71-F. Trends and Development in Electrical Automation Systems for Steel Plant Processes. W. E. Miller. *Blast Furnace and Steel Plant* v. 47, Jan. 1959, p. 64-71.
Summary of automatic control processes in rolling mills. (F23, W23, 18-74)

72-F. New Brinsworth Mill. *Iron and Steel*, v. 32, Jan. 1959, p. 13-17.
Equipment and layout at Steel Peech and Tozer's new continuous strip plant in Brinsworth, England. (F23, 18-67; ST, 4-53)

73-F. Operations Research in a Metal Rolling Mill. A. P. M. Purdon. *Metal Treatment and Drop Forging*, v. 25, Dec. 1958, p. 503-507.
Application of operations research to problems of a Cu rolling mill. (F23, A9n; Cu)

74-F. Short-Run Forging Can Be Economic. E. Merrill Gardner. *Metalworking Production*, v. 103, Jan. 9, 1959, p. 53-56.
(F22, 17-53)

75-F. Automatic Handling May Triple Forging Rates. *Metalworking Production*, v. 103, Jan. 9, 1959, p. 68-69.

77-F. (Hungarian.) Tube Manufacturing in Hungary. Jeno Ruhmann. *Kohaszati Lapok*, v. 13, no. 8, 1958, p. 362-366.
Mannesmann, Stiefel and Erhardt processes for producing seamless tubing. (F26)

78-F.* Fabrication of Refractory Metals. W. L. Bruckart. *Metal Industry*, v. 94, Jan. 23, 1959, p. 63-66.
Properties, forming and machining, applications for molybdenum. Room-temperature mechanical properties of Cb, Mo, Ta, Re and W. (To be continued.) (F-general, G-general, Q-general; Mo, Cb, Ta, Re, W, EG-d37)

79-F.* Forging Presses Strength Into Lightweight Castings. W. Rostoker. *Product Engineering (Design Issue)*, v. 30, Feb. 16, 1959, p. 61-63.
Follow-up forging improve parts cast from Al and Mg alloys. (F22, Q-general; Al-b, Mg-b, 5-61)

80-F. (Translation—BISI, no. 1130.) Use of Water-Cooled Plugs in the Piercing of Billets. M. M. Kaufman. *Stal'*, Feb. 1958, p. 144-151.
See item 167-F, 1958. (F26q, W23h)

81-F. (Translation—BISI, no. 1190.) Nomograms for the Determination of Rolling Efforts, Based on the Equation of S. Ekelund. Alfred Mathea. *Stahl und Eisen*, v. 78, Oct. 2, 1958, p. 1383-1389.
See item 338-F, 1958. (F23, U4q)

82-F. Improved Extrusion Lubricants. G.C. Giles. *Precision Metal Molding*. v. 17, Jan. 1959, p. 57-58, 73.
More accurate extrusions with better surface finish and longer die life result from the use of colloidal graphite suspended in water. (F24; NM-h)

83-F. How Theory Can Help the Cold Roller. E.L. Morgan. *Sheet Metal Industries*, v. 36, Jan. 1959, p. 53-61.
Insight into the factors affecting the rolling load can indicate the correct camber of roll to be used and maintain a uniform rolling load and uniform shape. (F23, 1-67)

84-F. Combines Mains-Frequency and High-Frequency Induction Heating for Forging. Y. Sundberg. *ASEA Journal*, v. 31, no. 8-9, 1958, p. 111-116.
(F21b, F22, 1-69)

85-F.* The Fundamentals of Wire Drawing. J. G. Wistreich. *Metallurgical Reviews*, v. 3, no. 10, 1958, p. 97-142.
Theoretical analysis of stress and strain distribution within confines of die and external forces. Influence of process variables. Heat development and temperature distribution; temperature measurement; surface finish; coefficient of friction; lubricants and lubrication; mechanism of die wear; effect of drawing on properties of

wire. 93 ref. (F28, F2, 2-61, 3-66, 3-68; ST, Cu-b, Al-b, NM-h)

86-F.* Properties of Extruded Alloys. *Precision Metal Molding,* v. 17, Feb. 1959, p. 44-45.

Fabricating characteristics, corrosion resistance and types of finishes for some six Al alloys. (F24; 4-58, Al-b)

87-F. (German.) Power Consumption in the Manufacture of Seamless Steel Tubing. A. Geleji, E. Kiss and G. Devenyi. *Acta Technica,* v. 22, no. 3-4, 1958, p. 395-412.

Computation of power consumption based on measurements carried out during manufacture. (F26; ST)

88-F.* (Russian.) Process of Production of Seamless Tubes From High-Alloy Boron Steels. V.S. Rudoi, N.S. Alferova and V.P. Konovalov. *Stal',* Jan. 1959, p. 68-73.

Low temperature of piercing of hot rolled seamless tubes. 4 ref. (F26q, 1-67; SS, *B*)

89-F.* (Russian.) An Increase in Strength and Reduction of Weight of Welded Tubes Made of MK Steel. A.V. Prokhorov. *Stal',* Jan. 1959, p. 88-91.

Uniformity of properties of MK alloy steel and its high strength and ductility make it possible to reduce the wall thickness of steel pipe 7 to 8 mm., provided low-alloy electrodes are used for welding. (F26p; SS-b, 4-60)

90-F.* Control of the Shape of Metal Strip by Camber Variation During Rolling. A. R. E. Singer. *Sheet Metal Industries,* v. 36, Feb. 1959, p. 134-139.

Causes of camber and shape variation, methods of compensating for camber deficiencies, existing schemes for shape control by camber variation during rolling, development of a variable-camber mill and effectiveness of shape control by means of roll cambering forces. 5 ref. (F23, W23c; 4-53, 17-51)

91-F. (Russian.) Quality of Cast Steel for Rolling 9.75-Ton Rail. S. Yn. Skoblo, E. A. Kazachkov and E. G. Pereverzeva. *Metallurg,* Jan. 1959, p. 19.

Chemical, physical, structural and mechanical properties of steel stock used in rolling 9.75-ton rail. (F23, Q-general; 5-59, ST)

92-F.* Tungsten Is Forged, Extruded, Even Deep-Drawn. *Iron Age,* v. 183, Mar. 19, 1959, p. 126-127.

Using hot tungsten carbide tools and fast equipment, W can now be extruded, drawn, spun, forged and deep drawn, but loses its ductility below 400° C. (F22, F24, G-general, Q-general; W)

93-F.* Forgeability of Steels. G. P. Contractor and W. A. Morgan. *Metal Treatment and Drop Forging,* v. 26, Feb. 1959. p. 65-71.

Hot torsion tests indicate reliably the best temperature for hot working. The number of twists to failure, when related to temperature, normally shows a maximum; the temperature at which it occurs is the optimum forging temperature. Hot workability curves are shown for a high-carbon toolsteel and Type 304 stainless. Curves indicate that the number of revolutions required for fracture increases as the temperature is raised until an optimum or a maximum temperature is reached. 43 ref. (F22, 17-52; SS, TS)

94-F.* (Russian.) Strength of Welded Gas Pipes. M. P. Anuchkin, N. I. Anenkov and G. V. Shakhovskaya. *Svarochnoe Proizvodstvo,* Feb. 1959, p. 21-22.

Pipe manufacture from hot rolled strip and cold flaring brings about, in some cases, a complete disappearance of plastic properties. Normalizing, elimination of inclusions and lamination in the steel, and reduction of deformation during flaring, are suggested remedies. 200 ref. (F26p, J24; ST, 4-60)

95-F. (Translation--BISI no. 744.) Heating Alloy Steel Ingots in Soaking Pits. O. A. Semchenko. *Stal',* Oct. 1957, p. 915.

See item 72-F, 1958. (F21b, W20g; AY, 5-59)

96-F. (Translation--BISI no. 909.) Manufacture and Properties of Hot Rolled Tubes in Steel EI595. N. S. Alferova, G. P. Pishchikov and V. P. Konovalov. *Stal',* Jan. 1958, p. 60-66.

See item 183-F, 1958. (F26s, Q26s; ST)

97-F. (Translation--BISI no. 1037.) Production of Alloy Steel Light-Pressure Boiler Tubes. S. I. Borisov. *Stal',* May 1958, p. 442-446.

See item 218-F, 1958. (F26s; AY)

98-F. (Translation--BISI no. 1200.) Calculation of Metal Pressure on Rolls. Yu. M. Chizhikov. *Stal',* v. 18, May 1958, p. 428-433.

See item 216-F, 1958. (F23, 4-52, 4-53, 10-51)

99-F.* Non-Slip Angle and Forward Slip During Rolling Involving Spread. Z. Wusatowski and Z. Szalajda. *Iron and Steel*, v. 32, Feb. 1959, p. 61-67.

Effect of rolling pressure, temperature and spread on forward slip during rolling of carbon steel, using measurements of forward slip. 8 ref. (F23)

100-F.* Metallurgical Factors in the Hot Working and Cleaning of Hot Rolled Strip and Their Influence on the Cold Reduced Annealed Product. R. D. Hindson. Paper from "Annealing of Low Carbon Steel, Proceedings", Lee Wilson Engineering Co., Inc., Cleveland, Oct. 1957, p. 9-17.

Influence of finishing and coiling temperatures on grain size, effects of carbide distribution and mechanical properties of the final annealed product. Variations in hot strip mill practice for special steels and cleaning or pickling of hot rolled strip. 13 ref. (F23q, M27c, L12; CN-g)

101-F.* Cold Rolling of Steel Strip. G. A. Finch. *Sheet Metal Industries*, v. 36, Mar. 1959, p. 211-222.

Rolling of strip and sheet, types of mills, types of rolls, instrumentation. (F23, W23k, X-general, 1-67; ST, 4-53)

102-F.* (Rumanian.) Quality as Influenced by the Entrance Angle of Rolling Pass. R. Fischgold and L. Dragan. *Studii si Cercetari de Metalurgie*, v. 3, no. 3, 1958, p. 345-358.

Determination of entrance angles for three types of steels and nodular cast iron. 6 ref. (F23, 17-51; CN-g, AY-n, SS, CI-r)

103-F. Erase Draft While Forging to Save Machining Steps. Herbert Chase. *Iron Age*, v. 183, Feb. 26, 1959, p. 98-100. (F22n; ST)

104-F.* Production of Zinc Wire. A. G. Arend. *Wire Industry*, v. 26, Mar. 1959, p. 251, 270.

Effect of Al content in rolling and on the properties of the wire. (F23q, 2-60; Zn, *Al*, 4-61)

105-F.* Rolling of Metals. J. L. Greenberger. *Iron and Steel Engineer*, v. 36, Mar. 1959, p. 99-107.

Basic engineering and operating problems involved in hot and cold rolling, particularly with regards to flat rolling. (F23, W23)

106-F.* Improved Lubrication in Cold Strip Rolling. J. C. Whetzel, Jr., and Sayre Rodman. *Iron and Steel Engineer*, v. 36, Mar. 1959, p. 123-132.

For a given amount of lubricant, increasing its viscosity up to a certain value reduces rolling loads. Water-soluble chemicals and mixtures were found to be the best lubricants. 5 ref. (F23, 18-73; ST, NM-h, 4-53)

107-F.* Welding Aluminum Tube at 400 Ft. Per Min. *Metalworking Production*, v. 103, Mar. 13, 1959, p. 463-464.

High-frequency welding equipment combined with a tube forming mill. (F26p, K5j; Al)

108-F.* (Hungarian.) Crowning Rolls for the Hot Rolling of Aluminum and Aluminum Alloys. Imre Kohler and Gyula Schultheisz. *Kohaszati Lapok*, v. 91, Oct-Nov. 1958, p. 483-391.

Duo-type ingot rolling mills for Al-Mn, Al-Mg, Al-Mg-Si and Al-Cu-Mg alloys. Calculation of type and dimensions of roll convexity based on effective roll width and lubricant used. Comparison of oil and emulsion type lubricants. (F23, W23k; Al-b, *Mn, Mg, Si, Cu*)

109-F.* (Russian.) Production of Riveting Stock Wire From 30KHGSA Alloy Steel. Ya. Kh. Sartan. *Metallurg*, Feb. 1959, p. 32-33.

Wiredrawing methods; heat treatment; calibration and bundling. Structure must be that of granular pearlite. Commercial name for such wire is "Cromansil" (Cr-Mn-Si steel). (F28; AY, *Cr, Mn, Si*)

110-F.* High-Frequency Resistance Welded Tubes. *Light Metals*, v. 22, Mar. 1959, p. 94-95.

Strip is formed into an unwelded tube. High-frequency current is then induced in the tube by shoes on either side of the gap. At a point about a $1\frac{1}{2}$ in. beyond these shoes a pair of pinch rolls brings the tube together and applies pressure to form the weld. (F26p, 1-69; Al, 4-53)

111-F.* Forgeability of Steels. Pt. 2. G. P. Contractor and W. A. Morgan. *Metal Treatment and Drop Forging*, v. 26, Mar. 1959, p. 107-114.

Effect of alloying elements on the hot workability aspect of the fabrication of stainless steels and to indicate how changes in the forgeability characteristics may be predicted by laboratory tests. (Concluded.) (F22, 17-52, 2-60, 1-54; SS)

112-F.* High Speed Production of Light Alloy Tube. C. W. J. Vernon. *Welding and Metal Fabrication*, v. 27, Mar. 1959, p. 80-82.

New machine roll forms and high-frequency resistant welds Al strip in continuous operation. (F26p, 1-52, 1-69; Al)

113-F.* Precision Forgings: Solution or Delusion? Alfred G. Jones. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 174, American Society of Tool Engineers, Detroit, 1958, 5 p.

Development of precision forgings in stainless steel and Ti alloys; die materials. (F22, 17-55; Ti-b, SS; 4-51)

114-F. The Extrusion Process for Converting Zircaloy-2 Ingots to Strip. W. H. Friske and E. L. Richards. Paper from "Bettis Technical Review, no. 10, Reactor Metallurgy". WAPD-BT-10, Oct. 1958, p. 1-8. U. S. Office of Technical Services, Washington 25, D. C.

Stringers and stringer-type corrosion are not eliminated or minimized by the process of extruding atmosphere-melted Zircaloy-2 ingots at an all-beta temperature (1900°F.) and hot rolling the resultant slabs at an all-alpha temperature (1475°F. max.) The over-all conversion of ingots to strip by this process is considered to be competitive with conventional blooming or forging techniques with respect to both yield and conversion costs. (F24, F23; Zr-b)

115-F. (Czeck.) Computations on the Utilization of Ingot Heat and Additional Heating in Soaking Pits. Zdenek Volf and Erich Gladys. *Hutnicke Listy*, v. 14, Feb. 1959, p. 98-104.

22 ref. (F21b, W20g)

116-F. (Russian.) Rationalization of Roll Pass Design for Continuous Billet Mills. N. I. Boyarshinov and I. P. Shulaev. *Stal'*, Feb. 1959, p. 137-141.

(F23, 1-61, W23, 17-51)

117-F. (Russian.) Flame Scarfing of Stainless and Heat Resistant Steels. D. I. Gololdbov and B. M. Litvinov. *Stal'*, Feb. 1959, p. 145-147.

Scarfing of various steels with high Cr and Si content by means of oxy-acetylene flame rather than mechanical trimming. (F21e, SS, *Si, Cr*, SGA-h)

118-F. (Russian.) Nature of Fissures in 1KH18N9T Steel. L. D. Kossovskii, V. A. Khorosh and M. A. Mukhina. *Stal'*, Feb. 1959, p. 147-148.

Principal cause of fissures is water used in cooling the rolls. Fissure formation is reduced by preventing the water from falling upon steel during rolling. (F23; SS, 9-72)

119-F.* Improvement of Castings by Press Forging. Digest of "Development of a Method to Improve Castings by Press Forging". Andrew H. Murphy and Lyle L. Clark. Air Force Contract Report. *Metal Progress*, v. 75, Apr. 1959, p. 147-148, 149A, 150.

Al, Mg and Ti casting alloys tested to establish the best forging conditions to obtain optimum properties and to investigate the feasibility of casting dies to shape for press forging parts. A range of forging deformations was used at each temperature and for each heat treated condition. (F22; Al-b, Mg-b, Ti-b)

120-F.* (English.) Study on Rolling of Metals and Alloys With Sendzimir Reversing Cold Strip Mill. Pt. 1. Pattern of Waves Appearing on Metal Foils. Eihachiro Tanaka and Tadatsugu Yoshiki. *Tohoku University, Science Reports of the Research Institutes*, v. 10A, no. 6, 1958, p. 405-413.

Occurrence of the waves was dependent on the front tension, but not essentially on the back tension. These waves were thought to be a kind of the center buckling of strip. 4 ref. (F23; CN, 4-56)

121-F.* Light Sheet-Metal Containers. W. Panknin. *Sheet Metal Industries*, v. 36, Apr. 1959, p. 257-267, 280.

Processes and equipment for the manufacture of cans; collapsible tubes and aerosol containers. (F26s, G5, T10g, 1-52; ST, Sn, Al-b, 4-53, 8-62)

145-F. (Book-German.) Die Forging of Steel. Kurt Lange. 379 p. Sept. 1958. Springer-Verlag, Berlin, Gottingen, Heidelberg, Germany. DM54.

Deformation mechanism of die forging. Hammering, pressing, upsetting, rolling and other die forging processes. Deburring, piercing and other subsequent treatments; defects; materials, design and manufacture of dies. (F22n, W22a, 17-51)

146-F.* (Japanese.) Experiments in Cold Strip Rolling. Hiroo Takahashi and Satoshi Miyoshi. *Journal of Mechanical Laboratory (Japan)*, v. 13, Jan. 1959, p. 1-11.

Roll loads and torques in rolling of annealed and prestrained steel strip at various reduction rates. Observed values are higher at low reduction and lower at high reduction than the theoretical values. With an increase of the number of passes, coefficient of friction decreases due to work hardening and thin oxide layers. (F23; ST)

147-F. Extrusion Cladding of NRU Fuel Element. H. S. Milne. Chalk River, Ont. *Atomic Energy of Canada Ltd.*, AECL 519, Nov. 14, 1958, 37 p.

Process for extruding the Al sheath directly on the core material is accomplished by a vertical hydraulic press forcing preheated Al billets into a converging chamber of a die-block arrangement. Metal flows around the core material and welds into a continuous sheath over the core as the core is guided horizontally through the die. The size of the die aperture determines the thickness of the cladding. (F24, L22, T11g; Al)

148-F. Fabrication of Uranium Welding Rod. E. L. Brundige, G. S. Hanks and J. M. Taub. Los Alamos Scientific Laboratory. *U. S. Atomic Energy Commission*, LA-2225, Sept. 9, 1958, 27 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Optimum results are achieved by the extrusion of uranium from a cast billet in the gamma range. The extruded rod is swaged to the desired size and coiled on a graphite mandrel. The coiled wire is then electrolytically cleaned and plated with a 4 to 6 mil coating of Ag. The Ag plate eliminates oxidation problems during storage and materially reduces oxidation during welding. (F24, F25, L17; U, *Ag*)

149-F. The Rolling Pressures of Uranium Sheet and Plate. J. E. Hockett. Los Alamos Scientific Laboratory, *U. S. Atomic Energy Commission*, LA-2233, Jan. 8, 1959, 159 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $3.

Uranium specimens tested in compression at several constant true strain rates and temperatures. From load and time measurements, true stress versus true strain curves are calculated. The method takes into account both roll flattening and inhomogeneity of deformation to calculate the roll pressure distribution along the arc of contact during the rolling of depleted uranium into sheet and plate. (F23, 3-74; U, 4-53)

150-F. (Russian.) Rolling of Twinned Ingots in 1150 Mm. Blooming Mill. A. P. Chermrev, V. I. Meleshko and V. L. Pavlov. *Stal'*, Mar. 1959, p. 243-247.

Major precautions are maintenance of proper rolling rate and avoidance of overloading of motive power of rolling drives. (F23q)

151-F. (Russian.) Rolling of Shapes With Automatic Repeaters. G. P. Klimenko. *Stal'*, Mar. 1959, p. 248-252.

Use of automatic repeaters when rolling shapes reduces labor, rejects and electric power consumption. (F23q)

152-F. Some Metallurgical Considerations in Forging Molybdebum, Titanium and Zirconium. Harry B. Goodwin. *Defense Metals Information Center*, Memorandum no. 12, Mar. 25, 1959, 41 p.

Review of forging temperatures, changes in grain size and transformation structures. (F22, N5, 2-61; Mo, Ti, Zr)

153-F.* Forging of Molybdenum and Its Alloys. J. J. Russ. Paper from "Fabrication of Molybdenum". American Society for Metals, Cleveland, 1959, p. 169-173.

Grain size and room-temperature mechanical properties of forgings produced from sintered compacts. Inspection techniques; problems associated with volatilization of Mo trioxide. (F22g, Q-general; Mo-b, 4-51)

154-F.* (Italian.) Production of Cold Rolled Strip With Good Surface Appearance and Mechanical Properties. L. Dainelli and L. Cocciolo. *Metallurgia Italiana*, v. 51, Apr. 1959, o. 145-153.

Cupping and tensile tests on three low carbon steels subjected to various degrees of cold rolling and a range of annealing temperatures. (F23, Q23q, Q27, 1-67; CN-g, 4-53)

155-F.* (German.) Effects of Extruding Conditions and Recrystallization Retarding Agents on Strength and Yield Point of Wrought Aluminum Alloys. Bruno Beyer and Hellmut Seliger. *Neue Hutte*, v. 4, Mar. 1959, p. 165-173.

"Double extrusion" applied to the production of small shapes does not produce any increase in strength. Neither is it achieved with extrusions from ingots when the degree of deformation surpasses a limit. By Zr additions a promotion of the limit to higher deformation degrees and an increase in strength, even with double extrusion, can be obtained. Extruded round bars show the best strength properties. 34 ref. (F24, Q23b, 3-68, 2-60; Al-b, *Cu, Mg, Zr*)

156-F. (Russian.) Finished Mill Products Obtained Directly From Molten Metal With the Elimination of Rolling Operations. Pt. 2. A. L. Shakh-Buragov and A. V. Stepanova. *Zhurnal Tekhnicheskoi Fiziki*, v. 29, no. 3, 1959, p. 394-405.

Mechanical properties of light and heavy strip; rods of different diameters and pipes experimentally produced directly from molten metal are not inferior to mechanical properties of finished products obtained by conventional rolling practice from billets. 5 ref. (F-general, C5q, A9)

157-F. The Forging Industry: Past, Present and Future. G. H. Jackson. *Metal Treatment and Drop Forging*, v. 26, May 1959, p. 191-197.

Press forging; reducer rolls; upsetting; light-alloy forging; hot brass pressing; electrical upsetting; steel and defects; future requirements; spark erosion; cold extrusion of steel and other new forming methods. (F22, G-general; ST, Cu-s)

158-F. (Japanese.) Cold Rolling by the Pilger Process. Toyohiko Okamoto. *Sumitomo Metals*, v. 10, Oct. 1958, p. 258-264. (F26q)

159-F. (Russian.) Machines for Separation of Pack Rolled Sheets. I. B. Rubinshtein. *Stal'*, Apr. 1959, p. 344-347.

Steel sheets produced by pack rolling were successfully separated by specially designed roller equipment, thereby eliminating a number of manual operations. (F23q; ST)

160-F. (Russian.) Automation of Heating in Soaking Pits. I. I. Sterlikov. *Metallurg*, May 1959, p. 42-44.

The conventional practice of measuring the temperature of combustion products

escaping from the top of the pit and then to determine the temperature of the bloom was replaced by a radiation pyrometer which measured the temperature of both the near and the far side of the pit. (F21b, S16b)

161-F.* 1958 Review of Metal Processing Literature (Plastic Working). F. W. Boulger. *American Society of Mechanical Engineers,* Paper no. 59-PROD-5, 1959, 4 p. $.80.

Sheet rolling, cold working, warm working, hot working and extrusion. 47 ref. (F23, F24, G4, G5; 4-53)

162-F.* (Russian.) Effect of Deformation Rate on the Distribution of Specific Pressure During Rolling. M. L. Zaroshchinskit. *Stal',* v. 19, May 1959, p. 433-436.

The rate of deformation has the greatest effect on the specific pressure of the curve of the bite, when the mean height of the rolled bar approximately equals the length of the curve of the bite. 12 ref. (F23, 3-68, 3-74)

163-F. A Summary of the Work Associated With the Solution and Understanding of Stringer-Type Corrosion in Zircaloy-2 and 3. J. G. Goodwin, L. S. Rubenstein, J. D. Grozier and F. L. Shubert. Bettis Plant. *U. S. Atomic Energy Commission,* WAPD-212, Apr. 1959, 22 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Gas-voids formed during inert atmosphere melting become stringers during fabrication, while the walls of the gas-voids are covered with a precipitate which is formed either during the solidification or during fabrication of the ingot. The voids do not seal during fabrication becasue of the pressure built up by the entrapped inert gas. 27 ref. (F23, E10; Zr-b)

164-F. Application of Data-Logging and Programming Techniques to Steel-Mill Processes. R. W. Barnitz and G. E. Terwilliger. *American Society of Mechanical Engineers,* Paper no. 59-AUT-5, 1959, 8 p. $.80.

Automation in rolling mills. (F23, S13, S14, W23p, 18-74; ST, 4-53)

Newly developed installation for rolling 1.5 to 5.5-mm. thick and 600 to 1000-mm. wide strip. (F23, 1-66; AY, 4-53)

180-F. (Russian.) Rolling of Angle Bars Through a Repeater. V. K. Yatsura. *Metallurg*, June 1959, p. 26-30.

(F23; CN)

181-F.* (Chinese.) Lamination Defects in Rimming Steel Slabs. Shao Hsiang-Hua. *Acta Metallurgia Sinica*, v. 4, Mar. 1959, p. 16-21.

Serious lamination defects that often occur in slabs are due to the presence in large rimming steel ingots of inner cavities which contain gases at high pressure and are surrounded by heavily segregated metal. In most cases such discontinuities are sealed during subsequent rolling into plates. (F23; ST-d, 4-52, 5-59, 9-71)

182-F. Forging Characteristics and Properties of HM21XA and EK31XA Magnesium Alloy Production Forgings. J. F. Pashak. Dow Chemical Co. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151536, Nov. 1958, 171 p. $3.

Forging methods and characteristics of EK31XA (alloy of Mg with Nd and Pr) and HM21XA (alloy containing Mg, 2% Th and 0.6% Mn). Heat treatment and mechanical properties of forgings at room and elevated temperatures. (F22, Q-general, 2-62, 2-64; Mg-b, *Th, Mn, Pr*, 4-51, *Nd*)

183-F. (German.) Deformation Measurements in Re-Rolling. Joseph Billigmann, Josef Lenze and Dieter Schonert. *Stahl und Eisen*, v. 79, no. 14, July 9, 1959, p. 977-989.

Re-rolling parameters influencing the elastic limit and hardness of deep drawing steel strip and baling hoops. 45 ref. (F23, Q21e, Q29n, 3-68; CN, 4-53)

184-F. (Russian.) Rolling of Wide Heavy Steel Plate With Vertical Edging Rolls. M. E. Kugaenko, A. M. Meleshko and M. V. Kovynev. *Stahl'*, June 1959, p. 533-538.

To obtain true parallel edges after cross rolling on a vertical edging stand, the ends of the plate must be widened

before rolling. This compensates for the possible tapering off in the ends and eliminates cropping the narrowed ends as scrap. 7 ref. (F23q, 4-53; CN)

185-F. (Russian.) Roll Pass Design and Rolling of Light-Weight Channels. I. I. Kuchko and Kudrryavtsev. *Stal'*, June 1959, p. 538-543.

Improved roll pass design and the use of closed box passes on a 900-mm. rolling line makes it possible to roll a large (400-mm.) lightweight channel. (F23q, W23k, 17-51)

186-F.* Processing and Properties of Selected Experimental Molybdenum-Base Alloys. T. K. Redden. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 292-305.

High-alloy Mo ingots were successfully converted to bar stock by extrusion and rolling at temperatures somewhat higher than those used commercially. Binary Zr-Mo alloys in range of 0.2 to 0.5% Zr have equal or better strength than commercial 0.5% Ti alloy, and 200 to 500° C. higher recrystallization temperature. Outstanding resistance to recrystallization of 5.0 Ti, 0.25% carbon alloy indicates possibility of developing improved alloys having higher strength and recrystallization temperatures over 3000° F. 6 ref. (F23, F24, N5, 2-60, 2-62; Mo-b, *Zr, C, Ti*, 5-59, SGA-h)

New techniques and equipment used in production of Cu tubes, gas cylinders and nozzles. (F25; Cu)

190-F. Metal Working Lubricants. *Lubrication*, v. 45, July 1959, p. 85-100.

Selection and utilization of lubricants in rolling, forging, drawing, cutting and grinding of metals. (F-general, G-general, NM-h)

191-F.* (French.) Importance of Lubrication in Hot Deformation. Bernard Jaoul and Jacques Sejournet. *Metaux Corrosion-Industries*, v. 34, June 1959, p. 221-235.

Use of vitreous materials in extrusion and upsetting processes. Lubrication rate is determined by deformation speed, modifications of the viscosity in preheating and by tool shape and design. Importance of lubricants for friction reduction, homogeneity of deformation and heat flow. (F24, F22j, G5; NM-h)

192-F.* (French.) Extrusion of Zirconium and Its Alloys With Glass as a Lubricant. G. Leclerc and J. Buffet. *Metaux Corrosion-Industries*, v. 34, June 1959, p. 236-246.

Extrusion at temperatures ranging from 600-900° C.; areas to be lubricated; factors influencing the process in relation to Zr and Zr alloys. Structure of ring-shaped blanks for the extrusion of tubing after hot broaching, and texture of extrusions. (F24, M26; Zr-b, NM-h, NM-f42)

193-F. (Translation—BWRA.) Coiled Flat Aluminum Tube. R. I. Barbanel, I. G. Martinov, and B. F. Lebedev. *Avtomaticheskaya Svarka*, v. 66, Jan. 1959, p. 19-27.

Flat Al tube formed by hot rolling of semi-continuously cast hollow cylindrical ingots. Tolerances and mechanical properties of tubing. Use of flat-coiled tubes. 6 ref. (F26s, Q-general; Al-b, 4-60)

194-F.* Causes and Correction of Extrusion Die Failures. *Precision Metal Molding*, v. 17, Aug. 1959, p. 32-33.

Common failures of Al extrusion dies; types, causes and corrective measures in relation to such tool failures as cracking, caving, heat checking and upsetting. (F24, 1-52, W24n; TS)

195-F.* (German.) Times Allowed for the Production and Control of Grinding and Deseaming of Billets Based on Performance Data. Josef Wolf. *Stahl und Eisen*, v. 79, July 23, 1959, p. 1075-1079.

High time allocations for different billet dimensions are caused by total surface grinding and deseaming of quadratic billets. Estimates are made by means of reference tons determined by time and motion study. Statistical analysis taking into account surface finish and weight per unit. (F21e, F21f, S12; 4-52)

196-F. (Russian.) Rolling of Square Sections With Sharp Edges. I. B. Litovchenko, N. I. Sirazitdinov and I. P. Shulaev. *Metallurg*, July 1959, p. 22-24.

Sharp-edged square sections are obtained when the grooves in the rolls of the last four passes are of the rhombic square design on the diagonal axis with sharp acute angles. The rhombic pass before the last finishing pass has an apex contour that results in a finished square with the desired sharp edge. (F23q; ST)

197-F. (Russian.) Roll Design for Bars. I. M. Konovalov and I. F. Revenko. *Metallurg*, July 1959, p. 25-36.

The most efficient roll design for bars to reduce the number of passes is the rhombic-rhombic contour of roll grooves. It is possible to eliminate two passes by using rhombic-rhombic design. (F23q, W23k, 17-51; ST)

198-F.* New Techniques Broaden Forging Picture. Pt. 1. J. H. Jackson and H. B. Goodwin. *Metal Progress*, v. 76, Aug. 1959, p. 97-102.

Several new forging methods offer much promise. Of these, the counter-blow hammer, the "impacter", the precision forging process, the "continuous grain flow" process and roll forging are discussed. (F22, 1-52)

199-F.* (English.) Drawn Special Carbon and Alloy Steels. *Aciers Fins et Speciaux*, no. 32, July 1959, p. 22-24.

For the fabrication of toolsteel care must be taken to avoid surface defects such as scale, cracks and lines from drawing operations. In rough rolled bars elimination is possible during the machining process. For heat treatable steels surface decarburization must be held to a minimum since heat cannot be subsequently eliminated. (F27, 2-64; SS, TS, 9-71)

200-F.* (English.) The Gueugnon Forging Plant. *Aciers Fins et Speciaux*, no. 32, July 1959, p. 88-102.

Stainless and special sheet production; blooming mills; hot and cold rolling of sheet; strip rolling; annealing and pickling line. Tinning and lead coating equipment. Ferritic, austenitic and heat resisting austenitic sheet compositions. (F22, F23, J23, L16; SS, 4-53, *Sn*)

201-F.* (Italian.) Manufacture of Large-Diameter Tubes. *Fonderia*, v. 8, July 1959, p. 297-301.

Properties required for the steel sheet as a starting material, such as geometric shape, state of surface, with reference to scale and defects. Effect of internal defects and inclusions on quality of tubes. (F26p, 3-73; ST, 4-53, 9-71, 9-69)

202-F.* Unitized Forming + Welding Raises Tube Production. David G. Osterer. *Modern Metals*, v. 15, July 1959, p. 60, 62, 64.

High-frequency resistance welding tools in tube mill produce small-bead welded ferrous and nonferrous metal tubes. (F26p, K5j, 1-52)

203-F. Continuous Trip From Molten Metal to Coiled Strip. *Modern Metals*, v. 15, July 1959, p. 70-71.

Casting and rolling line for continuous production of Al strip. (F23, C5q; Al-b)

204-F. Aluminum Forgings for Precision Tolerances. D. D. Erhard and S. J. Krajewski. *Product Engineering (Design Issue)*, v. 30, Aug. 17, 1959, p. 51-53.

Tolerances are closer than with steel forgings because of the lower forging temperatures, and usually are precise enough to be used "as is"—with machining reserved for only a few of the more critical dimensions. (F22; Al, 4-51, 17-55)

205-F.* (Polish.) Principal Problems in the Production of Heavy Forgings. Zenon Krzekotowski. *Hutnik*, v. 26, June 1959, p. 223-237.

Manufacture and classification of heavy forgings. Choice of the grade of steel; ingot casting; forging and pressing; heat treatment following forging. 10 ref. (F22, D9; ST)

206-F.* (Polish.) Prevention of Flake Formation in Heavy Steel Forgings. W. Luty. *Hutnik*, v. 26, June 1959, p. 237-245.

Factors affecting flake formation originate in the melting processes and pouring but the formation itself takes place during cooling following hot plastic deformation. Preventive measures include continuous casting and heat treatment after forging. 9 ref. (F22, D9; ST, 9-70)

207-F. Inflatable, Seamless Metal Tubing Could Alter Many Fabricating Methods. *Steel*, v. 145, July 27, 1959, p. 106-108.

Metal can be made in foil-thin or regular wall thicknesses, in small or large diameters. Shipped in ribbon form, it's inflated at point of use. (F26)

208-F.* Billet Slicing Marks a Giant Step in Beryllium Fabricating. Clark R. Bennett. *American Machinist*, v. 103, July 13, 1959, p. 103.

Slicing large sintered Be ingot with bandsaw. (F29p, Be, 5-59)

209-F.* New Machine Spirals Welds on Tubing at High Speeds. *Iron Age*, v. 184, Aug. 6, 1959, p. 79-80.

High-frequency resistance welding of steel, Al, Cu or Zr tubes. (F26p; ST, Al, Cu-b, Zr)

210-F.* Application of Stretch Reducing of Tubes for Greater Production and Economy. William Rodder. *Iron and Steel Engineer*, v. 36, July 1959, p. 100-106.

Reductions in diameter and wall of tubes achieved by hot rolling without inside mandrel. Types of stretch reducing mills. Typical rolling schedule. (F26s; ST)

211-F.* High Temperature Mechanical Working of Arc-Cast Molybdenum. D. O. Pickman and E. W. Ward. *Journal of the Less-Common Metals*, v. 1, Apr. 1959, p. 116-124.

Equipment for hot working; data on rolling and extrusion. (F23, F22, F24; Mo)

212-F.* (German.) Pressing of Small Precision Parts With the Help of High Frequency. Roland Hubner. *Industrieblatt*, v. 59, July 1959, p. 293-296.

Blank is heated with high frequency and then hot pressed. Favorable effect of rapid heating on structure. (F22; CN, EG-a39)

213-F. Form Tubing by Inflating Strip Makes Compact System That's Easy to Install. *Iron Age*, v. 184, Aug. 6, 1959, p. 88-89.

(F26)

214-F.* Metal Working Lubricants. *Lubrication*, v. 45, July 1959, p. 85-100.

Properties and characteristics of oils used for hot and cold rolling of Cu and brass, forging, drawing, cutting and grinding. (F-general, G-general; NM-h)

215-F.* (Czech.) Plasticity and Deformation Resistance During Forging. Antonin Vach. *Hutnicke Listy*, v. 14, Aug. 1959, p. 667-670.

Deformation resistance of a material is shown as a function of temperature, modulus of elasticity and direction of deformation in relation to the lattice. 5 ref. (F22, Q23p, Q21a, 3-68, 3-71, 2-61)

216-F.* An Investigation of Aluminum-Copper Composites Prepared by Solid-State Bonding. J. M. Williams and M. B. Bever. *American Society for Metals, Transactions*, v. 52, Preprint no. 175 1959, 13 p.

Composites of Al and Cu were made by a two-step process in which thoroughly cleaned bars were rolled together under heavy reductions and the resulting "green bond" was strengthened by sintering. The processing variables were time and temperature of sintering; two surface conditions were used. Tensile tests with specially designed specimens showed that the bond strength went through a maximum with sintering time. 9 ref. (F23, K5k, Q27; Al, Cu, 7-58, 4-55)

217-F.* Calculation of Rolling Forces Using the Orowan Theory. John E. Hockett. *American Society for Metals, Transactions*, Preprint no. 149, v. 52, 1959, 19 p.

Early theories of rolling and objections to them. Objections to the use of the Orowan "exact" theory; means of overcoming these objections by modifications of the theory and use of electronic computation. Modifications such as corrections for inhomogeneity of deformation and for elastic deformation of the roll enhance the value of the original theory and improve the accuracy of the results. 18 ref. (F23, 10-51)

218-F.* The Effect of Rolling Variables on the Hot Rolling of Titanium and Titanium Alloys. Frank R. Larson and John Nunes. *American Society for Metals, Transactions*, Preprint no. 153, v. 52, 1959, 14 p.

Hot rolling characteristics of Ti-75A, Rc-130A, Ti6A1-4V and Rc-130B alloys rolled at two speeds of 30 and 195 surface ft. per min. at rolling temperatures of 1000 to 2000° F., and reductions ranging from approximately 10 to 50%. Rolling load, specific pressure, lateral spread and forward slip increase with increasing reductions. Increases in rolling load with reduction were most pronounced in the low-temperature range (below the beta transus). (F23, 1-66; Ti-b, *Al, V*)

219-F.* For Best Results Draw-Bend and Braze Stainless Missile Tube Assemblies. H. M. Jenkins. *Tooling & Production*, v. 25, Sept. 1959, p. 60-64.

How and why to draw-bend and braze tubing and fittings where close tolerances and leak-proof joints are required. Use of ball mandrel prevents tube collapse. (F26r, K8; SS)

220-F. (Russian.) Computation of the Coefficient of Friction in the Rolling of Titanium and Its Alloys. I. M. Pavlov and A. E. Shelest. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 105-112.

Coefficient as a function of rolling temperature. 5 ref. (F23, 1-66, Q9p, 2-61; Ti)

221-F. This Man Rolls Metals Ghost Thin. *Steel*, v. 145, Sept. 1959, p. 166-167.

How to roll metals to thicknesses of 0.000085 in. Rolling is performed on a 2-high Sendzimir mill. (F23q)

222-F.* Fabrication of a Zirconium Core Tank. E. C. Miller and G. M. Adamson. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". Pergamon Press, Inc., New York 22, 1959, p. 159-166.

The main pressure-containing vessel is spherical and 5 ft. in diameter, made of 4-in. thick SAE 212 steel clad internally with 0.4-in. Type 347 stainless steel. Inside, and more or less concentric with the pressure vessel, is a 32-in. diameter Zircaloy-2 core vessel. Forming and welding techniques. (F-general, K-general, T11, T26q; Zr)

223-F.* Fabrication of Uranium Base Alloy Fuel Plates for the Experimental Boiling Water Reactor. Robert E. Macherey and Charles H. Bean. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 261-279.

The EBWR is currently fueled with a uranium-base alloy containing 5 % Zr and 1.5% Cb. The fuel is protected from water corrosion and fission product loss by Zircaloy-2 bonded by a hot rolling process. Manufacture of the cladding components from Zircaloy-2 ingot, processing of the cladding billets, and roll bonding heat treatment and finishing of the fuel plates. 13 ref. (F-general, L22, T11g; U-b, *Zr, Cb*)

224-F.* New Techniques Broaden Forging Picture. Pt. 2. J. H. Jackson and H. B. Goodwin. *Metal Progress*, v. 76, Sept. 1959, p. 89-94.

Cored forgings, a unique multiple-ram forging technique, high-energy forming and improvements in conventional methods make better forgings at lower cost. (F22)

225-F.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Rolled Zinc. R. K. Martin and Lewis S. Somers. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 523-533.

Casting slabs and bars; rolling sheet, strip, plate and rods. Photo-engraving plates, dry battery sheels, lithography plates and other applications of rolled Zn. 14 ref. (F23, C5, T9n; Zn-b)

226-F.* Wet Wiredrawing. J. K. Annandale. *Wire Industry*, v. 26, Aug. 1959, p. 741-746.

Wet drawing of steel wires in galvanized, coppered or bright conditions; surface finishes; pretreatments and lubricants; dry and wet wire-drawing machines. (F28h, W24k; ST, 8-65, 8-69)

227-F. (Russian.) Heating Process in a Recuperator Soaking Pit With Central Burner. N. M. Itskovich. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya*, no. 2, 1959, p. 109-116.

(F21b)

228-F. (Russian.) Determination of the Internal Friction Coefficient. E. F. Sharapin. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya*, no. 2, 1959, p. 145-149.

9 ref. (F22, Q22)

229-F.* Fabrication of Zircaloy-2 Channels for Vallecitos Boiling Water Reactor Fuel Assemblies. C. N. Spalaris. *Nuclear Science and Engineering*, v. 6, July 1959, p. 37-43.

Process and fixture development for fabrication of square Zircaloy-2 channels. Bundles were welded and then irradiated for various exposures. Corrosion resistance and mechanical integrity proved to be of a high order. (F-general, K-general, T11g, 2-67; Zr-b)

230-F.* An Experimental Approach to Some Control Problems of Multi-Stand Rolling Mills. H. Gill. *Society of Instrument Technology, Transactions*, v. 11, June 1959, p. 97-105.

Model mill of three two-high stands having a 1-hp. main drive was built to study the cold rolling of thin sheet steel in tandem mills. (F23q, W23; ST, 4-53)

231-F.* (German.) Rolling Forces and Torsion Moments Imposed on Low-Carbon Steels During Hot Rolling. Harald Kraut. *Freiberger Forschungshefte*, v. B-36, May 1959, p. 63-82.

Theoretical calculation of imposed rolling forces and torsion moments occurring during hot rolling are compared with actual measured results from the strip section. Resistance to changes in shape was proved to be temperature dependent. (F23, 3-74; CN-g)

232-F.* (German.) Rolling of Flat Products With Increased Direct Pressures and Forming Moments. Georg Juretzek. *Freiberger Forschungshefte*, v. B-36, May 1959, p. 108-126.

Direct pressure is applied as result of vertical pressure to the rolling axis; indirect pressure is achieved by pressure in the direction of the rolling axis. Both direct and indirect rolling pressures are angle dependent. Results show that the rolling pressure remains unchanged up to 30-40° measured from the rolling plane. The influence of the indirect pressure becomes obvious when the specific rolling force is increased which in turn increases resistance to plastic flow. (F23, 3-74)

233-F. (German.) Terms Used in Wire Manufacture and Simplified Methods for Calculation of Processes. A. Mohrnheim. *Draht*, v. 10, Aug. 1959, p. 345-348. 7 ref. (F28)

234-F.* Some Problems in Working Zirconium and Its Alloys. A. A. Kiselev, I. D. Nikitin, I. I. Kornilov, V. A. Fedorchenko, D. D. Sokolov and T. I. Mozhaiskaya. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 52-59.

Annealing, drawing, tube rolling, cold rolling, extrusion, forging and hot rolling of Zr alloys. 5 ref. (F26, F23, F24, J23, Q24; Zr-b)

235-F.* Properties and Production of Aluminum Wire. H. D. Feldmann. *Draht (English Edition)*, no. 42, Aug. 1959, p. 86-93.

Common Al alloys with reference to mechanical properties, available sizes and shapes. Effect of wiredrawing, extruding and roll forming methods, temperature, composition and heat treatment on strength. Theoretical principles of the wiredrawing of Al. (F28, G5, G11, 2-60, 2-61, 2-64, 3-73; Al-b)

236-F.* The Effect of Process Variables on Extrusion Pressures of Lead. J. Frisch and E. G. Thomsen. *Journal of Engineering for Industry (ASME Transactions, Series B)*, v. 81, Aug. 1959, p. 207-216.

Experimental report of effect upon extrusion pressure—displacement diagram of variation in die shape, ram speed, eccentricity of die and number of bars extruded. Both direct and indirect extrusion at constant extrusion ratio. (F24a, F24b, 3-73; Pb-a, 4-55)

237-F.* Approximate Solutions to a Problem of Press Forging. S. Kobayashi and E. G. Thomsen. *Journal of Engineering for Industry (ASME Transactions, Series B)*, v. 81, Aug. 1959, p. 217-277.

Measurement of incremental displacement in step-wise forging and comparison with disk and slip-line theory. Hodographs are constructed for both, assuming axial symmetry. Total forging pressure is derived in dimensionless form. (F2, F22g)

238-F. Development and Properties of Coextruded Zircaloy-Clad Uranium Fuel Elements With Integral End Seals. H. F. Sawyer. Nuclear Metals, Inc. *U. S. Atomic Energy Commission*, NMI-4710, Nov. 6, 1958, 83 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $2.25.

Fabrication techniques and effect of fabrication variables on the end product. Efforts to produce successful end closures, uniform cladding and metallurgical bonds. 18 ref. (F24, L22, T11g; U, Zr-b)

239-F. Definitions and a Simplified Method of Calculating Wire Processing. A. F. Mohrnheim. *Draht (English Edition)*, no. 42, Aug. 1959, p. 84-86.

Relationships used in wiredrawing practice; process terms; slide-rule methods for the solution of common wiredrawing problems. (F28)

240-F. Rotary Swaging—What It Is—What Can Be Swaged. Pt. 1. Keith Bernhardt. *Tooling & Production*, v. 25, Oct. 1959, p. 56-57.

A fast forging technique. (F25)

241-F. (Russian.) Specialization of Continuous Rod Rolling and Small Section Rolling Stands. I. S. Kagan and V. S. Chernov. *Stal'*, July 1959, p. 636-637.

In rolling rounds of 10-16 mm. diameter it is expedient to switch from short bar rolling to continuous rolling. (F23; 4-55)

242-F.* (Polish.) Forces and Torques Effective in the Hot Rolling With High Drafts of Low Carbon Steel. Zygmunt Wusatowski and Bronislaw Hoderny. *Archiwum Hutnictwa*, v. 4, no. 2, 1959, p. 161-180.

Effects of working temperature and degree of deformation on rolling forces. Mean deformation resistance as a function of temperature. 7 ref. (F23, 1-66, Q23q, 2-61, 3-68; CN-g)

243-F.* Development of New Extruding Techniques for Pure Beryllium and High Temperature Steel. Lyle M. Christensen. *Society of Automotive Engineers*, Preprint no. 98U, 1959, 25 p.

Extrusion of thinner (0.06-0.09 in.) and more accurate sections for use in air and space vehicles is facilitated by use of glass die lubricants, precise temperature control methods and advanced die design and material selection; mechanical properties of extrusions. (F24; ST, Be-a, SGA-h)

244-F. The Structure of Steel. Pt. 13. Structural Effects of Mechanical Working. Edwin Gregory and Eric N. Simons. Edgar Allen News, v. 38, Sept. 1959, p. 200-201.

(To be continued.) (F-general, 3-68; ST)

245-F. (Russian.) Calibration of the Rolling Pass for the Cold Rolling of Tubing. M. Z. Ermanok. *Izvestiya VUZ—Tsvetnaya Metallurgiya*, no. 4, 1959, p. 131-141.

Computations. 13 ref. (F23, 1-67; 4-60)

246-F. (Russian.) Forces Effective in the Extruding of Tubing From TsAM 9-1.5 Alloy. I. L. Perlin and V. K. Korol'. *Tsvetnye Metally*, no. 7, 1959, p. 69-74.

15 ref. (F24, 4-60)

247-F. (Russian--Book.) Rolling and Heat Treatment of Plates. P. G. Islent'yeva, Editor. 152 p. 1959. Metallurgizdat, Moscow. (Available from Library of Congress, Washington, D. C.)

Manufacturing process of rolling carbon and alloy steel plates and modern two-stand tandem, continuous and semi-continuous plate mills; methods of removing defects from billets and slabs and of heating metal in continuous furnaces. (F23, J-general; 4-52, 4-53, CN, AY)

248-F. (Translation--Brutcher no. 4628.) Hydrogen Content and Flakes in Blooms Used in the Production of Heavy Profiles. D. Ya. Povolotskii and A. N. Morozov. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 37-41.

Alloy steel was rolled into blooms, allowed to cool to 200-500° C. and then annealed at 660-700° C. for 90-140 hr. Profiles were forged from the treated blooms and subsequently air cooled. Profile sections showed no flakes. 4 ref. (F23, 1-66, F22, N15e, 9-70, 2-64; AY, 4-57)

249-F. (Translation—PERA.) An Electrical Contact Method for Removing the Defect Layer From Ingots. A. L. Livshits and M. E. Yukhvid. *Stanki i Instrument*, v. 30, no. 4, 1959, p. 14-17.

Experimental production process for stripping ingot surface of inclusions before rolling. A rotating disk electrode traverses the ingot surface with a high current a-c. arc discharge, fusing the separated surface. (F21a; 9-69)

250-F.* Application of Press Forged Castings. P. Gouwens, T. Watmough and J. Berry. *Modern Castings*, v. 36, Oct. 1959, p. 47-54.

Experiments substituting an austenitized casting for a last-stage forging blank. Slow forging is a form of cold working at higher temperatures. Strength and hardness are controlled by aging temperature and time to quench to forging temperature. (F22g, E25q, N8f; SS-b, SS-e, 2-64, 2-65)

251-F. Swaging Thin-Wall Super Alloy Tubing. *Western Metalworking*, v. 17, Sept. 1959, p. 44.

Brief description of cold drawing technique used for reducing one end of 2 in. diameter, 0.01 in. wall M-252 tube to 0.5 in. diameter. (F25, G4, 1-67)

252-F.* Forging the Beryllium-Heat Sink. *Light Metal Age*, v. 17, Aug. 1959, 18-20.

Preparation of a Be saucer-shaped disk 80 in. in diameter and 3 in. thick from a 62-in. QMV Be brillet. (F22; Be)

253-F.* Hot Forming Sheet Metal Parts. Alfred F. Hofstatter. *Metal Progress*, v. 76, Oct. 1959, p. 97-99.

Fabrication of parts from 17-7 PH stainless, and commercially pure titanium Ti-75 A. Techniques are outlined which eliminate erratic springback. (F22n; SS, Ti-b)

254-F.* High-Energy Forming With a Machine Tool. Ralph G. Monsees. *Metal Progress*, v. 76, Oct. 1959, p. 111-113.

With high-velocity action, material is formed in only a fraction of the time required by traditional methods. This ultrashort forming cycle allows simplified tooling at lower initial cost, reduces die wear and inhibits growth of scale. Apart from forging, its advantages are generally applicable to other areas of forming, such as extruding and compacting. (F-general, F22, F24)

255-F.* Hot Extrusion. Ahthur B. Tesmen. *Metal Progress*, v. 76, Oct. 1959, p. 114-117.

Process in which metal in the plastic state assumes the shape of the die orifice. Limitations of extruded shapes with respect to size, weight and shape are determined by cross-sectional area, circumscribing circle, length, complexity, thickness, thickness-to-width ratio, extrusion die limitations and required mechanical and metallurgical properties. (F24, 1-66)

256-F.* Characteristics Influencing the Production of Quality Molybdenum Mill Products. Pt. 1. *Industrial Heating*, v. 26, Sept. 1959, p. 1762, 1764, 1766, 1768.

Abstracts of seven papers presented at two sessions on the fabrication of Mo held as part of the "William Park Woodside Panel Conferences" sponsored by A.S.M. during the 40th National Metal Congress, Cleveland, Oct. 1958. (F-general; Mo)

257-F.* Improvement in the Anodizing Properties and Corrosion Resistance of Aluminum Alloys by Hyper-Hotworking. J. Herenguel and P. Lelong. *Metal Finishing Journal*, v. 5, July-Aug. 1959, p. 275-282.

Microstructures present in different shearing zones of direct extruded Al-1% Fe alloy. Effect of structural reorganization resulting from hyper-hot working on pattern of defects developed by anodic oxidation and resistance to corrosion by high-temperature water. 9 ref. (F24a, M26b, Q24m, L19, R4e, 2-62; Al-b, *Fe*)

258-F.* New Tubing Alloy. *Modern Metals* v. 15, Oct. 1959, p. 74, 76.

Development of new Alcan tube-alloy which may be heat treated and exhibits higher strength than extruded 6063 Al alloy. (F24; Al-b, 4-60)

259-F. (Russian.) Metal Flow at the Points of Maximum Deformation During Rolling. I. M. Pavlov. Paper from "Production and Further Processing of Steel and Alloys. Collection of Papers, no. 38, Moscow Steel Institute". Metallurgizdat, Moscow, p. 245-281.

21 ref. (F23, Q24)

SECTION G

SECONDARY MECHANICAL WORKING

1-G.* Thread and Form Rolling. D. H. Seymour and F. M. Lomas. *Machinery (London)*, v. 93, Sept. 17, 1958, p. 673-677.

Development of materials with improved forming properties and in the design and construction of thread rolling machines. Techniques considered are rolling of worm gears, splines and knurled surfaces, burnishing and straightening operations. (G11, G12)

2-G.* Operations on Components for Missile Guiding Equipment. F. A. Cuthbertson. *Machinery (London)*, v. 93, Oct. 8, 1958, p. 818-823.

Small pivots are rough machined on Tornos Swiss-type automatics, and after hardening and electrochemical cleaning, are finished on a Hauser pivot-burnishing machine. The pivot portion is first semifinished with a ceramic wheel, then finished with a tungsten carbide wheel. Precision-boring of the Al alloy gimbals is performed on a battery of six Heald Bore-Matics. A Barber-Colman hobbing machine is used to cut fine-pitch gears. (G17, T24e)

3-G.* (Japanese.) Machining Performances of Domestic Ceramic Tool and Its Wear Processes. Hidehiko Takeyama and Teruni Murai. *Journal of Mechanical Laboratory*, v. 12, July 1958, p. 118-124.

Tests were performed comparing machining performance and wear processes of ceramic tools with carbide tools. For Meehanite cast iron ceramic tools gave substantial increases in cutting speed and tool life. Results indicate need for increased tool toughness. (G17, Q9, T6n; CI-b, SGA-j, 17-52)

4-G.* (Japanese.) Photo-Elastic Analysis of Machining Stresses. Pt. 1. Distribution of Frictional and Normal Stresses on Rake Face. Eiji Usui, Hidehiko Takeyama, Shoji Shimamura and Toshiaki Oguchi. *Journal of Mechanical Laboratory*, v. 12, July 1958, p. 125-130.

The photo-elasticity of a special epoxy resin tool was used to ascertain the distribution of stresses on the rake face of the tool while machining Pb. The frictional stress was uniformly distributed over a wide range of tool-chip contact length, transistionally near point of separation. Normal strength was extremely high near the cutting edge but rather stationary in the middle part of the tool-chip contact length and decreased gradually to zero in the rest of the tool-chip contact length. 6 ref. (G25, G17, Q9p, T6n; Pb)

5-G. Machining Titanium. Pt. 2. M. C. Shaw, P. A. Smith, B. Colding and N. H. Cook. Massachusetts Institute of Technology. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 131536, Feb. 1957, 100 p.

Machining characteristics of clamped carbide tools when machining Ti alloys and AISI 4340 steel are compared. The relative machinability values (based on relative machining cost per part) were determined. Optimum tool life for the eight-edged clamped carbide tool was about 17 min. for any of the Ti alloys. A hard finishing grade cast iron type carbide was superior in machining Ti provided it did not chip. Ceramic tools gave poor results. Unlike steel under identical conditions the relative amount of rake wear decreased when a Ti alloy was machined at increasing speed. (G17k, Q9, T6n, 1-59; ST, Ti-b, SGA-j, NM-h)

6-G. Producing Electrical Components on Automatic Machines. *Machinery*, v. 93, Oct. 8, 1958, p. 815-817.

One machine is arranged for the automatic production of plug pins from coiled brass wire, and the second machine carries out secondary operations on previously turned terminal sleeves. (G17, T1, 18-74; Cu-n)

7-G. Large Extrusion Press Rams Reconditioned by the Master-Hone Process. *Machinery*, v. 93, Oct. 8, 1958, p. 843-844.

(G19n, W24g, 18-72)

8-G. Machining Blades for Gas Turbine Units. Pt. 3. *Machinery*, v. 93, Oct. 29, 1958, p. 976.

Methods and equipment for machining master cams for the aerofoil milling, grinding and polishing machines. (G17, T7h; SS, 18-74)

9-G. (German.) Precision Stamping. Hans Stadtman. *Industrielle Organisation*, v. 27, no. 5, 1958, p. 135-142.

(G3)

10-G. (German.) Practical Tips for Cutting Stainless and Heat Resisting Steels. Pt. 1. *Technica*, v. 7, June 20, 1958, p. 751-754

Composition of rustproof, heat resisting, and scale resistant steels. Physical, mechanical and chemical properties of three sample steels. Difficulties in machining. Tools and machine tools used. (To be continued.) (G17; SS)

11-G.* An Analysis of the Mechanism of Orthogonal Cutting. Keiji Okushima and Katsundo Hitomi. *Kyoto University, Faculty of Engineering, Memoirs*, v. 20, Apr. 1958, p. 95-116.

Theoretical analysis of mechanism of orthogonal cutting based on the flow region concept; data obtained with orthogonal dry cutting of such materials as lead and brass which produce a simple continuous chip. 8 ref. (G25; 10-51, Pb, Cu-n)

12-G.* Contribution to the Study of Ceramic Cutting Tools. R. Weill. *Microtecnic*, v. 12, no. 2, 1958, p. 51-63.

Composition, properties of ceramic tools. High cutting speed, ability to machine abrasive materials, simple construction noted. (G17, T6n, SGA-j, 6-70)

13-G. Electrolytic Saw. M. Metzger. *Review of Scientific Instruments*, v. 29, July 1958, p. 620-621.

Strain-free cutting of metallic crystals at moderate rates can be obtained by localized electrochemical dissolution using a wire cathode. The width of the attacked zone is limited by applying a protective plastic film. Clean, sharp cuts cannot generally be expected. (G24d; Al)

14-G.* Explosive Forming Breaks Fabrication Bottleneck. Irwin Stambler. *Space Aeronautics*, v. 30, Nov. 1958, p. 50-52, 54-55.

Material to be formed is held in place over a large, bowl-shaped, portable metal mold backed in ordinary concrete. Air is pumped from mold to form a partial vacuum and an explosive charge is suspended above the blank. (G-general; ST, NM-k34)

15-G. Development and Application of Trepanning. Arthur C. Heidenreich. *American Society of Mechanical Engineers*, Paper no. 58-A-183, 1958, 8 p.

(G19r)

16-G. Red Ring Broaching Process for Cutting External Gears. *Machinery (London)*, v. 93, Nov. 12, 1958, p. 1121-1122.

(G17g)

17-G. Metal-Working Processes and Equipment. Pt. 1. A. G. Thompson. *Welding and Metal Fabrication*, v. 26, Nov. 1958, p. 405-411.

Survey of machines, including purpose, principles of operations, range of application, typical machines. (G-general; 10-54)

18-G.* Improving Punchability of Silicon Steel. C. S. Wukusick and R. S. Zeno. *Tool Engineer*, v. 41, Dec. 1958, p. 63-70.

Punchability can be improved if scale is removed before punching or treatment is such to obviate scale. Punchability is function of material properties and punching practice. 5 ref. (G17k; AY-b, *Si*, SGA-n)

19-G.* (German.) Flame Gouging in Production and Repair Work. H. H. Grix.

Schweissen und Schneiden, v. 10, Oct. 1958, p. 395-400.

Equipment and operation. Properties of gouged welds show improvement in tensile strength up to 10%, reducing need for final grinding. Applications in large welded vessels of wall thickness up to 5 in. and length up to 25 ft. Cost of weld finishing up to six times less than for similar mechanical processes. Grooves of uniform depth and width easily obtained; particular importance in automatic welding. (G22, K9p)

20-G.* (German.) Problems in Machining Titanium Alloys. Milton C. Shaw. *Technische Mitteilungen*, v. 51, May 1958, p. 211-216.

Nature of Ti alloys. Comparison of properties of Ti with steel, stainless steel and Al. Chemical and mechanical properties of four Ti alloys. Equation for estimating influence of material properties and cutting conditions on cutting temperature. Tool life for Ti compared with steel and Al. Cutting power and specific work for Ti compared with steel. (G17k, G18; Ti-b)

21-G.* (French.) How to Improve Your Processes of Cylindrical Finish Grinding. J. A. Mueller. *Machine Moderne*, no. 594, Sept. 1958. p. 21-24.

Basic factors are transverse speed, cutting speed, approach, depth of pass and retraction. Transverse speed determines rhythm of production: too high deteriorates grinding wheels, raises costs, makes poorer surfaces. With increased cutting speed finishing is less accurate, grinding wheel deteriorates. Best result in finish is to reduce transverse speed, increase cutting speed to make a slower approach. If spindle power is weak, lower grade grinding tools are necessary and operation becomes costly. Retraction must be equal to or less than approach, or pitting results in grinding wheel. Total condition of the machine and outside vibrations affect performance. Cutting liquids (oil or detergent) must be chosen for metal and grinding wheel and used generously. (G19q, W25s)

22-G. Capabilities and Limitations of Chemical Milling. *Australasian Manufacturer*, v. 43, Oct. 4, 1958, p. 54, 56-57.

Comparison with machine milling. (G24b)

23-G. Machining Stainless Tough? Try Unorthodox Methods. *Carbide Engineering*, v. 10, Nov. 1958, p. 21.

Negative rake angles, high speeds, high feeds and soluble-oil coolant used with small throw-away inserts increase tool life 400%. (G17; SS)

24-G. Mechanics of Orthogonal Machining. W. B. Palmer and P. L. B. Oxley. *Chartered Mechanical Engineer*, v. 5, Nov. 1958, p. 419-420.

4 ref. (G17)

25-G. Step Cutter Mills Tough Jobs With Indexable Carbide Tips. *Iron Age*, v. 182, Nov. 20, 1958, p. 108-109.

Progressive "bites" with sets of throwaway carbide wafers let this tool cut faster, smoother and at less cost. (G17b; ST, 6-69)

26-G. New Techniques for Grinding Sintered Carbides. E. Zmihorski. *Machinery (London)*, v. 93, Nov. 19, 1958, p. 1186-1188.

Raising temperature of the tool to between 750 and 850° C. prior to grinding, and maintaining it at this temperature during the operation, materials can be ground with standard corundum or silicon carbide wheels. Finish grinding done by an electrolytic method. (G18, T6n; 6-69)

27-G. Interblanking of Metals. O. C. Hermann. *Metalworking Production*, v. 102, Nov. 14, 1958, p. 1991-1994.

An insert, either harder or softer, can be blanked into a base metal to act as a bearing surface or other function. (G2h; Cu, ST, Al-b, Cu-n)

28-G. Latest Progress in the Field of Electro-Erosion Machining. Y. S. Kroundycheff. *Microtechnic*, v. 12, no. 4, 1958, p. 206-209.

Two principal methods are continuous action of the current and action of a make-and-break current. The former is used primarily for destructive pruposes, the latter in all electro-erosion machines. (G24a)

29-G. Deep Drawn Shells for Magnesium Luggage. Louis Degen. *Modern Metals*, v. 14, Nov. 1958, p. 60, 62-63.

(G4b, T10k; Mg-b, 4-53, 4-58)

30-G. Testing Soluble Cutting Oils. Edmond J. Ritter and Jo Ann Amspaugh. *Production*, v. 42, Nov. 1958, p. 66-67.

(G17; NM-h)

31-G. Special Machine Jacks Up Quantity and Quality. *Steel*, v. 143, Nov. 24, 1958, p. 104-105.

Specially converted milling machine for bronze castings. (G17b, W25r)

32-G. Modern Methods of Fabricating Structural Steelwork. M. F. Palmer and R. J. Fowler. *Structural Engineer*, v. 36, Nov. 1958, p. 365-376.

Flame cutting and electric-arc welding; radiographic inspection. (G22, K1, S13e; ST)

33-G. Superalloys Formed With Explosives. Paul J. Wolf. *Tool Engineer*, v. 41, Dec. 1958, p. 78-82.

Forming, swaging, forging, extrusion, bulge forming, cutting and flattening by explosive. (G-general; NM-k34, SGB-a)

34-G. (French.) Operational Techniques on Multispindle Screw Machines. G. J. Granger and R. Clausse. *Pratique des Industries Mecaniques*, v. 44, Aug. 1958, p. 203-207.

Boring and drilling defined; types of reamers and drills; speeds, feeds, chip formation. (To be continued.) (G17)

35-G. (Japanese.) Machinability of Ceramic Tools. Pt. 1. Ulta-High-Speed Lathe for Machinability Studies of Ceramic Tools. Hisao Mii, Kunio Yamada Noboru Nakayama, Eiichi Ota, Hiroshi Kajiwara and Seisuke Sakai. *Nagoya Government Industrial Research Institute, Reports*, v. 7, Sept. 1958, p. 8-12.

(G17k, T6n; SGA-j)

36-G.* Machining of Cobalt Superalloys. *Precision Metal Molding*, v. 16, Nov. 1958, p. 36-37.

Drilling, turining and facing, milling, broaching, reaming, shaping and cutoff operations. Many of the machining techniques used with austenitic stainless steels work with the superalloys. (G17; Co-b)

37-G.* (German.) Influence of Speed on the Deformation Limit in Deep Drawing. J. Novotny. *Fertigungstechnik*, v. 8, Aug. 1958, p. 361-365.

Deep drawing of steel, brass, stainless steel and Al can be considerably speeded up if high-quality lubricants are used. Best lubricants are Mo-sulphide base. (G4b; ST, SS, Cu-n, Al-b, NM-h)

38-G.* (German.) Hammer Pressing of Hemispheres From Sheet Metal. H. Gross. *Fertigungstechnik*, v. 8, Aug. 1958, p. 366-367.

Deep drawing of hemispheres from thin and medium sheet metal varies with thickness of material and diameters of hemispheres. The lower the ratio the more difficult the processing. Recommends material of high strength and low elasticity. (G4d; 4-53)

39-G.* (German.) Application of Oxy-Acetylene Cutting and Flame Shaping in Hammer Forging Practice. E. Pflaume and W. Winter. *Fertigungstechnik*, v. 8, no. 10, 1958, p. 444-454.

Preparation of semifinished raw materials for hammer forging by autogenous cutting opens new fields of application. Use for the oxy-actylene flame is the shaping of finish-forged pieces following the forging process to eliminate blemishes and to smooth the surface. 14 ref. (G22g, F21, F22)

40-G.* (German.) Slab Milling With "Porcupine-Type" Cutters. G. Schroter. *Fertigungstechnik*, v. 8, no. 10, 1958, p. 463-465.

Combined effect of staggered roughing teeth and plain finishing blades in the slab milling cutter produces high rate of chip removal and smoothly machined surfaces. Design principles regarding dimensions and spacing of cutter teeth for proper load distribution. (G17b, T6n, 17-51)

41-G.* (German.) Establishment of Cutting Speeds and Feeds for Carbide Milling. H. in der Wiesche. *Werkstattstechnik und Maschinenbau*, v. 48, Oct. 1958, p. 529-531.

Instructions for designing graphs showing life expectancy of tools and for determining the most favorable service life for the cutter. (G17, Q9, T6n; 6-69)

42-G.* Surface Finish--Metallurgical and Mechanical Aspects. K. G. Lewis. *Metal*

Treatment and Drop Forging, v. 25, Aug. 1958, p. 335-342.

Various expressions used in study of surface finish, with important machine and material variables which affect them. Chip formation and formation of built-up edge; influence on surface finish. Formation of "smear metal" and means for its removal. 31 ref. (To be continued.) (G17, S15; ST, 1-52, 17-52)

43-G.* Chemical Milling Broadens Magnesium-Thorium Alloy Use in Missiles. *Modern Metals*, v. 14, Aug. 1958, p. 62-64.

New techniques reduce costs, eliminate health hazards, simplify machining processes in fabrication of aircraft and missile components. New alloys retain high mechanical properties in 350 to 500° F. range. (G24b, T24e; Mg-b, *Th*, 17-57)

44-G.* (Slovak.) Cutting With a Tungsten Electrode Under a Protective Gas Atmosphere. Michal Matejec. *Zvaranie*, Sept-Oct. 1958, p. 303-307.

Directions for cutting; amperages, voltages, gas flow, welding speed for different thicknesses of Al-Mn, 99.5% Al and Al-Mg. (G22h; Al-b)

45-G.* A Photo-Elastic Analysis of Machining Stresses on Rake Face. Biji Usui and Hidehiko Takeyama. *Journal of Mechanical Laboratory of Japan*, v. 4, no. 1, 1958, p. 6-14.

Frictional stress on the lead rake face is distributed uniformly over a wide range of the tool-chip contact length but decreases rapidly near the point of chip-separation on the rake face. Normal stress has peak near the cutting edge, being rather stationary in the middle part of the contact length and decreasing gradually towards point of chip-separation. 4 ref. (G17, G25; Pb-b)

46-G.* (English.) Analysis of Mechanism of Orthogonal Cutting. Keiji Okushima and Katsundo Hitomi. *Kyoto University, Faculty of Engineering, Memoirs*, v. 20, Apr. 1958, p. 95-116.

In orthgonal cutting a simple continuous chip is produced. Instead of conventional shear plane a transitional range or flow region is assumed to exist between the rigid region of the workpiece and the plastic region of steady chip. Derivation of expressions which can be applied to a wide range of cutting conditions. Experimental data for Pb and brass. The starting boundary line of the flow region situated under conventional shear line and the ending boundary line above it. Influence of rake angle and depth of cut, on strain of chip, the inclination angles of boundary lines and the sector angles of flow regions. 8 ref. (G17, G25, Q24h, Q2j; Cu-n, Pb)

47-G. A Guide to Rough Grinding Carbide Tools. Richard A. Parke. *Grinding and Finishing*, Nov. 1958, 28-30.

Grinding by silicon carbide and diamond grinding wheels. (G18, Tbn, 6-69)

48-G. Better Diamond Dressing for Precision Grinding. H. B. Patterson. *Grinding and Finishing*, Nov. 1958, p. 32-34.

(G18; NM-k37)

49-G. Machining With Chemicals. D. J. Fishlock. *Metalworking Production*, v. 102, Nov. 21, 1958, p. 2045-2048.

(G24b)

50-G.* (French.) Compression in Pressing Operations. J. Guyot and P. Mercier. *Revue de Metallurgie*, v. 55, Sept. 1958, p. 801-814.

Pressing of sheet metal entails not only deformation by extension but also deformation under compression. Simple test designed to determine behavior of metal under compression uses tension test machine and "flat drawing" accessory. Coefficients of compression bear no relation to coefficients of elongation. Results on several grades of steel and Cu, brass and Al sheet. (G1, Q28g; Al-b, Cu-b, ST, 4-53)

51-G. (Book-Russian.) Technology of Cold Stamping. A. N. Malov. 375 p. 1958. Oborongiz, Moscow, USSR. 19 R.

Stamping machinery and techniques. (G3, 1-67, W24g)

52-G.* (Russian.) Technology and Economics of Air-Arc Cutting. I. S. Shapiro. *Svarochnoe Proizvodstvo*, Nov. 1958, p. 33-34.

The greater the current value, the greater the effectiveness. (G22h)

53-G. Machining Operations on Honeycomb Structures. R. G. Kellner. *Machinery*, v. 93, Dec. 3, 1958, p. 1295-1300.

Milling, grinding and sawing; filler material. (G17; 7-59)

54-G. Indenting and Embossing. Arnold Throp. *Sheet Metal Industries*, v. 35, Dec. 1958, p. 917-922.

Processes and machinery. (G3p, W24n)

55-G. Progress in the Application of Carbide-Tipped Gun Drills. Watervliet Arsenal. *U. S. Office of Technical Services*, PB 131644, n. d., 40 p. $1.25.

One of the outstanding features attributed to this drilling technique is that potentially any component, regardless of size, can be gun drilled. It is possible to produce a hole in one pass that will have less than 0.002 in. per ft. runout, a diameter within 0.0005 in. of the prescribed dimension, and a surface finish smoother than 16 micro-in. (G17e, T6n; AY, 6-69)

56-G.* (German.) Economical Machining of Gas, Water and Special Fittings. Robert Richter. *Werkstatt und Betrieb*, v. 91, Oct. 1958, p. 609-612.

New method based on appropriate equipment developed for machining fittings made of different materials in the most diverse and intricate shapes. Machining proceeds entirely automatically and is equally adaptable for medium and large lot sizes. The parts are machined from three angles simultaneously, clamping is included in the cutting time and carbide tools are used. (G17, T6n; 6-69)

57-G.* (German.) Deep Drawing of Metals. Alfred Harer. *Werkstatt und Betrieb*, v. 91, Oct. 1958, p. 625-629.

Survey of rules governing design of drawing tools and methods used to determine dimensions of blanks. Drawing ratios for various metals, edge radii for drawing rings and punches, tool clearances, down holders, power requirements of drawing operations, lubricants and special drawing methods; formulas for designers, supported by practical examples. (G4b)

58-G. (German.) Improved Spark Erosion Process. *Werkstatt und Betrieb*, v. 19, Oct. 1958, p. 619.

Simplified version of frequently applied production process designed particularly for removal of broken tool stubs. (G24a)

59-G. (German.) Shaving, a Method in Pressworking of Metals. Rene Haag. *Werkstatt und Betrieb*, v. 91, Oct. 1958, p. 624.

In certain cases hole diameters can be made within a tolerance of ± 1 micron and the distance between hole centers within a tolerance of 3 microns. Shaving tools made of carbide produce surface finishes equivalent to ground surfaces. (G2)

60-G. (German.) Duplicate Cutting of Sheet Metals by the Nibbling Process. *Werkstatt und Betrieb*, v. 91, no. 11, 1958, p. 667.

Permits cutting out complex shapes of metal sheets without previous layout or scribing, because patterns used are duplicated by the machine. (G17; 4-53)

61-G.* (French.) How to Select Soluble Oils According to Machining Needs. S. C. Zylstra. *Machine Moderne*, v. 596, Nov. 1958, p. 34-46.

Increased feeds, speeds, tool life and quality of surface finish result from use of high-output soluble oils. Chemical or synthetic cutting liquids contain from 50 to 60% water. Their pronounced lubricating propriety diminishes wear and improves surface finish. Factors to be considered in selecting soluble oils are price, mixing ratio of oil to water, flexibility of application, and possibility of adding bactericides. (G17; NM-h)

62-G.* (French.) Machining of Refractory Alloys. A. B. Albrecht. *Machine Moderne*, v. 596, Nov. 1958, p. 41-44.

Based on composition and machinability, four categories of refractory alloys are compared: (1) ferritic steels containing Cr and Cr-Ni, (2) austenitic alloys of Cr-Ni-Mo, (3) age hardening alloys of high Ni content, and (4) cobalt alloys. Variables influencing deformation of machined object are analyzed. Analysis of tools according to grades and profiles, and cooling liquids according to alloys machined. (G17; SS, Co-b, Cr-b, Ni-b, EG-d)

63-G.* (German.) Mechanics of Metal Cutting. Gerhard Rohlke. *Werkstatt und Betrieb*, v. 91, Aug. 1958, p. 473-483.

Method of carrying out orthogonal machining allows the share of rake friction in the cutting force to be calculated from three measurable force components. Relationship of rake angle, shearing angle with shearing angle stress and cutting

force. Evaluation of four different shearing angle equations. 14 ref. (G17, G25; CN)

64-G.* Machining Irradiated Uranium. D. Shaw and W. G. Hufton. *Nuclear Power*, v. 3, Dec. 1958, p. 600-601.

Depth of cut that could be applied to the irradiated bar was smaller than that for unirradiated U. Cuttings from the irradiated bar were smaller than those from the unirradiated bar, and there was no tendency for long curled turnings to be formed; otherwise there was little difference in machinability. (G17; U, 14-70)

65-G. Diamond Machining and Thread Cutting on Aluminum. K. Sterl. *Industrial Diamond Review*, v. 18, Nov. 1958, p. 206-209.

(G17; Al, NM-k37)

66-G. (French.) Application of Ceramic Tools to Manufacturing Operations. Robert Derny and J. L. Guedeu. *Machine Moderne*, v. 596, Nov. 1958, p. 15-23.

Case studies on turning and milling castings and steels. Higher speeds, wider speed ranges, reduced wear, versatility, shock resistance and improved surface finishes are possible. Disposal of chips and choice of tool-holder present problems. (G17, T6n, 6-70)

67-G. (French.) Using Atomized Liquid Lubricants as Coolants in Turning Operations. J. G. Proskourjakoff and W. A. Koulikowsky. *Machine Moderne*, v. 596, Nov. 1958, p. 45-47.

Special atomizing device provides three types of cooling processes within cutting zone: pressurized liquid, compressed air and a cooling-air emulsion mixture. Optimum effect is obtained when rate of liquid flow is 100-200 g. per hr., air flow 3 sq. m. per hr. and air pressure 4.5 atm. (G17, NM-h)

68-G. (Russian.) Ultrasonic Machine for Machining Hard Metals. M. G. Kogan and V. A. Tuzlukova. *Vestnik Mashinostroeniya*, v. 38, Nov. 1958, p. 92-95.

Used for processing brittle and hard metal, the machine is vibrated by magnetostriction conversion of the PMS-7 type. Nominal vibration frequency is 22 cycles, maximum required power is up to 2 kwt. Can be operated with ordinary industrial ultrasonic generator of UZP-10 type. (G24c, 1-52, SGB-q)

69-G.* Application of Spark Erosion Machining. A. J. Lawrance. *Institution of Production Engineers Journal*, v. 37, Nov. 1958, p. 694-709.

Advantages and limitations of the process of electrosparking and its application to automatic machining. (G24a, 18-64; W, 6-69)

70-G.* Trouble-Shooting in the Press Room. Blanking of Large Pieces. Federico Strasser. *Iron & Steel*, v. 31, Dec. 1958, p. 579-581.

Difficulties involved in the stamping of large blanks can often be avoided by substituting contour-sawing, square-shearing, composite construction and changing the shape. (G2h)

71-G.* Hardened Bearing Races Machined With Cemented-Oxide Tools. H. J. Siekmann. *Machinery*, v. 65, Jan. 1959, p. 109-111.

Turning, boring and facing SAE 52100 steel with hardness range of Rockwell C-60 to 63 using cemented oxide tools. Tool characteristics, speeds, feeds, tool life, surface finish. (G17, T6n, T7d; AY, 6-70)

72-G.* Titanium Drawing Is Both Cold and Hot. R. A. Lanciano. *Machinery*, v. 65, Jan. 1959, p. 120-121.

Ti sheet first drawn cold in progressive steps then heated for final draw in production of turbine casting. (G4b, W11n; Ti-b)

73-B.* Fabricating Stainless Steel. Pt. 1. Machining. Richard E. Paret. *Tool Engineer*, v. 42, Jan. 1959, p. 62-68.

Characteristics of austenitic, ferritic and martensitic steels. Cutting tools, speeds, feeds and lubrication for turning, milling, drilling, tapping, reaming and sawing operations on the various types of stainless steel. (G17; SS)

74-G.* Speed Drills Versus Test Drills. Test Results. B. E. Logsdon. *Tool Engineer*, v. 42, Jan. 1959, p. 70-71.

Comparative German test on SAE 8620, 4140 and 1117 steels; Hy-Pen toolsteel and cast iron. Results and recommendations. (G17e, W25p; AY, CI, TS)

75-G.* Heavy Plate Cutting. B. Brasseur. *Welding and Metal Fabrication*, v. 26, Dec. 1958, p. 443-448.

Use of oxygen-cutting for profiling steel in thicknesses of 4 in. and upward is growing as means of replacing complicated

forgings or avoiding lengthy machining. Basic factors involved when cutting are size of cutting jet, oxygen and fuel gas pressures, cutting speed. Typical faults are listed with corresponding causes and remedies. (G22g; ST, 4-53)

76-G.* (German.) Extrusion of Steel Profiles. Hermann Preussler. *Draht*, v. 9, Nov. 1958, p. 435-440.

In cold extrusion reduction of 10 to 25% per pass permissible, sometimes requiring several passes. Resulting finish requires minimum machining. Very accurate dimensions obtainable. (G5; ST)

77-G.* (German.) Parameters Controlling Spark-Discharge Machining. H. Rossa. *Fertigungstechnik*, v. 8, Nov. 1958, p. 497-501.

Current as function of spark frequency characteristic for performance. Rate of material removal strongly influenced by current fluctuations. Other controlling parameters are work area, penetration depth, electrode material, purity and type of dielectric (usually transformer oil). Rapid material removal produces poor surface finish. (G24a)

78-G.* Observations on the Angle Relationships in Metal Cutting. D. M. Eggleston, R. Herzog and E. G. Thomsen. *American Society of Mechanical Engineers*, Paper no. 58-A-138, 1958, 17 p.

Orthogonal-cutting experiments using SAE 1112 free-cutting steel, 2024-T4 and 6061 T6 Al alloys, and alpha brass (85% Cu, 15% Zn), at feeds of 0.002 to 0.010 in. per revolution, were performed on a lathe with 18-4-1 high-speed steel cutting tools. The angle between the shear plane and the resultant tool force R was only approximately constant for each test condition and varied with cutting speed. (G17; Al-b, Cu-n, ST)

79-G.* Some Observations on the Shearing Process in Metal Cutting. S. Kobayashi and E. G. Thomsen. *American Society of Mechanical Engineers*, Paper no. 58-A-139, 1958, 12 p.

Shearing stresses on the shear plane for SAE 1112 free-cutting steel and for the test conditions investigated appear to be independent of normal stress, finite strain and strain rate. Shearing stresses for the remainder of the alloys (i.e., 2024-T4 and 6061-T6 Al alloys and alpha brass) also were constant, but the range of cutting conditions was not as extensive as that for SAE 1112. 29 ref. (G17; Al-b, Cu-n, ST)

80-G.* Self-Excited Vibrations in Metal Cutting. Nathan H. Cook. *American Society for Mechanical Engineers* Paper no. 58-A-189, 1958, 4 p.

Metal-cutting vibrations can be excited by a variety of mechanisms. At high frequencies, the negative slope of the friction-velocity curve is apparently responsible. At low frequencies, the variation of shear angle may be the important factor. Damping can take place in the mechanical system and also in the shear plane. Amplitude limitation can occur by the chip leaving the tool face or by interferences on the clearance face. 5 ref. (G17, Q9p)

81-G. Progress in Spark Machining. *Australasian Engineer*, v. 50, Oct. 7, 1958, p. 67-69.

Increased cutting speeds and better finishes of tungsten carbide. (G24a; 6-69)

82-G. Thread and Form Rolling. *Australasian Manufacturer*, v. 43, Nov. 22, 1958, p. 44-50.

Thread rolling is essentially a cold forging process, in which the required thread form is impressed on the workpiece by rolling it between hard metal dies. (G12)

83-G. Grinding—an Ancient Art as Applied to Alloy, High-Speed and Die Steels in the Tool Room. D. H. Currie. *Automatic Machining*, V. 20, Jan. 1959, p. 49-53.

(G18, W25c; ST)

84-G. Spark Machining by Electro-Erosion. W. O. Norton. *Engineer and Foundryman*, v. 24, Oct. 1958, p. 63-69.

Electrolytic maching, electro-arcing and electro-sparking. (G24a, G24d)

85-G. High-Speed Machining With Disposable Inserts. C. S. Currie, Jr. *Machinery*, v. 65, Jan. 1959, p. 95-96.

(G17, T6n; SS, 6-69)

86-G. Reed Coining Goes Through Interesting Die Development. A. P. Jurnak and E. W. Nelson. *Machinery*, v. 65, Jan. 1959, p. 112-115.

(G3n; Ni-b, Fe, 4-61)

87-G. Metal-Working Processes and Equipment. Pt. 2. A. G. Thompson. *Welding and Metal Fabrication*, v. 26, Dec. 1958, p. 449-454.

Punching, shearing, cropping, notching and nibbling techniques as performed on standard equipment. (G2, W24m)

88-G. (German.) Spark-Discharge Drilling of Very Small Holes. M. Dorfel, H. Klemm and H. Wappler. *Fertigungstechnik*, v. 8, Nov. 1958, p. 501-503.

Spark-discharge machine for drilling holes 0.008 to 0.020 in. in nozzles of diesel fuel pumps. (G24a, G17e, 18-74)

89-G.* Study of Machinability of Metals. H. Takeyama and E. Usui. *American Society of Mechanical Engineers*, Paper no. 58-A-161, 1958, 4 p.

Machinability in terms of chip formation is closely related to the ratio of shearing strain to shearing stress near fracture point of the ratio, the poorer the machinability from the viewpoint of chip formation. (G17k)

90-G.* (German.) Relationship Between Chip Formation and Tool Life. Gunter Weber. *Stahl und Eisen*, v. 78, Nov. 13, 1958, p. 1678-1690.

Investigations regarding behavior of carbide - tipped tools as characterized by cratering and flank wear when turning steels of different composition and preliminary heat treatment. Influence of machinability on tool life expectancy and a simple method for calculating relationship between feed rate and admissible cutting speed for maintaining 60-min. net cutting capability. 26 ref. (G17, G17k, T6n; 6-69)

91-G. (Translation — Brutcher, 4432.) New Method of Working of the Contact Surfaces of Machine Parts. I. V. Kudryavitsev and N. A. Balabanov. *Metallovedenie i Obrabotka Metallov*, Nov. 1958, p. 44-50.

Cold working by multiple impact strikes from a heavy hammerhead results in formation on the surface of grooves, flutes or corrugations in the form of furrows. This treatment increases the surface hardness by 40%, with favorable residual constricted stress. It is possible to double the ultimate fatigue strength. (G23n, Q7a, Q29n)

92-G.* Lubricants in the Forming of Aluminum. Marco Petronio. *Lubrication Engineering*, v. 14, Dec. 1958, p. 510-522.

Lubricants evaluated in slow-speed draw test of 2024, 5052, 7075 and R303 Al alloys. Condition of surface found highly significant. Surface pretreatments, (alkali, phosphating, treatments, oxidation) evaluated. (G4c, L12, L13p; Al-b, 18-73)

93-G.* (French.) Cutting of Ferrous and Nonferrous Metals. E. Sellier. *Revue Universelle des Mines*, v. 14, Oct. 1958, p. 359-372.

Theory of classic oxygen cutting processes, influence of metallurgical and physical factors; cleanness and precision of cut, structural changes and physical properties of cut surfaces of ferrous metals. Processes using combustible and noncombustible powders. Heliarc process, application to nonferrous metals. Equipment and applications of all processes. 9 ref. (G22)

94-G. Theory of Metal Cutting. P. H. Black. *Current Engineering Practice*, v. 1, Nov. 1958, p. 11-13.

Fundamental physical aspects and mechanics of the metal cutting process. (G17)

95-G. Grinding Sintered Carbide, Especially Sintered Carbide Cutting Tools, With Diamond Grinding Wheels. G. Pahlitzsch and G. Rafflenbeul. *Industrial Diamond Review*, v. 18, Dec. 1958, p. 225-234.

110-G.* Why Explosive Forming Works. John S. Rinehart, Vasil Philipchuk and John Pearson. *Steel,* Jan. 9, 1959, p. 62-65.

Under explosive pressures metals are formed plastically and do not become fluid, moving through the elastic into the plastic range and taking permanent set in a few millionths of a second. An explosive force distributes itself far more evenly than the forces in a conventional forming die to provide even penetration into every crack and crevice. It is possible that an explosion affects the atomic force relationship in rearranging crystal slip planes. (G-general, NM-k34)

111-G*. (German.) Poor Machinability of Light Metal Castings. *Giesserei-Praxis,* Dec. 24, 1958, p. 482-483.

Caused by Si crystals and improved by treatment of the melt with Na or Na-containing fluxes. A high percentage of Fe also reduces machinability. Careful molding, risering and avoidance of sand-containing charges prevent the penetration of sand particles. (G17k, E-general; EG-a39, 5)

112-G. Grinding Operations on Compressor Vanes. *Machinery (London),* v. 94, Jan. 14, 1959, p. 77-83.

Machining AMS 5613 and 5616 stainless steel precision forgings for jet propulsion unit. (G18k, G18m, T24b; SS)

113-G. High Speed Bending of Aluminum Tubes and Shapes. W. A. Osterland. *Modern Metals*, v. 14, Jan. 1959, p. 50, 52.

Hydraulic machines increase production of tubing, shapes, bars and rods. Anodized or precoated materials may be bent. (G6; Al-b, 4-55, 4-57, 4-60)

114-G.* (German.) Powder Cutting. Valentin Trunschitz. *Schweisstechnik*, v. 12, Nov. 1958, p. 148-152.

Stainless steel cannot be cut by conventional oxygen methods because of refractory Cr oxide in the kerf. Two methods were tested: (1) iron powder; (2) mechanical acting powder consisting of about 82% $CaCO_3$ and 16% $MgCO_3$. (G22g; SS)

115-G. (French.) Plastic Stamping Dies Reinforced With Steel Fiber. *La Machine Moderne*, v. 53, Jan. 1959, p. 51-53.

(G3, W24n; ST, NM-d, 9-69)

116-G. Plasma Heat Newest Addition to Welding's Product Lineup. *Welding Engineer*, v. 44, Feb. 1959, p. 50, 52.

(G22h, K1c)

117-G. Metal Bonding Aids Spinning. Harold Marks. *Product Engineering (Design Engineering)*, v. 30, Feb. 16, 1959, p. 63.

(G13, L22; SS, Ti, 4-53)

118-G. (Russian.) Cutting With Lubricants During Cold Working of Metals. V. D. Kuznetsov, A. I. Loskutov and S. N. Pavlova. *Doklady Akademii Nauk, SSSR*, v. 123, no. 2, 1958, p. 272-724.

Drilling of brass, Cu, Al, Zn and Cd with stearic acid of various concentrations, vaseline grease and oleic acid as lubricants. Presence in the lubricant of surface-active products has practically no effect on strengthening of metals. Best strengthening results were obtained when the lubricant was a mixture of stearic acid in toluol. 10 ref. (G17e; NM-h, Al, Zn, Cd, Cu-n, Cu)

119-G. (Russian.) Best Conditions for Spark Machining High-Temperature Nickel Alloys. V. P. Alexandrov and B. I. Zolotukn. *Izvestiya Akademii Nauk SSSR*, June 1958, p. 99-100.

(G24a; Ni-b)

120-G. (Russian.) Reliability of Metal Cutting Processes. M. E. Elyasherg. *Izvestiya Akademii Nauk SSSR*, Sept. 1958, p. 37-52.

Theory formulated on auto-vibration of metal cutting based on conditions of metal deformation during machining and pressure of shaving on surface of cutters. 7 ref. (G17)

121-G.* (French.) Cold Heading. Theodore B. Smith. *Machine Moderne*, v. 52, Oct. 1958, p. 9-15.

Capabilities of process, design principles for tools and products, selection of split or solid dies. Grain texture of upset parts, increased tensile strength, product material savings, examples of typical parts produced. (G10p, 1-67)

122-G.* Grinding Sulfurized Tool Steels. L. P. Tarasov. *Tool Engineer*, v. 42, Feb. 1959, p. 77-80.

Surface and form grinding tests to determine affects of sulphur additions to high-vanadium of high-speed steels. Influence of hardening temperature, grinding fluid, V content and sulphur on grindability. (G18k, G18m, 2-60, 2-64; TS-m, 17-52)

123-G.* Fabricating Stainless Steel, Pt. 2. Forming. Richard E. Paret. *Tool Engineer*, v. 42, Feb. 1959, p. 97-100.

Procedure and problems in drawing, punching, blanking, brake forming, tube bending or spinning various types of stainless steels. (G-general, 2-60; SS)

124-G.* Hot-Forming Titanium With Adjustable-Section Dies. Ed Selmer. *Tool Engineer*, v. 42, Feb. 1959, p. 101-104.

Dies for forming corrugations in 0.039-in. Ti sheet at 1200° F. (G4d; Ti-b)

125-G. (Translation—BISI, no. 1107.) Die Stamping and Drop Forging. W. Engelhardt. *Neue Hutte*, v. 3, March 1958, p. 165-173.

See item 309-G, 1958. (G3, F22n, W24n)

126-G.* Electro-Erosion Makes Tools for Valve Parts. Peter Trippe. *Metalworking Production*, v. 103, Jan. 30, 1959, p. 179-183.

Carbide progression dies and punches for small high-precision parts, with much increased life and reduced use of skilled labor. (G24a, W24n, W24p; W, *C*, 6-69)

127-G.* Modern Machining Methods. Digest of seven papers presented at the William Park Woodside Panel Conference, American Society for Metals". Oct. 1958. *Metal Progress*, v. 75, Feb. 1959, p. 138, 140, 142, 145-146.

New cutting tool materials (carbides and sintered alumina); advantages of constant speed machining; selection of quick-change, preset tooling; trends in high-speed machine tools; roll forming and electrical machining methods; machining of steels at high strength levels; machining of arc-cast Mo. (G-general, W25; Mo)

128-G. New Method Speeds Machining of Honeycomb Core Material. *Iron Age*, v. 183, Feb. 5, 1959, p. 94-95.

Interrupted arcing in electrolytic solutions. (G24a; SS-e, Al-b)

129-G. Metal Gathering Builds Up Thin Round Parts. Alfred H. Peterson. *Metalworking Production*, v. 103, Jan. 23, 1959, p. 153-154.

Heat and pressure are used to form tube ends into heavy sections that can be machined as flanges and threaded necks. This results in an integral end structure that provides strength and rigidity in parts built up from thin-wall tubing. It is an alternative to using drawing and swaging methods. (G1; 4-60)

130-G.* Turning Alloy Steels With Ceramic and Carbide Tools. *Machinery (London)*, v. 94, Feb. 11, 1959, p. 325-335, 341.

Tests to determine suitability of the tips for stock removal and finish turning after preliminary tests to determine suitable cutting conditions had been performed. Supplementary tests to ascertain effects of cutting edge side rake and cutting speed on tool life, chip formation. (G17a; AY, SGA-y; 6-69, 6-70)

131-G.* (Japanese.) Effect of Lubricant Upon Deformation of Aluminum Sheet. Takashi Ikeno, Shinkichi Yotsu and Osamu Ichii. *Light Metals*, v. 8, Nov. 1958, p. 5-10.

Effect of MoS_2 gives superior workability and tends to prevent rupture. (G4b; Al-b, NM-h, 4-53)

132-G.* (Ukrainian.) Effect of Temperature on Turning. F. Ya. Zagavura. *Dopovidi Akademii Nauk Ukrainskoi RSR*, no. 11, 1958, p. 1204-1206.

Turning of metal at -195° C.; +20° C.; and with electrical contact heating by direct current. 4 ref. (G17a, Q9, 2-61)

133-G. How Chemical Milling Benefits Canadair. *Canadian Metalworking*, v. 22, Feb. 1959, p. 16-17.

Lower costs, ease of operation and ability to mill all sides simultaneously. Chemical milling of aircraft parts of Al and Mg alloys, steel and Ti. (G24b, T24a; Al-b, Mg-b, ST, Ti-b)

134-G.* Fabrication of Refractory Metals. W.L. Bruckart. *Metal Industry*, v. 94, Jan. 30, 1959, p. 83-86.

Hydroforming, deep drawing, stretch forming, cold drawing, sawing, shearing, punching, stamping, machining, screw cutting and grinding of Mo. (To be continued.) (G-general; Mo, EG-d37)

135-G.* Steel Sheet for Deep Drawing. A. Snedden. *Australian Institute of Metals, Journal*, v. 3, Nov. 1958, p. 242-249.

Properties of the finished sheet determined mainly by grade of steel used. The five principal grades available in the "dead soft" range with a C content below about 0.10% are ingot iron (rimmed), rimmed, capped, semikilled, and aluminum-killed steels. (G4b; CN-g, Al, 4-53)

136-G.* (German.) Pilger Process in Rolling Solid Cylindrical Rods. Rolf Hinkfoth. *Neue Hutte*, v. 4, Jan. 1959, p. 40-45.

Pilger process applied to pure Al, case hardened steel and Ni. With solid rods a homogeneous deformation takes place throughout the cross section. 9 ref. (G11, 1-67; 4-55, CN-g, Al, Ni)

137-G.* Theory and Application of Electro-Discharge Machining. Robin O. Williams and Philip E. Berghausen. Paper from "New Fabrication Techniques". American Society for Metals, Cleveland, 1958, p. 1-13.

Process is accomplished by high-frequency series of discharges between a tool and the work where a small amount of metal is removed each time. These charges are of high current density and can produce melting and vaporization. Comparision with other competitive processes. (G-24a)

138-G.* High Speed Cutting. E. K. Henriksen. Paper from "New Fabrication Techniques". American Society for Metals, Cleveland, 1958, p. 14-18.

High cutting speeds with good tool life can be attained in conventional cutting by careful attention to correct tool geometry, good edge and surface finish on tools, correct grade of tool material, correct cutting fluid and possible supercooling of work and tool with preheating or workpiece. (G17, T6n)

139-G.* The Chemical Milling Process and Its Primary Applications. Roy L. Chandler

and Glenn E. Boehmer. Paper from "New Fabrication Techniques". American Society for Metals, Cleveland, 1958, p. 19-23.

Applications and limitations of chemical milling applied to wrought Al alloys, Mg alloys FS-1, HK31, ZU60 and HM21, Ti and steel alloys. (G24b; Ti-b, Al-b, Mg-b, ST)

140-G.* Designing Aluminum for the Impact Process. Mark A. Ziegler. Paper from "New Fabrication Techniques". American Society for Metals, Cleveland, 1956, p. 24-30.

Tooling, tolerances and design features in the impact extrusion of 1100, 3003, 6061, 6151, 2014-T6 and 7075-T6 Al alloys. (G5; Al-b)

141-G.* Forming at Elevated Temperatures. Harry B. Osborn, Jr. Paper from "New Fabrication Techniques". American Society for Metals, Cleveland, 1958, p. 31-35.

Tensile strength versus temperature is plotted for a number of steels to determine optimum forming temperatures. Warm forming is, in many cases, more satisfactory than either hot forming or cold forming. (G-general, 1-66, 2-61; ST)

142-G.* (German.) Metal Forming by Necking. R. Beck, K. H. Schenck and H. Gross. *Fertigungstechnik*, v. 8, Dec. 1958, p. 538-544.

Reduction of open ends on cylindrical shells either on presses by various types of necking tools and/or by special necking machines. Special tooling exists for measurement of stresses in material and to determine limits of compression admissible for various thicknesses of pure Al, Al-Cu-Mg and Al-Mg alloys. 7 ref. (G4; Al-b, *Cu, Mg*)

143-G. Metal Cutting. W. B. Rice. *Engineering Institute of Canada, Transactions*, v. 2, Dec. 1958, p. 149-152.

Development of a model of chip formation. 10 ref. (G17; Al-b)

144-G. Lubrication of New Metals During Heat Treatment and Forming. J. Grindrod. *Scientific Lubrication*, v. 11, Jan. 1959, p. 13-14.

Use of glass as lubricant in heat treating Ti alloys and in forming Mg and Ti alloys. (G1, J-general; Mn-b, Ti-b, NM-h, NM-f42)

145-G. (Dutch.) Flow Turning. D. A. de Fremery. *Metalen*, v. 13, Nov. 15, 1958, p. 388-390.

Manufacture of cylindrical and conical objects with thicker bottoms and thinner walls by the flow turning process. (To be continued.) (G13)

146-G.* (German.) Strain Hardening of Austenitic Steels in Deep Drawing. H. Wiegand and H. K. Kloos. *Werkstatt und Betrieb*, v. 92, Jan. 1959, p. 1-6.

Measurement of hardness and tensile strength changes to determine part played by martensite formation in strain hardening of deep drawn cups. By increasing temperature of forming the martensitic phase was almost completely suppressed. 9 ref. (G4b, N7e, 2-61; SS-e)

147-G.* Residual Stresses Produced by Up Grinding and Down Grinding. John A. Mueller. *Grinding and Finishing*, v. 4, Jan. 1959, p. 30-33.

In surface grinding the degree of stress in the ground surface produced by conventional crossfeeding is the same as that produced by crossfeeding at only one end. Performance characteristics of the wheel are changed by the method of crossfeeding. Whatever method will produce the most satisfactory end product can be used without changing the residual stress in the product. 4 ref. (G18k, Q25h)

148-G.* How to Design and Check Bends in Welded Steel Tubing. *Iron Age*, v. 183, Feb. 26, 1959. p. 85-88.

Minimum bend radii for various size and gage tubes bent with or without mandrel. Minimum bend radii for flat-sided tubing. Design considerations; diameter tolerances for end sizing. (G6, 17-51; ST, 4-60)

149-G.* Metal-Working Processes and Equipment. Pt. 4. A. G. Thompson. *Welding and Metal Fabrication*, v. 27, Feb. 1959, p. 71-73.

Relation of bend radius and thickness, length and tensile strength of plate to the design of plate bending rolls, roll diameters and power requirements in plate bending. (To be continued.) (G6, 1-52; ST, Al-b, 4-53)

150-G.* (German.) Cold Forming of High-Temperature Alloys. Rolf Krause. *Werkstatt und Betrieb*, v. 92, Feb. 1959, p. 81-83.

Formability, strain hardening, lubrication, process annealing of Ni and Co-base alloys. Die design, machine requirements for deep drawing, bending, spinning, shearing and punching. (G-general, 1-67, Q23q; SGA-h, Ni-b, Co-b)

151-G. Machinability Ratings May be Misleading, But What Other Yardstick Is Available? John A. Hedrick. *Carbide Engineering*, v. 11, Jan. 1959, p. 17.

Revision of existing machinability charts for particular applications. (G17k)

152-G.* Machining and Fabrication of Beryllium. Keith G. Wikle. *Machinery (London)*, v. 94, Feb. 25, 1959, p. 428-432.

Hot pressing, extrusion, forming and joining; properties. (G-general, H-general, K-general, Be)

153-G.* Shape, Fasten, Engrave, Test Materials With Explosives. H. P. Tardif. *Materials in Design Engineering*, v. 49, Feb. 1959, p. 82-87.

Three main approaches to explosive forming are direct forming using cartridge explosives, hydraulic fluid forming using propellant gases and a drop hammer actuated by propellant gases. Explosive bulge tests are performed at temperatures of -100 to 200° F. and are used to evaluate metal for crack initiation and crack propagation characteristics. (G-general; NM-k34)

154-G.* Fabricating Sheet Metal for Aircraft. Adolph Vlcek, Jr. *Metal Progress*, v. 75, Mar. 1959, p. 77-79.

Aircraft and missile manufacture is sparking a revolution in sheet metal fabricating. Routine forming and joining methods formerly used are being replaced with techniques designed to handle the high-strength alloys needed for supersonic aircraft. (G14, G-general, F22, J-general, K-general, T24)

155-G.* Stress-Relief of Aluminum for Aircraft. R. T. Myer, S. A. Kilpatrick and W. E. Backus. *Metal Progress*, v. 75, Mar. 1959, p. 112-115, 190.

Use of machined components instead of assemblies in aircraft has led to much research on stress-relief processes. Stretching, cold forging and skin-pass rolling are successful, in descending order, in relieving stresses in heat treated Al alloy plates. (G23, G9, Q25; Al)

156-G.* The Action of Metal Cutting Fluids at Low Speeds. Milton C. Shaw. *Wear*, v. 2, Feb. 1959, p. 217-227.

Low-speed materials function by reacting chemically with the chip to form a solid layer which prevents welding and metal transfer between the chip and the tool. Carbon tetrachloride acts both to reduce cutting forces to improve surface finish. Cutting data given for Pb and steel. 19 ref. (G17; Pb, ST, NM-h)

157-G. (Book.) Bending Aluminum. Information Bulletin no. 24. Aluminum Development Assoc., 33 Grosvenor St., London, W.1, England, Nov. 1958, 47 p. 2 s.

Bending properties of heat treatable and nonheat treatable Al alloys. Bending, forming, roll forming, roll bending, draw bending, wrap bending and ram bending operations. Data on minimum bend radii for cold bends in sheet, plates, bars, sections or tubes. 14 ref. (G6, G11; Al-b)

158-G. (Translation—BISI no. 709.) Tool Wear in Machining as Reflected in the Wear Cutting Speed Curve. Gustav Vieregge. *Stahl und Eisen*, v. 77, Sept. 5, 1957, p. 1233-1244.

See item 32-G, 1958. (G17, Q9; CN, CI-n, TS, 6-70, 6-69)

159-G. (Translation—Brutcher no. 4481.) Improvement in Fatigue Strength of Components by Shot Peening. M. Ya. Shashin. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Jan. 1959, p. 42-47.

Effect of deformed layer, depth on increased fatigue strength, on distribution of residual compressive stresses and on distortion changes of second and third order in surface layers. 11 ref. (G23n, Q25h, Q7)

160-G. (Translation--Brutcher no. 4484.) Vibrational Working of Deformed Metal AMtsM. Yu. P. Sogrishin. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Jan. 1959, p. 55-57.

Compared with static working of metals, vibrational working produces a more homogeneous structure and more uniform hardness distribution in the deformation region. Data for Al alloy (AMtsM). (G-general, Q29; Al-b)

161-G.* Current Practice in Chemical Milling. Neil W. Berst. *Products Finishing (London)*, v. 23, Feb. 1959, p. 31-35.

Survey of chemical milling processes; methods for cleaning, masking, etching, and for milling Al, Mg and stainless steel. (G24b; Al-b, Mg-b, Ti-b, SS)

162-G.* (Hungarian.) Magnesium Sheet Fabrication. Gyula Emod. *Kohaszati Lapok*, v. 91, Sept. 1958, p. 414-419.

Spinning, drawing and impact extrusion methods used on heated Mg strips, holding temperatures, preheating of forming tools to 150-200° C. 5 ref. (G-general; Mg-b, 4-53)

163-G.* Fabrication of the Stainless Steels. Pt. 1. Lester F. Spencer. *Metal Products Manufacturing*, v. 15, Mar. 1959, p. 29-30, 32, 60.

Workability, forming, and welding properties correlated with the various types of stainless steel. (G-general; SS)

164-G.* Cold Extrusion Process. *Automobile Engineer*, v. 49, Feb. 1959, p. 74-77.

During cold extrusion operations, the severe cold working raises the hardness and strength properties of the material. Low-carbon steels, as a result of cold working during extrusion, acquire mechanical properties approximating heat treated carbon steels or low-alloy steels. (G5; ST)

165-G.* Hard Spots in the Machined Surface. Antoni Niedzwiedzki. *Tooling & Production*, v. 24, Mar. 1959, p. 57-59.

While machining with feeds too fine, the cutting edges of milling cutters may slide over instead of cut the machined metal. These sliding cutting edges cold work the machined surface and thus form the hard spots. (G17)

166-G.* Stronger Carbon Steel Bars Produced by Elevated Temperature Drawing. E. S. Nachtman. *Materials in Design Engineering*, v. 49, Mar. 1959, p. 98-99.

Carbon and alloy steel parts produced by elevated-temperature drawing have high strength, little distortion and require no heat treatment. (G4, 1-67; CN, AY)

167-G.* Metal Forming and Cutting in the Aircraft Industry. L. G. Burnard. *Sheet Metal Industries*, v. 36, Mar. 1959, p. 179-190.

Routing, chemical machining, rubber press forming, hydroforming and stretch forming. (G-general; Al-b, 4-53)

168-G. Roll Grinding. *Iron and Steel*, v. 32, Feb. 1959, p. 71-74.

Equipment and techniques for satisfactorily grinding 0.024 in. from a 20½-in. diameter hardened forged steel roll 80 in. long in 15 min. (G18, W23k; ST)

169-G. Metal-Cutting Research. M. P. L. Siebel. *Columbia Engineering Quarterly*, v. 12, Jan. 1959, p. 20-23, 48-49.

Theoretical and experimental investigations of metal cutting. 15 ref. (G17, A9)

170-G. (Russian.) Optimum Conditions for Oxygen Cutting of Steels. V. S. Il'inskii. *Svarochnoe Proizvodstvo*, Jan. 1959, p. 22-24.

Oxygen purity has an effect on the quality of cutting. A 1% impurity in oxygen causes 19% more oxygen to be used, lowers the cutting rate by 16% and is more time-consuming. (G22g; ST)

171-G.* Hot Roll-Spinning. F. Spiegel. *Aircraft Production*, v. 21, Feb. 1959, p. 44-47.

Forming of hemispherical forms of Ti alloys with a hydraulically activated spinning roller. (G13; Ti-b)

172-G.* Producibility Barrier for Tough Alloys Hurdled in Manufacturing Revolution. Nat Wood, Editor. *Western Metalworking*, v. 17, Mar. 1959, p. 48-51.

Machining, forming and welding high-strength heat resistant metals. (G-general, K6; SGA-h)

173-G.* Fabricating Techniques for High Strength Superalloys. H. E. Haley. *Western Metalworking*, v. 17, Mar. 1959, p. 52-55.

Welding, forming, heat treating and forging heat resistant alloys. (G-general, K-general, J-general, F22; SGA-h)

174-G. Photo-Etching Molybdenum Foil. H. A. C. Hogg. *Institution of Electrical Engineers, Proceedings*, Pt. B., Supplement, May 1958, p. 614-616.

(G24b, T1c, 17-57; Mo, 4-56)

175-G. (Russian.) Ultrasonic Machining of Hard and Brittle Materials. L. D. Rosenberg and D. E. Yakhimovich. *Vestnik Mashinostroeniya*, v. 39, Feb. 1959, p. 51-55.

Process rate depends on amplitude and frequency of equipment used, hardness and size of abrasive, quantity of abrasives in the liquid, type of liquid used (water in most cases) surface area, cutting depth and kind of material to be treated. (G24c)

176-G.* Chemical Milling Process and Its Primary Applications. Roy L. Chandler and Glen E. Boehmer. *Machine Production*, v. 18, Feb. 1959, p. 13-16, 50.

Chemical milling, primary applications, design and standard practices. (G24)

177-G.* Split-Second Explosive Forming. *Ryan Reporter*, v. 20, Mar. 5, 1959, p. 4-5, 26.

Experiments with high-strength metals using dynamite, tetryl, cyclonite and PETN. (G-general; SGA-h, NM-k34)

178-G.* Advances in the Technique of Forming Metals. Frank G. Helander. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 165, American Society of Tool Engineers, Detroit, 1958, 5 p.

High-pressure rubber forming of large high-strength sheet metal parts. Roll forming or flow spinning process. (G13, G14a; SGA-h, SGB-a)

179-G.* Challenging Future of Power Spinning. John N. Heater. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 171. American Society of Tool Engineers, Detroit, 1958, 9 p.

Theoretical flow mechanisms in shear spinning. Extrusion and bending zones in the area of deformation. Thinning resulting from bending. Effect of extreme cold work or extrusion on metallurgical structure. (G13)

180-G.* Chemical Milling—Key to Space Age Design. L. B. Stearns. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 148, American Society of Tool Engineers, Detroit, 1958, 5 p.

Process development; application to Al, Mg, Ti or Ni alloys and stainless steels. (G24b; Al-b, Mg-b, Ti-b, Ni-b, SS)

181-G.* Fabrication of Refractory Metals. W. L. Bruckart. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 177. American Society of Tool Engineers, Detroit, 1958, 26 p.

Forming, spinning, cutting, machining, joining, annealing, surface treatment, mechanical properties and application of Mo, W, Ta, Cb and Re. (G-general, J23, K1d, K8; Mo-a, W-a, Ta-a, Cb-a, Re-a, SGA-h)

182-G.* Grinding Techniques for Advanced Materials. J. A. Mueller. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 138. American Society of Tool Engineers, Detroit, 1958, 11 p.

Wheel specifications and grinding procedures for Zr, Mo, Ti, dense Si carbide, dense high-purity alumina and sprayed coatings of Cr-Ni-B or alumina. (G18, W25c; Ti, Mo, Zr, 6-69, 6-70, 8-67, Cr, Ni, B)

183-G.* Hot Roll Spinning Titanium. Fred Spiegl. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 173, American Society of Tool Engineers, Detroit, 1958, 3 p.

Equipment and process requirements for hot forming thick hemispherical shapes. (G13, T26q, 1-66; Ti-b)

184-G.* Machining of Metals for Advanced Aircraft and Missiles. Norman Zlatin and Leonard J. Nowikowski. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 142, American Society of Tool Engineers, Detroit, 1958, 6 p.

Machining properties of high-strength heat resisting alloys A-286, S-816, 6A1-4V Ti, Mo, AISI 4340 steel and 420 stainless steel. (G17k; SS, Ti-b, Ni-b, Mo-b, Co-b)

185-G.* New Milling Techniques. A. O. Schmidt. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 139. American Society of Tool Engineers, Detroit, 1958, 7 p.

Increased tool wear, high temperatures and other limiting factors in machining high-strength alloys at ultra-high cutting speeds. 14 ref. (G17b; SGB-a, SGA-h)

186-G.* Non-Mechanical Machining Methods for New Metals. Lynn A. Williams. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 140. American Society of Tool Engineers, Detroit, 1958, 9 p.

Characteristics of spark-arc disintegration, chemical milling and electrolytic machining. Application of electrolytic machining to special problems. Advantages. (G24a, G24b, G24d)

187-G.* Precision Cold Extrusion Technology for High-Temperature Metals. Raymond A. Quadt. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 167, American Society of Tool Engineers, Detroit, 1958, 8 p.

Cold extrusion of sintered Al powder alloys, 4130 steel, 446 stainless steel, unalloyed Ti, Mo. Zr, Cb, Ta and U. Mechanical properties of tubular extrusions. (G5; Al-b, ST, SS, Ti, Mo, Zr, Cb, Ta, U, SGA-h)

188-G.* Theoretical Approach to the Solution of Machining Problems. Robert L. Vaughn. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 164. American Society of Tool Engineers, Detroit, 1958, 8 p.

Problems in machining new high-strength heat resistant alloys. Theoretical behavior of metals at ultra-high machining velocity. Tests with linear velocity explosively actuated metal removal apparatus. (G17; SGA-h, ST)

189-G.* Tooling for Welded Aircraft and Missile Pressure Vessels. Gerald Garfield. Paper from "ASTE Collected Papers", v. 58,

Book no. 2, Paper no. 151. American Society of Tool Engineers, Detroit, 1958, 7 p.

Tooling for deep drawing, hydroforming or spinning of hemispherical heads and for forming of cylinders in production of spherical and cylindrical pressure vessels. (G4b, G14b, G13, T26q; AY)

190-G.* Tube Bending; Plumbing-Art or Science? J. E. Hawking. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 168. American Society of Tool Engineers, Detroit, 1958, 7 p.

Relation of wall thinning with ratio of bend radius to tube diameter. Effect of wall thinning on mechanical properties of stainless steels. (G6; ST, SS, 4-60)

191-G. Metalworking and Machine Tools in the USSR. Richard E. Stockwell. *Modern Machine Shop*, v. 31, Apr. 1959, p. 122-129. (G-general, W25)

192-G. 4000 Lb. Iron Castings Salvaged by Compressed Air Arc Cutting. Martin G. Boyer. *Welding Journal*, v. 38, Mar. 1959, p. 239-240. (G22H; Fe, 5, 18-72)

193-G. (Russian.) Increasing Durability of Cogging Mill Rolls by Knurling. L. V. Andreyuk. *Stal'*, Feb. 1959, p. 141-145.

Design of a single roller for knurling cogging rolls immediately after turning. Improved surface condition resulted in a 27.5% increase in roll durability. 6 ref. (G12, W23k, 17-51)

194-G.* Some Remarks on Impact Extrusion. P. Landberg. *Microtecnic*, v. 12, Dec. 1958, p. 301-312.

Experiments to determine the mechanism of the process. (G5)

195-G.* Gray Cast Iron Machinability. W. W. Moore and J. O. Lord. *Modern Castings*, v. 35, Apr. 1959, p. 55-60.

Relationship of machinability of unalloyed cupola melted sand cast gray iron with changes in size of graphite flakes, volume of pearlite and graphite. Comparative accuracy of machinability indices when calculated from microstructure, carbon equivalent, tensile strength or hardness. 4 ref. (G17k, 3-71; CI-n)

196-G.* Explosive Welding and Forming Open Another Door for Industry. Jack Fairlie. *Welding Engineer*, v. 44, Apr. 1959, p. 61-64.

Advantages and application of explosive welding, forging and forming. Relation between plasticity by explosive forces and percentage elongation. Relative plasticity of Al, carbon steel, stainless steel, Ti and Ni. (G-general, F22, K5; Al-b, ST, SS, Ni-b, Ti-b, NM-k34)

197-G. (Pamphlet.) Technical Data: Hi-Qua-Led Steel Forgings. 37 p. Alco Product, Inc., 107 Gertrude St., Latrobe, Pa.

Effect of Pb additions on machinability, yield strength, tensile strength, ductility, hardenability, weldability of carbon and low-alloy steels. Machining characteristics of leaded steel. (G17k, 2-60, Q-general; 4-51, ST, *Pb*)

198-G. (Book—German.) Yearbook for Grinding, Polishing and Surface Treating, 1959. Bernhard Kleinschmidt. 511 p. 1959. Vulkan-Verlag Dr. W. Classen, Essen, Germany.

Grinding and polishing techniques. Data on abrasives, grinding wheels and equipment. (G18, W2)

199-G. (Translation—Digest) Surface Rolling to Increase Fatigue Strength. Digest of "Surface Rolling as a Method of Increasing the Fatigue Strength of Gears". A. A. Novik and M. S. Balter. *Vestnik Machinostroyeniya*, no. 10, 1957, p. 65-68. *Metal Progress*, v. 75, Apr. 1959, p. 174, 176, 178.

Surface rolling was selected to introduce the residual compressive stresses. The roller profile was designed to insure coverage by surface rolling of the entire transition surface between the flank of the tooth and the bottom of the tooth space (the zone of maximum bending stresses). S-N curves show a great improvement in fatigue life due to the surface rolling treatment. (G23s, T7a, Q7a)

200-G.* Fabrication of the Stainless Steels. Pt. 2. Lester F. Spencer, *Metal Products Manufacturing*, v. 16, Apr. 1959, p. 37-39, 70.

Forming and welding. (G-general, K-general; SS)

201-G.* Breakthrough in Tungsten Fabrication. Donald E. Perry. *Missiles and Rockets*, Mar. 23, 1959, p. 22-23.

Deep drawing and brazing makes tungsten available for new applications. (G4f, K8; W, 17-57)

202-G.* Controlled Explosive Blasts Hardness Into Steel. W. A. Harper. *Product Engineering (Design Edition)*, v. 30, Apr. 13, 1959, p. 62-63.

Velocity impact work-hardening Mn steel castings using sheet explosive. (G-general, NM-k34, Q23a; AY, *Mn*, 5)

203-G.* (German.) Spark Machining of Hard Metallic Materials. Pt. 1. Development and Fundamentals of Speak Machining. F. W. Neumann and J. Wetzger. *Frequenz*, v. 13, Jan. 1959, p. 15-21.

Historical development of spark machining; main types of circuits, physical process of electro-erosion; typical machine. 8 ref. (G24a)

204-G.* (German.) Materials Suited for Automatic Processes. K. Wellinger and H. Gassmann. *Werkstattstechnik*, v. 49, Mar. 1959, p. 148-152.

Machinability properties of various free cutting steels and cast irons as determined by composition and heat treatment tested by observing tool life in relation to cutting speeds applied in such operations. 25 ref. (G17k, 2-64; SGA-k, ST, CI, 17-57)

205-G.* (German.) Properties and Internal Stresses of Free Cutting Steels. Alexander Schepers and Arnold Peiter. *Stahl und Eisen*, v. 79, Mar. 19, 1959, p. 337-349.

Causes of cracking in cold drawn killed and rimming-type free cutting steels, with and without Pb content. Relationship between internal stresses and longitudinal cracking was established. Influence of asymmetric machining pattern or the incidence of cracks. 53 ref. (G17, Q25; ST-c, ST-d, *Pb*, SGA-k)

206-G. (German.) Die Pressing of Flatware From Brass, Silver and Cr-Ni Steel. Ernst F. Scheven. *Zeitschrift fur Metallkunde*, v. 50, Feb. 1959, p. 106-111.

Experiments with various flatware pressing equipment, carried out to reduce die wear. (G1, T6q; Cu-n, Cu-b, SS)

207-G.* (German.) Machining Properties of High-Alloy Steels Containing Chromium, Nickel and Manganese. Georg Menges and Helmut Treppschuh. *VDI Zeitschrift*, v. 101, Mar. 1, 1959, p. 265-273.

Machining properties of ferritic Cr, heat treatable Cr, hardenable martensitic, austenitic, ferritic-austenitic and stainless free-maching steels. (G17k; SS, *Cr, Ni, Mn*)

208-G.* Hot Forming of Magnesium Moves Into High Gear. Louis R. Degen and Willard Axtell. *American Machinist*, v. 103, Apr. 20, 1959, p. 128-129.

Manufacture of suitcases from drawn sheets and extrusions of Mg. (G4; Mg)

209-G. In Electric-Discharge Machining What's the Best Electrode Shape for Removing Metal? Richard W. McDowell and Orville D. Lascoe. *American Machinist*, v. 103, Apr. 20, 1959, p. 133-135.

15 ref. (G24a)

210-G. O_2 Cutting Keeps Pace With Progress. H. Thomasson. *Canadian Metalworking*, v. 22, Apr. 1959, p. 54, 56.

New equipment and techniques. (G22g)

211-G. Stretch Former Compensates for Yield Strength Variations. *Iron Age*, v. 183, Apr. 23, 1959, p. 110-111.

New unit gives each workpiece a tensile test to determine its yield point before forming begins. (G9, 1-52)

212-G. Breakthrough in Tungsten Fabrication Promises Wider Use of Pure Metal. *Steel*, v. 144, Mar. 23, 1959, p. 102-103.

Tungsten parts produced by forging, extrusion, deep drawing or spinning. (G-general, F22; W, 17-57)

213-G. Do It Yourself: Explosive Cutting. *Steel*, v. 144, Mar. 23, 1959, p. 104-105.

Cutting steel plates with shaped explosives. (G17; ST, 4-53, NM-k34)

214-G.* (German.) Production of Screws by Plastic Forming. W. Schuster. *VDI-Berichte*, v. 39, 1959, p. 9-13.

Cold heading of steel bolts in multiple-step operations; static and dynamic load-carrying capacity of various types of cold headed bolts; plastic forming of threads by flat dies and by thread rollers. (G10; ST)

215-G.* (German.) Practicality of Substituting Cold Forming for Other Metalworking Processes. K. Sieber. *VDI-Berichte*, v. 39, 1959, p. 13-16.

Limits of application of various cold forming processes such as upsetting, form pressing, cold extrusion, drawing, trimming to the production of carbon steel and low-alloy steel components. (G-general, 1-67; CN, AY)

216-G.* (German.) Forming Metal Sheet With Elastic Media. G. Oehler. *VDI-Berichte*, v. 39, 1959, p. 17-22.

Application of rubber dies for drawing and pressing of Al parts. Relationship between Shore hardness number and specific forming pressures needed for drawing, forming, bending, blanking and combined operations on soft metal sheets. 5 ref. (G14; Al)

217-G.* (German.) Cold Pressing of Symmetrical and Asymmetrical Small Parts. O. May. *VDI-Berichte,* v. 39, 1959, p. 22-25.
Process differs from the conventional cold extrusion by reduced ram speeds, thereby allowing more time for the metal to flow. (G1, 1-67)

218-G.* (German.) Coining of Drop Forged Parts. R. Meier. *VDI-Berichte,* v. 39, 1959, p. 35-38.
Analysis of deformation forces and plastic flow. (G3n)

219-G.* (German.) Defects in Cold Pressing of Light Metals. H. Hornauer. *VDI-Berichte,* v. 39, 1959, p. 38-42.
Flaws found in cold pressed Al parts related to material properties, component design and processing. (G1, 1-67; A1)

220-G.* (German.) Extrusion of Metals in Pre-Loaded Dies. H. J. Friedewald. *VDI-Berichte,* v. 39, 1959, p. 42-49.
Accuracy of hot and cold extruded metal shapes can be increased by preloading of extrusion dies. Methods for finding optimum preloads for various extruded metal shapes to counterbalance the expected radial forces in the dies during process. (G5)

221-G.* (German.) Metal Forming and Tooling. K. Sieber. *VDI-Berichte,* v. 39, 1959, p. 49-55.
Processes of wiredrawing, reducing and cold extrusion analyzed to determine deformation pressures needed. Methods of designing tools capable of withstanding these pressures, using various metals for the forming and the armor part of the dies. (G-general, F28, W24)

222-G.* (German.) Specific Cutting Tool Loads for Cylindrical Milling Cutters. H. Philipp. *Werkstatt und Betrieb,* v. 92, Apr. 1959, p. 179-187.
Computation of forces acting in milling when the work is fed against the movement of blades. Tool loads are shown for various materials, tools and chip thicknesses. 45 ref. (G17b; ST, CI, Cu-n)

223-G.* Machining of Ultra Strength Alloys. John Maranchik, Jr., J. V. Gould and P. R. Arzt. *Society of Automotive Engineers,* Preprint no. 43 R, 1959, 40 p.
Turning, milling, drilling and tapping tests on AISI 4340 and VascoJet 1000 steels in quenched and tempered conditions. Turning and drilling tests on solution treated and aged AM-350 and A-286 stainless steels. Influence of cutting speed, feed, tool material and geometry and workpiece hardness. (G17; AY, SS-e, TS-k, SGB-a)

224-G.* Looking Ahead the Next 10 Years in Manufacturing by High Energy Rate Plastic Deformation of Materials. J. B. Ottestad. *Society of Automotive Engineers,* Preprint no. 52 T, 1959, 4 p.
Plastic deformation process; utilization of high-velocity forming; precision extrusion; forging and forming. (G-general, Q24, Q23q, NM-k34)

225-G. Facts About Explosive Metal Forming. Gilbert C. Close. *Modern Machine Shop,* v. 31, May 1959, p. 108-113.
Research work conducted by Aerojet-General Corp., Azusa, Calif. (G-general)

226-G. Explosive Forming. *Pacific Factory,* v. 91, Apr. 1959, p. 22-23.
Survey of progress. (G-general)

227-G. Explosive Forming Blasts Complex Shapes in Fraction of Time by Conventional Methods. *Western Metalworking,* v. 17, Apr. 1959, p. 52-53.
Experimental work at Ryan Aeronautical Co. (G-general)

228-G. (German.) Plastic Bending of Sheet Metal. F. Proksa. *Stahlhau,* v. 28, Feb. 1959, p. 29-36.
Theoretical treatment of bending process. 18 ref. (G6, 4-53, 10-51)

229-G.* Chip Formation in Metal Cutting. Hydrodynamic Theory. M. M. Lamm. *Engineering,* v. 137, Apr. 3, 1959, p. 444-446.
The metal appears to be squeezed plastically between the face of the tool and the main body of the metal being machined. (G17)

230-G. Cold Extrusion of High Strength Aluminum Alloys. Walter A. Backofen, Richard B. Palme and Shillings Tsang. *Massachusetts Institute of Technology,* Project no. 7263, June 1, 1958, 124 p.
Cold piercing tests on cylindrical billets of 7075 and 2024 Al alloys. Relationship of punched pressure requirements, deformation characteristics in billets and properties of resulting cup to reduction, billet geometry, punch design, scale of operation and lubrication. Calculation of deformation efficiency; deformation analysis using grids and microhardness surveys. (G5; A1-b)

231-G.* Designing Magnesium Extrusions. John J. Clemens. *Machine Design*, v. 31, May 14, 1959, p. 179-183.

Costs, characteristics, mechanical properties of Mg extrusions. (G5, Q-general, Mg-b, 4-58, 17-51)

232-G. (German.) Production of Hollow Cylinder Shapes: Impact Extrusion or Deep Drawing? Otto May. *Zeitschrift fur Metallkunde*, v. 49, July 1958, p. 381-385.

Comparison of the two processes. (G5, G4b)

233-G.* Turning Alloy Steels With Ceramic and Carbide Tools. *Mechanical World and Engineering Record*, v. 139, Apr. 1959, p. 174-175.

Investigation at Production Engineering Research Assoc. shows that ceramic tools can be used successfully at high stock removal rates and that they may be superior for finish turning. (G17a; AY, SGA-j, NM-f)

234-G.* What Is Known Today About Metal Cutting. Francis W. Boulger. Paper from "An Evaluation of the Present Understanding of Metal Cutting". American Society of Tool Engineers, Detroit, 1959, p. 4-30.

Empirical relationships showing effects of changing workpiece materials, tool and cut geometry and cutting speeds on tool live. Influence of cutting speed and workpiece microstructure on surface finish. 46 ref. (G17, T6n)

235-G.* Influence of Metallurgical Properties on Metal-Cutting Operations. Francis W. Boulger. Paper from "An Evaluation of the Present Understanding of Metal Cutting". American Society of Tool Engineers, Detroit, 1959, p. 190-254.

Strength, ductility, strain-hardening characteristics and hardness are closely interrelated. Properties depend on composition and microstructure and influence machinability. Tensile data are not directly applicable to the cutting process because temperatures, strain rates, specimen sizes and stress conditions are independent. 89 ref. (G18k)

236-G.* (German.) High-Speed Cutting. M. Kronnenberg. *Werkstattstechnik*, v. 49, Apr. 1959, p. 181-184.

Comparison of highest cutting speeds of steel, steel alloys, high-speed steel, carbon steel, cast iron, Al, Cu, Cu alloys and phosphorus-bronze. The consumption of impact energy depends on the impact speed. It first increases with the increase of speed but when critical speed is reached it begins to decrease rapidly. (G17; ST, CN, Fe-b, Cu-b, Cu-s)

237-G.* (Russian.) Effect of Flux Composition on the Physical and Chemical Properties of Slag in Oxygen Flux Cutting of Stainless Steels. O. Sh. Spector. *Svarochnoe Proizvodstvo*, Apr. 1959, p. 22-25.

In slags formed during oxygen flux cutting Cr is present in the form of Cr-oxide compounds of the type $FeOCr_2O_3$. If, during cutting, the flux is fed by double injection, the total quantity of Cr-oxides, in the resulting low-temperature melting compounds, should not exceed 15% of the total slag. (G22; RM-q, SS)

238-G.* Forming of Metals by Explosives. Julius Roth. *Explosives Engineer*, v. 37, Mar-Apr. 1959, p. 52-55.

Properties of explosives which may be important in the shaping of metals. 8 ref. (G-general; NM-k34)

239-G.* Explosive Forming, Slicing and Extruding. *Plant Engineering*, v. 13, May 1959, p. 124-127.

Slicing billets, shaping without dies, direct forming, activation of pistons and extrusion. (G-general; NM-k34)

240-G.* Heat Makes It Easy to Drill Small, Deep Holes in Uranium. Edward J. Lach and Randall Lenz. *American Machinist*, v. 103, May 19, 1959, p. 117-118.

Hot machining solves the work-hardening problems. (G17e; U)

241-G.* Designing for Steel Extrusions. J. J. Barrett. *Precision Metal Molding*. v. 17, May 1959, p. 68-69.

Applications, design pointers. (G5; ST, 17-57, 17-51)

242-G.* Machining Characteristics of AISI 4340 Low Alloy Steel. P. R. Arzt, J. V. Gould and J. Maranchik, Jr. *SAE Journal*, v. 67, May 1959, p. 37-45.

Turning, milling, slotting, drilling and tapping tests. (G17; AY-n)

243-G. Report on Explosive Forming. Thomas A. Dickinson. *Light Metals*, v. 22, May 1959, p. 136-137.

(G-general, NM-k34)

244-G. The Mechanism of Chip Formation. Donald Gideon, Ralph Simon and Horace Grover. Paper from "An Evaluation of the Present Understanding of Metal Cutting".

American Society of Tool Engineers, Detroit, 1959, p. 31-57.

Chip formation at the shear plane in terms of stresses, geometry and the rela - tive motion of the tool-work combination. Dissipation of the input power at the shear plane, tool face and in stored energy in the chip and workpiece. 59 ref. (G17, G25)

245-G. Some Thermal and Physical Aspects of Cutting. Donald Gideon, Ralph Simon and Horace Grover. Paper from "An Evaluation of the Present Understanding of Metal Cutting". American Society of Tool Engineers, Detroit, 1959, p. 70-88.

Analyses of cutting temperatures; effects of temperature increments in shear zone; effects of high temperatures on the tool face; strain and strain rate in the shear zone. 22 ref. (G17, G25)

246-G. Present Knowledge of Cutting Fluids. Stanley L. Cosgrove and Roy W. Greenlee. Paper from "An Evaluation of the Present Understanding of Metal Cutting". American Society of Tool Engineers, Detroit, 1959, p. 135-189.

Cutting fluids in relation to their ability to extend tool life, permit greater depths of cut at high cutting speeds and improve surface finish. 65 ref. (G17; NM-h)

247-G. Recommendations for Further Research on Metal Cutting. D. N. Gideon, S. L. Cosgrove, R. Simon, H. J. Grover and F. W. Boulger. Paper from "An Evaluation of the Present Understanding of Metal Cutting". American Society of Tool Engineers, Detroit, 1959, p. 265-273.

Future research in relation to cutting fluids, tool life and tool wear, mechanics of the cutting operation, thermal and physical aspects of metal cutting. (G17)

248-G. (German.) Forming and Shaping of Austenitic Steels. Georg Menges. *Industrie-Anzeiger*, v. 81, Mar. 24, 1959, p. 11-14.

Directions for cold and hot deformation, heat treatment, pickling, welding, stamping and piercing, grinding, polishing and forging. 4 ref. (G-general, F22, L10b; SS-e)

249-G. (Italian.) Electrolytic Grinding. Sirio Leporatti. *Macchine*, v. 14, Apr. 1959, p. 305-317.

Electrical machining processes and equipment with special reference to electrolytic grinding. (G24)

250-G. (Japanese.) Case Hardening by Shot Peening. Syoukichi Hirose. *Metal Finishing Society of Japan, Journal*, v. 10, Mar. 1959, p. 98-102.

Air nozzle and centrifugal-type equipment. (G23n)

251-G. (Japanese.) Lubricants in the Drawing of Aluminum. Hisashi Ikeno. *Metals*, v. 29, Jan. 1959, p. 69-72.

Difficulties in drawing are caused by deformation resistivity, deformation hardening, roughness of the surface of tools and friction. Several lubricants are recommended. (G4; NM-h)

252-G. Belt Grinding of Titanium Sheet and Plate. Carl T. Olofson. *Defense Metals Information Center*, Memorandum no. 11, Mar. 15, 1959, 7 p.

Successful grinding of Ti with abrasive belts depends on reducing its welding action to the mineral. This can be accomplished by lowering the temperature at the grinding point through adequate cooling, and by using appropriate grinding fluids which will inhibit the chemical reaction between the mineral and the Ti. (G18, W25c; Ti, 4-53, NM-h)

253-G. The Finishing and Inspection of Uranium Fuel Slugs in the Processing Refabrication Experiment. J. Guon, J. R. Foltz and W. Cockrell. Atomics International. *U. S. Atomic Energy Commission*, NAA-SR-2798, Dec. 15, 1958, 65 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.75.

Cold short fracture, abrasive, electrical discharge and ultrasonic methods of machining cast uranium slugs. Sub-surface defects in the slugs cannot be detected by commercially available ultrasonic instruments. 29 ref. (G24, T11g, S-general; U, 4-55)

254-G.* (Hungarian.) Properties of Mild Aluminum Sheets Influenced by Macrostructure of Semicontinuously Poured Slabs. Istvan E. Boczor. *Kohaszati Lapok*, v. 92, Feb-Mar. 1959, p. 65-69.

The tendency of Al alloys to form ears and develop scalloped edges during sheet rolling and subsequent deep drawing can be counteracted in part by improved ingot casting methods, which produce a fine-grained structure, and by adequate annealing. 20 ref. (G4b, F23, C5g, 2-64; Al-b, 4-53, 9-71)

255-G.* Machining of Molybdenum and Its Alloys. W. A. Taebel and J. Gelok. Paper

from "Fabrication of Molybdenum". American Society for Metals, Cleveland, 1959, p. 134-138.

Speed, feed, depth of cut, tool shape and geometry for turning, milling, drilling, shaping, reaming and grinding Mo and Mo alloys. Effect of anisotropy, microstructure and hardness. (G17, 3-71, 3-72; Mo-b)

256-G.* Press Extrusion of Molybdenum Tubing. R. A. Quadt. Paper from "Fabrication of Molybdenum". American Society for Metals, Cleveland, 1959, p. 139-147.

Microstructure, mechanical properties and tolerances of tubes formed by hot, followed by cold, extrusion. Recrystallization temperatures of unalloyed Mo extrusions. (G5, F24a, Q-general, N5; Mo, 4-60)

257-G. The Chemical Contouring of Aluminum-Alloy Panels. *Machinery (London)*, v. 94, May 13 1959, p. 1093-1097.

(G24b, T24a; Al-b)

258-G. When You Machine the "Big Four" Refractories. *Metalworking*, v. 15, June 1959, p. 10-11.

Data on Mo, W, Ta and Cb. (G17; Cb, W, Mo, Ta)

259-G. How to Machine Stainless Steel With Cut-Off Tools. G. J. Stevens. *Modern Machine Shop*, v. 32, June 1959, p. 108-112.

Cut-off tool design, selection, operating techniques. (G17, T6n; SS)

260-G. Choosing the Lubricant for Carbides. John A. Boyd. *Tooling & Production*, v. 25, June 1959, p. 62.

(G17, T6n; NM-h, 6-69)

261-G. (German.) Machinability Testing Methods. Henning Siebel. *Industrie-Anzeiger*, v. 81, May 5, 1959, p. 554-558.

11 ref. (G17k, 1-54)

262-G. (Portuguese.) Sonics in Modern Industry. Pt. 2. L. X. Nepomuceno. *Engenharia, Mineracao e Metalurgia*, v. 29, Mar. 1959, p. 125-129.

Cleaning of parts; drilling operations on hard metals. (G24c, L10f)

263-G.* Practical Approach to Machining Stainless Steels. James M. Galimberti. *Metal Removing*, v. 3, Apr-May 1959, p. 14-15.

Recommended speeds and feeds for three grades of finishing various stainless steels with carbide tools. (G17; SS)

264-G.* The Effect of Selenium on the Machinability and Tensile Properties of 5% Chromium Steel. Francis W. Boulger. *American Society for Metals, Transactions*, v. 52, Preprint no. 131, 1959, 18 p.

Machinability of 5% Cr—1.2% Mo hot work die steels containing up to 0.26% S and 0.18% Se. Longitudinal and transverse tensile properties of experimental steels in the annealed conditions as heat treated to give tensile strengths of 278,000 psi. Microstructures. 5 ref. (G17k, Q27a, M27, 2-60; TS-k, *Se, Mo, Cr*)

265-G.* (Czech.) Oxy-Acetylene Cutting of Die Forgings. Jan Bezdicek and Jaromir Zabrodsky. *Zvaranie*, v. 8, Apr. 1959, p. 97-100.

Investigation of cracks found in forgings when the material is cut with an oxy-acetylene torch. Crack elimination is achieved by heat treatment, modified according to material composition and ambient temperature. 8 ref. (G22g, 2-64; CN, AY, 4-51, 9-72)

266-G.* Metallurgical Examination of Oxygen-Cut Titanium. J. C. Borland and W. G. Hull. *British Welding Journal*, v. 6, May 1959, p. 225-229.

Various zones of contamination were detected in oxygen-cut unalloyed Ti and specimens of Ti-150A and A110-At. Severe hardening, and thus contamination, was restricted to flame-cut surface. Commercially pure Ti sheet was flame cut and butt welded along line of cut. Contamination of weld metal was small and increase in hardness was only 38 D.P.N. 5 ref. (G22g, Q29n; Ti, 4-53)

267-G. Explosive-Forming Meets Space-Age Production Demands. P. F. Lambert. *Machinery*, v. 65, June 1959, p. 124-128.

Methods, advantages and limitations, current status, future possibilities. (G-general; NM-k34)

268-G.* (German.) Application of Electro-erosion and Ultrasonics in Metal Production. H. Kusserov. *Maschinenbau*, Feb. 1959, p. 42-44.

In the electro-erosion process, the removal of material is influenced by the shape of the anode, the composition of the workpiece, dielectric phenomena and heat flow. Roughness depends on the frequency of spark. In the ultrasonics process, a cutting tool is vibrated by sound waves. (G24d, G24c)

269-G.* (Italian.) Experiments With Various Cutting Fluids in Surface Finishing. Gian Federica Micheletti. *Ingegneria Meccanica*, v. 8, Feb. 1959, p. 68-74.

Distribution of heat in workpiece, tool and chip as a function of cutting speed. Passivation effect of a fluid containing amino soaps and passivation agents on cast iron, carbon steel and alloy steel at room temperature and at 40° C. (G18k; CI, CN, AY, NM-h)

270-G.* Flanging and Pressing of Dished Heads. Harry S. Beers. Digest of "The Flanging and Pressing of the Dished Head". Paper presented at Philadelphia Regional Technical Meeting of American Iron and Steel Institute, Nov. 20, 1957, 23 p. *Metal Progress*, v. 75, June 1959, p. 183-184.

Pressed heads are formed by hot or cold forming, depending on the thickness, diameter and depth of draw. Hot pressing can usually be done in flat clamping and forming dies. Cold pressing is more complex and various beaded-type dies are used, depending on the contours desired. (G6, G1)

271-G. Chemical Milling. *Design News*, v. 14, May 25, 1959, p. 18-19.

Review. (G24b)

272-G. Friction on Relief Face of Cutting Tool. Makoto Okoshi and Toshio Sata. *Institute of Physical and Chemical Research, Scientific Papers (Japan)*, v. 52, Dec. 1958, p. 216-223.

Compared with that on the rake face. (G17, Q9p, T6n)

273-G. Behavior of Chips in Steel Cutting. Keiji Okushima and Kiyoshi Minato. *Japan Society of Mechanical Engineers, Bulletin*, v. 2, no. 5, 1959, p. 58-64.

Methods for controlling shape of chip; angle of chip; ejection of chip; chip classification and effect of cutting conditions on chip shape. (G17; ST)

274-G. The Cutting Mechanism of Honing. Tokio Sasaki and Kenjiro Okamura. *Japan Society of Mechanical Engineers, Bulletin*, v. 2, no. 5, 1959, p. 80-85.

The best cutting efficiency is obtained at a cutting speed of 40 m. per min. (G19n)

275-G. Electro-Spark Machining by Alternating Current. Tokuzo Matsuyama and Takao Kayaba. *Japan Society of Mechanical Engineers, Bulletin*, v. 2, no. 5, 1959, p. 86-91.

With a-c. the machining speed is maximum, and in the widest extent of the work-current, machining is stable, using a solid brass bar electrode. (G24a)

276-G. Recent Advances in Honeycomb Fabrication. *Metalworking Production*, v. 103, May 29, 1959, p. 946-947.

Machining, brazing and inspection techniques. (G17, K8, S13m; 7-59)

277-G.* Some Electrical Phenomena in Metal Cutting. V. Solaja and H. L. Hughes. *Wear*, v. 2, May 1959, p. 311-314.

Dependence of the thermo-e.m.f. magnitude on cutting conditions in fine turning; effects of naturally generated and additional injected electrical currents. 16 ref. (G17)

278-G. Flexible Sheet-Explosive for Metal Cutting. *Welding Engineer*, v. 44, June 1959, p. 46-47.

Advantages and procedures for cutting and hardening by this new method. (G-general; NM-k34)

279-G.* (German.) Hole-Piercing in Steel by Means of the Oxy-Acetylene Blowpipe. E. Zorn. *Schweissen und Schneiden*, May 1959, p. 171-175.

Piercing perpendicular to the surface in carbon steel sheets up to 200 mm. thick and in austenitic Cr-Ni steel up to 150 mm. thick; stack-piercing of five superimposed sheets, each 10 mm. thick. (G22g; CN, SS, 4-53)

280-G. (Pamphlet.) Automatic Screw Machining of Aluminum. 31 p. 1959. Reynolds Metals Co., Richmond 18, Va.

(G17g; Al)

281-G. (Book.) Evaluation of the Present Understanding of Metal Cutting. 275 p. 1959. Battelle Memorial Institute. Research Report, no. 20, American Society of Tool Engineers, 10700 Puritan Ave., Detroit 38, Mich.

Papers abstracted separately. (G17)

282-G.* The Cold Extrusion of Metals Using Lubrication at Low Speeds. R. J. Wilcox and P. W. Whitton. *Institute of Metals, Journal*, v. 87, June 1959, p. 289-293.

Super-pure Al extruded by the direct and inverted methods using dies of semicone angle varying from 30° to 90° and of extrusion ratio varying from 2:1 to 150:1. A general equation is presented which can be used for pressure predictions over a wide range. Optimum die angle is dependent on extrusion ratio. 9 ref. (G5; Al-a)

283-G.* Tungsten-Arc Cutting of Stainless Steel Shapes in Steel Warehousing Operations. John D. Wait and Stephen H. Resh. *Welding Journal*, v. 38, June 1959, p. 576-581.

Method offers a substitute for powder cutting. The tungsten-arc product is cleaner and cut to much closer tolerances without iron powder contamination and little or no carbide precipitation. It requires a minimum of machining and the edges of the material cut can often be immediately welded without further preparation. (G22h; SS, 4-53)

284-G. The Theory and Practice of Explosive Metal Forming. Robert A. Cooley. *American Machinist*, v. 103, June 15, 1959, p. 128-130.

12 ref. (G-general; NM-k34)

285-G. Explosives Form Tubes With and Without Dies. Jacob Savitt. *American Machinist*, v. 103, June 15, 1959, p. 135-137.

(G-general; 4-60, NM-k34)

286-G. Effect of a Lead Additive on the Machinability of Alloy Steels. Norman Zlatin and John V. Gould. *Journal of Engineering for Industry*, v. 81, May 1959, p. 131-138.

The use of a Pb additive in medium-carbon alloy steels results in appreciable increases in tool life for steels having a hardness of Rockwell C-30 or less. (G17k, 2-60; AY, *Pb*)

287-G. Effects of Tool Flank Wear on Tool Chip Interface Temperature. D. R. Olberts. *Journal of Engineering for Industry*, v. 81, May 1959, p. 152-158.

Effect of land wear upon the interface temperature between a carbide tool and an AISI 1015 steel workpiece. (G17, T6n, Q9n; ST, 6-69)

288-G. Electron Beams Machine by Vaporization. *Metalworking Production*, v. 103, June 5, 1959, p. 986-987.

Concentrated beam of electrons vaporizes the workpiece material to form holes or slots of 0.0015 in. width or less. (G24a)

289-G. (French.) Technology's Newest Baby: The Plasma Torch. *Machine Moderne*, v. 53, May 1959, p. 9-12.

Description and operation; use in welding cutting, melting, forming and coating. (G13, L29)

290-G. (German.) Method of Piercing Elongated Holes Using Pressurized-Gas Blowpipe. R. Peiffer. *Schweissen und Schneiden*, v. 11, May 1959, p. 192-194.

Piercing holes through the entire cross-section of metal walls by an oxy-acetylene blowpipe in which gas is used under pressure. (G22g)

291-G. (Russian.) Powder Cutting of Stainless Steels. B. I. Smirnov. *Svarochnoe Proizvodstvo*, May 1959, p. 27-30.

Powder cutting has hardly any effect on the structure of steel near the cutting area. The dendritic structure formed did not exceed more than several tenth of a mm. in depth. (G22g; SS-e)

292-G. (Russian.) Nitrogen-Arc Cutting of Stainless Steels. I. S. Shapiro. *Svarochnoe Proizvodstvo*, May 1959, p. 30-32.

Blowing of a concentrated stream of nitrogen, containing not more than 1% oxygen, into the electric arc discharge when cutting stainless steel sheets 4-28 mm. thick. For sheets thicker than 25 mm. addition of hydrogen is recommended. 5 ref. (G22h; 4-53, SS)

293-G.* Shear Spinning. B. N. Colding. *American Society of Mechanical Engineers*, Paper no. 59-PROD-2, 1959, 12 p. $.80.

Data on spinning machines and tooling. Material flow during shear spinning; analytical expressions for shear spinning stresses and tangential force; maximum theoretical reductions; efficiency of deformations. 6 ref. (G13, G25; Al, ST, SS, Ni-b, Ti)

294-G.* Shear-Zone Size, Compressive Stress, and Shear Strain in Metal Cutting and Their Effects on Mean Shear-Flow Stress. Dimitri Kececioglu. *American Society of Mechanical Engineers*, Paper no. 59-PROD-3, 1959, 9 p. $.80.

Machining SAB 1015 seamless steel tubing under a wide range of conditions. 13 ref. (G17, G25; ST, 4-60)

295-G.* 1958 Review of Metal Processing Literature (Grinding). George Reichenbach. *American Society of Mechanical Engineers*, Paper no. 59-PROD-4, 1959, 3 p. $.80.

Chatter and vibration; grinding chip formation; residual grinding stress; abrasive wear. 8 ref. (G18, Q25h, W25c)

296-G.* 1958 Review of Metal Processing Literature (Metal Cutting Analysis). J. M. Galimberti, H. J. Siekmann, R. S. Hahn and E. G. Thomsen. *American Society of Mechanical Engineers*, Paper no. 59-PROD-6, 1959, 5 p. $.80.

Mechanics of chip formation, plasticity, cutting forces, tool life, cutting zone temperature and vibration in machining. Drill design and residual stresses. 40 ref. (G17, G25)

297-G.* Electrical Discharge Machining as Applied to Engineering for Productivity. Albert E. Holm. *American Society of Mechanical Engineers,* Paper no. 59-PROD-9, 1959, 5 p. $.80.

Use of electrical discharge machining in the fabrication of stamping dies. (G24a, W24n; TS)

298-G. Centerless Grinding Faults and How to Correct Them. Edwin R. Larson. *Grits and Grinds,* v. 50, May 1959, p. 12-15. (G18h)

299-G.* Progress in Cold Extrusion of Steel. *Sheet Metal Industries,* v. 36, May 1959, p. 353-358, 366.

Practice at the Royal Ordnance Factory, Birtley, England, together with experimental work by some industrial firms. (G5; ST)

300-G.* (Spanish.) Sheet Steel for Stamped and Deep Drawn Parts. Ernesto Diaz-Varela y Ceano Vivas. *Instituto del Hierro y del Acero,* v. 12, Jan-Mar. 1959, p. 1-27.

Mechanical and structural properties required for the deep drawing process; tests for determining properties; heat treatment and natural aging. 23 ref. (G3, G4b, Q-general; 4-53, ST)

301-G.* (German.) Cutting of Stacked Sheet by Acetylene and Propane. A. Matting and Tin Ming Wu. *Industrie-Anzeiger,* v. 81, June 9, 1959, p. 15-22.

Effect of heating gas and the type of burner on cutting efficiency. 15 ref. (G22g; ST, 4-53)

302-G.* (German.) Flame and Arc Cutting of Nonferrous Metals. W. Mantel and L. Wolf. *Industrie-Anzeiger,* v. 81, June 9, 1959, p. 22-27.

Advantages and disadvantages; quality and cost of oxygen, MIG SIGMA, argon arc and the electrocutting process using a coated electrode. 15 ref. (G22g, G22h; Al, Cu, Ni)

303-G. (German.) New Type Flame Cutting Equipment. R. Bechtle. *Werkstatt und Betrieb,* v. 92, June 1959, p. 335-344.

6 ref. (G22g, 1-52)

Materials and methods. (G18; EG-d)

306-G. How to Design for Grinding. M. M. Patterson. *Grinding and Finishing,* v. 5, June 1959, p. 26-29.

Grinding used for stock removal more accurately and faster than single-point machining as well as for finishing. (G18k, G19)

307-G. (Translation—Brutcher No. 4529.) Cold Bending and Flame Straightening of Steels 15M and 12MKh. A. P. Simakovski. *Metallovedenie i Termicheskaya Obrabotka Metallov,* v. 5, Feb. 1959, p. 40.

Installation practices for cold bending of small-diameter pipes and flame bending and straightening of large-diameter pipes. (G6, Q5g; AY, 4-60)

308-G. (Translation—Brutcher No. 4531.) Machinability of Steel and Cast Iron by Carbide Tools. G. L. Khaet. *Metallovedenie i Termicheskaya Obrabotka Metallov,* v. 5, Feb. 1959, p. 49-53.

(G17k, T6n; CN, CI, 6-69)

309-G. Hot Forming the Answer for Tungsten. *Metalworking Production,* v. 103, June 26, 1959, p. 1098-1099.

High temperatures make possible the formation of pure tungsten products by drawing, forging, extrusion and spinning. (G-general, 1-66; W)

310-G. Spark Electrode Shape Decides Cutting Rate. *Metalworking Production,* v. 103, June 26, 1959, p. 1100-1101.

An electrode having a 90° point is the optimum shape for evacuation of particles during cutting process. (G24a, 3-73)

311-G. Auto Attachment Broaches Space Rings. Forest McDaniel. *Metalworking Production,* v. 103, June 26, 1959, p. 1103-1107.

Thickness tolerance on Al alloy spacer rings is controlled by a second-operation broaching attachment. (G17d; Al)

312-G.* (German.) Production of Casting Dies by Cold Hobbing. W. Haufe. *Giesserei,* v. 46, June 1959, p. 353-361.

Selection of die materials. Molybdenum steels compared with tungsten steels.

Compression strength and viscosity of steels for punches. Method is recommended to reduce the pressure applied in the process. (G17b, 1-67, W19n; AY)

313-G.* Belt Grinding Titanium. Carl T. Olofson. *Light Metal Age*, v. 17, June 1959, p. 6-7.

Abrasives, belt backing, contact wheels, speeds, feeds and grinding fluids. (G18p, W29c; Ti)

314-G.* (German.) Material Problems Connected With Automation. K. Wellinger and H. Gassmann. *VDI-Berichte*, v. 40, 1959, p. 28-32.

Effects of nonmetallic additions and phase composition on the machinability of free-cutting steel and gray cast iron. 25 ref. (G17k, 18-74, 2-60; CN, SGA-k, CI-n)

315-G. (German.) Belt Grinding of Titanium. R. Berger. *Metall*, v. 13, July, 1959, p. 656-657.

Grinding directions and equipment. (G18; Ti)

316-G. (Russian.) How to Rate the Deep Drawing Capacity of Steel Sheet. B. M. Ovsyanikov and L. T. Timoshuk. *Stahl'*, June 1959, p. 560-562.

Rating based on measuring the ultimate diameter of the sample, drawn without sheet rupture. 11 ref. (G4b, 17-52; 4-53, CN)

317-G.* (German.) The Hydroform Process and Hydromechanical Deep Drawing. W. Panknin. *Industrieblatt*, v. 59, June 1959, p. 245-249.

New method eliminates the matrix and uses dies of highly workable material and an oil cushion. (G14b)

318-G. Heat and Speed Form Latest Titanium Alloys. George H. DeGroat. *American Machinist*, v. 103, July 27, 1959, p. 108-111.

(G-general, 1-66; Ti-b)

319-G. M.S.E. "Fette" Thread Rolling. *Australasian Manufacturer*, v. 44, July 4, 1959, p. 44-46.

System whereby the principle of cold rolling is carried out by axially rolling threads in the direction of the grain flow of the metal; no tearing or cratering occurs. (G12)

320-G. Norair Heats Work Within Seconds for High-Temperature Forming. J. E. Hagins. *Machinery*, v. 65, July 1959, p. 118-119.

Titanium alloy blanks heated on the die by radiant heat and formed within 1 sec. of heating. (G-general, 1-66; Ti)

321-G. Missile Guidance System Tooled for Production. D. G. Gill and C. D. Spainhour. *Machinery*, v. 65, Aug. 1959, p. 94-103.

Multiple-purpose machines, unique tooling setups and template-controlled profiling for machining of many different Al and Mg castings. (G17, 5; Al, Mg)

322-G. Jet-Age Drilling at Convair. Thomas W. Driver. *Machinery*, v. 65, Aug. 1959, p. 104-107.

(G17c, W25p)

323-G.* Titanium Machining Techniques. *Titanium Engineering Bulletin*, no. 7, (n.d.), p. 6-31.

Directions for machining. Factors influencing machinability, such as poor thermal conductivity and the tendency to form alloys and chemical compounds with materials of the cutting tool. (G17, G17k; Ti)

324-G. Cookie Cutter Dies Save Money. *Canadian Metalworking*, v. 22, Aug. 1959, p. 38-40.

By shearing, stamping, piercing and punching sheet metal in a compound operation with a single die, stampings are produced in less time and at lower costs. (G3, W24n)

325-G. Ryan's Split-Second Explosive Forming. Charles O. Herb. *Machinery*, v. 65, July 1959, p. 102-108.

Sheet metal is forced into the die to which it is attached by the force of explosives carried out under water. (G-general; Ti, SS, NM-k34)

326-G. (Dutch.) Spark Machining. D. A. deFremery. *Metalen*, v. 14, July 15, 1959, p. 194-199.

Equipment and process. 9 ref. (G24a)

327-G.* Reduction of Warpage by Creep Forming and Die Quenching of Nonferrous Alloys. Joseph Soja. *Metal Progress*, v. 76, Aug. 1959, p. 77-80.

Jet planes are built with large and complex parts made from high-strength materials. Often, these parts are difficult to form by conventional means and special forming methods must be developed. Three new techniques are discussed. (G-general, T24a; Al-b, Ti-b, 9-74)

328-G. Band Sawing of Titanium and Titanium Alloys. Carl T. Olofson. *Defense Metals Information Center*, DMIC Memo. 23, July 1, 1959, 14 p.

Difficulties from galling, smearing, abrasiveness and generation of high temperatures in the cutting zone can be minimized by selecting the proper saw pitch and feeding pressure for the work thickness involved. 12 ref. (G17h; Ti)

329-G. Hacksawing of Titanium and Titanium Alloys. Carl T. Olofson. *Defense Metals Information Center*, DMIC Memo. 24, July 6, 1959, 12 p.

Appropriate selections of pitch, speeds and feeds minimize difficulties. Cutting rates are about 25 to 50% lower than those associated with quenched and tempered alloy steels of equivalent hardness. Blade life in terms of productivity is about 50% lower than that with alloy steels of equivalent hardness. 5 ref. (G17h; Ti)

330-G. Profile Milling Titanium and Its Alloys. Carl T. Olofson. *Defense Metals Information Center*, DMIC Memo. 25, July 10, 1959, 3 p.

Method in which the path of a single-spindle cutter is guided and controlled by a stylus tracing a master form or a template made to the contour, shape or pattern to be reproduced on the workpiece. (G17b; Ti)

331-G. Spindle Shaping of Titanium Sheet. Carl T. Olofson. *Defense Metals Information Center*, DMIC Memo. 26, July 15, 1959, 3 p.

Hand-fed, edge-profiling operation for sheet-metal parts produces aircraft-quality edge finish. Method is feasible for shaping sheet in gages from 0.060 to 0.187 in. using carbide cutters and carbon dioxide as a coolant. (G17b; Ti, 4-53)

332-G.* Simple Cold Forming of Aluminum Sheet and Shapes. *Modern Metals*, v. 15, July 1959, p. 28-36.

Simple and improvised methods of supporting work during bending. Techniques for cutting, folding, beating, flanging and annealing. (G2, G6, G23, 1-67; Al-b)

333-G.* What's Going on in Electromachining. *Steel*, v. 145, Aug. 24, 1959, p. 80-83.

Electrolytic machining, in which the metal is electrolytically deplated from the work, is already proving itself on new, difficult-to-work steels. (G24d; AY)

334-G.* (Czech.) Improvement of Drawing Coefficients in the Deep Drawing of Cylindrical Shapes. J. Domorazek. *Strojirenstvi*, v. 9, Apr. 1959, p. 279-282.

Use of a high drawing coefficient permits a reduction in the number of operations. Determination of the highest drawing coefficient limit. The drawing coefficient is dependent on wall thickness. Reduction of the draw force is achieved by reduction of the friction coefficient. (G4b, G4d)

335-G. Producing Blanks for Multiple-Diameter Shafts by the Cold-Forming Method. Harold C. Seifert. *Machinery (London)*, v. 95, July 22, 1959, p. 99-103.

Advantages are: less raw material required and increased tensile strength, yield strength and hardness which result from cold working the steel. (G1, 1-67, T7j; ST)

336-G. Attachment Caresses Surfaces to a Controlled Finish. *Steel*, v. 145, July 27, 1959, p. 110-112.

Precision surface finishes as fine as 0.5 micro-in. can be turned out with relative ease and economy by the microstoning process. Stones are placed against the work with light pressure (20 to 40 psi.) and vibrated (2000 to 3000 times a min.) as the workpiece rotates. (G19n)

337-G.* If Kinks, Bulges, Bends and Distortion Can't Be Pressed Out Use Low-Cost Heat Straightening. Louis J. Larson. *Welding Design & Fabrication*, v. 32, Aug. 1959, p. 34-35.

Use of heat to straighten weldments and other metal structures. (G23p, G6, K9q; 7-51)

338-G.* Material Selection in Chemical Milling Process. W. C. Rockwell. *Corrosion*, v. 17, Aug. 1959, p. 105.

Milling system for Al, Mg, Ti and steel. Tabular data list cleaner, deoxidizer and etchant solutions and tank materials for each solution. (G24b, 1-52; Al, Mg, Ti, ST)

339-G.* (German.) Cutting Temperature During Machining. W. Lehwald. *Industrie Anzeiger*, v. 81, Aug. 4, 1959, p. 27-30.

Distribution of energy during machining and temperatures on the edge of the cutting tool determined by means of colorimetry. Single and double chisel

methods, measurement of heat losses, use of thermo-color dyes and thermo-elements. 22 ref. (G17, S16b; ST)

340-G.* Carbide Grade Selection. W. E. Montgomery. *Carbide Engineering*, v. 11, July 1959, p. 15-17.

Mechanical and physical properties of carbides. Hot hardness, modulus of elasticity, density, coefficient of thermal expansion, torsional strength, compressive strength and transverse rupture properties. Effect of Co content on the hardness of carbides. (G17, P-general, Q-general, 2-60; 6-69, *Co*)

341-G.* "Hula Head" Hacks Honeycomb. Leon E. Laux and Clyde S. Hill. *SAE Journal*, v. 67, Aug. 1959, p. 68-71.

Techniques and equipment for initial fabrication of cores, for joining, hot and cold contour forming, machining, sawing and assembling stainless steel sandwiches. (G17; SS, 7-59)

342-G.* Air Force Program Evaluates the Machining Characteristics of a Stainless Steel. P. R. Arzt, J. V. Gould and J. Maranchik, Jr. *SAE Journal*, v. 67, Aug. 1959, p. 87-89.

Recommended machining conditions and characteristics for super-strength alloys SAE 4340, H11, AM-350, A-286. (G17k; SS, SGB-a)

343-G.* (German.) Treatment of Hard Metallic Materials With Spark Erosion Machining. F. W. Neumann and J. Wetzger. *Frequenz*, v. 13, July 1959, p. 197-203.

Spark machining contrasted to conventional machining methods. Energy determination per spark unit and electrical loading. (G24a)

344-G.* (German.) Effect of Crystal Structure on the Machinability of Structural Steels. Walter Knorr. *Harterei-Technische Mitteilungen*, v. 13, no. 3, 1959, p. 201-226.

Structure control of carbon steels, case hardening and heat treatable steels by modifying the austenitizing temperature and cooling conditions. 13 ref. (G17k, M26, 3-71, 2-64; CN, AY)

345-G.* The Importance of Directionality in Drawing Quality Sheet Steel. R. L. Whiteley. *American Society for Metals, Transactions*, Preprint no. 174, v. 52, 1959 10 p.

While directionality which produces earing during drawing is generally objectionable, another component of directionality representing differences in properties perpendicular and parallel to the plane of the sheet can be an asset to good drawability. This component of directionality can be measured in a simple tensile test by the ratio of transverse strains. 8 ref. (G4, Q23q; ST, 4-53, 3-72)

346-G. Lockheed Uses Oil Dies to Make Multiple-Bead Sheets. Fred C. Hoffman. *Machinery*, v. 66, Sept. 1959, p. 120-122.

Process whereby oil is forced directly on the work surface and serves as a forming or drawing medium. (G14c)

347-G. Possibilities of High Energy Rate Plastic Deformation. J. B. Ottestad. *Machinery (London)*, v. 95, Aug. 12, 1959, p. 228-230.

(G-general, F-general, NM-k34)

348-G. Difficult Milling Operations Performed With Carbide Cutters. C. Sharp and B. Main. *Machinery (London)*, v. 95, Aug. 19, 1959, p. 284-286.

Milling of high-strength materials used for aircraft landing-gear components. (G17b, T6n; 6-69, SGB-a)

349-G. Hot Forming Operations on Sheet Materials. *Machinery (London)*, v. 95, Aug. 26, 1959, p. 311, 361.

Forging, stamping and hot pressing. (G-general; 4-53)

350-G. Heliarc Offers Better Way to Cut Stainless Steels. *Steel*, v. 145, Sept. 7, 1959, p. 93.

Argon-hydrogen gas mixture protects cut edges from oxidation. Cuts performed to meet tight tolerances without distortion or discoloration. (G22h; SS)

351-G. (Book.) Dimensional Control in Precision Manufacturing. John L. Gadzala. 203 p. 1959. McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York 36, N. Y. $7.50.

Fundamentals and methods of dimensional control as applied in production machining. (G-general, 17-55)

352-G.* Magnesium Hot-Formed in Quantity. Louis R. Degen and Willard Axtell. *Metalworking Production*, v. 103, Aug. 14, 1959, p. 1228-1230.

Suitcase shells formed by drawing lubricated Mg alloy sheet in electrically heated dies. (G4d; Mg-b, 4-53)

353-G.* Applications of Cold-Formed Sections. R. M. Kenedi and W. Shearer Smith. *West of Scotland Iron and Steel Institute, Journal,* v. 66, 1958-1959, p. 24-50.

Behavior characteristics of cold formed struts and beams. Methods of fabrication, corrosion protection and application. Possibilities of cold formed structures and functional units. (G11, 1-67; SGB-s)

354-G.* Cold Roll Forming Practice in the United States. W. G. Kirkland. *West of Scotland Iron and Steel Institute,* v. 66, 1958-1959, p. 51-92.

Review of cold rolling, including machining, roll design, tolerances and lubrication. High production capacity is the principal advantage of cold roll forming, with uniformity in cross section and close dimensional tolerances. (G11, 1-67)

355-G.* (German.) Fatigue Strength of Weld Repaired Flame Cut Steel Samples. H. D. Steffens. *Industrie Anzeiger,* v. 81, Aug. 25, 1959, p. 46-53.

Leaping off of the flame during plate cutting often results in the formation of tiny notches on the cutting face. These defects reduce the strength, particularly under cycling stress. Repair of the cutting face by arc welding and correct choice of cutting electrodes. (G22g, K1, Q7a, 18-72; 9-71)

356-G. Spring-Back and Stretch-Forming of Sheet Metal. D. M. Woo and J. Marshall. *Engineer,* v. 208, Aug. 28, 1959, p. 135-136.

When the ratio of forming radius to metal thickness is large, the spring-back is severe and has to be reduced by applying a tensile force at each end of the metal strip. 5 ref. (G9, Q25h; 4-53)

357-G. Production Methods at Daimler-Benz. Pt. 2. Automation Applied to Axles and Blocks. David Scott. *Metalworking Production,* v. 103, Aug. 14, 1959, p. 1223-1227.

Machining of axle housings, front swivel axles and cylinder blocks. (G17, 18-74)

358-G. Hydraulic Roll Forming Bends Big Bumpers. *Metalworking Production,* v. 103, Aug. 14, 1959, p. 1235-1239.

(G11; ST)

359-G. Milling of High-Strength Steels in the Hardness Range of 330 to 560 Brinell. C. T. Olofson. *Defense Metals Information Center,* DMIC Memo. 30, Aug. 17, 1959, 21 p.

Face milling, end milling, side milling and plotting of steels such as 4130, 4340, Chromalloy and Super-Tricent. Tool and cutters grades best suited as well as cutting angles, cutting speeds and feeds help determine the compromise between best cutting conditions and longest tool life per tool required. 30 ref. (G17b; ST, SGB-a)

360-G. Drilling High-Strength Steels Heat Treated to 330 to 560 Brinell Hardness. A. F. Gerds, Carl T. Olofson and F. W. Boulger. *Defense Metals Information Center,* DMIC Memo. 31, Aug. 24, 1959, 11 p.

Drilling of hardened steels such as 4130, 4340, Chromalloy, Inco Super-Tricent steel, with most applicable drilling speeds and feeds. Optimum conditions and tools for various work-pieces. Rigid setups between work and drill, and the use of short, heavy-duty drills increase drill life and hole accuracy and frequently allow the use of less expensive high speed steel drills. (G17e; ST)

361-G.* The Effects of Atmosphere on Dry-Grinding Steel With Al_2O_3 Coated Abrasives. Ernest J. Duwell and William J. McDonald. *American Society of Mechanical Engineers,* Paper no. 59-LUB-6, 1959, 5 p. $.80.

Surface chemical reaction of abrasive with oxygen, Group VIA and VIIA gases which act as a lubricant. 5 ref. (G18; ST, EG-m44)

362-G. The Explosive Press as a Research Tool in Material Behavior and Forming. E. W. LaRocca and J. Pearson. U. S. Naval Ordnance Test Station. *U. S. Office of Technical Services,* PB 151844, May 1958, 17 p. $.50.

Expendable explosive presses were devised for research in explosive forming of powdered metals and nonmetals. Unlike most metal explosive systems, the presses permit recovery of the test specimens. Presses are single and double-action. The double-action press uses two explosive charges fired simultaneously to drive two opposed pistons together into a central steel cylinder in which the specimen material has been placed. Pressures of several million psi. can be obtained. (G-general, 1-52; NM-k34)

363-G. High Energy Rate Metal Forming. G. N. Rardin. Lockheed Aircraft Corp. *U. S. Office of Technical Services*, PB 151849, Mar. 1959, 70 p. $1.75.

Cupping tests confirmed that use of a shock focusing device is advantageous for increasing draw depth for air shots. Tests with a steel cupping die, with the air evacuated between die and workpiece, and the explosive charge suspended above the workpiece, were inconclusive because the workpieces fractured before drawing to the full depth of the air. Tests using the cupping and beading dies in assembly with the bolster and tube, and a 24-in. column of water as the transfer medium, showed satisfactory performance with considerably less explosive weight. (G-general; NM-k34)

364-G.* Forming Cones by Metal Gathering. H. P. Tardif. *Metal Progress*, v. 76, Sept. 1959, p. 84-85.

Cones formed without danger of rupture by recessing the flat workpiece in the die cavity. Metal near the base of the cone is thicker than the original blank. (G4b; NM-k34)

365-G.* Making Compacts by Explosive Forming. E. W. LaRocca. *Metal Progress*, v. 76, Sept. 1959, p. 85-86.

Acting through pistons, the explosive force compresses powders and solid materials. (G1, H14; NM-k34)

366-G.* Grinding and Polishing With Abrasive Belts. W. K. Seward. *Metal Progress*, v. 76, Sept. 1959, p. 95-100.

Understanding basic principles, production men can put abrasive belts to their best use—keeping productivity high and costs low in many finishing operations. (G18, L10b, W25c; NM-j)

367-G.* Abrasive Belt Grinding of Zirconium Sheet. H. N. Dyer and R. A. Leggett. Behr-Manning Co., Troy, N. Y. Digest of "Surfacing of Zirconium Alloy Sheet by Abrasive Belt Grinding". *Metal Progress*, v. 76, Sept. 1959, p. 154, 156.

Effects of abrasive belt speed, type of grinding fluid, and type and size of abrasive grain on bonding qualities of reactor-grade Zircalloy-2 (hot and cold rolled). Bonding was accomplished by sealing surface-ground sheets in a protective container from which air had been evacuated. (G18; Zr-b, 4-53, NM-j)

368-G.* Fabrication of Molybdenum Sheet. Alan V. Levy and Saul E. Bramer. Digest of "The Development of Refractory Sheet Metal Structures". Paper Presented Before the Society of Automotive Engineers National Aeronautical Meeting, New York, Mar. 31, 1959, *Metal Progress*, v. 76, Sept. 1959, p. 180-183.

Forming and joining of the 0.5% Ti alloy sheet. Shearing or sawing done after preheating to 700° F. Spinning, stamping, "floturning", stretch forming done on hot sheet; proper working temperatures vary with thickness, ranging from 600° F. for 0.020-in. sheet to 2200° F. for 0.320-in. (G-general, K-general, 2-62; Mo-b, *Ti*, 14-53)

369-G.* (French.) High-Frequency Electrical Heating of Brass and Copper Alloys for Stamping Operations. *Cuivre, Laitons, Alliages*, no. 50, July-Aug. 1959, p. 23-27.

High-frequency heating provides small brass stampings with greater homogeneity, very fine crystal structure, excellent surface finish and freedom from porosity and oxide inclusions. (G1, J2g; Cu-n, 4-59)

370-G. The Spark Erosion Method in Metal Working. *Australasian Manufacturer*, v. 44, Aug. 8, 1959, p. 76-78.

Application to hard materials not readily machinable, such as carbides. (G24)

371-G. Spark Erosion—Would It Pay to Do It in Your Own Plant? A. C. Parsons. *Canadian Machinery*, v. 70, Sept. 1959, p. 138, 140.

Process is useful in the correction of errors made in the manufacture of dies, salvaging of castings or dies by the removal of broken taps or drills without damaging the item to be salvaged. (G24a)

372-G. Developments in Explosive Forming. P. F. Lambert. *Machinery (London)*, v. 95, July 29, 1959, p. 131-135.

Two distinct methods of explosive forming are pressure-forming with propellant-type explosives and shock-forming with explosives of high order. (G-general; NM-k34)

373-G.* How to Machine Aluminum. C. J. Vlahos. *Mill and Factory*, Sept. 1959, p. 104-110.

Machinability rating and mechanical properties of common wrought Al alloys. Recommended speeds and feeds; appropriate tool geometry. (G17k, Q-general; Al-b)

374-G.* (German.) Design of Wire Twisting Plants. H. W. Aengeneyndt. *Draht*, v. 10, Aug. 1959, p. 339-345.

Increase of tensile strength and elastic limit of reinforcing steel for concrete construction by twisting. Description of machinery and calculation of forces, rotations and rate of twisting and process parameters. (G23, 1-67, N7e, W24k, 17-51; ST, SGB-s, 4-61)

375-G.* (German.) Optimum Values Reached With Arc Cutting. W. Herzfeld. *Industrie-Anzeiger*, v. 81, Aug. 1959, p. 1005-1009.

Test surface quality is attained only with decreased cutting speed which results in increased cutting time and gas consumption. (G22h)

376-G.* (German.) Automatic Machining of Aluminum and Aluminum Alloys. W. Scholz. *Metall*, v. 13, Sept. 1959, p. 837-842.

Turning, drilling and thread cutting operations on Al-Mg, Al-Mg-Si, Al-Mn and Al-Cu-Mg alloys with tools from carbon steel, high speed steel or hard metal. Machinability of the above alloys for the individual operations. (G17, T6n; Al-b, *Mg, Si, Mn, Cu*)

377-G. Carbide Grade Selection. Pt. 3. W. E. Montgomery. *Carbide Engineering*, v. 11, Sept. 1959, p. 18-21.

Review of machining operations, machine tool requirements and cutting tools. (G17, T6n, 6-69)

378-G. How to Spin Titanium. *Mill and Factory*, Sept. 1959, p. 127.

Use of a new hydraulically controlled lathe for hot spinning large Ti blanks with cast tools. (G13; Ti)

379-G. Cold Extruding Steel Alloys to Precision. Gilbert C. Close. *Modern Machine Shop*, v. 32, Oct. 1959, p. 126-129. (G5; ST)

380-G. Stripforming Tools. *Sheet Metal Industries*, v. 36, July 1959, p. 515-522.

Tooling arrangement for piercing, cropping, bending and forming of steel, brass, Cu or phosphor bronze strip. (To be continued.) (G-general; ST, Cu-b, Cu-n, 4-53)

381-G. Sheet-Metal Fabrication Practice in the American Aircraft Industry. Adolph Vlcek, Jr. *Sheet Metal Industries*, v. 36, July 1959, p. 523-525, 538.

Forming, heat treating and bonding. (G-general, J-general, K-general; ST, Ti, Al, 4-53)

382-G. (German.) Present Stage of Developments in the Cold Forging of Steel. D. Feldmann. *Draht*, v. 10, Aug. 1959, p. 397-398. (G5; ST)

383-G.* The Plasma Arc Torch. *Welding and Metal Fabrication*, v. 27, July 1959, p. 287-290.

Use of either wire or powder heated to temperatures up to 16,648° C. (G13, L29)

384-G.* (German.) Explosive Forming. Erwin O. Genzsch. *Industrieblatt*, v. 59, Aug. 1959, p. 383-385.

Explosive forming of Ti, stainless and high-strength steels, light metal and cast iron. Surface hardening with a propane-oxygen jet at 3000° C. and 60 m. per sec. discharge velocity, followed by quenching. (G-general, J2h; Ti, SS, AY, SGB-a, EG-a39, CI, NM-k34)

385-G.* Some Observations on the Shearing Process in Metal Cutting. S. Kobayashi and E. G. Thomsen. *Journal of Engineering for Industry (ASME Transactions, Series B)*, v. 81, Aug. 1959, p. 251-262.

Study of stresses in the work during machining. Analysis of shearing force on the shear plane, verified by correlation of shear stresses with static compression test data for low-carbon steel, Al alloy and alpha brass. The effect of strain rate on flow stress. (G17, G25, 3-68; CN-g, Al-b, Cu-n)

386-G.* Forming Metals at High Velocities. Pt. 2. T. C. DuMond. *Machine Production*, v. 18, Aug. 1959, p. 15-17.

Feasibility of explosion forming in regard to extruding, compacting, casting and forging. Special emphasis on application to precipitation hardening stainless steels such as 17-7PH and AM 350, many austenitic stainless grades and high Cr-Ni alloys, Ti, low-carbon steel, brass and Cu. (G-general, NM-k34; SS-e, Ti, CN, Cu-n, Cu)

387-G.* (Japanese.) Machinability of Metals. Hidehiko Takeyama. *Government Mechanical Laboratory, Report*, no. 31, Aug. 1959, 87 p.

Plastic deformation and machinability of Al, Cu, brass, mild steel and Ni-Cr steel are dependent on shearing, sharpness of tool and surface conditions of the

specimen. (G17k, Q24; Al, Cu, Cu-n, CN-p, CI, AY)

388-G. A Three-Dimensional Tool-Life Equation—Machining Economics. B. N. Colding. *Journal of Engineering for Industry (ASME Transactions, Series B)*, v. 81, Aug. 1959, p. 239-250.

Graphs for predicting machine tool wear from cutting speed, feed and depth of cut and thermal parameters of the metal being worked, based upon empirical data. (G17k)

389-G. Observations on the Angle Relationships in Metal Cutting. D. M. Eggleston, R. Herzog and E. G. Thomsen. *Journal of Engineering for Industry (ASME Transactions, Series B)*, v. 81, Aug. 1959, p. 263-279.

Determination of optimum tool angles for machining low-carbon steel, Al alloys and alpha brass. Two-dimensional stress analysis shows that none of present theories of tool action can explain these data. (G17, G25; CN-g, Al-b, Cu-n)

390-G. Recent Metal-Removal Developments With Compressed-Air Carbon-Arc Process. Myron D. Stepath, Homer B. Nelson and William J. Coughlin. *Welding Journal*, v. 38, Aug. 1959, p. 755-759.

Process consists of melting the metal to be gouged or cut with an electric arc and blowing away the molten metal with a high-velocity jet of compressed air parallel to the electrode. (G22h)

391-G.* (Swedish.) Deep Drawing Problems. Ake V. Larsson. *Metallen*, v. 15, no. 2, 1959, p. 43-54

Deep drawing of brass, Al and electrolytic Cu. Importance of blank diameter, radius of punch edge and grain size on quality. (G4b, 2-59, 17-51; Cu-a, Al, Cu, 4-53)

392-G.* (Swedish.) Bending of Aluminum Tubing and Profiles. W. Hegmann. *Metallen*, v. 15, no. 3, 1959, p. 83-97.

Various methods applied in bending. Tensile strength, elongation and hardness of an Al-Cu-Mg alloy as functions of the heat treating temperature. (G6, 2-64, 2-61; Al-b, *Cu, Mg*, 4-60, 4-57)

393-G. Explosive Forming by Pneumatic Machine. *Australasian Manufacturer*, v. 44, Sept. 12, 1959, p. 56, 58, 59.

Forming machine provides energy rates up to 1,500,000 ft-lb. to make extrusions and forgings to close tolerances with good surface finishes. (G-general, 1-52; NM-k34)

394-G. Machining Practices in Plastic Mold Making. E. J. Krabacher and P. A. Ropp. *Society of Plastics Engineers, 14th Annual Technical Conference*, v. 4, 1958, p. 286-303.

Machining high-strength die steels by electro-discharge and hot machining. (G19r, G24a; TS, NM-d30)

395-G. Machining Nimonic. G. A. Streets. *Machinery (London)*, v. 95, Sept. 30, 1959, p. 633-638.

Practical aspects of machining the Nimonic range of Ni alloys. (G17; Ni-b)

396-G. Metal-Cutting Research Determines Tooling and Machining Methods. K. W. Stalker. *Metalworking*, v. 15, Oct. 1959, p. 10-17.

Tool-life curves on high-strength, high-temperature alloys. (G17, T6n; SGA-h, SGB-a)

397-G. Tool and Machining Specifications for High-Strength and High-Temperature Alloys. J. F. McAuliffe and S. W. Lovejoy. *Metalworking*, v. 15, Oct. 1959, p. 18-20.

Recommended tool design, cutting rate and selection of tool materials. (G17, T6n; 17-51, SGA-h, SGB-a)

398-G. Machinability Research Aids High-Temperature-Alloy Selection and Use. Harry S. Wharen. *Metalworking*, v. 15, Oct. 1959, p. 21-22.

Importance of machinability in selecting alloys. (G17k; SGA-h)

399-G. Heat Treating Affects Tool Selection in Machining Ultra-Strength Tool Steel. Thomas A. Dickinson. *Metalworking*, v. 15, Oct. 1959, p. 23-24.

Heat treating may permit machining ultra-strength steels in the softened condition when they cannot be machined in the hardened condition. (G17, J-general; SGB-a)

400-G. Choosing Forming Methods for the New Metals. Harold R. Daniels. *Metalworking*, v. 15, Oct. 1959, p. 120-125.

Forming techniques for W, Mo, Ta, Cb, Ti, Be, ultra-strength steel and superalloys. (G-general; W, Mo, Ta, Cb, Ti, Be, SGA-h, SGB-a)

401-G.* (German.) Forming Problems in Die Pressing of Cast Iron. P. Gurner. *Maschinenmarkt*, v. 65, Aug. 1959, p. 29-33.

Grouping of burr formations in the dies, optimum temperatures, preforming of the dies and production conditions. (G1, W24n; CI)

402-G.* (German.) Quality Control in the Deep Drawing Process. C. Bohne. *Maschinenmarkt*, v. 65, Aug. 1959, p. 46, 51.

Main control techniques consist of hardness and bend testing, microscopic texture control, cupping, deep drawing and expansion tests. Imperfections and defects in texture of cold rolled and annealed sheets. (G4b, Q23, 1-54; 4-53, 9-71)

403-G.* (German.) Arc Cutting of Aluminum With the Gas Shielded Arc Process. L. Gajdos. *Periodica Polytechnica (Budapest)*, v. 3, no. 2, 1959, p. 169-187.

Al is easily arc cut with a tungsten electrode under a gaseous stream. Principal variables are density, gas volume and composition, cutting velocity, arc length and electrode diameter. (G22h; Al)

404-G.* Machining Titanium. Pt. 4 and 5. Bennet V. Whiteson. *American Machinist*, v. 103, Sept. 7, 1959, p. 149, 151.

Tool materials and geometry; machine settings for removal of scale of forging skin for rough turning, for interrupted cutting, semifinish turning and finish turning of Ti and Ti alloys. (G17a; Ti-b)

405-G.* (Dutch.) Weld Joints Prepared by Flame Cutting. C. A. Feytel. *Lastechniek (NVL)*, v. 25, Sept. 1959, p. 215-217.

Flame cut edges for I, V, Y, X and K groves. (G22g)

406-G.* Rubber Forming. J. E. Broderick. *Metal Progress*, v. 76, Oct. 1959, p. 105-108.

Application of the Guerin, impact rubber forming and the Wheelon processes. (G14a)

407-G.* Chemical Milling. J. L. Gault, C. C. Shepherd and H. H. Muller. *Metal Progress*, v. 76, Oct. 1959, p. 108-111.

Applications of chemical milling to airframe designs. The process is most advantageously used when a part has complex contours, complex milled patterns, when very tough or hard alloys are used, when thin sections are required, and when a great deal of metal is removed over a wide area to a shallow depth. (G24b, T24a)

408-G.* Metal Spinning. *Metal Progress*, v. 76, Oct. 1959, p. 118-121.

Pressure forming of metal on a rotating chuck or die. The forming is done by application of pressure by a roller or spinning tool on the metal piece while it is being rotated in a spinning lathe. Two basic types are conventional spinning and displacement spinning. (G13)

409-G.* Cold Extrusion. Elliot J. Epner. *Metal Progress*, v. 76, Oct. 1959, p. 122-125.

Steel parts which are ideal for production by cold extrusion are in the range of 2 to 15 lb.; diameter 1 to 6 in. O.D. and up to 4 in. I.D.; and length up to 20 in. In individual instances, parts both smaller and larger can be made. (G5; ST)

410-G.* Contour Rolling. *Metal Progress*, v. 76, Oct. 1959, p. 125-127.

Process combines advantages of conventional rolling and extruding to produce varied configurations over relatively large areas. Parts made by this method exhibit desirable grain flow characteristics and material distribution advantages while machining operations are minimized or eliminated. (G11)

411-G.* Carbon and Alloy Steels. *Metal Progress*, v. 76, Oct. 1959, p. 140-143.

Cold heading and cold extrusion; warm heading; developments in carbon electrical steels; finishes. (G10, G5, 1-67; CN, AY)

412-G.* Impact Extrusion. *Metal Progress*, v. 76, Oct. 1959, p. 127-128.

Impact extruders have progressed from soft alloys to hard alloys and to other metals. In Al impact extrusions, mechanical properties exceed those obtained by forging plus the added advantage gained by cold working. Since the grain flow lines of an impact follow the contour of the finished shape, impacts are stronger than drawn or cast part or parts machined from rod and bar. (G5; Al)

413-G.* Beryllium Copper. Pt. 1. Working, Machining and Joining. G. Fitzgerald-Lee. *Metal Treatment and Drop Forging*, v. 26, Sept. 1959, p. 317-322.

Melting, pouring and casting procedures; methods of hot and cold working; lubrication during cold working; machinability and joining processes. (G-general, F-general, E-general, K-general; Cu-b, *Be*)

414-G.* Tube Bending. J. E. Hawking. *Metal Progress*, v. 76, Oct. 1959, p. 102-105.

Typical current bending applications include stainless steel tubing, 8 in. in diameter, with a wall thickness of 0.020 in., bent for use in modern jet aircraft. High-pressure steam boiler tubes, 2.75 in., with thinning of the outer wall held to 5% or less. Use of hydraulic bending presses. (G6; SS, 4-60)

415-G. New Forming Process—"Intraforming"— by Cincinnati Milling. *Machine Production*, v. 18, Sept. 1959, p. 30, 32.

"Chipless machining" consists of cold forming cylindrical workpieces, such as tubes or rings, to obtain profiles on the inside diameter. (G17)

416-G.* An Electrolytic Jet Machining Technique for the Production of Thin Foils of Steel. P. M. Kelly and J. Nutting. *Iron and Steel Institute, Journal*, v. 192, July 1959, p. 246-248.

New method allows controlled reduction of the thickness of metal sheet without destruction or modification of the metal structure. Process involves use of a jet of electrolyte composed of three parts concentrated HCl and one part aqueous solution of $CuCl_2$. A small amount of mechanical cutting and grinding precedes the actual jet process. (G24d; ST, 4-56)

417-G.* Machinability of Sintered Iron. Roy S. Jamison and Ernst Geijer. Paper from "General Session on Powder Metallurgy". 15th Annual Meeting. Metal Powder Industries Federation, New York 17, 1959, p. 82-93.

The tear point seems to be of more interest than the actual surface finish. Copper, phosphorus and sulphur have a beneficial hardening effect which moves the tear point to higher feed rates. Small sulphur or large copper additions improve tool life, while phosphorus additions are detrimental. (G17k, 2-60; Fe, 6-71, *S, Cu, P*)

418-G. The Principles of the Modern Arc Torch. R. Gage. *Welding Journal*, v. 38, Oct. 1959, p. 959-962.

Basic designs of modern arc-plasma jet for cutting Al properties, advantages, physical principles and voltage gradients of arc constricting nozzles. Arc temperatures and operational variables. 6 ref. (G13, G22b; Al-b)

419-G.* How to Minimize and Control Residual Machining Stresses. Robert D. Halverstadt. *American Machinist*, v. 103, Oct. 19, 1959, p. 137-144.

Proper heat treatment and machining minimize residual stresses caused by thermal transformation and mechanical effects. Such stresses affect dimensional stability and fatigue strength and can be detected by distortion of parts, mechanical relation, X-ray diffraction and stress-corrosion. (G17, Q25h, 2-64)

420-G. Applications of Cutting and Welding Processes. E. C. Alexander and J. D. Nicol. Union Carbide Nuclear Co. *U. S. Atomic Energy Commission*, Report no. KY-315, Oct. 9, 1959, 10 p. (Available from U. S. Office of Technical Services, Washington, 25, D. C.) $ .50.

Copper clad steel sheets economically cut to size by utilizing a tungsten inert-gas cutting process eliminates need of chipping Cu from cutting line prior to cutting operation. Welding time is reduced 50% by a semi-automatic short-arc process using metallic inert-gas torch in making root pass in steel pipe. (G22h, K1a; ST, *Cu*, 8-66)

421-G.* (French.) Machinability of Metals. *Trempe*, no. 36, Sept. 1959, p. 52-55.

Rating of 36 A.I.S.I. steels and 19 nonferrous metals and alloys. Standard of reference is A.I.S.I. steel B1112. AFNOR equivalents are given for A.I.S.I. designations. (G17k; ST, SS, Zn, Al-b, Cu, Cu-n, Cu-s, Ni)

422-G.* Low-Cost Chemical Milling Shapes Honeycomb Cores. *Iron Age*, v. 184, Oct. 29, 1959, p. 122-123.

Chem-Mill technique, developed by Norair Division, Northrop Corp., Hawthorne, Calif., by which Al can be held to 0.003 in. and stainless steel parts to 0.002 in. (G24b; Al, SS)

423-G.* Remedy Roll Grinding Woes. H. E. Balsiger. *Iron Age*, v. 184, Oct. 29, 1959, p. 132-134.

Recommended step-by-step procedures for the grinding of rolls with commercial, semifinish, and ultrafinish surfaces. (G18, W23k)

424-G. (Russian.) Machining of Titanium With CO_2 Refrigeration and Metallurgical Use of Titanium Shavings. M. A. Makhatadze and G. A. Aladashvili. *Tsvetnye Metally*, no. 2, 1959, p. 75-78.

6 ref. (G17, R1h, A8d; Ti)

425-G.* Experimental Investigation of Chip Formation and Resulting Theoretical

and Practical Considerations. F. Eugene. *Microtecnic*, v. 13, June 1959, p. 113-119.
Yield point of the machined material determines chip thickness. Elastic deformation energy in the cutting of steel is higher than plastic deformation energy. 4 ref. (G17, G25, Q24, Q23; ST)

426-G.* Causes of Machinability Divergences in Steels. Weill. *Microtecnic*, v. 13, June 1959, p. 133-142.
Mechanical properties due to composition and heat treatment in relation to machinability. Built-up edge of cutting tool is a significant factor. 7 ref. (G17k, 2-60, 2-64; SS, AY, CN)

427-G. Behavior of Ceramic Cutting Tools When Applied in Cutting Cast Iron. J. L. Remmersmaal. *Microtecnic*, v. 13, June 1959, p. 126-132.
(G17, Q9n, T6n; Ti, 6-69, CI)

428-G. Spark Machining—Today's Top New Process. *Plant Administration*, July 1959, p. 48-50.
Cuts through tough carbides or performs delicate die sinking with ease. (G24a)

429-G.* Cold Extrusion of Steel. F. G. Witteman. *Precision Metal Molding*, v. 17, Nov. 1959, p. 43.
Cold extrusion processes are essentially "chipless" and considerable savings can be affected in material losses. Where secondary machining operations are necessary, such as reaming, boring, tapping, threading and broaching, there is less metal removal because of much closer tolerances. Higher metal cutting rates are normally attained, especially in low carbon steels, due to the effect of cold working. (G5; ST)

430-G. A Photoelastic Analysis of Machining Stresses. E. Usui and H. Takeyama. *American Society of Mechanical Engineers*, Paper no. 59—A-37, 1959, 5 p.
Orthogonal machining tests using a tool of epoxy resin for the analysis of the distribution of strain on rake face. (G17, G25)

431-G. Machining 'R' Monel Alloy on Bar Automatics. E. L. Fowler. *Automatic Machining*, v. 20, Oct. 1959, p. 40-45.
Optimum procedures for machining Ni-Cu alloy. (G17, Ni-b, *Cu*, SGA-g)

432-G. What Shapes Can Be Extruded? *Precision Metal Molding*, v. 17, Nov. 1959, p. 46-53.
Examples of solid, hollow and impact Al extrusions; extruded brass, steel and Ni-Ag shapes. (G5; Cu-n, ST, Al)

433-G. Superalloy Machining Gets Boost From Cavity-Sinking Setup. *Iron Age*, v. 184, Nov. 12, 1959, p. 166-167.
Process for drilling into the surfaces of superalloys operates on the electrolytic metal-removal principle. Direct current flows between the workpiece and the electrode through a water-base electrolyte solution. Metal from the workpiece is removed simultaneously. (G24d; SGA-h)

434-G. Machining With Ceramic Tools at the Works of Alvis, Ltd. *Machinery (London)*, v. 95, Oct. 7, 1959, p. 692-694.

452-G.* Method Choice Whips "Can't Be Done" Job. *Metalworking*, v. 15, Nov. 1959, p. 12-13.

Machining methods and tools developed for very soft (90 Brinell) Mirromold steel. (G17, W25; ST-f, *Mn, V*)

453-G.* Galvanized Steel Selected for Forming. *Metalworking*, v. 15, Nov. 1959, p. 80-81.

Techniques used for resistance welding, rolling, deep drawing and other severe forming operations used in appliance manufacturing. (G-general, K3; ST, *Zn*, 8-65, 4-53)

454-G.* (English.) A Comparison of Boundary Lubricants Under Light and Heavy Loads. P. R. Lancaster and G. W. Rowe. *Wear*, v. 2, Oct. 1959, p. 428-437.

Experimental study of the lubrication of steel bars during the slow drawing process. Heavy loads up to 10 tons involve dies of high entry-angle to avoid hydrodynamic contribution. Good boundary properties are required from the lubricant to be effective on grit-blasted surfaces. 4 ref. (G4, G27, Q9n, Q9p; ST, NM-h, 4-55)

455-G. (Book.) The Fabricator's Handbook. 162 p. 1959. Crucible Steel Co. of America, Oliver Bldg., Melon Sq., Pittsburgh 22, Pa.

Methods for forming, machining, joining, heat treating and finishing most grades of stainless steel. Mechanical properties, corrosion resistance and gage and weight for different shapes. (G4b, G9, G13, G17, J-general, K-general; SS)

456-G. (Book.) Practical Design of Sheet Metal Stampings. Federico Strasser. 175 p. 1959. Chilton Co., Book Div., Philadelphia 39, Pa. $10.

Details of stamping design and special problems in metal stamping. (G3, 4-59, 17-51)

457-G. (Book-Russian.) Operating Conditions for Cutting With Ceramic Tools: Turning and Milling. D. V. Mikhaylov, Editor. 49 p. 1958. Mashgiz, Moscow. (Available from Library of Congress, Washington, D. C.).

Machining data on various steels and cast iron. Tools, tool shape, speeds and feeds. (G17k, T6n; ST, CI)

458-G. (Translation—AIP.) Investigation of Ultrasonic Cutting Mechanism by Means of High-Speed Photography. L. D. Rosenberg and V. F. Kazantsev. *Machines and Tooling*, v. 30, no. 5, 1959, p. 20-22.

Physical processes by which abrasive strikes the work surface in sonic cutting investigated by stopping motion with high-frame speed photographs. (G24)

459-G. (Translation—PERA.) Investigation of Ultrasonic Cutting Mechanism by Means of High-Speed Photography. L. D. Rosenberg and V. F. Kazantsev. *Machines and Tooling*, v. 30, no. 5, 1959, p. 20-22.

Physical processes by which abrasive strikes the work surface in sonic cutting investigated by using a stopping motion with high-frame speed photographs. (G24)

SECTION H

POWDER METALLURGY

1-H.* (Russian.) Sintering of Fe-Ni-Al Base Cermets. A. B. Altman. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 456-465.

Three stages in this process: (1) reducing oxides, increasing of contact area between pressed particles; (2) mutual solution of particles, precipitation hardening of the resulting solid solution and growth of the compact; (3) homogenization and precipitation hardening of the solid solution, growth and shrinkage of the compact. There is no reason to attribute the remarkable shrinkage of the Fe-Ni-Al alloys to formation of a liquid phase during the process. 17 ref. (H15n; Al, Fe, Ni, 6-70)

2-H. Alumina-Base Cermets. Pt. 5. J. G. Stradley and T. S. Shevlin. Ohio State University Research Foundation. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151143, Feb. 1958, 15 p. $.75.

Noncombustible helium-hydrogen atmosphere produced compact, nonporous cermet specimens with fired properties equal to or better than the metal alone. Solid solutions of Al_2O_3-Cr_2O_3 and Al_2O_3-NiO spinels were combined with iron and their physical properties studied. Secondary oxides Cr_2O_3 and NiO were reduced and alloyed with the original metal. (H-general; Al, Fe, 6-70)

3-H. Sintering Method for Semiconductor Material. Gerhart K. Gaule, James T. Breslin and John R. Pastore. *Review of Scientific Instruments*, v. 29, July 1958, p. 565-567.

Sintering process which makes it possible to utilize semiconductor material which comes in the form of small grains of small dendrite-like pieces. When pressure, alternating current, and an r-f. field are applied, this loose material is sintered into rods without using a binder. These rods are used as "feed" for a floating zone apparatus. (H15; Si, EG-j)

4-H.* Pressing and Sintering Characteristics of Certain Copper and Tin Powder Mixes. G. R. Bell, F. B. Webb and R. Woolfall. *Metallurgia*, v. 58, Nov. 1958, p. 233-241.

Manufacture of Cu powders by atomizing, having apparent densities as low as 2.1 g. per ml. Pressing and sintering properties of this type of powder in comparison with two electrolytic Cu powders when mixed with 10% tin powder. Atomized powder is an entirely satisfactory substitute for electrolytic powder. (H10f, H14, H15; Cu, 6-68)

5-H.* (Rumanian.) Experimental Studies on Methods of Obtaining Porous Iron for Bearings. G. Dan. *Studii si Cercetari de Metalurgie*, v. 1, July-Dec. 1956, p. 325-337.

Fine electrolytic iron powder containing about 8% iron oxides is used. Powder was reduced in a current of hydrogen, mixed with 1% glycerine (as a binder) and pressed into cylindrical molds (with a diameter equal to, or greater than, the height) with a pressure of 4 tons per sq. cm. 7 ref. (H-general, T7d; Fe)

6-H. Who Uses Sinterings. *Precision Metal Molding*, v. 16, Nov. 1958, p. 24-27.

Properties and applications. Some advantages exist over castings. (H-general; 6-72, 17-57)

7-H. Hafnium Metal Powder by the Hydride-Dehydride Process. R. N. Honeyman and C. T. Waldo. Knolls Atomic Power Laboratory. U.S. Atomic Energy Commission, KAPL-1929, May 6, 1958, 13 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $.75.

Upon completion of the hydriding process, the furnace is cooled from 700° C. to room temperature and the system purged with He. The hafnium hydride (HfH_2) is removed from the furnace under He atmosphere. The powder hydride is placed in a Mo or stainless steel boat and removed from the dry-box to the dehydriding furnace. Approximately 8 lb. of Hf powder are dehydrided at one time. 5 ref. (H10c; Hf)

8-H. International Powder Metallurgy. Glossary. *Metal Powder Report*, v. 13, no. 2, Oct. 1958, 3 p.

Definitions are founded on those drawn up by the American Society for Testing Materials and incorporate modifications suggested by various other authorities. (H-general, 11-67)

9-H. (German.) Powder Metal Bearing and Friction Materials. Friedrich Eisenkolb. *Abhandlungen der Deutschen Akademic der Wissenschaften zu Berlin*, no. 3, 1958, p. 5-24.

Manufacture of sintered Fe and Cu parts. Use of sintered metals for bearings and piston rings. Bearing materials on a metal-graphite base. Brake and clutch linings. 15 ref. (H-general; Fe, Cu, SGA-c)

10-H. (Translation-Brutcher, 4393.) Dilatometric Study of Physico-Chemical Phenomena of Sulphurizing Process. T. P. Gilman. *Metallovedenie i Obrabotka Metallov*, Oct. 1958, p. 33-36.

Iron-ceramic samples with varying sulphur content aimed at finding what effect different S quantities have on baking temperature, on volumetric changes and finding the critical points of phase and structural changes during sintering. Baking powdered Fe with S produces FeS, which is shown by changes in dilatometric curves. To obtain a sulphide film on parts, sulphurizing of hardened work piece can be carried out at 180-200° C., thus combining sulphurizing with tempering. (H15, L15; Fe, S, 6-70)

11-H.* A Review of the Development of Cermets. G. C. Deutsch, A. J. Meyer, Jr., and G. M. Ault. *North Atlantic Treaty Organization Advisory Group for Aeronautical Research and Development*, Report no. 185, Mar-Apr. 1958, 23 p.

Elevated-temperature strength, thermal shock resistance, ductility and impact strength of representative cermets in relation to jet engine and turbine blade applications. 25 ref. (H-general, Q-general, T24b; SGA-h, 6-70, 17-57)

12-H. Fundamentals of Sintering. Pt. 3. A. L. Pranatis, L. S. Castelman and L. Seigle. Sylvania Electric Products. *U. S. Atomic Energy Commission*, SEP-250, June 30, 1958, 30 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.

Influence of presence of grain boundaries on rates of sintering of Ni, Cu and Fe wire-wound compacts. In Fe compacts sintered in the alpha range, surface diffusion appears predominant and no grain boundary effect is evident. Sintering of Cu and Ni compacts at temperatures close to their respective melting points apparently occurs by volume diffusion but with varying grain-boundary effects. 17 ref. (H15, N1; Ni, Cu, Fe)

13-H.* Furnace Sintering of Metals and Ceramics. Pt. 2. R. L. Harper. *Industrial Heating*, v. 25, Dec. 1958, p. 2446, 2448, 2450, 2452, 2454.

Sintering stainless steel powders, Mo and Ta carbides, Ti and Zr powders, powder rolled products. (To be continued.) (H15, W26e; SS, Ti, Zr, Mo, Ta)

14-H. Design Parameters for Cermets. John C. Redmond. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services*, PB 131783, D. C., p. 70-87.

Tests for determining properties of TiC compositions including density, hardness, tensile and stress-to-rupture data. Test methods are applicable to temperatures in excess of 1800° F. (H11, Q-general; Ti, C, 6-70, 17-51)

15-H.* Factors Affecting Sintering. L. L. Seigel and A. L. Pranatis. Paper from "Powder Metallurgy in Nuclear Engineering". American Society for Metals, 1958, p. 10-30.

At least four material-transport processes operate during the sintering of a powder compact — evaporation and condensation, surface diffusion, volume

diffusion and bulk flow. As particle size is decreased and the ratio of surface area-to-volume increased, surface diffusion becomes relatively more important as a material-transport process. Volume-diffusion is the rate-controlling process in all but the initial stages of sintering of normally sized particles of nonvolatile metals and oxides. 42 ref. (H15, N1)

16-H.* Preparation of Metal Powders for Reactors. P. Chiotti and H. A. Wilhelm. Paper from "Powder Metallurgy in Nuclear Engineering". American Society for Metals, 1958, p. 31-50.

Preparation of U powder by reduction of uranium oxides with Ca, Mg or calcium hydride; reduction of uranium halides with K, Na, Mg or Ca; or electrodeposition from fused salts. Similar processes for the preparation of Th powders. 39 ref. (H10c, T11; U, Th, *Ca, Mg, K, Na*)

17-H. Powder Metallurgy of Zirconium and Beryllium. Harold H. Hirsch. Paper from "Powder Metallurgy in Nuclear Engineering". American Society for Metals, 1958, p. 51-72.

Full-density bodies are prepared from Be powder by a variety of processes including hot pressing, warm pressing, cold pressing followed by sintering and pressing and by warm or hot working. Powder preparation, consolidation techniques and properties for Zr. 23 ref. (H-general; Zr, Be)

18-H.* Powder Metallurgy of Uranium. Henry H. Hausner and John L. Zambrow. Paper from "Powder Metallurgy in Nuclear Engineering". American Society for Metals, 1958, 73-81.

Powder production, compacting and sintering techniques. U prepared by hot pressing is high in hardness and tensile strength and low in ductility. The hardness corresponds approximately to that of hot rolled beta-annealed specimens. Special heat treatments of the sintered product are necessary to increase ductility and to lower hardness. 4 ref. (H-general; 2-64)

19-H. Powder Metallurgy of Thorium. W. W. Beaver and K. G. Wikle. Paper from "Powder Metallurgy in Nuclear Engineering". American Society for Metals, 1958, p. 82-119.

Direct reduction of ThO_2, ThF_4, and $ThCl_4$ by a reactive alkaline metal such as Ca, Na, or K and reduction of $ThCl_4$ or ThF_4 electrolytically in a molten salt bath. Th powders can be compacted at room temperature to a high degree of densification, especially under high pressure. The pressure required for densification is dependent on the type of powder, particle size, purity, die lubrication and the size and shape of the compact. 32 ref. (H10c, H11, H14; Th)

20-H.* Alloying by Powder Metallurgy. H. A. Saller and F. A. Rough. Paper from "Powder Metallurgy in Nuclear Engineering". American Society for Metals, 1958, p. 120-140.

Alloying has been practiced in the reactor field in the metallurgy of Zr and U alloys and of various metal-compound composites or cermets. The preparation of bimetallic reactor components, such as U-containing fuel elements, is limited by the alloying behavior of U. 37 ref. (H12n, Zr-b, U-b, 2-60)

21-H.* Uranium Alloys by Powder Metallurgy. Herbert S. Kalish. Paper from "Powder Metallurgy in Nuclear Engineering". American Society for Metals, 1958, p. 141-148.

Mo is one of the most beneficial addition elements from the standpoint of enhancing the densification of U during sintering and also for controlling grain size. Cb gives good densification and even finer as-sintered grain size. Si is not as good as Mo or Cb, but due to its low cross section is an attractive addition element. The 1.0% Cr and 2 to 5% Zr alloys are promising. (H-general, 2-60; U; *Mo, Cb, Si, Cr, Zr*, 2-60)

22-H.* New Methods of Powder Metallurgy. W. D. Manly and J. H. Coobs. Paper from "Powder Metallurgy in Nuclear Engineering". American Society for Metals, 1958, p. 165-179.

Techniques used in the fabrication of components for nuclear reactors include powder rolling, electrophoresis, extrusion, cold pressing and sintering combined with cladding by hot working, hot pressing, infiltration and hot coining. 7 ref. (H-general, T11g)

23-H.* Uranium Dioxide as a Nuclear Fuel Material. Henry H. Hausner and R. G. Mills. Paper from "Powder Metallurgy in Nuclear Engineering". American Society for Metals, 1958, p. 207-223.

Fabrication of UO_2 powders into finished shapes can be accomplished by any conventional ceramic technique. UO_2 can be cold compacted either in a steel die or

hydrostatically, slip cast, extruded or hot pressed. These methods are normally followed by sintering to obtain desired density, strength and other properties. 15 ref. (H14, T11g; U, O)

24-H.* Mechanical Filter Transducer Wire and Resonator Disks by Powder Metallurgy. W. E. Whittington. Paper from "Proceedings of the 14th Annual Meeting". Metal Powder Assoc., New York, 1958, p. 9-18.

Mechanical bandpass filters are devices used in electronic circuitry. A 45% Ni, Fe-Ni alloy compact is sintered 100 hr. at 2200° F. Following prolonged purification-homogenization sintering, compacts are rolled and drawn into required diameters of wire by standard methods. (H15, T1c; Fe, Ni)

25-H.* Effect of Sintering Atmospheres on the Properties of Sintered Iron Compacts. E. P. Kawasaki. Paper from "Proceedings of the 14th Annual Meeting". Metal Powder Assoc., New York, 1958, p. 23-31.

Four compositions are investigated: Fe, Fe with 7% Cu, Fe with 3% Cu with 1% C, Fe with C. Highest tensile strengths are obtained by sintering in a carburizing atmosphere with endo or scrubbed and dried exo gas. Carburizing atmospheres reduce the elongation characteristics of compacts. (H15q; Fe, Cu, C)

26-H.* Application of the Endothermic Atmosphere Generator to the Sintering of Powder Metallurgy Parts. Norbert K. Koebel. Paper from "Proceedings of the 14th Annual Meeting". Metal Powder Assoc., New York, 1958, p. 42-46.

The atmosphere produced by the generator is ideally suited for sintering Fe powder compacts since not only does the atmosphere contain 60% of reducing constituents, but also the carbon monoxide content makes it possible to produce an atmosphere with a controlled carbon potential. (H15q; Fe)

27-H.* Frontiers of Powder Metallurgy in the U.S.S.R. Claus G. Goetzel. Paper from "Proceedings of the 14th Annual Meeting". Metal Powder Assoc., New York, 1958, p. 47-54.

Basic research programs; processing and testing techniques; powder metallurgy of Be and Ti; refractory metallurgy; cermets, intermetallics and dispersion alloys. (H-general; Be, Ti)

28-H.* Slip Casting of Metal Powders. Henry H. Hausner. Paper from "Proceedings of the 14th Annual Meeting". Metal Powder Assoc., New York, 1958, p. 79-90.

Preparation, pouring and molding of slip mixture. Properties of the slip before and after sintering depend on the liquid-to-metal ratio and type and amount of the deflocculant. Particle size distribution of the deflocculant. Particle size distribution and apparent density for Type-316 stainless steel powder. (H14; H11; 6-70)

29-H.* (French.) Application of Equilibrium Halogenated Reducing Atmospheres in Powder Metallurgy. Ph. Galmiche and A. Hivert. *Revue de Metallurgie*, v. 55, Oct. 1958, p. 907-917.

Surface protection of dies used in powder metallurgy and extruding with an atmosphere of chromium fluoride. Cr coating of iron particles by addition of Cr powder. Treatment of Cr powder in a halogenated atmosphere to increase plasticity. 9 ref. (H-general; Fe, Fe-b, Cr, F, Cl, Br)

30-H. Hydrogen and Dissociated Ammonia for Sintering. M. Robert Ogle. Paper from "Proceedings of the 14th Annual Meeting". Metal Powder Assoc., New York, 1958, p. 32-36.

Application of highly reducing furnace atmosphere gases. (H15q)

31-H. Exothermic and Purified Exothermic Atmospheres for Sintering. H. M. Webber. Paper from "Proceedings of the 14th Annual Meeting". Metal Powder Assoc., New York, 1958, p. 37-41.

Rich exothermic gas is used for sintering various materials such as bronze, Ag and Fe, although CO_2 and moisture content are such that it is still considered unsuitable for some powdered metal parts. (H15q; Ag, Fe, Cu-s)

32-H.* General Metallurgical Problems in the Design of Nuclear Power Reactors. Vincent P. Calkins. Paper from "Powder Metallurgy in Nuclear Engineering". American Society for Metals, 1958, p. 1-9.

Problems are centered on physical and mechanical property requirements, nuclear property requirements, corrosion limitations and radiation damage phenomena. Powder-metallurgy structures of fuel elements, moderators and controls can be wholly stable over useful temperature ranges, even though in some cases they might be thermodynamically unstable and

completely lose all their desirable properties if heated to temperatures approaching those required for melting and casting consolidation. 7 ref. (H-general, T11, 17-57, 2-67)

33-H.* Metal-Powder Rolling. Samuel Storchheim. Paper from "Powder Metallurgy in Nuclear Engineering". American Society for Metals, 1958, p. 180-192.

Process has many advantages — unique properties can be obtained with very fine grains; rolled sheets have no crystallographic orientation; purer sheet can be obtained than by conventional techniques; metal strip can be clad on one or both sides by using it as a carrier of the chosen powder through the rolls; a larger percentage of any scrap material reclaimed in powder form can be made into strip, rod and wire more cheaply than by conventional techniques. (H14j)

34-H.* Fundamentals of Powder Metallurgy Lecture. A New Viewpoint of Sintering. Frederick N. Rhines. Paper from "Proceedings of the 14th Annual Meeting". Metal Powder Assoc., New York, 1958, p. 91-101.

The driving force of the geometric changes that constitute sintering originates in the surface tension. Geometric changes that result in reduced surface area are densification of the powder mass, rounding and smoothing of the surface contours, isolation of the connected porosity into individual pores and segregation of the unfilled space into fewer though larger pores. (H15)

35-H. (Book.) Powder Metallurgy in Nuclear Engineering. 275 p. 1958. American Society for Metals, 7301 Euclid Ave., Cleveland 3, Ohio, $8.50.

Proceedings of Conference on Powder Metallurgy in Atomic Energy, Oct. 20, 1955, in Philadelphia under joint sponsorship by U.S. Atomic Energy Commission and American Society for Metals. Papers abstracted separately. (H-general, T11)

36-H. (Book.) Proceedings of the 14th Annual Meeting of the Metal Powder Association. 125 p. 1958. Metal Powder Assoc., 130 W 42nd St., New York 36, N. Y.

Meeting held Apr. 21-23 at Philadelphia. Papers abstracted separately. (H-general)

37-H. (Translation—Brutcher no. 4415.) Sintering of Columbium Powder. O. P. Kolchin and N. P. Chuveleva. *Tsvetnye Metally*, v. 13, no. 12, 1957, p. 65-70.

Variation with sintering temperature of electrical resistivity, hardness, density, weight and percentage of foreign elements in Cb powder compacts. (H15, H11; 6-72; Cb)

38-H. Ultrafine Al Bids for Markets. *Chemical and Engineering News*, v. 37, Jan. 19, 1959, p. 53-54.

Al powder, average particle size 0.03 micron, is possible fuel for rockets. (H-general; Al, RM-j)

39-H.* Slip Casting. Chalmers Dale. *Ordnance*, v. 43, Jan-Feb. 1959, p. 678-680.

Process variables include density of the liquid slip, type and amounts of deflocculant, ratio of liquid to solid, viscosity and pH value of the slip, reaction of the metal powder with the deflocculant and liquid, slip temperature, moisture content and porosity of the mold and rate of drying after separation. (H-general)

40-H.* New Powder Metallurgy Applications in the Metal Cutting Field. Horace Frommelt. Paper from "Proceedings of the 14th Annual Meetings". Metal Powder Assoc., New York, 1958, p. 5-8.

Dampening of vibrations induced in cutting tools, both single and multi-edged, by the use of powder metal bodies for single point and milling cutters. Application of carbide inserts. (H-general, T6n; 17-57, 6)

41-H.* Production of Nuts and Washers From Brass Powder. Philip V. Tarr. Paper from "Proceedings of the 14th Annual Meeting". Metal Powder Assoc., New York, 1958, p. 107-111.

Sintered brass nut is produced to reasonable tolerances, and maintains "as-sintered" an average ultimate tensile strength of 30,000 psi. Tests are outlined for ductility, malleability and ultimate axial sustaining load strength. (H-general; T7f; Cu-n, 6-72)

42-H.* Hot Forming Techniques for Consolidating Metal Powders. Harold H. Hirsch. Paper from "Proceedings of the 14th Annual Meeting". Metal Powder Assoc., New York, 1958, p. 112-125.

The best mechanical and physical properties attainable from metal powders are achieved through hot compaction methods. Advantages of hot forming include high density; possibility of producing large and often complicated shapes; beneficial effects on microstructure; brittle, nonductile

materials can be made to flow plastically at high temperatures to produce dense structures, not otherwise attainable. (H14h)

43-H.* Powder Metallurgy of Nuclear Materials. Henry H. Hausner. Digest from "Powder Metallurgy at the Atoms-for-Peace Conference", A.I.M.E. Powder Metallurgy Committee. *Metal Progress*, v. 75, Jan. 1959, p. 144, 146, 148-150.

Powder metallurgy production of U for fuel rods, Th powder metallurgy, co-reduction of oxides, uranium carbides, plutonium cermets. (H-general; U, Th, Pu, *C, Si, Be*)

44-H. Metal Parts for Operating at Higher and Higher Temperatures. D. A. Robins. *Metal Progress*, v. 75, Jan. 1959, p. 84-86.

Several hundred experts in the field of powder metallurgy gathered at Reutte, Austria, in June to discuss "High-Melting Metals, Their Manufacture, Properties and Applications". Columbium, molybdenum, tungsten, tantalum appear to hold most promise for the future. (H-general; EG-d37, Cb, Mo, W, Ta)

45-H. (German.) Powder Metallurgy of Boron Carbide. K. Adlassnig. *Plansee-berichte fur Pulvermetallurgie*, v. 6, Dec. 1958, p. 92-103.

Survey on methods of pressure and pressureless sintering; properties of compacts; methods for improving properties; applications. 30 ref. (H15n; B, C, NM-a35)

46-H. (Czech.) Production of Iron Powder. Jaroslav Kubelik. *Hutnicke Listy*, v. 13, Dec. 1958, p. 1129-1131.

Comparison of different powder production methods—grinding of wire shot, spraying of liquid steel or cast iron and reduction of iron oxides. 6 ref. (H10; Fe, ST)

47-H.* (Czech.) Production of Lead Bronze Bearings by Powder Metallurgy. Zdenek Ministr. *Hutnicke Listy*, v. 13, Dec. 1958, p. 1132-1137.

Mixtures of powdered Cu and Pb with different composition ratios were pressed at 1 to 4 tons per sq. cm. pressures and sintered at 800 to 900° C. in a hydrogen atmosphere to determine the best conditions for the manufacture of bearings. 26 ref. (H-general, T7d; Cu-b, *Pb*, 17-57)

48-H.* (Russian.) Sintering of Metallic Powders at Constant Heating Rate. Ya. E. Geguzin. *Fizika Metallov i Metallovedenie*, v. 6, no. 4, 1958, p. 650-656.

Dilatometric experiments with Cu powders. 10 ref. (H15, 2-62, Cu-b)

49-H* (Russian.) Preparation of Boride Cermets. K. I. Portnoi and E. B. Samonov. *Izvestiya Akademii Nauk, SSSR*, July 1958, p. 140-141.

Preparation of boride cermets with Cr, Fe, Mo, Ti and Zr. Increased resistance to oxidation can be obtained by adding silica and silicides. Relation of heat resistance to brittleness; relation of properties to composition. (H-general; Cr, Fe, Mo, Ti, Zr, 6-70)

50-H. Preliminary Study of the System Titanium-Aluminum Oxide Extruded Alloys. P. Turillon and N. J. Grant. Massachusetts Institute of Technology. (Wright Air Development Center.) *U.S. Office of Technical Services*, PB 151207, Mar. 1958, 15 p. $.50.

Extrusions of Ti powder mixed mechanically with Al oxide and rare earth oxides produced relatively sound bodies, but were too brittle. Both the Al oxide and the rare earth oxide are not stable enough in the presence of Ti during a hot extrusion process to avoid reaction. (H-general; Ti, Al, EG-g, NM-a34)

51-H. (Translation—BISI, no. 1092.) Particle Size and Grating Distortion of Tungsten Powders and Tungsten Carbide Powders. H. Hendus. *Zeitschrift fur Metallkunde*, v. 48, Dec. 1957, p. 615-624.

See item 59-H, 1958. (H11j, M21e, M21f; W, 6-69)

52-H. (Translation—Brutcher, no. 4444.) Powders in Iron-Nickel-Aluminum System. A. B. Al'tman. *Metallovedenie i Obrabotka Metallov*, Dec. 1958, p. 17-20.

Physical properties and microstructure of alloy Fe-Ni-Al-Co Type, "Alnico". Alloy was prepared both at high and ordinary sintering temperatures. Heating to temperature exceeding that at which the alloy begins to melt considerably accelerated sintering; however, the sintered alloy has a decreased density, resulting in lowering of the residual induction and magnetic saturation. (H15, P16; Fe-b, Ni, Al, Co)

53-H.* Growth of Sintered Metal Compacts. J. E. Elliot. *Metallurgia*, v. 59, Jan. 1959, p. 17-27.

Growth during sintering of Fe-Cu and Cu-Sn mixtures; effect of powder characteristics, additions to mixture, green compact density and sintering conditions. (H15; Fe, *Cu, Sn*)

54-H. The Production of a Stable Beryllium Powder From Electrolytic Flake, Its Fabrication and Properties. J. Williams, W. Munro and J. W. S. Jones. *United Kingdom Atomic Energy Authority*, AERE-M/R-1679, Sept. 8, 1958, 27 p.

New treatment involves leaching dry-milled flake powder with 10% aqueous oxalic acid, which reduces the chloride content to 200 ppm., and yields a powder stable in air. Its fabrication behavior and mechanical properties when fabricated are very similar to O.M.V. powder. Mechanical properties are given for extruded rod. (H10b, Q-general; 4-55, Be, 6-72)

55-H.* (Russian.) Properties of Solid Alloys With a Nonuniform Distribution of Cementite Phase. K. A. Bystrova and V. F. Funke. *Izvestiya Akademii Nauk SSSR*, June 1958, p. 35-41.

Preparation of tungsten carbide-cobalt bodies with a nonuniform distribution of cementite phase and investigation of physical, mechanical and cutting properties. Material contained 94% WC and 6% Co. (H-general; W, Co, C, 6-69)

56-H. A Proposed Mechanism for the Strengthening of Sap-Type Alloys. G.S. Ansell. Naval Research Laboratory. *U.S. Office of Technical Services*, PB 151047, Oct. 1958, 4 p. $.50

Extrusion process causes motion of the grain boundaries, sweeping dislocation sources into the vicinity of the second phase where they are pinned in place and no longer active. If the manufacturing process of the alloys were adjusted so that only some of the dislocation sources were pinned, alloys with high-temperature tensile properties superior to those of the normal dispersion hardened alloys could be obtained without extreme loss of ductility. (H14k; Al-b)

57-H.* Custom Atomized Metal Powders. Gordon J. LeBrasse and Robert L. Probst. *Precision Metal Molding*, v. 17, Feb. 1959, p. 40-41, 55.

Metal powders manufactured by atomization include high-temperature alloy compositions such as Co-Cr (80-20), Udimet 500, Ni-Cr (80-20) alloy. (H10f; Co-b, Ni-b, *Cr*)

58-H. The Preparation of Tungsten Carbide-Uranium Compacts of High Density and High Hardness. P. A. Kulin and N. S. Dallas. Watertown Arsenal Laboratory. *U. S. Office of Technical Services*, PB 131751, Dec. 1953, 36 p. $1.25.

Combinations of 27% W carbide, 72% U, and 1% of either Co, Fe, Ni or Cr possess densities greater than 16 g. per cc. and hardness values between Rockwell A-80 and 85. (H11k, H15, H14, 2-60; U, *W, C*, Co, Fe, Ni, Cr, 6-69)

59-H. Structural Evaluation of Beryllium Produced by Several Processes. B. B. Muvdi. Martin Co. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151263, June 1958, 66 p. $2.

Evaluation of five powder metallurgy methods for fabrication of Be showed cold compacting followed by upsetting to produce plate or sheet with optimum properties. (H-general; Be, 4-53)

60-H.* (Polish.) Pressing of Brittle Powders. Wladyslaw Rutkowski. *Hutnik*, v. 25, Oct. 1958, p. 397-402.

Comparison between pressing brittle and ductile powders (Fe_2O_3, Al_2O_3, Si_2O_3, Cr, Cu, Mn). Results obtained by adding ceramic mixtures to metallic powders. 13 ref. (H12, H14, 2-60; *Fe, O, Al, Si*, Cr, Cu, Mn, 6-70)

61-H. Slip Casting Offers Greater Design Flexibility for Cermets. L. M. Schifferli, Jr. *Ceramic Age*, v. 73, Jan. 1959, p. 28-30.

Technique, limitations, advantages. (H14; 6-70)

62-H.* (German.) Non-Scaling Materials of Ni-Al Base. Friedrich Bisenkolb and Hein-Eberhard Rollig. *Neue Hutte*, v. 3, Dec. 1958, p. 721-731.

Mechanical properties, scaling behavior and phase composition of Ni-Al alloys produced by melting or sintering. 8 ref. (H14, H15, Q-general, R2q, 2-60; Ni-b, *Al*)

63-H.* (French.) Preparation and Sintering Under Load of Uranium. J. Dubuisson, A. Houyvet, E. Le Boulbin, R. Lucas and C. Moranville. *Revue de Metallurgie*, v. 56, Jan. 1959, p. 55-60.

U powder is prepared by calcium reduction of UO_2. Calcium oxide is eliminated by acetic acid. U powder is pyrophoric; special treatment in aqueous solution of Cl_2Zn eliminates this condition and makes it possible to handle powder in air. Powder is sintered in double-acting

graphite container in vacuum furnace. Characteristics of sinter product are comparable to those of smelted U. (H10, H14h, H15; U)

64-H.* (French.) Sintering of Beryllium Oxide Mixtures Containing 3 and 5% Boron. R. Pointud, Ch. Rispal and M. Le Garec. *Revue de Metallurgie*, v. 56, Jan. 1959, p. 68-74.

Bricks for fabrication of protective shields in nuclear installations were made by sintering mixtures of BeO and boron carbide at 1500° under pressure of 150 kg. per sq.cm. Densities of brick were between 2.85 and 2.90. Also, results of tests with BeO alone, and BeO and B mixtures of other proportions under various sintering conditions. 6 ref. (H15, T11; Be, B, RM-h)

65-H. (Book.) Hoeganaes Iron Powder Handbook. 2 v. 148 p. (v. 1) 254 p. (v. 2), 1959. Hoeganaes Sponge Iron Corp., Riverton, N. J. $36.

Iron powder: history, production, properties, applications; testing, designing, heat treatment, finishing and machining powder metal parts. (H-general; Fe)

66-H. (Translation—BISI no. 1076.) Improved Methods for Manufacture of Hard Alloy Tube Drawing Dies. G. S. Maksimovich. *Stal'*, v. 18, July 1958, p. 629-633.

See item 127-H, 1958. (H14h, F26r, 1-52)

67-H.* (Rumanian.) Sintered Electrical Interruption Contacts. A. Domsa, G. Muller, T. Bereczky, S. Kovacs and H. Colan. *Studii si Cercetari de Metalurgie*, v. 3, no. 4, 1958, p. 491-503.

Contacts produced by sintering tungsten powder and impregnation with Ag or Cu. Contacts of pure W, manufactured in two sintering processes, the second of which employs high frequency to heat the part to approximately 2000 to 2500° C. 7 ref. (H15, H16d; 6-72, W, *Ag, Cu*, SGA-r)

68-H.* Powder Metallurgy Growing. *Chemical and Engineering News*, v. 37, Mar. 16, 1959, p. 46, 48-49.

Production of large ingots of Mo, Cb, Ta and W. Applications of refractory metals. (H14; Cb, Mo, Ta, W, EG-d, 17-57)

69-H.* (Italian.) Preparation of a Chromium Powder Suitable for the Manufacture of Cermets. G. Venturello and V. Coen. *Metallurgia Italiana*, v. 50, p. 538-540.

Metallic Cr in form of very fine powder is obtained by reaction between CR_2O and metallic Mg in presence of MgO heated in vacuum at 700° C. for 20 min. Powder is 96% Cr and highly compressible. Effect of time, temperature and MgO addition to starting mixture on efficiency of reaction. (H10, 2-60, 2-61, 3-67; Cr, 6-70)

70-H.* (German.) Elastic Deformation of Metal Powder During Pressing. W. Rutkowski. *Neue Hutte*, v. 4, Feb. 1959, p. 110-113.

The elongation of the compact after release of pressure is determined for Fe, Cu, Cr, Pb and Ag. Influence of pressure, particle size and hardness, lubrication. 21 ref. (H11n, H14g, Q21; Fe, Cu, Cr, Pb)

71-H.* Dispersion Strengthened Alloys: The Possibilities for Light Metals. Pt. 2. Claus G. Goetzel. *Journal of Metals*, v. 11, Mar. 1959, p. 189-194.

Fundamentals of dispersion strengthening process; theory of dispersion hardening; role of interparticle spacing; storage of strain energy during extrusion; mechanical properties of Al and of Mg alloys. (To be concluded.) 43 ref. (H14, H15, Q-general, N7a; Al-b, Mg-b)

72-H. Dispersion Hardening of Sintered Titanium Alloys by Refractory Metal Powder Additions. Armour Research Foundation, Illinois Institute of Technology. *U. S. Office of Technical Services*, PB 131937, Mar. 1958, 47 p. $1.25.

Powder metallurgical techniques used to improve Ti-base alloys for service at temperatures to 1200° F. Dispersion hardening of Ti by mechanically blending fine particles of W with Ti powder, and by internally oxidizing Ti-Th alloys to disperse the thoria. (H12, H15, N7; Ti-b, *Th, W*)

73-H.* Problem of Manufacturing Hard Alloys in India. E. I. Mozjukhin and H. N. Sinha. *Indian & Eastern Engineer*, v. 123, Dec. 1958, p. 435-438.

Characteristics, methods of preparation and production. (H-general; 6-69)

74-H.* Some Preliminary Experiments on the Continuous Compaction of Titanium, Molybdenum and Tungsten. P. Evans and G. C. Smith. *Metallurgia*, v. 59, Mar. 1959, p. 117-120.

Technique consisted of rolling to strip followed by sintering. Argon atmosphere was used for Ti and although strip of reasonable strength was produced, the ductility was low. Mo and W strip was sintered

in vacuo but the green strength was low. 11 ref. (H14j; Mo, Ti, W)

75-H.* How to Do More With Prealloyed Powders. W. L. Batten. *Metal Progress*, v. 75, Apr. 1959, p. 105-112.

Pre-alloyed powders are produced from molten alloys, and compacts have properties of the composition within limitations of the density achieved. Parts made from alloy steel powders, such as gears and cams, can be heat treated to high strength. A variety of stainless steel and special powders are useful in corrosion resisting, high-temperature and electrical applications. (H-general, H12n; AY, SS, TS)

76-H.* Extruding Metal Powders. Eric Gregory. *Metal Progress*, v. 75, Apr. 1959, p. 113-116, 150-152, 154, 156, 158.

By modifying conventional extrusion methods, powders can be extruded in long bars with cross sections of varying complexity. In many instances, density is close to 100%. Still largely in the experimental stage, powder extrusion methods are used to produce materials with good elevated-temperature properties. Certain atomic reactor fuel elements could also perhaps be fabricated by these methods. (H14k)

77-H.* Cermets From Thermite Reactions. J. D. Walton, Jr., and N. E. Poulos. *American Ceramic Society, Journal*, v. 42, Jan. 1, 1959, p. 40-49.

Oxide of the cermet (Al_2O_3) is produced from the oxidation of powdered Al and the metallic phase is produced from the resulting reduction of its oxide. Formation of metallic silicides and borides as the metallic phase of a cermet from the appropriate silicates and borates, or metallic oxides with silica or boric acid. (H15; Al, Zr, 6-70)

78-H.* Fourth Dimension: Controllable Density. *Powder Metallurgy Quarterly*, Spring 1959, p. 3-7.

Various degrees of porosity for filters, bearings, gears and various components. (H11k, 6-72, 9-68, 17-57)

79-H.* Furnace Sintering of Metals and Ceramics. Pt. 3. R. L. Harper. *Industrial Heating*, v. 26, Mar. 1959, p. 498, 500, 502, 504.

Necessary atmospheres, heating cycles and equipment for sintering ferrites and uranium oxide. The sintering operation is similar to that used for other powdered materials. (H15; Fe, NM-a34, U)

80-H.* Process Compacts Metal Powders Into Continuous Bars. F. Emley and C. Deibel. *Iron Age*, v. 183, Apr. 23 1959, p. 122-113.

Powder in a trough-like container is compressed by a sloping punch. Some of the powder is completely compacted, but that part under the sloping portion of the punch is compacted a variable amount—from full compaction to zero. By reciprocating the sloping punch while advancing the powder, the bar is formed. (H14; 4-55)

81-H.* Designing for Metal Powder Structural Parts. John L. Everhart. *Materials in Design Engineering*, v. 49, Apr. 1959, p. 113-124.

Manual covering powder properties, pressing, sintering, heat treatment, design and properties of parts. 9 ref. (H-general, 17-51)

82-H.* (Japanese.) Sintering of TiC-Base Cermet. Pt. 2. Shrinkage of TiC-Ni Compact by Heating in Vacuum. Etsuro Kato and Shigeharu Naka. *Nagoya Government Industrial Research Institute*, Reports, v. 8, Mar. 1959, p. 228-234.

Shrinkage varies with ratio of TiC and Ni content. 6 ref. (H15, P10c, 2-60; Ti, C, Ni, 6-69)

83-H.* Sizing and Coining of Metal-Powder Parts. John Haller. *Machinery*, v. 65, Apr. 1959, p. 135-138.

Improving density and dimension by sizing with punch presses. (H16a)

84-H.* Dispersion Strengthened Alloys: Properties and Applications of Light Metals. Claus G. Goetzel. *Journal of Metals*, v. 11, Apr. 1959, p. 276-280.

Al, Be and Mg cermets. 16 ref. (H-general, N7; Al, Be, Mg, 6-70)

85-H.* High Quality Strip From Powder Metal. *Canadian Metalworking*, v. 22, Apr. 1959, p. 20-21.

Recent tests show superior mechanical properties and lower oxygen content in Cu strip. (H14, Q27a; Cu, O, 4-53)

86-H. Metal and Self-Bonded Silicon Carbide. R. E. Wilson, L. B. Coffin and J. R. Tinklepaugh. Alfred University. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151115, Jan. 1955, 46 p. $1.25.

Method was devised for the formation of dense self-bonded silicon carbide by hot pressing. Al in small quantities was found essential to the formation of uniformly dense specimens. In a metal-bonding study, molybdenum and silicon carbide were hot pressed to form dense specimens having good oxidation resistance. (H14h, R1h; Si, C, 6-69, 6-70)

87-H.* Fiber Metals. Robert H. Read. *Frontier*, v. 32, Spring 1959, p. 1-5.

Preparation, properties and applications. (H17)

88-H.* Application of the Endothermic Atmosphere Generator to the Sintering of Powder Metal Parts. N. K. Koebel. *Industrial Heating*, v. 26, Apr. 1959, p. 692-702.

Principle of endothermic atmosphere generators. Sintering iron or nonferrous powder metal compacts. (H15q, W28q; Fe, Cu)

89-H.* (German.) Effects of Adsorbed Gases and Impurities on Sintering of Tin. Wolfgang Friemel, Ottmar Knacke and Iwan N. Stranski. *Zeitschrift fur Metallkunde*, v. 49, Aug. 1958, p. 404-408.

In a testing apparatus, a tin ball was pressed against a Sn plate, after surface treatment, and under modified atmospheric and temperature conditions, to study the sintering process. Mechanically polished Sn could not be sintered, while pickled Sn sintered at 140° C.; vacuum remelted Sn sintered above 20° C. Sintering is retarded by any hydrogen and CO_2 present. 9 ref. (H15, 1-54; Sn, *H, C, O*)

90-H.* (German.) Sinter Bronze of High Strength and High Elongation. Horst Schreiner. *Zeitschrift fur Metallkunde*, v. 49, Aug. 1958, p. 409-415.

To avoid porosity, bulging and formation of cracks in sintered parts caused by a surface layer impermeable to gases, an organic substance ("Sterotex") is added to the powder. The substance decomposes, forming carbon-containing layers which permit gases to escape. 15 ref. (H15; Cu-s)

91-H.* Production of Electrolytic Copper Powder. Frank Wills and E. J. Clugston. *Electrochemical Society, Journal*, v. 106, Apr. 1959, p. 362-366.

Operation, equipment and quality control used in commercial production. 4 ref. (H10b; Cu)

92-H.* Pressureless Sintered Beryllium. Pt. 2. Evaluation of a New Process. T. R. Barrett. *Engineering*, v. 137, Apr. 3, 1959, p. 437-439.

By this method, loose Be powder of 45 to 50% bulk density is consolidated to near theoretical density by vacuum sintering in an uncoated graphite mold at 1200° C. without the application of pressure. (H15, Q-general; Be, 4-53)

93-H.* (German.) Metals With High Melting Points. Pt. 1. R. Kieffer and F. Benesovsky. *Metall*, v. 13, May 1959, p. 379-385.

Preparation of Mo by sintering, refining, tungsten arc melting and electron bombardment. Effect of alloying elements on cold and hot deformability, recrystallization temperature, creep, high-temperature strength. Sintering of tungsten by direct passage of current. 42 ref. (H15, C5h, 2-60; Mo, W)

94-H.* (German.) Powder Metallurgy in the Construction of Nuclear Reactors. R. Palme. *Metall*, v. 13, May 1959, p. 386-389.

Sintered U and Th fuel elements and their fabrication. Construction parts of Mg, Al, sintered Zr and Be. Screening materials obtained by sintering tungsten powder with 5-15% Cu and Ni or by sintering tungsten powder and impregnating with Pb. 33 ref. (H-general, T11; U, Th, Mg, Al, Zr, Be, W, *Cu, Ni*, Pb, 17-57)

95-H.* (German.) Production of Strip From Zinc and Zinc-Lead Alloy Powders. H. Weik, G. Ogiermann and R. Ergang. *Metall*, v. 13, May 1959, p. 398-404.

Strip with satisfactory mechanical properties can be produced by pressing mixtures of powdered Zn and Pb (up to 10%) followed by repeated rolling. Corrosion resistance and mechanical properties vary in proportion to the Pb content. 22 ref. (H14j, 2-60, Q-general, R-general; Zn, Pb, 4-53)

96-H. (Japanese.) Slip Casting. Atsumi Ohno. *Metals*, v. 29, Jan. 1959, p. 47-49.

Advantages, disadvantages, applications. (H14)

97-H.* (German.) Preparation and Properties of Sintered Nickel Aluminides. Erich Fitzer and Peter Gerasimoff. *Zeitschrift fur Metallkunde*, v. 50, Apr. 1959, p. 187-196.

Preparation of nickel aluminide powder by heating Ni-amalgam together with Al-amalgam in a sealed vessel up to 500° C. Resistance to scaling and strength of sin-

tered parts vary with the Ni content (80-84% optimum). Strength behavior in influenced by an oxidizing heat treatment. Effect of testing temperature on strength. 10 ref. (H10c, H15, R1h, 2-64, Q-general; Ni-b, *Al*)

98-H.* (Portuguese.) Influence of Manufacturing Conditions on Porosity, Volumetric Changes and Density of Porous Bronze Bushings. Vincente Mazzarella. *Instituto de Pesquisas Tecnologicas*, Publication no. 590, 1959, p. 162-170.

Influence of mesh size of Cu, percentage of Sn, molding pressure and sintering temperature. (H11, H14, H15; Cu-s)

99-H. Powder Metallurgy. A. Kapilov. *Indian Ceramics*, v. 5, Feb. 1959, p. 267-269.

Production techniques at "Udarnik" plant in Minsk (Byelorussian SSR). (H-general)

100-H. Basic Concepts and Techniques of Modern Ceramics. L. S. Williams. *Australasian Engineer*, v. 51, Apr. 7, 1959, p. 50-56.

Fabrication of special ceramics and cermets. 21 ref. (H14, H15; 6-70)

101-H. (Japanese.) Powder Metallurgy in the United States. Hisashi Kimura. *Metals*, v. 29, Apr. 1959, p. 275-279.

Review of powder rolling methods, slip casting, infiltration and canning. Analysis of sintering mechanism. (H-general)

102-H.* New Uses for Powder Metallurgy. *Metal Progress*, v. 75, June 1959, p. 97-99.

Report on meeting of the Metal Powder Industries Federation. A method for continuous compaction opens up new possibilities for using powders to produce bar and sheet products and to fabricate bimetal combinations. Metal powders are mixed with other materials to give compositions for special uses in nuclear and other applications. (H-general)

103-H. Report on the Third International Plansee Seminar. *Powder Metallurgy Bulletin*, v. 8, Mar. 1959, p. 75-115.

Abstracts of papers presented at the Seminar held in Reutte, Austria, June 22-26, 1958. (H-general)

104-H. (German.) Factors Influencing the Behavior of Tungsten in Sintering. J. Vacek. *Planseeberichte fur Pulvermetallurgie*, v. 7, Apr. 1959, p. 6-17.

Examination of the influence of metal additions on the sintering behavior of tungsten powder shows that Ni and Co, more than Fe, increase the reactivity during sintering. Other metals so not show any marked influence. (H15, 2-60; W, *Ni, Co, Fe*)

105-H.* (English.) Rare Earth Hardmetals. J. Binder and R. Steinitz. *Planseeberichte fur Pulvermetallurgie*, v. 7, Apr. 1959, p. 18-21.

Hot pressed samples of gadolinium hexaboride (GdB_6) and dysprosium disilicide ($DySi_2$) investigation as to structure, physical and scaling properties. Because of their high thermal-neutron capture cross section, possible applications include use as materials for control rods in nuclear reactors. 10 ref. (H-general, P18j; Gd, Dy, EG-g)

106-H. Powder Metallurgy of Beryllium. *Precision Metal Molding*, v. 17, June 1959, p. 36-37.

(H-general; Be)

107-H.* Powder Metallurgical Products. Henry H. Hausner. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 370-391.

Effect of vacuum sintering and vacuum infiltration on density and properties of Be, Cu and Zr powder compacts. 16 ref. (H15, H16e, 1-73; Be, Cu, Zr)

108-H. (Slovakian.) Manufacture of Metal Powders Used in Electrode Coatings. Frantisek Zahoransky. *Zvaranie*, v. 8, May 1959, p. 149-152.

Various methods for the manufacture of metal powders. (H10, W29h)

109-H.* (Rumanian.) Manufacture of Iron Powder by Reduction With Methane. A. Domsa and A. Palfalvi. *Studii si Cercetari de Metalurgie*, v. 4, no. 1, 1959, p. 59-72.

Method allowing the direct reduction of finely ground rolling mill scale in an atmosphere of natural methane or in methane after partial combustion. Sintering in a mixture of methane and air permits the control of carbon content by varying the ratio of methane to air. 5 ref. (H10c, H15; Fe, *O*)

110-H.* (Polish.) Elastic Deformation During Powder Pressing. Wladyslaw Rutkowski and J. Bryniarski. *Hutnik*, v. 26, Apr. 1959, p. 154-158.

Hametag Fe, electrolytic Fe, electrolytic Cu, mechanical Cr, sprayed Pb and chemical Ag powders were pressed, with and without a lubricant composed of camphor solution in ethyl alcohol, at pressures

between 1 and 15 tons per sq.cm. Dependence of elastic deformation on the hardness of starting material, the initial powder weight, oxidation, particle shape and pressure. 21 ref. (H14g, H11n, Q24; Fe, Cu, Cr, Pb, Ag)

111-H.* (Ukrainian.) Effect of Compressive Stresses on Shrinkage in the Sintering of Porous Bodies. I. M. Fedorchenko and Andrievskii. *Dopovidi Akademii Nauk Ukrainskoi R.S.R.*, no. 3, 1959, p. 281-284.

Dependence of shrinkage on the compressive stress in Ag, Cu and Ni powders proved to be nonlinear in the case of annealed powders. This is due to plastic deformation arising from the application of the load to the sintered body. 10 ref. (H15, P10d, 3-66; Ag, Cu, Ni)

112-H.* (Czech.) Manufacture of Metal Fiber. Ludek Kratky. *Hutnicke Listy*, v. 15, June 1959, p. 499-500.

Molten Al is pressed through orifices 0.06-0.08 mm. in diameter. The fiber produced is used in a similar manner to metal powders in sintering. 4 ref. (H17; Al)

113-H.* (German.) Surface Activity of Tungsten Trioxide Powders. Will Kleber and Dieter Radloff. *Neue Hutte*, v. 4, June 1959, p. 323-328.

Comparison of the surface activity of various tungsten trioxide powders with the structure of sintered bars produced using the powders as starting materials. 4 ref. (H10c, H11j; W)

114-H.* The Development of SAP-Type Structures in Titanium for Elevated Temperature Service by Powder Metallurgical Techniques. R. W. Jech, A. D. Schwope and E. P. Weber. Paper from "High Temperatures Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 332-341.

Dispersion-strengthening effect of Al_2O_3, ThO_2 and TiC in TiH. Bonding of dispersed phase to matrix must be achieved for improvement of dispersion strengthened systems. 5 ref. (H-general, N7, 2-62; Ti-b, *Al, Th*, 6-69, SGA-h)

115-H.* Recent Developments in Powder Metallurgy. Ivor Jenkins. *Powder Metallurgy*, no. 1-2, 1958, p. 3-12.

Materials and processes; recent work on sintering; grain boundaries; hard metals and dispersed hard particles; research trends. (H-general)

116-H.* Atomization of Metal and Alloy Powders. J. F. Watkinson. *Powder Metallurgy*, no. 1-2, 1958, p. 13-23.

Atomization of stainless steels, high-speed steels and Ni-base or Co-base alloys with gas or water jets. Powder properties; process limitations. (H10f, H11; Ni-b, Co-b, SS, TS)

117-H.* Electrolytic Production of Straight and Alloyed Metal Powders. I. Ljungberg. *Powder Metallurgy*, no. 1-2, 1958, p. 24-32.

Electrolytic preparation of Fe, ferroalloys and Ni powder from aqueous solutions, fused salt baths or amalgam dispersions. 13 ref. (H10b; Fe, Ni, SS)

118-H.* Electrolytic Copper Powder. E. Mehl. *Powder Metallurgy*, no. 1-2, 1958, p. 33-39.

Conditions and mechanisms of electrodeposition of metal sponge. Commercial production of Cu powder. 9 ref. (H10b; Cu, 6-74)

119-H.* Manufacture and Properties of Metal Powders Produced by the Gaseous Reduction of Aqueous Solutions. *Powder Metallurgy*, no. 1-2, 1958, p. 40-52.

Ni, Co, Ni-Co and Cu powders. 26 ref. (H10c, H11; Ni, Co, Cu)

120-H.* Production of the Powders of Some of the Reactive Metals. G. L. Miller. *Powder Metallurgy*, no. 1-2, 1958, p. 53-64.

Preparation of Be, Zr, Ti, Ta and Cb powders using electrolysis, reduction or hydrogenation. (H10b, H10c; Be, Zr, Ti, Ta, Cb)

121-H.* Mechanical Methods of Powder Production as Used in the Carbide Industry. E. M. Trent. *Powder Metallurgy*, no. 1-2, 1958, p. 65-72.

Ball milling of carbides with bonding metals in the preparation of powder for manufacture of cemented carbides. 11 ref. (H10h; 6-69)

122-H.* Compacting of Powders Using Molds Made From Reversible Gels. T. W. Penrice. *Powder Metallurgy*, no. 1-2, 1958, p. 79-84.

Pressing powder metal compacts in high plasticized and gelled polyvinyl chloride mold. (H14g, W26f)

123-H.* The Continuous Production of Strip by the Direct-Rolling Process. D. K. Worn. *Powder Metallurgy*, no. 1-2, 1958, p. 85-93.

Rolling metal powders into strip; sintering and cold rolling; capabilities and limitations of the process. 17 ref. (H14j, H15, 1-61; Ni, Cu, Fe, ST)

124-H.* The Consolidation of Metal Powders by Hot Working Within Sheaths. J. Williams. *Powder Metallurgy*, no. 1-2, 1958, p. 94-103.

Upsetting, forging, extrusion, rolling, swaging and hydrostatic pressing of metal powders sealed in metal sheaths. Choice of sheath material. (H14, F21g; Be, Zr, U, 6-68)

125-H.* Conditions for Effective Vacuum Sintering and Their Realization in Practice. Otto Winkler. *Powder Metallurgy*, no. 1-2, 1958, p. 114-121.

Physical and chemical absorption in metal powders. The desorption process; evaporation; vacuum sintering practice. 5 ref. (H15n, H15q, 1-73)

126-H.* The Pressureless Sintering of Loose Beryllium Powder. T. R. Barrett, G. C. Ellis and R. A. Knight. *Powder Metallurgy*, no. 1-2, 1958, p. 122-132.

Ingot casting, swarf turning and milling in production of powder. Vacuum sintering of loose Be powder held in a graphite mold at 1200° C. (H15, H10, 1-73; Be)

127-H.* Zone Sintering. J. Antill and M. Gardner. *Powder Metallurgy*, no. 1-2, 1958, p. 133-142.

Th and U powdered compacts sintered into dense tubes and rods by slowly passing furnace over the length of green compacts. Changes in dimensions and density. (H15n; Th, U)

128-H.* Fabrication and Properties of Chromium-Alumina and Molybdenum-Chromium-Alumina Cermets. J. B. Huffadine, L. Longland and N. C. Moore. *Powder Metallurgy*, no. 1-2, 1958, p. 235-252.

Powder preparation, sintering and hot pressing in production of cermets. Modulus of rupture; resistance to creep, oxidation, thermal shock and impact. 32 ref. (H12q, H14h, Q-general; Cr, Mo, 6-70)

129-H.* Fabrication and Properties of Uranium Oxide-Iron Cermets. W. J. Wright, R. B. Gibbon and J. Williams. *Powder Metallurgy*, no. 1-2, 1958, p. 253-272.

Hot rolling and hot extrusion of uranium dioxide dispersed in Fe and clad in mild steel. Density, structure, dimensions, defects and mechanical properties of cores. 11 ref. (H14j, H14k, Q-general; Fe, U, 6-70)

130-H. Metal-Ceramic Laminates. R. K. Francis, R. Brown, E. P. McNamara and J. R. Tinklepaugh. Alfred University. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151664, Nov. 1958, 78 p. $2.

Techniques for brazing or hot pressing metal-ceramic laminates. Fabrication of Fosterite-stainless steel 430, Mo-alumina, Kovar-alumina and Mo-alumina-mullite laminates. Thermal expansion and conductivity of metal-ceramic compacts. Apparatus for measurement of thermal conductivity. (H14h, K8, K11b, P11h, SS, Mo, Co, 6-70, 7-58)

131-H. Metal Fiber Reinforced Ceramics. R. S. Truesdale, J. J. Swica and J. R. Tinklepaugh. Alfred University. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151610, Dec. 1958, 45 p. $1.25.

Sintering and hot pressing of alumina and aluminas containing up to 20% Mo fibers. Strength, resistance to impact and thermal shock. (H14h, H15, H17, Q-general; Al, *Mo*, 6-70)

132-H.* The Compaction of Metal Powders by Rolling. Pt. 1. The Properties of Strip Rolled From Copper Powders. P. E. Evans and G. C. Smith. *Powder Metallurgy*, no. 3, 1959, p. 1-25.

Crystallographic orientation in green strip and following sintering and cold rolling. Variation of tensile properties with rolling direction, powder properties, density, porosity and grain size of sintered strip. Relation of electrical conductivity to density, sintering time and rolling direction. 21 ref. (H14j, H15n, H11j, Q27a, P15g; Cu, 4-53)

133-H.* Compaction of Metal Powders by Rolling. Pt. 2. An Examination of the Compaction Process. P. E. Evans and G. C. Smith. *Powder Metallurgy*, no. 3, 1959, p. 26-44.

Deformation of particles in pressing and rolling. Determination of average roll pressure; variation in gripping angle and strip thickness with shape of powder and with roll-powder friction. Relation of powder flow properties with their behavior in compaction. Compaction mechanisms. 12 ref. (H14j, H11j, H11m; Cu-a, 4-53)

134-H.* Production of Pure Nickel Strip by the Direct-Rolling Process. D. K. Worn

and R. P. Perks. *Powder Metallurgy*, no. 3, 1959, p. 45-71.

Effect of powder properties, rolling speed, powder head and roll gap on density, thickness, breaking strength and rate of production of grain strip. Use of hydrogen in powder feed; sintering conditions; comparison of properties of strip produced from carbonyl Ni powder with conventional strip. 8 ref. (H14j, H15n, Q-general; Ni-a, 4-53)

135-H.* The Removal of Internal Porosity in Copper. B. Clapson and D. A. Robins. *Powder Metallurgy*, no. 3, 1959, p. 72-79.

Importance of grain boundaries in the sintering process. Grain boundaries act as strong vacancy sinks in contrast to twin boundaries and dislocations, which apparently do not absorb a large number of vacancies. The mechanism of sintering involves the diffusion of vacancies to the grain boundaries, where they are destroyed by the progressive removal of planes of atoms adjacent to the boundaries. 7 ref. (H15, P10m, M26s, 2-64, 3-71; Cu)

136-H.* Processes Involved in Sintering. Rene G. Bernard. *Powder Metallurgy*, no. 3, 1959, p. 86-103.

Adhesion, densification and void disappearance stages during sintering of a pure single-phase metal interpreted on the basis of volume self-diffusion and grain boundary diffusion. Sintering mechanisms in mixtures capable of forming solid solutions or of undergoing chemical reactions; sintering processes in presence of liquid phase. 33 ref. (H15n, N1d, N1h)

137-H.* Recent British Developments in the Theory of Sintering. G. A. Geach. *Powder Metallurgy*, no. 3, 1959, p. 104-114.

Definition, sintering mechanisms, effect of particle size, compact density, composition, temperature, atmosphere and grain boundaries on sintering. Adhesion between metal surfaces. 28 ref. (H15n, H15q)

138-H.* Current Progress in Theories of Sintering in the U. S. A. John T. Norton. *Powder Metallurgy*, no. 3, 1959, p. 115-124.

Theoretical transport mechanisms involved in sintering of single-component solid phases in solids in the presence of liquid phase. 20 ref. (H15n, N1, N3m)

139-H.* Recent Work on the Theory of Sintering in the German Democratic Republic. F. Thummler. *Powder Metallurgy*, no. 3, 1959, p. 125-145.

Elementary mechanisms involved in sintering. Factors affecting sintering processes including crystal orientation, diffusion coefficient, total contact surface, crystal structure, surface activity, lattice activity, foreign constituents and liquid phases. 36 ref. (H15n, N1)

140-H.* Mechanism of Sintering in Single-Component Systems. I. M. Fedorchenko and R. A. Andrievsky. *Powder Metallurgy*, no. 3, 1959, p. 147-171.

Flow and diffusion processes responsible for densification and changes in physical and mechanical properties during sintering. Influence of external stresses on shrinkage during sintering of Cu, Ni and Ag compacts. Effects of surface conditions of powder particles. Magnetic properties of Fe compacts resulting from activated sintering. 73 ref. (H15n, N1, 3-66; Cu, Ni, Ag, Fe)

141-H.* Powder Metallurgy. Robert L. Pettibone. *Engineering Forum*, v. 20, June 1959, 5 p.

Powder blending, molding, sintering and secondary operations; capabilities and recommendations for fabrication of parts. (H-general)

142-H.* Recent Advances in Infiltrated Titanium Carbides. H. W. Lavendel and C. G. Goetzel. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 15, 1959, p. 140-154.

Modified microstructures providing greater strength and ductility for gas-turbine components have been obtained by employing finer carbide powders. Increased stress-rupture strength at 1800 and 2000° F. made possible by changing from Ni-base to Co-base superalloys as infiltrants. (H16e, Q-general; Ni-b, Co-b, 6-69, SGA-h)

143-H. Fiber Metallurgy: New Opportunities for Metal Working? *Steel*, v. 145, Aug. 10, 1959, p. 126-128.

Processes, properties and applications. (H17)

144-H.* (English.) Sintered Intermetallic Compound NiAl as a High-Temperature Material. Pt. 1. Yunoshin Imai and Masuji Kumazawa. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, June 1959, p. 210-219.

Microstructure, density, porosity, volume change and hardness of intermetallic compound prepared by pulverizing Ni-Al alloy, compacting the powder at pressures of 1-10 tons per sq. cm. and sintering in a vacuum at 1100-1600° C. (H10e, H14g, H15n, 1-73, P10, Q29n; Ni-b, *Al*, 14-68)

145-H.* (German.) Effect of Storage on the Properties of Metal Powders. Martin Clasing. *Zeitschrift fur Metallkunde*, v. 50, July 1959, p. 424-428.

Ag powder is obtained by different processes. The rippling angle, bulk density, tap density, pressed density and sinter density are determined immediately following powder preparation and 60 to 3200 hr. afterwards to study the effect of storage. 10 ref. (H10b, H11, 3-67; Ag)

146-H.* (Czech.) Progress in Powder Metallurgy. Z. Ministr. *Strojirenstvi*, v. 9, July 1959, p. 525-527.

Manufacture of steel parts impregnated with Cu. Strength properties of steel powder parts with phosphorus and Mn additions. Al fibers used as starting material for rolling porous sheets. (H16d, F23, 2-60; ST, Al, 4-53, 4-62, *P, Cu, Mn*)

147-H.* Perfected and Practical Methods of Processing Powder Into Commercial Strip. Richard A. Smucker. *Iron and Steel Engineer*, v. 36, July 1959, p. 118-124.

Equipment requirements; mechanical properties of Cu and Ni strip produced from powder. (H14j, 1-61, Q27a; Cu, Ni, 4-53)

148-H.* Observations on the Structure and Sintering Mechanism of Cemented Carbides. J. Gurland. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 601-608.

Investigation of the structure of sintered WC-Co and TiC-Co alloys by means of dilatometric and metallographic methods. The sintering of cemented carbides takes place by transport of particles through the liquid binder, followed by grain growth and coalescence of carbide grains. The structure changes during sintering by the formation of contacts between carbide grains. 26 ref. (H15; W, Co, Ti, 6-69)

149-H. New Methods Spur Metal Powder Use. Charles Burley, Jr. *American Machinist*, v. 103, July 13, 1959, p. 108-109.

Improved materials; application of extruding, rolling and forging techniques. (H-general)

150-H.* (Polish.) Nitriding of Metallic Manganese. H. Zak and Z. Kulinski. *Prace Instytutow Hutniczych*, v. 11, no. 2, 1959, p. 83-91.

Effect of temperature, time and grain size of Mn powder on the quantity of combined nitrogen. Three grain sizes were used: 0-0.06 mm., 0.06-0.35 mm. and 0.35-0.5 mm. Gaseous nitrogen was applied as nitriding agent at pressures about 1.5 atm. and temperatures of 650-900° C. (H12, 2-61, 2-59, 3-67; Mn)

151-H.* (German.) Columbium Powder Metallurgy. Jiri Vacek. *Neue Hutte*, v. 4, Aug. 1959, p. 493-501.

Pressing and sintering of Cb powder. Effects of applied compression force and sintering temperature on density, hardness, bend strength, electrical resistivity. Influence of sintering temperature on shrinkage, tensile strength and structure. 7 ref. (H15, P10a, P10c, P15g, Q29n, Q5g, Q27a, M26, 3-68, 2-61; Cb, 6-72)

152-H.* (German.) Volume Changes Occurring During the Sintering of Fe-Cu and Fe-Cu-C Powders. G. Bockstiegel. *Stahl und Eisen*, v. 79, Aug. 20, 1959, p. 1187-1201.

Volume changes of Fe-Cu, Fe-Cu-C powders are explained by the diffusion activity of Cu into the Fe lattice during the sintering process. The powder increases its volume in proportion to the volume of the diffused Cu. The dissolution of Fe is caused by the Cu melt and shrinks the lattice of the sintered material. The shrinkage increases in proportion to decreases in grain size of the Fe powder, and with increased Cu additions. (H15, P10c, N1; Fe, Cu, C)

153-H.* Pressureless Sintered Beryllium Powder. T. R. Barrett, G. C. Ellis and R. A. Knight. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 319-327.

Technique for the consolidation of loose Be powder to high densities in solid and hollow shapes without the application of pressure. (H15, Q-general, 3-74; Be)

154-H.* Composite Neutron-Absorbing Materials for Control-Rod and Screening

Applications. E. J. Bradbury, C. R. Sutton and D. K. Worn. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 328-333.

Direct rolling of pre-mixed powders for the production of sheet and strip, and a tube-drawing technique for producing tubular control-rod elements. Production of a stainless-steel-clad Cu-base material containing boron carbide. 6 ref. (H14j, F26r, T11j; Cu-b, *B*, SS, 8-66, 4-53)

155-H.* (Rumanian.) Sintering of Ferrous Powders in an Atmosphere Obtained by Incomplete Combustion of Methane. G. Dan, A. Protopescu and O. Stefan. *Studii si Cercetari de Metalurgie*, v. 4, no. 2, 1959, p. 189-199.

Effect of mixing ratio of gases on sintering process of electrolytic Fe powder investigated by measuring hardness, weight and volume changes and by microscopic tests. 8 ref. (H15q, Q29n, P10d; Fe-a, 6)

156-H. Sizing and Coining Metal-Powder Parts. John Haller. *Machinery (London)*, v. 95, Sept. 30, 1959, p. 648-650. (H16a; 6-72)

157-H.* (English.) Study of Sintering of Carbonyl Iron by Electrochemical Potential. B. Bovarnick. *Planseeberichte fur Pulvermetallurgia*, v. 7, Aug. 1959, p. 34-49.

Influences of sintering temperature and time on the electrochemical potential, tensile strength and density. 22 ref. (H15, P15, Q27a, P10a, M27, 2-61, 3-67; Fe-a, 6-72)

158-H.* (English.) Infiltration of Iron Powder With Tin-Lead Alloy. Takashi Kimura. *Planseeberichte fur Pulvermetallurgie*, v. 7, Aug. 1959, p. 50-66.

Close-packed iron powder is infiltrated with a liquid solder composed of Pb and Sn. Effect of gases adsorbed or occluded on the powder surface on the infiltration process and promotion of the process by chemical pretreatment. Effect of powder size on tensile strength. 12 ref. (H16e, 2-66, 3-73; Fe, 6, Sn-b, *Pb*)

159-H.* (German.) Processes Occurring in the Pressing of Complicated Powder Compacts. H. Silbereisen. *Planseeberichte fur Pulvermetallurgie*, v. 7, Aug. 1959, p. 67-78.

Flow or powder particles during pressing and density distribution in the pressed compact. Reasons for cracking and strata formation. 7 ref. (H14, P10a, 9-72; 6-72)

160-H.* (French.) Heavy Alloys. R. Bernard. *Machine Moderne*, v. 53, Aug. 1959, p. 81-85.

Recent progress in the powder metallurgy of W-Ni-Cu and W-Ni-Fe alloys. (H-general; W-b, *Ni, Cu, Fe*)

161-H.* Slip Casting. L. M. Schifferli, Jr. *Metal Progress*, v. 76, Oct. 1959, p. 99-102.

Process consists of preparing concentrated, stable suspensions of finely ground materials in a liquid, pouring these suspensions into absorbent molds, removing the partially dried and solidified shapes from the molds, drying completely and sintering to increase density and strength. Materials to be slip cast must, however, have definite characteristics. (H14)

162-H.* A New Method for Compacting Metal or Ceramic Powders Into Continuous Sections. Frank Emley and Charles Deibel. Paper from "General Session on Powder Metallurgy". 15th Annual Meeting. Metal Powder Industries Federation, New York 17, 1959, p. 5-13.

Pressing technique capable of producing bars of unlimited length and relatively large cross-sectional area uses continuous compaction. In addition to straight metal powders, a variety of alloys can be pressed from elemental powder mixes. (H14g, 1-61)

163-H.* The Effects of Lithium Stearate Additions and Various Atmospheres on Sintered Brass Compacts. Frank I. Zaleski and Robert A. Powell. Paper from "General Session on Powder Metallurgy". 15th Annual Meeting Metal Powder Industries Federation, New York 17, 1959, p. 28-40.

Substantially higher properties were obtained with sintered 70-30 brass compacts when Li stearate, rather than the conventional Zn stearate,was used as the lubricant. Improvements were apparent whether the sintering atmosphere was reducing, inert or oxidizing. (H15; Cu-n, NM-h)

164-H.* Detergency During Infiltration in Powder Metallurgy. T. Kimura, J. C. Kosco and A. J. Shaler. Paper from "General Session on Powder Metallurgy". 15th Annual Meeting. Metal Powder Industries Federation, New York 17, 1959, p. 56-66.

Elements and compounds which belong to the atmosphere and which modify powder metallurgy processes are called "detergents" since they act primarily by altering the surface and interface energies of the primary constituents. 13 ref. (H16e)

165-H.* Current Status of Aluminum Powder Metallurgy. John D. Sahaw and Walter V. Knopp. Paper from "General Session on Powder Metallurgy". 15th Annual Meeting. Metal Powder Industries Federation, New York 17, 1959, p. 67-71.

Manufacture and application of Al powders; die lubrication; SAP and APM powders; rolling of Al powders as strip. 7 ref. (H-general; Al)

166-H. Stainless Steel Clad Dispersion of Boron in Iron for Pressurized Water Reactors. C. F. Leitten, Jr., R. J. Beyer and A. E. Richt. *Journal of Nuclear Materials*, v. 1, July 1959, p. 136-143.

Cold pressing and sintering of boron-iron powder mixture to form high density core and roll cladding with austenitic stainless steel to produce boron-bearing neutron absorber section of reactor control rod. Mechanical properties of fabricated dispersion of 3% B in Fe at 25 to 980° C. Performance under irradiation. (H14g, H15n, L22, Q27a, P10d, 2-67; Fe-b, *B*, *SS*, 8-66)

167-H. The Preparation of a Large Plutonium-Beryllium Neutron Source. K. L. Wauchope and J. Baird. *Journal of Nuclear Materials*, v. 1, July 1959, p. 191-195.

Reduction of plutonium dioxide with Be followed by vacuum sintering at 1450° C. to form a mechanically strong nonfriable alloy compact. 5 ref. (H12q, H15n, C26; Be, *Pu*)

168-H. Some New Applications of Lead Powders. R. L. Ziegfeld. Paper from "General Session on Powder Metallurgy". 15th Annual Meeting. Metal Powder Industries Federation, New York 17, 1959, p. 22-23.

Pb powder can be mixed with polyethylene to produce molded mechanical parts. Pb powder has been bonded to steel sheet experimentally. Compressed Pb powder is used to make superconducting connections between thin films of vapor-deposited metals and external circuits in computers. (H-general; Pb)

169-H. Automatic Control of Endothermic Sintering Atmospheres. George F. Sommer. Paper from "General Session on Powder Metallurgy". 15th Annual Meeting. Metal Powder Industries Federation, New York 17, 1959, p. 41-48.

Carbon content is controlled by proper regulation of the dew point of the furnace atmosphere during sintering. 5 ref. (H15)

170-H. Direct Measurement of Fine Metal Powders Evaluation of Micromesh Sieves From 10 to 45 Microns. John Haertlein. Paper from "General Session on Powder Metallurgy". Metal Powder Industries Federation, New York 17, 1959, p. 49-55.

Simple method for extension of particle size distribution measurement from the 325 mesh screen (44 microns) to 20 microns. (H11g)

171-H. A New Basis for an Inspection Method for Sintered Metal Components. Bennett Bovarnick. Paper from "General Session on Powder Metallurgy". 15th Annual Meeting. Metal Powder Industries Federation, New York 17, 1959, p. 72-81.

Test method for measuring changes in the surface energy in sintering. 14 ref. (H15, 1-54)

172-H. Fundamentals of Sintering. Pt. 4. J. Brett, L. S. Castleman and L. Seigle. Sylvania Electric Products, Inc. *U. S. Atomic Energy Commission*, SEP-254, June 30, 1959, 33 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.

The disappearance of porosity during sintering in the absence of grain boundaries and free surfaces is studied in Cu. After sintering, metallographic observations of the intragranular porosity at regions remote from grain boundaries and free surfaces reveal no significant densification, even though considerable decrease in the numbers and increase in the size of voids has occurred. Intragranular sinks such as dislocations are not effective in eliminating vacancies during sintering. (H15, M26; Cu, 9-68)

173-H. (Russian.) Sintering of Molybdenum at Relatively Low Temperatures. A. V. Savin and Yu. A. Eiduk. *Tsvetnye Metally*, no. 5, 1959, p. 81-84.

8 ref. (H15; Mo)

174-H.* Iron Carbon System in Powder Metallurgy. Pt. 1. Quality of Iron Powder and Graphite. P. Ulf Gummeson. *Precision Metal Molding*, v. 17, Nov. 1959, p. 56, 58-59.

For best results when using iron carbon close attention should be paid to quality of the Fe powder (reactivity, hydrogen loss), quality of the graphite and atmosphere composition. (H11; Fe, C)

175-H. (Russian.) Pressing of Beryllium, Zirconium, Uranium and Thorium. I. L. Perlin, V. A. Fedorchenko and N. M. Bogorad. *Tsvetnye Metally*, no. 2, 1958, p. 68-76.

176-H. (Russian.) Production of Zinc Powder From Vapors in an Electric Furnace. P. A. Sokolovskii and Yu. I. Belov. *Tsvetnye Metally*, no. 11, 1958, p. 20-25.

(H10, C22, G21d; Zn)

177-H.* Role of Grain Boundaries in Sintering. L. Seigle. Paper from "Kinetics of High-Temperature Processes". John Wiley & Sons, Inc., New York 16, 1959, p. 172-178.

In porous compacts of Cu, Ni and Al_2O_3, grain boundaries play an important role in densification. They are of negligible importance in sintering which involves only interparticle bonding. 17 ref. (H15, M24f; Co, Ni)

178-H.* The Relationship Between Free Energy and Kinetics in Sintering Processes. H. J. Oel. Paper from "Kinetics of High-Temperature Processes". John Wiley & Sons, Inc., New York 16, 1959, p. 179-186.

Both the free energy of the substance and the kinetics of the sintering process depend upon the number of defects. Experiments show the different behavior of amorphous and regular powders. 13 ref. (H15)

179-H.* Sintering in the Presence of a Liquid Phase. W. D. Kingery. Paper from "Kinetics of High-Temperature Processes". John Wiley & Sons, Inc., New York 16, 1959, p. 187-194.

During sintering in the presence of a liquid phase, the fractional shrinkage during both the initial and secondary rearrangements is related to definite powers of time. 22 ref. (H15)

180-H.* Electrolytic Iron Powder From a Caustic Soda Solution. J. Adrien M. LeDuc and Richard E. Loftfield. *Electrochemical Society, Journal*, v. 106, Aug. 1959, p. 659-667.

Conditions of deposition are influenced mainly by temperature (90° C.), caustic soda concentration (600-800 g. per liter) and low current densities. A ductile, dendritic deposit is obtained which can be easily ground up. 5 ref. (H10b, Q-general; Fe, 6-68)

181-H.* Powder Metallurgy. N. Chowdhuri. *Science and Engineering*, v. 12, May-June 1959, p. 70-72.

Applications, production mixing, pressing, hard carbides, sintering, Cu alloy infiltrated Fe, porous metals and non-alloying metals. 4 ref. (H-general)

182-H. (Book.) General Session on Powder Metallurgy. 15th Annual Meeting. 105 p. 1959. Metal Powder Industries Federation, 60 E. 42nd St., New York 17, N. Y.

Proceedings of meeting held at Sheraton-Cadillac Hotel, Detroit, Apr. 20-22, 1959. Papers abstracted separately. (H-general)

183-H. (Translation—ConBur.) Metallic Thorium. G. A. Meerson and A. F. Islankina. *Soviet Journal of Atomic Energy*, v. 5, Aug. 1958, p. 993-1005.

Compacting of Th from electrolytically and Ca-reduced Th. Theoretical analysis of sintering; strength and ductility in terms of sinter temperature and time. Cold pressing and annealing. Physical and mechanical properties of Th produced by various processes. (H14g, H15n, 2-61; Th)

SECTION J

HEAT TREATMENT

1-J.* Softening Characteristics of Al-$MgZn_2$ Alloys. Rihei Kawachi. *Light Metals*, no. 31, July 1958, p. 22-34.

Samples of Al alloy sheets which contained approximately 8% $MgZn_2$ were heated to 470° C. and quenched to various temperatures. They were held for varying periods at quenching temperature and then water quenched and aged immediately following initial heating, then reheated and briefly maintained at tempering temperatures, followed by water quenching and aging. Effects of alloy composition, of heat treatment and step quenching on hardness. Mn and Cr accelerated the softening. Quenching stress had an effect similar to Mn or Cr. The split-aging effect as shown by greater hardness of samples tempered after natural aging compared to those tempered immediately after quenching varied according to quantity of Mg or Zn. 21 ref. (J27, Q29n, 2-60; Al-b, Mg, Zn, *Cr, Mn*)

2-J.* Heat-Treated Powder-Iron Parts for Improved Strength and Hardness. Navin Kothari. *Machine Design*, v. 30, Oct. 30, 1958, p. 93-96.

Properties of ferrous parts produced by the powder-metal process can be improved by the same conventional heat treatment techniques used on carbon and low-alloy steels. Carburizing, carbonitriding and carbo-austenizing discussed in relation to density, tensile strength, yield strength, elongation and Rockwell hardness. (J28; 6-72, Fe)

3-J.* Developments in Surface Hardening. E. Mitchell. *Metal Treatment*, v. 25, Oct. 1958, p. 425-430, 433.

Methods by which chemical composition of the outer layer of the steel is altered; methods in which the surface is hardened by rapid localized heating followed by quenching. Optimum methods of gas carburizing. 6 ref. (To be continued.) (J28; ST)

4-J.* Annealing of Malleable Iron: Effect of Repeated Annealing on Rate of Second Stage Graphitization. J. E. Rehder and J. E. Wilson. *Modern Castings*, v. 34, Aug. 1958, p. 49-52.

Annealing of malleable iron is affected by the thermal history of the material. If re-annealing is necessary because of retention of primary carbide due to furnace trouble or insufficient time at specified temperature, the cooling rate through the critical temperature range can be increased for the re-anneal by about 85% with a proportionate saving in time. Annealing is independent of soaking time at high temperatures. Hardness of material decreases as annealing is repeated. 6 ref. (J23, 2-64; CI-s)

5-J.* New Thermo-Chemical Techniques. Pt. 1. Bright Annealing. P. Galmiche. *Metal Treatment*, v. 25, Oct. 1958, p. 405-408.

The ONERA process of bright annealing consists of the use, for annealing, of reducing atmospheres halogenized 'at equilibrium' similar to those which are produced in the ONERA process of bright chromizing. (J23a; SS)

6-J. (Translation —Brutcher no. 4095.) Improved Heat Treating Processes for Large Forgings. N. V. Fiksen. *Metallovedenie i Obrabotka Metallov*, no. 11, Nov. 1957, p. 77-80.

Previously abstracted from original. See item no. 71-J, 1958. (J-general, W27, 4-51, ST)

7-J. Tempering Type-410 Stainless Steel. Charles F. Lewis. *Metal Progress*, v. 74, Nov. 1958, p. 88-89.

Method of determining tempering time to get desired hardness in steels, the hardness of which falls rapidly in a short temperature range. (J29; SS)

8-J. (German.) Fatigue Strength Increased by Bath Nitriding. Bruno Finnern. *Draht*, v. 9, Oct. 1958, p. 414-415.

Crankshafts and axle journals were nitrided in salt bath at 550-570° C. in 90 to 120 min. Fatigue strength of parts subject to bending and torsional cyclic stresses is greatly increased. (J28k, Q7a, T7j; ST)

9-J.* Electrical Resistance Heating. S. Nordin. *ASEA Journal*, v. 31, no. 4-5, 1958, p. 47-53.

Theory, several types of machines; advantages and disadvantages of method. (J2, 1-68; 10-51)

10-J.* Application of Progressive Induction Heating to Forged Roll Hardening Operations. John Dugan. *Iron and Steel Engineer*, v. 35, Nov. 1958, p. 65-76.

Gives better control of hardening operation; internal stresses reduced, grain structure improved. (J2g, W18a; 4-51)

11-J.* (French.) Deformation Occurring During Quench Hardening of High-Chromium Steels. Pt. 1. C. Rovirosa. *Metallurgie et la Construction Mecanique*, v. 90, June 1958, p. 473-481.

Equilibrium diagram plotted for steels containing 2% C, 12% Cr, 0.4% Mn, 0.3% Si and 0.3% V was used to establish heat treatment techniques for hardening of dies used to cut sheet for magnetic circuits. Influence of thermo-mechanical history of steel. Heating and cooling phenomena, including structural changes, which occur during hardening treatments. (J26, M24d; TS, *Cr*)

12-J.* (French.) Deformation Occurring During Quench Hardening of High Chromium Steels. Pt. 2. C. Rovirosa. *Metallurgie et la Construction Mecanique*, v. 90, July 1958, p. 541-551.

Laboratory study of die steel provides data for establishing heat treating techniques. Structure of steel should be as homogeneous as possible before hardening; a preliminary stabilizing heat treatment is advised. Use of oil or water quench depends on size of part. In designing die parts, it must be borne in mind that areas most subject to deformation are located in planes parallel to plane of hot rolling. Dimensional changes in laboratory specimens and Rockwell hardness readings. (J26, P10d; TS, 17-51)

13-J.* Temperature Distribution Throughout a Stack of Electrical Sheet Steel During Annealing. R. J. Wakelin. *British Journal of Applied Physics*, v. 9, Sept. 1958, p. 353-358.

During the final annealing process in the manufacture of 4% Si-Fe electrical sheet, the temperature at any one time varies horizontally across the plane of the sheets and vertically up the stack. By combining results of a number of experiments, the temperature distribution throughout a stack of sheets was obtained at all times during the three-day annealing cycle. (J23; SGA-n, *Si*, Fe, 4-53)

14-J.* (German.) Use of Protective Gas in Cold Rolling Mills. Werner Feige and Paul Middelhaufe. *Stahl und Eisen*, v. 78, Oct. 16, 1958, p. 1441-1448.

Water gas constant is important when a bright surface is to be preserved in low-carbon steel strip, while the carbon equation determines the preservation of carbon in high-carbon steels. Production, composition and uses of protective gases. 17 ref. (J2k, B25; CN, 4-53)

15-J.* (Japanese.) Electrolytic Heating. Pt. 11. Diffusion of Hydrogen Into Cathode. Hisao Mii, Toshikazu Sato and Susumu Minowa. *Nagoya Government Industrial Research Institute, Reports*, v. 7, Sept. 1958, p. 13-15.

Specimens of a carbon steel were electrolytically heated to 850° C under various conditions and quenched in electrolytic bath. Specimens of the same material and size were heated to the same temperature in a salt bath and quenched into water. Hydrogen was analyzed in

these as well as nontreated specimens to determine whether or not electrolytic heating causes a hydrogen embrittlement problem. 5 ref. (J2, R26s; CN, *H*)

27-J.* (German.) Influence of Protective Gas Circulation and Holding Time in Pot Annealing Furnaces on Properties of Cold Rolled Steel Strip. Jacques Gerhard Brockhaus, Roland Horst and August Luth. *Stahl und Eisen*, v. 78, Oct. 16, 1958, p. 1449-1456.

Experiments with commercial open-hearth and C75 steel strip 0.2 to 2.5 mm.

thick. When the protective atmosphere was circulated by a ventilator the consumption of fuel gas was 17% lower with 3-ton charges of strip. With small charges of about 1.5 tons circulating the protective gas did not decrease fuel gas consumption. Good mechanical properties with this method. For openhearth deep drawing steel with 0.06% C, 0.31% Mn, 0.018% P and 0.03 S a holding time of 6 hr. at 650° C. was optimal; 2 hr. satisfactory. (J23a; ST, 4-53)

28-J.* (Rumanian.) Cementation of Alloy Steels Using Two New Mixtures Based on Calcium Carbonate and Dolomite. Toma Farcas, Tiberiu Golgotiu, Gh. Ailincai, C. Ciochina and Emil Andrei. *Buletinul Institutului Politehnic Din Iasi. Serie Noua*, v. 2, no. 3-4, 1956, p. 335-349.

By comparison of the results obtained with the values found by cementation with "Feridon" (barium base) the cheaper mixtures of calcium carbonate and dolomite give almost the same results. (J28g; AY)

29-J. Selective Case Hardening. *Automatic Machining*, v. 20, Dec. 1958, p. 31-33.

Methods and apparatus for rapid hardening of surfaces during production. (J2n; ST)

30-J.* Heat Treatment of Aluminum. H. M. Short. *Industrial Heating*, v. 25, Dec. 1958, p. 2432, 2434, 2436, 2438, 2440, 2442-2443, 2549.

Effect of heating method and furnace atmosphere and equipment used for solution heat treating wrought alloys. (J27a, W27; Al-b)

31-J.* How Nickel Affects High-Speed Tool Steels. R. F. Hehemann and A. R. Troiano. *Iron Age*, v. 182, Dec. 25, 1958, p. 52-56.

Ni improves hardening of steel. Austenitizing temperatures versus as-quenched hardness, austenitizing temperatures versus percentage of structural constituents, austenitizing temperatures versus grain size; tempering conditions versus hardness, tempering conditions versus amount of retained austenite, and cyclic tempering versus hardness. (J22, J29, Q29n, 2-60; TS-m, Ni)

32-J.* Heat Treating. Pt. 3. A. S. Eves. *Modern Machine Shop*, v. 31, Jan. 1959, p. 122, 124, 126, 128, 130.

Tempering temperatures and time; brittleness; discoloration. (J29; ST)

33-J.* (Russian.) Increasing Durability of Hardened Steel Rolls by Low-Temperature Annealing. N. S. Vasil'chenko. *Stal'*, v. 18, Oct. 1958, p. 917-920.

Rolls were forged for cold rolling; weight 210-390 kg., diameter 210-250 mm., length 450-650 mm. Durability of these hardened rolls was greatly improved by additional tempering at 165-180° C. for 6 hr. to remove internal stresses. Additional annealing, although it completely eliminates internal stresses, has insignificant effect on hardness of rolls. (J23, 1-67, W23k; ST)

34-J.* (Russian.) High-Quality Cold Rolled Transformer Steel. A. A. Rastorguev, A. A. Nefedov and P. I. Borzov. *Stal'*, v. 18, Nov. 1958, p. 1023-1029.

Low-alloy Si steel (about 1.5% Si) is subjected to high-temperature recrystallizing anneal at 1000°. Low-alloy two-phase Si steel with a relatively low anisotropy can be obtained by comparatively low anneal of 850°, which is not accompanied by significant grain growth. 4 ref. Composition of alloy steels is not the only factor to determine proper heat treating procedure and temperatures. Nuclei as partly recognizable in their effects on grain dimensions have a determining effect on behavior hardenability of alloy steels and degree of hardness obtained in the heat treating process. 7 ref. (J5, N8n, Q29n, 2-60, 3-71; AY)

44-J.* (German.) Factors Influencing the Heat Treatment of High Speed Steels. Karl Wagner. *Haerterei-Technische Mitteilungen*, v. 12, May 1958, p. 18-35.

Relationship between hardness (depending on quenching temperature and tempering procedure) and impact strength. Comparative chart on hardness losses sustained by various compositions of high-speed steels when subjected to temperature of 600 and 650° C. following heat treatment. (J-general, Q6n, Q29n, 2-60; TS-m)

45-J.* (German.) Material and Heat Treatment of Stamping Dies. M. Strauber. *Werkstattstechnik und Maschinenbau*, v. 48, Nov. 1958, p. 593-596.

Dimensional changes due to heat treatment were analyzed to determine best methods for various materials and causing a minimum of warpage. Slow heating and slow quenching were found the most important factors. (J-general, P10d, W24n)

46-J. (Translation—Brutcher, 4427.) Structure, Properties and Heat Treating of New High Speed Steels. Yu. A. Geller and V. S. Kachanov. *Metallovedenie i Obrabotka Metallov*, Nov. 1958, p. 6-19.

High-V steels in contrast with Co and standard high-speed steels possess a more stable residual austenite. High-V steels with 5% Co are equal in thermal stability to 18% W steel and 10% Co and exceed them in machinability. Recommended hardening temperatures. Soaking rate and tempering temperatures. 10 ref. (J-general, N8, 2-60; TS, *Co, V, W*)

47-J. (Translation—Brutcher, 4431.) Heat Treatment of High Speed Toolsteels in Water Vapor Atmosphere. A. P. Gulyaev, Z. S. Luneva, G. G. Korolev and V. V. Samoilov. *Metallovedenie i Obrabotka Metallov*, Nov. 1958, p. 39-44.

Water vapor treatment produced an oxidizing surface of F_2O_3 (ferric oxide) which prevents the formation of a magnetic iron oxide. Water vapor treatment is recommended as a supplementary treatment. To increase tool corrosion stability and increase cutting qualities, the magnetic oxide film formed has a thickness of 1-4 microns. 4 ref. (J2k; TS)

48-J. (Translation—Brutcher, 4435.) Thermomagnetic Treatment of Magnetically Soft Alloys With a Rectangular Hysteresis Loop in Vacuum Furnaces. O. N. Alt'gausen, Sh.

I. Zusman and A. N. Stepanova. *Metallovedenie i Obrabotka Metallov,* Nov. 1958, p. 60-62.

Recommended procedure is high-temperature annealing at 1000-1100° in vacuum, cooling at a definite rate followed with a thermomagnetic treatment at 600-700° in hydrogen in presence of a magnetic field. Magnetic properties depend upon the magnitude of the superimposed magnetic field. To obtain best magnetic properties, it is sufficient to maintain a voltage range of 10-15 ergs. Increasing the range does not improve the alloy properties. (J23, P16a; Fe-b, Ni)

49-J.* What Controls Are Needed for Accelerated Carburizing? P. M. Unterweiser. *Iron Age,* v. 183, Jan. 15, 1959, p. 86-88.

Application of high temperatures, cooling, grain refining and annealing. (J28g, 1-66)

50-J.* (French.) Hardness and "Sulphinuzing". Y. de Villemeur. *Metaux-Corrosion-Industries,* v. 33, July-Aug. 1958, p. 324-334.

Although increase in microhardness is not principal object of "Sulphinuzation", it has interesting effects on properties of steels so treated. Effects on microhardness of nitriding and nitrided steels. Influence of surface hardness in sulphinuzed materials increased fatigue resistance, disadvantages due to hardness. 6 ref. (J28, Q29q, Q7a; ST)

51-J. Production Methods for Heat-Treatment of Steel Components in Salt Baths. *Current Engineering Practice,* v. 1, Nov. 1958, p. 14-18.

(J2j, J28k, K8n; ST)

52-J.* (German.) Heat Treatment of 13% Cr Steel Castings. Hans Zeuner and Ulrich Heubner. *Giesserei,* v. 45, Dec. 4, 1958, p. 747-753.

Influence of chemical composition on structure; various methods of heat treatment, including hardening and tempering. Dependence of ultimate hardness on the chemical composition of delta ferrite and on the method of heat treatment. Low C content 13% Cr alloy with slight addition of Ni produces best impact strength. 11 ref. (J-general, M28, Q6, Q29, 2-60; ST, *Cr, Ni,* 5)

53-J.* (German.) Case Hardening of Free-Machining Steels. Alexander Schepers and Werner Bartolome. *Stahl und Eisen,* v. 78, Nov. 27, 1958, p. 1745-1749.

In basic bessemer steel, increased Mn caused a lower C content in the carburization zone; Pb seems to act in a similar way. Decreased effect of Pb on C was observed in openhearth steel. Keeping steels for a minimum time at the high temperatures or heat treating in an inert salt recommended to avoid decarburization and reduction of hardness. (J28, J4a; ST, *Pb, Mn*)

54-J.* (Russian.) Heat Treatment of Cold Rolled Transformer Steel in Coils. M. I. Kolov and A. I. Terekhova. *Stal',* v. 18, Nov. 1958, p. 1029-1035.

Rejection of cold rolled transformer steel caused by deterioration of magnetic properties and dimensional deviations during bright annealing was eliminated by straightening the strips and subsequent second annealing of coil. Straightening and compressing of metal with deformation at 3.5% and secondary annealing at 750° improved the magnetic qualities due to grain growth resulting from recrystallization and coagulation of cementite. 11 ref. (J23a, F29r, P16; ST, SGA-n)

55-J.* (German.) Age Hardening of Al-Mg-Zn Alloy With or Without Chromium. W. Koster. *Aluminium,* v. 34, Dec. 1958, p. 694-699.

Changes of properties (tensile strength, longation, electric conductivity and thermal power) in relation to aging temperatures between 20 and 225° C. and time (up to 70 days) were tested, using specimens of two Al alloys, one of them containing 0.2% Cr, in 2-mm. wire which had been homogenized at 480° C. and then quenched in water. Isothermes and isochrones show decrease and increase in property values parallel to structural changes. Addition of Cr, which accelerates precipitation in different phases, increases resistance to stress corrosion. 17 ref. (J27d, Q-general, 2-60; Al-b, *Mg, Zn, Cr*)

56-J. Modified Martempering Permits Close Tolerance in Aircraft Pumps. Edgar C. Wallace and Howard E. Crouse. *Industrial Gas,* v. 37, Jan. 1959, p. 10-11, 20.

(J26p, T24d, W13d)

57-J. Controlled Atmospheres in Australia. F. P. Heard. *Metal Progress,* v. 75, Jan. 1959, p. 98-100.

Limited gas sources make the production of adequate controlled atmospheres

very difficult, but byproduct propane from newly built oil refineries appears to have solved the problem. An immense pool of natural gas under the Sydney area has also been considered as a potential source for controlled atmospheres. (J2k, B25)

58-J.* Heat Treatment of Drop Forgings. F. C. Bird. *Metal Treatment and Drop Forging*, v. 25, Dec. 1958, p. 518-520, 525.

Mechanism of grain growth, effect of increasing temperature and hot working and influence on physical properties; role of C in steel; various structures produced by heat treatment. (J-general, M27; 4-51, ST)

59-J.* Flame Buckled This Steel and Flame Straightened It! *Welding Engineer*, v. 44, Feb. 1959, p. 40-43.

Techniques for straightening steel members of aircraft carrier frame buckled by fire; heating with oxy-acetylene torches. (To be continued.) (J2h; ST)

60-J.* Bright Annealing. A. E. Pickles. *Metal Treatment and Drop Forging*, v. 26, Jan. 1959, p. 7-14.

Requirements for bright or clean annealing of variety of ferrous and nonferrous metals. Furnace types and atmospheres for various classes of work. (J23a, 1-55; ST, Cu-b, Ni-b)

61-J.* (German.) Structure, Heat Treatment, Age Hardenability and Soft Annealing of Sand Cast Remelted Aluminum Alloys. Hans Reininger. *Giesserei-Praxis*, Nov. 10, 1958, p. 423-428.

High content of heavy metals causes hardening by metallides, as does magnesium silicide. The result is lower plasticity and higher hardness and tensile strength. In casting, a strong and fine-grained structure can be obtained by the use of chills. 30 ref. (J-general, Q-general, E22r, 2-60; Al-a, 5-60)

62-J.* (German.) Nitriding of Steel by Glow Discharges. Helmut Knuppel, Karl Brotzmann and Friedrich Eberhard. *Stahl und Eisen*, v. 78, Dec. 25, 1958, p. 1871-1880.

Chromium steel nitrided by glow discharge in an ammonia or a nitrogen-hydrogen atmosphere at pressures between 1 and 10 mm. of mercury. Description of apparatus. 8 ref. (J28k, 1-68; AY)

63-J.* (German.) Structure of Nitrided Steels. T. M. Noren and L. Kindbom. *Stahl und Eisen*, v. 78, Dec. 25, 1958, p. 1881-1891.

Effects of glow discharge nitriding (in ammonia, alternating with a nitrogen-hydrogen atmosphere of 3 mm. of mercury) and gas nitriding on structure and properties. Ti alloyed nitrided steels found to be heat resistant. 7 ref. (J28k, 1-68, M27; AY)

64-J.* (Dutch.) Salt Bath Heat Treatment. H. Koops. *Metalen*, v. 13, Dec. 31, 1958, p. 436-440.

Carburizing baths, hardening, tempering, nitriding and carbonitriding baths and their application. Hardening and isothermal annealing in saltpeter baths, hardening in baths of NaOH or $CaCl_2$ and bath bright annealing. (J2j, J28)

65-J.* (French.) Double Quenching Prevents Deformation. *Machine Moderne*, v. 52, Oct. 1958, p. 46-48.

Quenching in heated oil to introduce martensite formation, retaining piece until quenching effect penetrates to core, then transferring part to air for finishing formation of martensite on the surface. (J26p; ST)

66-J.* (French.) Grain Refinement of Uranium. J. Lehmann and H. Aubert. *Revue de Metallurgie*, v. 55, Dec. 1958, p. 1188-1194.

Experiments to obtain fine-grained U by quenching from beta or gamma phases. Stabilizing of beta phase necessary to obtain uniform refinement. 7 ref. (J26, M27c; U-b)

67-J. (Translation—AIP.) Recrystallization Diagram of Rhenium. E. M. Savitskii, M. A. Tylkina and K. B. Povarova. *Soviet Physics Doklady*, v. 3, no. 2, 1958, p. 398-402.

Results obtained on recrystallization and variation in hardness show that annealing temperature of Re, 10% of more deformed, is 1750-2400° C. 7 ref. (J23c, N5, 3-68; Re)

68-J. (Translation—BISI, no. 1031.) Influence of Annealing on the Precipitation of Aluminum Nitride and the Mechanical Propties of Non-Alloyed Steels. Paul Werthebach and Hubert Hoff. *Stahl und Eisen*, v. 78, May 29, 1958, p. 736-743.

See item 281-J, 1958. (J23, J24, Q-general; CN, Al, N)

69-J. (Translation—Brutcher, no. 4446.) Quenching in Water-Air Mixtures. M.E. Blanter, N.A. Kulakov, I.M. Sergeichev, T.A.

Mikhin and S.D. Fainborn. *Metallovedenie i Obrabotka Metallov*, Dec. 1958, p. 29-34.

Cooling capabilities of water-air mixtures for quenching to obtain qualitative characteristics. Cooling (quenching) in oil is equivalent to quenching in mildly humid air. 5 ref. (J26n, W28p)

70-J.* Heat Treatment in the Foundry. A. B. Everest. Paper from "Modern Foundry Practice". 3rd Ed. Philosophical Library, Inc., New York, 1959, p. 62-83.

Annealing, quenching, tempering, flame hardening, normalizing, stress-relieving of cast iron or steel castings. Mechanical properties following heat treatment. Heat treatment of nonferrous alloys. (J-general; CI, ST, Al-b, Cu-b)

71-J.* H-12 Hot Work Tool Steel. R. F. Harvey. *Precision Metal Molding*, v. 17, Jan. 1959, p. 48-49, 70.

Recommended heat treatment for H-12 is preheat at 1200° F., harden at 1825 to 1850°, air cool, double temper at 1080° F., giving a Rockwell hardness of C-48 to 50. (J-general; TS)

72-J.* Some Considerations Involved in the Heat Treatment of Steel Strip. J. McMullen. *Sheet Metal Industries*, v. 36, Jan. 1959, p. 5-25.

Influence of the prior anneal; furnace atmospheres, quenching techniques and furnace equipment. (J-general; ST, 4-53)

73-J.* How to Carbonitride Low Carbon Steel. *Steel*, v. 144, Feb. 23, 1959, p. 86-88.

Optimum temperature, dew point, gas volumes and furnace times for case hardening production parts of 0.20% C steel in an automatic, shaker-hearth carbonitriding furnace. (J28m; CN-g)

74-J.* (Japanese.) Residual Stresses of Solid Rolled-Wheels Due to Various Kinds of Heat Treatment. Naoteru Oda and Kunio Nishioka. *Sumitomo Metals*, v. 10, July 1958, p. 137-143.

Treatments are normalization, forced air cooling, tempering, rim-quenching, slack-quenching, and combinations of two of these. No significant difference is observed in the residual compressive stress. (J-general, Q25h, T23p; ST)

75-J. Heating and Cooling of Flat Strip. Pt. 3. A. H. Vaughan. *Industrial Heating*, v. 26, Jan. 1959, p. 33-34, 36, 38-40, 42, 44.

Data for determining natural convection coefficients when utilizing air, combustion products or prepared atmosphere with low combustibles. (J2; ST, 4-53)

76-J. Foundry Heat Treatment Department. Pt. 1. Function of the Department. W.H. Everard. *Edgar Allen News*, v. 38, Jan. 1959, p. 1-3.

Heat treatment of castings, annealing, quenching, cooling, stress-relieving. (J-general; 5)

77-J. (Russian.) New Method of Surface-Profile Hardening of Gears With a Medium Module. K.Z. Shepelyakovskii and R.I. Entin. *Vestnik Mashinostroeniya*, Dec. 1958, p. 53-58.

Surface heating and surface hardening of teeth by induction heating. 10 ref. (J2g, J5, T7a)

78-J.* Post-Weld Annealing of Stainless Steel. M.W. Wilson. *Corrosion Prevention & Control*, v. 6, Jan. 1959, p. 62.

Difficulties in annealing long length of welded stainless steel tubing. Effect of annealing on corrosion resistances. (J23n; SS, 4-60)

79-J.* (German.) Heat Treatment of Small Parts. *Draht*, v. 10, Jan. 1959, p. 14-16.

Atmosphere control in furnaces used in the automatic heat treatment of springs and fasteners; quenching baths and equipment for air circulation in annealing furnaces. (J2k, J26, J23, T7c, T7f; ST)

80-J.* (Russian.) Heat Treatment of Low-Carbon Structural Steel. O.L. Petrov. *Stal'*, Jan. 1959, p. 81-85.

Application of simple heat treatment to machine parts made of low-carbon steel improves mechanical properties, reduces weight and gives significant savings by replacing low-alloy steels. 6 ref. (J23n; CN-g)

81-J.* (Russian.) Annealing Effect on Modified Ingot Molds. A.P. Rogach, A.P. Ryzhikova and D.V. Sklyarenko. *Stal'*, Jan. 1959, p. 92-93.

Cast iron molds, modified with 45% ferrosilicon, annealed at 500-850° C., which is repeated after 100-110 pours, increased durability by 2-2.5 times. (J23n, W19c; CI, *Si*, AD-n31)

82-J.* (Dutch.) Aging of Al-Mg Alloys. L. J. G. van Ewijk. *Metalen*, v. 13, Nov. 15, 1958, p. 376-382.

Microstructures of cross-sections of tensile samples. Aging is influenced by percentage of Mg, purity of alloy and deformation after heat treatment. 7 ref. (J27d, M27; 2-60, 3-68, Al-b, *Mg*)

83-J.* (English.) Stress Relief of Alloy Steels. W. Soete and G. E. Tummers. *Lastechniek*, v. 24, Nov. 1958, p. 236-240.

Cr-Mo-Ni alloy subjected to torsion and tensile tests at 475-800°C. for heating periods of 30-100 min. Relaxation behavior is analyzed for each heating period. (J1; AY, *Cr, Mo, Ni*)

84-J.* (German.) Induction Heating and Its Applications in Industry. G. Hoffmann. *Fertigungstechnik*, v. 8, Dec. 1958, p. 552-559.

Depth of heat penetration related to conductivity and permeability of material and its temperature in various steels. Application of induction heating to warm forming, brazing, sintering, normalizing, hardening, welding and melting. (J2g)

85-J.* (German.) Annealing With High-Frequency Current. G. Benkowsky. *Fertigungstechnik*, v. 8, Dec. 1958, p. 559-565.

Selection of frequency, efficiency of induction coils, specific resistance and magnetic conductivity of various metals as dependent on temperature. Applications of induction annealing. (J23, J2g, 2-61)

86-J.* (Russian.) Investigation of Decarburization Rate of Steel Pipe in Hydrogen Medium. V. V. Ipatiev, O. P. Merkulova and V. P. Teodorovich. *Zhurnal Prikladnoi Khimii*, v. 31, no. 12, 1958, p. 1891-1894.

Rate of decarburization in pipe made from 30 KHMA steel in H media at 400-600°C. and 100-700 atm. pressure. Mathematical equation relating depth to decarburization to time exposure and an equation relating decarburization rate to pressure and temperature. (J4a, 2-61, 3-74; ST, *H*)

87-J.* (Russian.) Decarburization of Carbon Steels With Hydrogen at High Temperatures and Pressures. S. L. Skop, V. P. Teodorovich and V. V. Ipats'ev. *Zhurnal Prikladnoi Khimii*, v. 31, no. 12, 1958, p. 1894-1897.

Effect of temperature, pressure and time on carburization depth of steel #35. Mathematical equation of relation of incubation period to pressure and temperature. (J4a, 2-61, 3-74; ST, *H*)

88-J. (Russian.) New Austenitic Steel for Nitriding. M. F. Aleksfenko and A. G. Anoreeva. *Stal'*, Jan. 1959, p. 78-81.

The steel has the following advantages: Quick nitriding to a depth of 0.18 mm. in 40 hr., stronger center, more gradual hardness transition from upper layer toward center, greater spread of the region of corrosion stability, absence of peeling of nitrided layer. (J28k; SS-e)

89-J.* (German.) Influence of Surface Condition on Carburization Properties of Steel. Rudi Jonck. *Industrieblatt*, v. 59, Jan. 25, 1959, p. HT1-HT3.

Rough surfaces carburized better; cold working preceding heat treatment has no measurable influence; presence of graphite on the surface has detrimental effects, amounting to 60% reduction in depth of penetration. (J28g, 3-70; ST)

90-J.* (German.) Development of Induction Hardening in Japan. Seiichi Ishida. *Industrieblatt*, v. 59, Jan. 25, 1959, p. HT4-HT6.

Composition and application of quenching media; distortions encountered and influence on fatigue strength. (J2g)

91-J.* (German.) Nitriding of Iron and Steel. Theo Kootz. *Stahl und Eisen*, v. 79, Feb. 5, 1959, p. 135-137.

Application of N, air, nitrogenized air (35% O) and pure N. Effect of O content in the metal on the velocity of nitriding. 12 ref. (J28k, 2-60; ST, *N, O*)

92-J.* Reducing Scuffing and Wear of Ferrous Metals. F. D. Waterfall. *Engineering*, v. 137, Jan. 23, 1959, p. 116-120.

The "Sulfinuz" process is used to impregnate the surface of steel, or cast iron, with S and N, with a view to improving the resistance of the treated surfaces to scuffing and wear. The treatment is carried out in a molten salt bath, containing cyanide and S compounds maintained at a temperature of 500 to 600°C.; more usually at 570°C. (J28, Q9, Q7, 2-60; ST, SS, CI)

93-J.* (Italian.) Heat Treatment of Meehanite Cast Iron. Alfredo Secciani. *Fonderia*, Nov. 1958, p. 501-519.

Time-temperature conditions for various annealing, hardening and isothermal heat treatments; structural changes; hardenability. (J-general, Q29n; CI)

94-J.* Automatic Heat Treating in Continuous Roller Bearing Manufacturing. Leo H. Everitt and O. E. Cullen. *Industrial Heating*, v. 26, Feb. 1959, p. 250-258, 424.

Automatic line achieves uniform carburizing and good size control. (J28g, T7d, 18-74; CN-g)

95-J.* Induction Hardening of Tractor Axles. P. W. Carbaugh and A. H. Pittaway. *Industrial Heating*, v. 26, Feb. 1959, p. 286-290, 292-294, 296, 298, 400.

Selection of optimum alloy composition and heat treatment cycle. (J2g, T7j, 2-60; AY)

96-J.* Quench and Temper Process for the Manufacture of High Strength Tubular Products. H. B. Emerick. *Industrial Heating*, v. 26, Feb. 1959, p. 303-304, 306, 308, 310, 312, 312, 316, 318, 320.

Pipe with high strength and a reasonable amount of ductility produced by heat treating carbon steel tubular products in modernized continuous quench and temper lines. 5 ref. (J26, J29, T28p; CN, 4-60)

97-J.* Continuous Annealing 60 Tons Per Hour of Tin Plate. Quentin M. Bloom. *Iron and Steel Engineer*, v. 36, Feb. 1959, p. 115-125.

Multi-line annealing facilities for continuous annealing of steel strip with single-pass direct-fired furnace and controlled cooling sections. Advantages of multi-line moderate speed installations. (J23a, W27n, 1-61; ST)

98-J.* (German.) Influence of Furnace Atmosphere on Fire Loss and Skin Decarburization in a Small Pusher-Type Furnace. G. Baukrowitz. *Werkstattstechnik*, v. 49, Feb. 1959, p. 113-116.

Heating with coke oven gas, oil, or both; influence of atmosphere, time and temperature; maximum fire loss at 20% oil, 80% gas. Equal decarburization at top and bottom of ingot. (J4a, J2k, W27g, W27h; ST, 5-59)

99-J.* Welding and Heat Treating Rocket Cases. C. N. Scott. *Metal Progress*, v. 75, Mar. 1959, p. 99-102.

Rocket engine cases are fabricated from precisc weldments of alloy steels which are heat treated to give high strength. Cases are quenched from austenitizing temperature into salt at 350° F. to minimize distortion. (J22, J2j, K1, T2p, AY)

100-J.* Cold Treatment for Better Properties. Rolland S. Jamison. *Metal Progress*, v. 75, Mar. 1959, p. 128-130.

Chilling of heat treated steel parts to -120° F. transforms retained austenite to martensite. Commercial refrigerating units are doing this today on a wide variety of parts. (J26q, W10g; ST)

101-J.* High Temperature Carburizing. H. N. Ipsen. *Metal Treating*, v. 10, Jan-Feb. 1959, p. 4-8, 42.

AISI 1117, 4615, 8620 and 9315 steels carburized in enriched endothermic atmosphere at 1700 to 2000° F. for 1 to 3 hr. Effect of temperature and time at temperature on case depth, percentage carbon in case and grain structure. (J28g, 2-62, 3-67; ST)

102-J. (Translation—BISI no. 859.) Use of Protective Coatings for Decreasing Steel Decarburization. S. Z. Yudovitch. *Stal'*, Jan. 1957, p. 69-71.

See item 23-J, 1958. (J4a; AY, *Cr*)

103-J. (Translation—Brutcher no. 4478.) Effect of Contact Electric Heating Upon Properties of Cold Rolled Stainless Steels. L. V. Mironov, V. G. Sazonov, V. V. Levitin and N. M. Rodigin. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Jan. 1959, p. 26-30.

Effect on mechanical properties, recrystallization and resistance to intercrystalline corrosion. Recrystallization proceeds at a greater rate but at much higher temperatures in comparison with the usual heating procedures. 6 ref. (J2, N5; SS)

104-J. (Translation—Brutcher no. 4480.) Annealing of Low-Coercivity Iron. N. V. Vyaznikov and G. I. Ivanyuk. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Jan. 1959, p. 39-41.

High ductility and low magnetic coercivity of technically pure iron are attained by slow cooling within the annealing furnace at 350-400° C. followed by accelerated air cooling. (J23, P16, 2-64; Fe)

105-J. (Translation—Brutcher no. 4483.) Aging of Alloy TsAM-4-1. F. S. Adel'skaya and P. L. Chernova. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Jan. 1959, p. 52-54.

Effect of natural and artificial aging and of cold treating on dimensional changes of TsAM 4-1 alloy (3.5-4.5% Al; 0.5-1.5% Cu, balance Zn). Artificial and natural aging produce the same shrinkage effect while cold treatment retards shrinkage. (J27d, P10d; Zn-b)

106-J.* (German.) Bright Annealing of Copper Alloys and Noble Metal Copper Alloys. Habil F. Erdmann-Jesnitzer, G. Wunsche and H. Schlegel. *Metall*, v. 13, Feb. 1959, p. 87-92.

Brittleness testing; effect of hydrogen and carbon monoxide content upon the alloys. 25 ref. (J23a; Cu-b, *EG-c*)

107-J.* (German.) Influence of Annealing Time on Structure and Transformation Behavior of Plain Carbon Steels. Heinz Borchers and Gunter Saur. *Stahl und Eisen*, v. 79, Feb. 19, 1959, p. 210-215.

Ferrite grain size, proportion of pearlite and location of Ar_3 and Ar_1 points in hypo-eutectoid plain carbon steel as dependent on annealing time. 11 ref. (J23, N8, 2-64; CN)

108-J.* Quench Aging, Strain Aging, Yield and Flow Phenomena in Low Carbon Steel. Eric R. Morgan. Paper from "Annealing of Low Carbon Steel, Proceedings". Lee Wilson Engineering Co., Inc., Cleveland, Oct. 1957, p. 19-28.

Quench and strain aging, and their relation to supersaturated solutions of carbon and nitrogen in iron; effects on magnetic and mechanical properties which may result in stretcher strains, buckling and tearing in deep drawn sheets. Yield and flow phenomena explained in terms of dislocation theories of plasticity. 10 ref. (J26d, N7e, Q23; CN-g)

109-J.* Annealing Cycles for Commercial and Drawing Quality Rimmed Steels. Howard E. Miller. Paper from "Annealing of Low Carbon Steel, Proceedings". Lee Wilson Engineering Co., Inc., Cleveland, Oct. 1957, p. 53-56.

Grain structure and corresponding hardness for various cycles. Temperature employed is between 1150-1340° F., while soaking time is determined by desired grain size and hardness. (J23, M27; ST-d)

110-J.* Short-Time Annealing of Cold Worked Low Carbon Steel. Georg Niebch. Paper from "Annealing of Low Carbon Steel, Proceedings". Lee Wilson Engineering Co., Inc., Cleveland, Oct. 1957, p. 63-74.

Deformation, annealing time and temperature required to produce full softening by recrystallization in short time, or retention of permanent part of strengthening on long-time annealing. Strip steel, cold rolled between 10 and 60% and annealed between 650 and 900° C. for 1 to 3 min. resulted in full softening either for normalizing at 900° C. or for annealing at lower temperatures. 7 ref. (J23, J24, N5; CN-g)

111-J.* Effect of Variation in Annealing Cycle and Composition on Mechanical Properties of Continuously Annealed Tin Plate. P. W. Marshall and J. A. Bauscher. Paper from "Annealing of Low Carbon Steel, Proceedings". Lee Wilson Engineering Co., Inc., Cleveland, Oct. 1957, p. 75-83.

Effect of increasing annealing temperature and decreasing cooling rate and amount of temper mill extension on hardness and tensile strength. Influence of carbon, Mn and nitrogen levels on mechanical properties. 8 ref. (J23, 1-61, 2-60, Q-general; 4-53, CN-g, *Sn, C, Mn, N*)

112-J.* The Economics of Annealing in the United States. Lyle F. Gulley. Paper from "Annealing of Low Carbon Steel, Proceedings". Lee Wilson Engineering Co., Inc., Cleveland, Oct. 1957, p. 85-93.

Procurement and cost of fuel, availability and cost of labor, metallurgical limitations and customers' requirements in production of low-carbon sheet steel. (J23, 17-53; CN-g, 4-53)

113-J.* Annealing of Cold Reduced Sheet and Coil in Europe. Harry H. Ascough. Paper from "Annealing of Low Carbon Steel, Proceedings". Lee Wilson Engineering Co., Inc., Cleveland, Oct. 1957, p. 95-124.

Annealing cycles, control of microstructure and ductility; surface quality and defects produced during annealing. 7 ref. (J23; CN, 4-53)

114-J.* (Italian.) Heat Treatment of Steel Springs. O. Dorigo. *Trattamenti Termici*, v. 1, Sept-Oct. 1958, p. 6-9, 24-26.

Methods to increase strength of material before shaping of spring. Patenting, hardening and tempering; stabilization after plastic working. (To be continued.) (J-general, T7c; ST)

115-J.* Present-Day Annealing and How It Is Affected by Cold Work. Fred L. Otto. Paper from "Annealing of Low Carbon Steel, Proceedings". Lee Wilson Engineering Co., Inc., Cleveland, Oct. 1957, p. 51-52.

Factors affecting grain size of batch-annealed low-carbon steel (AISI 1008 and 1010) include hot-mill temperatures, rate of heating, amount of cold work. (J23, N5, M27c; CN-g)

116-J.* Generation and Use of Prepared Atmospheres in the Annealing of Low Carbon Steel Strip. George J. Campbell. Paper from

"Annealing of Low Carbon Steels, Proceedings". Lee Wilson Engineering, Co., Inc., Cleveland, Oct. 1957, p. 57-62.

Prepared atmospheres in batch annealing of tin plate and cold rolled steel coils. Factors to consider in producing an acceptable gas and their effect on strip surface when gases vary beyond certain fixed chemical compositions and not in equilibrium. (J23, J2k; CN-g, 4-53)

117-J. (Italian.) Controlled Atmospheres. *Trattamenti Termici*, v. 1, Nov-Dec. 1958, p. 19-21.

Use of hydrogen and nitrogen atmospheres. (To be continued.) (J2k)

118-J.* (Slovakian.) Use of Producer Gas as Protective Atmosphere in the Heating of Thin Steel Sheet. Jan Mucka and Josef Teindl. *Hutnicke Listy*, v. 14, Feb. 1959, p. 104-110.

Formation of gray edges is explained by the action of sulphur present in the protective atmosphere. After removal of sulphur and moisture from producer gas, this can be used as a protective atmosphere. (J2k; CN, 4-53)

119-J. (Italian.) Controlled Atmospheres. *Trattamenti Termici*, v. 1, Sept-Oct. 1958, p. 15-18.

Use of ammonia gas and its derivatives. (To be continued.) (J2k)

120-J.* (Italian.) Sulphurizing Case Hardening of Steels. Alfredo Secciani. *Macchine*, v. 14, Jan. 1959, p. 25-34.

Patented sulphurizing processes (sulfinuz and sulfide). Morphology, microhardness, anti-wear and mechanical properties of sulphur-hardened layers. Influence of duration of treatment. 14 ref. (J28, Q-general; ST, *S, N*)

121-J. Precipitation Hardening Aluminum-Base Alloys. W. A. Anderson. Paper from "Precipitation From Solid Solution" American Society for Metals, Cleveland, 1959, p. 150-207.

Properties of alloy systems, wrought structural alloys, alloys for castings, rivets, electrical conductor and heat resistant alloys. 49 ref. (J27, Q-general; Al-b, *Cu, Mg, Si, Zn, Ni*, SGA-h, SGA-q)

122-J. Magnesium Alloys. R. S. Busk. Paper from "Precipitation From Solid Solution". American Society for Metals, Cleveland, 1959, p. 391-416.

Precipitation reactions in those Mg alloy systems that are used commercially. 28 ref. (J27, N7, Q-general; Mg-b)

123-J. Precipitation in Cobalt-Base Alloys G. A. Fritzlen, W. H. Faulkner, B. R. Barrett and R. W. Fountain. Paper from "Precipitation From Solid Solution". American Society for Metals, Cleveland, 1959, p. 449-494.

Properties of Co and some of its alloy systems discussed to evaluate their precipitation hardening behavior. 52 ref. (J27, N7, Q-general; Co-b)

124-J.* (Russian.) Production of Protective Atmospheres for Bright Annealing. F. B. Zenchenko and Ya. A. Peker. *Stal'*, Feb. 1959, p. 151-155.

Cold rolled strip steel can be bright annealed in bell-type furnaces by burning coke oven and blast furnace gas mixture of various compositions. Dew point must be below -30° C. (J23a, J2k; ST, 4-53)

125-J.* (German.) Precipitation Hardening of Quenched Beta-Brass Occurring Between 200 and 300° C. Erhard Hornbogen. *Zeitschrift fur Metallkunde*, v. 50, Feb. 1959, p. 70-74.

New phases develop at the grain boundaries and transformation from a bcc. to a face-centered lattice takes place. Precipitation is influenced by external stress. 6 ref. (J27d; Cu-n)

126-J. Precipitation Reactions in Iron-Base Alloys. Adolph J. Lena. Paper from "Precipitation From Solid Solution". American Society for Metals, Cleveland, 1959, p. 244-327.

High-alloy steels of the precipitation hardenable types. Heat treatment and properties of commercial alloys. 94 ref. (J27, Q-general, 2-62; SS)

127-J. Precipitation Hardening of Copper Alloys. W. D. Robertson and Robert S. Bray. Paper from "Precipitation From Solid Solution". American Society for Metals, Cleveland, 1959, p. 328-390.

Review of age hardening Cu alloys, mechanism of precipitation and accompanying changes in properties. 138 ref. (J27, N7, Q-general; Cu-b)

128-J. Some Age Hardening Characteristics of Nickel-Chromium Alloys (Nickel-Rich) Containing Aluminum and Titanium. C. G. Bieber and R. J. Raudebaugh. Paper from "Precipitation From Solid Solution". American Society for Metals, Cleveland, p. 417-448.

Outstanding attributes are oxidation resistance, high-temperature strength and

creep resistance associated with a relatively good insensitivity to overaging. 21 ref. (J27, N7a, Q-general; Ni-b, *Cr, Al, Ti*)

129-J.* Making of Aircraft Structures From Inconel X. Robert R. Ferguson. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 178, American Society of Tool Engineers, Detroit, 1958, 9 p.

Effect of solution treatment, aging, stress relief and annealing conditions on hardness and tensile properties of Inconel X. Heat treatment, Warpage and oxidation; fusion and resistance welding, machining, chemical milling, flame cutting, forming and cleaning. (J-general, G-general, K1d, K3n, Q27a, Q29n, T24a; Ni-b)

130-J.* (English.) Sub-Zero Treatment of Quenched Steel. Pt. 1. Stabilization of Retained Austenite. Yunoshin Imai and Masao Izumiyama. *Tohoku University Science Reports of the Research Institutes*, v. 10A, no. 6, 1958, p. 414-425.

Effects of quenching temperature, room-temperature aging and tempering on the stabilization of retained austenite. 15 ref. (J26q, N8n; ST, 2-61, 2-64)

131-J. Automatic Flame-Hardening Techniques Heat-Treat Giant Excavator Components. *Metalworking Production*, v. 103, Mar. 20, 1959, p. 491-493.

(J-general; ST)

133-J.* Prediction of Carburizing Cycles. E. N. Case. *Metal Treating*, v. 10, Mar-Apr. 1959, p. 2-7, 39.

Tables and formulas for case depth and carburizing rate. 6 ref. (J28g)

134-J.* Metallurgical Research Develops Improved Products Through Heat Treating. Helen Hoover. *Metal Treating*, v. 10, Mar-Apr. 1959, p. 8-13, 40, 42-44.

Determination of the cause of failure of harrow disks. Elimination of faults by austempering. (J26p, Q27; ST)

135-J.* Heat Treatment of Ductile Iron. W. D. McMillan. *Modern Castings*, v. 35, Apr. 1959, p. 77-78.

Treatment conditions and resulting mechanical properties of castings subjected to a full ferritizing anneal, a sub-critical anneal or to a two-temperature normalizing cycle. (J23, J24; CI-r)

136-J.* (German.) Observations When Hardening Tools. Pt. 2. *Industrieblatt*, v. 59, Mar. 1959, p. HT17-HT19.

Data on increase in volume and hardness in the inductive surface hardening of several carbon steels. Cracking of high speed toolsteels due to internal stress. Volume increase from nitriding. (J2g, Q26, J28m; CN, TS-m)

137-J.* (Japanese.) Sintered Iron-Base Alloys for Machine Parts. Gas Carburization of Sintered Iron-Base Compacts. Yasuji Fujii, Etsuo Hayashi, Teruhisa Watanabe and Masabumi Yasuda. *Nagoya Government Industrial Research Institute, Reports*, v. 7, June 1958, p. 412-420.

Sintered iron compacts expand during carburizing and quenching and the expansion increases with an increase in carburizing time and decreases with an increase in compacting pressure. 4 ref. (J28g; Fe-b, *Cu*, 6-72)

138-J.* New Thermo-Chemical Techniques. Pt. 1. Bright Annealing. P. Galmiche. *Metal Finishing Journal*, v. 5, Mar. 1959, p. 113-116.

Bright annealing, chromizing and brazing in fluoride-reducing atmospheres. (J23a, L15, K8)

139-J.* Heat Treatment of Sintered Iron. Ivan Ljungberg and P. Ulf Gummeson. *Precision Metal Molding*, v. 17, Apr. 1959, p. 30-31.

Relationship of hardness and depth of carburization to density, treatment time and carburizing medium. Effect of Cu on strength and hardness of carburized parts (J28g, J28j, Q29n, 2-60; Fe, *Cu*, 6-72)

140-J.* The How and Why of Quenching. Clarence A. Siebert. Paper from "Quenching of Steels". American Society for Metals, Cleveland, 1958, p. 1-9.

Cooling curves of water-quenched steels; variation of coefficient of heat transfer; diffusivity of various structures, thermal conductivity with temperature. Effect of temperature and size on severity of quench for oil or water-quenched steels. 9 ref. (J26n; ST, SS)

141-J.* Quenching: A Thermal Process. V. Paschkis. Paper from "Quenching of

Steels". American Society for Metals, Cleveland, 1958, p. 11-27.

Heat balance at surface of quenched object and quenching medium. Quenching of fully heated solids. Influence of size and shape on internal resistance to heat transfer in steel specimens. Apparatus for measuring boundary conductance. Variation in boundary conductance with temperature; quenching of surface heated objects. (J26n, P11k, 2-61, 3-73; ST)

142-J.* Evaluation of Quenching Media. George H. Robinson and Harry J. Gilliland. Paper from "Quenching of Steels". American Society for Metals, Cleveland, 1958, p. 29-43.

Hardening power and cooling power tests to determine effectiveness of special oil and additives for quenching carbon and alloy steels. Correlation of hardening power with results of magnetic quench, hot wire and 5-sec. tests. Effects of surface condition and quenching oil agitation and temperature. (J26n, W28p; ST)

143-J.* Hot Oil Quenching. William C. Hiatt. Paper from "Quenching of Steels". American Society for Metals, Cleveland, 1959, p. 45-49.

Marquenching of carburized gears in oil at 400° F. Oil selection; improving oil life. (J26p, W28p, T7a; ST)

144-J.* (German.) Increase of Fatigue Strength by Bath Nitriding. J. Mueller. *Draht*, v. 10, Mar. 1959, p. 94.

After nitriding and quenching in salt water, carbon steel with Mn shows increase in fatigue strength, especially under bending and torsion. (J28k, Q7; AY, CN, *Mn*)

145-J.* (German.) Influence of Flame Hardening on Internal Stress and Fatigue Strength. H. W. Groenegress. *Draht*, v. 10, Mar. 1959, p. 95.

Influence of feed rate, part size, and preheating on internal stress. Fatigue strength is increased by surface hardening. (J2h, Q25, 2-65, Q7a; ST)

146-J.* (German.) Interdependence of Heat Treatment, Internal Stress and Fatigue Strength in Flame and Induction Hardening. K. Falkenmayer. *Draht*, v. 10, Mar. 1959, p. 95-96.

Internal stress distribution depends on temperature fields resulting from the conditions of surface hardening and quenching and on size and shape of the parts. (J2g, J2h, 2-64, 3-73, Q25; ST)

147-J.* (German.) Transformation Times of the Case and the Core During Carburizing of Steel. O. Schaaber. *Draht*, v. 10, Mar. 1959, p. 96.

Inductive measurements show that case transforms after the core. (J28g, Q25m; ST)

148-J.* (German.) Stress-Relief Heat Treatment in Alloyed and Unalloyed Steels. M. Kroneis. *Draht*, v. 10, Mar. 1959, p. 96.

Annealing temperature depends on Mn, Ni, Cr, Mo and austenite content. (J1a, 2-60; ST, AY, *Mn, Ni, Cr, Mo*)

149-J. (German.) Heat Treatment of Steel. *Atompraxis*, v. 4, no. 12, 1958, p. 11-12.

(J-general; ST)

150-J. (German.) Continuous Cooling Curves of Surface Hardened Gears in Relation to Resulting Internal Stress. H. B. Knowlton. *Draht*, v. 10, Mar. 1959, p. 96.

By controlling the variables an optimum internal stress may be achieved which can improve the fatigue properties and reduce warping. (J28, T7a, Q7, Q25; ST)

151-J. (Russian.) Treatment of Welded Structures With Oxy-Acetylene Flame Heating. L. B. Tsal'man. *Svarochnoe Proizvodstvo*, Mar. 1959, p. 29-31.

(J2h, T26)

152-J.* Pearlitic and Malleable Iron Heat Treated Automatically. Lawrence E. Emery. *Foundry*, v. 87, May 1959, p. 82-87.

Automatic combination annealing and heat treating plant with atmosphere control produces both high-strength pearlitic and ferritic malleable irons. (J-general, W27; CI-s)

153-J.* (Italian.) Heat Treatment of Nimonic Alloys for Special Applications. W. Betteridge. *Metallurgia Italiana*, v. 51, Feb. 1959, p. 49-56.

Treatment of Nimonic alloys for industrial gas turbine applications involves super-aging at temperatures slightly below beginning of precipitation hardening and provides higher over-all creep elongation before rupture without impairing rupture life. Treatment of material for service at temperatures up to 600° C. involves

combination of cold working and precipitation hardening and provides wide range of tensile and creep properties.. 4 ref. (J27d, Q27a, Q3, 2-64, T7h; Ni-b)

154-J.* Precipitation in a Beta-Brass-Fe Alloy. A. E. Berkowitz and P. J. Flanders. *Journal of Applied Physics*, v. 30S, Apr. 1959, p. 111S-112S.

Single crystal samples of beta-brass containing 0.1% iron were annealed at 300 and 400° C. to develop the Fe precipitate particles. At intervals during the anneals, magnetic data were obtained and analyzed in terms of the size, shape, orientation and general magnetic behavior of the precipitate particles. 4 ref. (J27, P16; Cu-n, *Fe*)

155-J.* (French.) Quenching and Annealing of Uranium-Chromium Alloys With Small Chromium Contents. Jean Delaplace and Roland Bigot. *Comptes Rendus*, v. 248, Apr. 1, 1959, p. 2000-2002.

Effect of cooling speed and Cr content on beta phase transformation in annealing of U-Cr alloys quenched from beta or gamma ranges. Alloys containing 0.05, 0.37 and 0.50% Cr were quenched in gaseous argon, aqueous $CH_3CO_2NH_4$ solution, concentrated and aqueous KCl solution, water, diluted KCl solution and a mixture of NaCl with ice. (J23, J26, N7c, 2-60; U-b, *Cr*)

156-J.* Making and Treating Alloy Steel Plates, Pt. 2. R. Russell Fayles. *Industrial Heating*, v. 26, Apr. 1959, p. 742, 744, 746.

Normalizing, annealing, quenching, flattening, grinding and cutting of alloy steel plates. (J23n, J24, J26n, G18, G22g; AY, 4-53)

157-J.* (Russian.) Effect of Gaseous Atmospheres on Strengthening of Metals by Means of Electric Sparks. B. P. Kolesnik. *Fizika Metallov i Metallovedenie*, v. 6, no. 6, 1958, p. 1031-1035.

Phase composition and microhardness of Al-C, Fe-C, Fe-Al and Cu-Al strengthened by electric sparks in air and CO_2 atmospheres. Oxygen in the air affects the phase composition of the surface and forms metastable solid solutions. 13 ref. (J2; Al-b, Fe-b, Cu-b, *C*)

158-J. Modified Martempering for Attaining Close Tolerances in Aircraft Pumps. Edgar C. Wallace and Howard E. Crouse. *Industrial Heating*, v. 26, Apr. 1959, p. 683-686.

Oil hardening toolsteels, 5200 steel or stainless steels quenched in martempering bath at 260° F. Tempering and low temperature treatments. (J26p, J29; TS, SS)

159-J. The How and Why of Quenching. *Industrial Heating*, v. 26, Apr. 1959, p. 704, 706.

(J26n; SS, ST)

160-J.* High Temperature Carburising. H. N. Ipsen. *Metallurgia*, v. 59, Apr. 1959, p. 176-180.

Effect of carburizing temperatures from 927-1093° C. on case depth, grain growth and dimensional growth of AISI 1117, 4615, 8620 and 9315 steels. Microstructures after carburizing and following reheat hardening. (J28g, 2-62; CN, AY)

161-J.* Stress Relieving in Situ. Novel Use of Mineral Wool Insulation. J. W. Dawson. *Metallurgia*, v. 59, Apr. 1959, p. 183-184.

Large steel pressure vessels stress-relieved by covering with mineral wool insulation and applying heat within the vessel by means of electric resistance elements. (J1a, T26q; ST, 17-57)

162-J.* Stress-Relieving Titanium Alloy Weldments. Robert P. Brody and Alfred A. Taylor. *Metal Progress*, v. 75, May 1959, p. 67-71.

Compressor cases made of 5% Al, 2.5% Sn titanium alloy cracked on stress relieving. The problem was solved by altering the heating cycle. Previously heated in 200° F. increments, the case is now placed in a cold furnace and heated directly to 1150° F. (J1a; Ti-b, 7-51)

163-J.* Continuous Furnace Improves Annealing. A. G. Sturrock. *Metal Progress*, v. 75, May 1959, p. 103-105.

Cycle annealing in a continuous furnace insures uniform structures in bars and throughout different lots of steel. Loads are carried through automatically after proper times and temperatures are selected. There are also provisions for protective atmosphere and carbon restorations. (J23, W27g, 1-61; ST)

164-J.* (Hungarian.) Heat Treatment of Steel. Arpad Szombatfalvy. *Kohaszati Lapok*, v. 92, Jan. 1959, p. 36-37.

Hardenability, hardness penetration, carburizing, surface layer alloying and case hardening. (J-general; ST)

165-J.* Effect of Specimen Size on the Quench-Aging of an Aluminum-3.8% Copper Alloy. Ved Prakash and K. M. Entwistle. *Institute of Metals, Journal*, v. 87, Apr. 1959, p. 262-264.

Massive specimens show a much lower hardening rate during the first stage of quench-aging than do thin specimens. Failure to retain vacancies in the larger specimens is the cause of the low hardening rate. 6 ref. (J27d, 2-73; Al-b, *Cu*)

166-J.* Sub-Zero Temperature Refrigeration of Materials. R. L. Lee. *Institution of Production Engineers Journal*, v. 38, Apr. 1959, p. 198-205.

Sub-zero refrigeration and application to industrial processes. (J1b, J26q, K13r, 1-67)

167-J.* Heat Treating Today. Types and Uses of Controlled Atmospheres. Lester F. Spencer. *Tooling & Production*, v. 25, May 1959, p. 40-43.

Includes tables which show temperature, time and atmospheres for various metals and processes. (J2k, W27n)

168-J. Flame-Hardening Excavator Parts. Oxy-Town-Gas Equipment at Ruston-Bucyrus. *Metallurgia*, v. 59, Apr. 1959, p. 181-182, 184. (J2h, J26n; ST)

169-J. (Book-Russian.) Cold Treatment of Steel. P. P. Petrosyan. 121 p. 1957. Gosudarstvennoe Naucho-Teknicheskoe Mashinostroitel'noi Literatury Urainskoe Otdelenie Mashgiza, Kiev, Moskva. 5 Rub. and 50 k.

Kinetics and mechanism of martensite transition and stabilization of residual austenite below 0° C. Effect of residual austenite on properties of hardened steel; influence of subzero treatment on physical and mechanical properties of hardened steel. 206 ref. (J26q, N8)

170-J. (Book.) Quenching of Steels. 77 p. 1958. American Society for Metals, 7301 Euclid Ave., Cleveland 3. $2.95.

A compilation of papers presented at the National Metal Congress, Cleveland, Oct. 27-31, 1958. Papers abstracted separately. (J26n; ST)

171-J.* (Japanese.) Hardenability Specifications for Steel. Kazuo Tsuya. *Government Mechanical Laboratory (Japan)*, Report no. 29, Mar. 1959, 24 p.

H-band hardenability specifications are worked out for Cr-Mo-steel, and these coincide with that of 4140H. Estimation of hardenability cannot be used to determine H-band although sampling can be utilized. (J5; AY)

172-J.* (Russian.) Nitriding Molybdenum-Free Steels. M. V. Pridantsev, G. L. Livshits and G. A. Torpanova. *Stal'*, Mar. 1959, p. 262-267.

Three new grades of Mo-free steels—38KYUA, 38KHVFYUA and 38KHVYUA—have been developed. They are used for nitrided parts of large cross sections of equipment functioning at high temperatures. 4 ref. (J28k; SS, *Mo*)

173-J. (German.) Hot Quenching of Tools and Dies. W. Haufe. *Industrie-Anzeiger*, v. 81, Mar. 3, 1959, p. 253-258.

Directions for hardening in relation to stresses resulting from quenching. Constitution diagrams for 12% Cr steels and hot-work toolsteels. 18 ref. (J26p, N8; TS, *Cr*)

174-J.* (German.) Heat Treatment of Titanium Alloys. Willy Knorr. *Harterei-Technische Mitteilungen*, v. 13, no. 1, 1958, p. 1-29.

Heat treatment directions for unalloyed Ti and various Ti alloys. Effect on mechanical properties, hardness and phase transformations. Precipitation hardening of alloys containing elements of a stabilizing effect of the beta-phase. 34 ref. (J23, J27d, N5, Q-general; Ti-b, Al, Mn, Mo, *Cr, Fe*)

175-J.* (German.) Hardening and Annealing of Spheroidal Cast Iron. W. Patterson and D. Ammann. *Harterei-Technische Mitteilungen*, v. 13, no. 1, 1958, p. 30-45.

End quench tests on spheroidal cast iron and, for comparison, on laminar cast iron and eutectoid steel. Tensile strength in relation to annealing temperature; effect of hardening temperature on hardness and case depth. 38 ref. (J23, J29, J26; CI-r)

176-J. (Japanese.) Carbonitriding by the Salt Bath Method. Atsuo Ohmori. *Metal Finishing Society of Japan, Journal*, v. 10, Mar. 1959, p. 82-91.

Types of furnaces; pretreatment, carburizing and quenching. (J28m)

177-J. (Japanese.) Gas Carburizing and Gas Carbonitriding. Amane Yuuki. *Metal Finishing Society of Japan, Journal*, v. 10, Mar. 1959, p. 91-98. (J28g, J28m)

178-J. (Japanese.) Flame Hardening. Kanichi Tateishi. *Metal Finishing Society of Japan, Journal*, v. 10, Mar. 1959, p. 102-108.

Hardness of case and case depth; effect of rapid heating on transition point. (J2h)

179-J. (Japanese.) Case Hardening by the High Frequency Induction Method. Toshirou Saga. *Metal Finishing Society of Japan Journal*, v. 10, Mar. 1959, p. 108-115. (J28, 1-69)

180-J. (Japanese.) Case Hardening of Office Machine Parts. Toshifumi Ouhashi. *Metal Finishing Society of Japan, Journal*, v. 10, Mar. 1959, p. 115-122. (J28, T10f)

181-J. (Japanese.) Disadvantages of Case Hardening. Seitarou Motoyama. *Metal Finishing Society of Japan, Journal*, v. 10, Mar. 1959, p. 123-128.

Examples of carburizing failure include incomplete carburizing, inhomogeneous hardness distribution, cracking and corrosion. (J28)

182-J. (Russian.) Effect of Delayed Cooling of Bessemer Steel Rails. A. M. Karpunin. *Stal'*, Mar. 1959, p. 269.

Delayed cooling lowers the tensile strength of rails by 3-5 kg/mm² and generally reduces mechanical properties. (J2, Q27a; ST-b)

183-J.* Oil Quenched Iron-Carbon Alloys Differ. D. J. Fraser. *Canadian Metalworking*, v. 22, May 1959, p. 30-33.

Design of component parts is now possible due to modern heat treatment and quenching oils. (J-general, W28p; CN, AY, Fe-b, *C*)

184-J.* (Italian.) Applications of Controlled Atmospheres. O. E. Cullen. *Trattamenti Termici*, v. 2, Mar-Apr. 1959, p. 3-10, 22.

Carbon diffusion processes. Selection and control of atmospheric mixtures. (J2k, J28; ST)

195-J. (German.) "Soft" Nitriding of Cast Iron. *Giesserei-Praxis*, no. 8, Apr. 25, 1959, p. 145.

Treatment of cast iron in a cyanate-cyanide salt bath to improve wear resistance of sliding parts. (J28m, Q9n, T7; CI-b)

196-J.* (Japanese.) Hardness Measurement of Carburized Parts and Control of Case Depth. Tohro Yoshida. *Metals*, v. 29, Mar. 1959, p. 181-184.

Control of hardening depth due to carburizing by measurement of surface hardness of carburized steel products. (J28g, Q29; ST)

197-J.* The Thermo-Mechanical Method for Relieving Residual Quenching Stresses in Aluminum Alloys. H. N. Hill, R. S. Barker and L. A. Willey. *American Society for Metals, Transactions*, v. 52, Preprint no. 132, 1959, 32 p.

Residual stresses in quenched Al parts relieved by cooling to -320° F. and reheating in high velocity steam blast. (J1a, J26q, Q-general; Al-b)

198-J.* (German.) Tempering and Isothermal Annealing. B. Finnern. *Draht*, v. 10, Apr. 1959, p. 147-151.

Effects of austenizing, hardening temperature, cooling conditions and isothermal annealing temperature on mechanical properties. 9 ref. (J22, J23, J29, Q-general; AY, *Cr, Mn*)

199-J.* (Japanese.) Selection of Steel Quality for Carbo-Nitriding. Sohsuke Uchida. *Metals*, v. 29, Mar. 1959, p. 189-192.

Carbonitriding is affected by temperature and kind of bath or gas chamber used. If there is a ferrite band in steel, diffusion of carbon and nitrogen is hindered and hardened case has a discontinuous band which causes poor mechanical properties. (J28m)

200-J.* (Japanese.) Titanium Carbide Produced From Sponge Titanium. H. Yamasaki, T. Hirayama and N. Kamaze. *Metals*, v. 29, Apr. 1959, p. 298-302.

Carburizing of Ti is highly explosive if powder Ti is used, whereas it is diffusive if sponge Ti is employed. (J28g; Ti, NM-a35)

201-J.* (Japanese.) Springs Manufactured by High Frequency Induction Quenching. Toshiroh Saga. *Metals*, v. 29, Apr. 1959, p. 305-310.

The usual hot forming, oil quenching and high-temperature tempering processes are replaced by cold forming, high-frequency quenching and low-temperature tempering. (J26, J29, T7c)

202-J.* (Russian.) Effect of High-Temperature Annealing on Magnetic Properties of Soft Magnetic Alloys. N. I. Larkin and V. S. Mes'kin. *Izvestiya Akademii Nauk Seriya Fizicheskaya*, v. 23, no. 3, 1959, p. 280-284.

Data on rolling 50% Ni Permalloy, 50N-NH-S and Mo Permalloy N79-MO4 cold rolled generator and hot rolled transformer steels. Best magnetic properties are obtained when these steels are annealed at 1150-1400° C. in argon, refined with nitrogen, water vapor and heated by a series of moisture absorbent dryers. (J23n, P16; Ni-b, Mo-b, SGA-n)

203-J. (Czech.) Heat Treatment of Large Shells for Mill Rolls Used in Cold Rolling. F. Holoubek and J. Otahal. *Hutnicke Listy*, v. 14, May 1959, p. 415-421.

Basic openhearth steel is the material best suited for these applications. With satisfactory isothermal heat treatment shells of satisfactory properties can be obtained. 4 ref. (J23s, W23k; ST-e, 1-65)

204-J.* (Czech.) Induction Hardening of Roll Surfaces. Ivan Zlatnik. *Hutnicke Listy*, v. 14, May 1959, p. 421-429.

Two induction hardening methods for rolls used in cold rolling. Hardness is influenced by composition, by temperature measured on the roll surface and by time material is held at austenitization temperature. 24 ref. (J2g, W23k; CN)

205-J. (Dutch.) Residual Stresses in Welded Constructions. W. J. Kaufmann. *Lastechniek*, v. 25, May 1959, p. 91-97.

Stress relief by heating, hammering and hydraulic pressure; autogenous stress relief (by temperatures up to 200° C.) 5 ref. (J1a, G23n; 7-51)

206-J. (German.) Autogenous Stress Relief. H. G. Kunz. *Lastechniek*, v. 25, May 1959, p. 97-108.

Certain zones of the weldment are heated to temperatures around 200° C. and water-cooled. 7 ref. (J1a; 7-51)

207-J. (Russian.) Development of Primary Structure and Intra-Crystalline Segregation in Steel and Cast Iron by Austenitizing. Ya. N. Malinochka and N. G. Osada. *Zavodskaya Laboratoriya*, v. 25, Apr. 1959, p. 446-447. (J22, M26s; 9-69, AY, *Si*, CI)

208-J.* (French.) Case Hardening. Pt. 1. D. Flament. *Metallurgie et la Construction Mecanique*, v. 91, Apr. 1959, p. 261-262.

Metallurgical factors; physico-chemical reactions; role of carbon, hydrogen and nitrogen; effects of presence of graphite. (J28; ST)

209-J.* (Russian.) Controlled Gas Atmosphere Composed of Technically Pure Nitrogen for the Bright Annealing of Steel. L. V. Beloruchev and A. K. Shvachkin. *Stal'*, Apr. 1959, p. 355-360.

To prevent oxidation and decarburization of high-carbon steel, the nitrogen is treated with dissociated NH_3 which completely removes oxygen and adds the required quantity of hydrogen. 7 ref. (J2k, J23a; ST)

210-J.* Heat Treating the Stainless Steels. Pt. 1. S. W. Cole. *Industrial Heating*, v. 26, May 1959, p. 908, 910, 912, 914, 916.

Effects of various atmospheres related to design of heat treating furnaces; carburizing and oxidizing conditions; preparation of work. (J-general, W27, 17-51; SS)

211-J.* How to Avoid Trouble With Type 431 Stainless. C. C. Angstadt. *Metal Progress*, v. 75, June 1959, p. 86-91.

Although possessing excellent strength and corrosion resistance when properly melted and fabricated, it is difficult to process. Careful heat treatment in hydrogen-free atmospheres is essential to eliminate austenite and prevent embrittlement. Fabrication methods are similar to those needed for the 18-8 stainless types. (J-general, G-general; SS)

212-J.* The Gradient Furnace—a Versatile Research Tool. Andrew Feduska and Paul E. Busby. *Metal Progress*, v. 75, June 1959, p. 92-96.

A furnace muffle heated at only one end will have a range (or gradient) of temperature along its axis. With proper experimental techniques, such a furnace shortens considerably the time normally necessary to determine grain coarsening, austenitizing and tempering temperatures. It can also be used for isothermal transformation, solution treating and aging studies. (J-general, W27j; ST)

213-J. (Japanese.) Measurement of the Quantity of Mineral Oils Used for Quenching. Kenjiroh Hara. *Metal Finishing Society of Japan, Journal*, v. 10, Apr. 1959, p. 143-145.

Quenching curves of the test pieces of Ag, carbon steel and stainless steel in spindle oil. (J26, W28p; Ag, CN, SS)

214-J. (Japanese.) Quenching by Means of Mineral Oils. Kenjiroh Hara. *Metal Finishing Society of Japan, Journal*, v. 10, Apr. 1959, p. 145-148.

Quenching curves of test pieces of Ag, carbon steel and stainless steel in oil, paraffin and naphthalene. (J26, W28p; CN, Ag, SS)

215-J. (Russian.) Experience in Straightening Welded Structures by Local Heating. L. D. Veretnik. *Svarochnoe Proizvodstvo*, May 1959, p. 37-40.

(J-general; 7-51)

216-J.* (German.) Effect of Nitriding on Ultimate Strength of Steels. A. Juenger. *Industrieblatt*, v. 59, May 1959, p. 217-218.

Tests were made on 32A1CrMo4, 22CrA1Ni7, 27CrA16, C10, Ck10, ECN35, ECMo80 and 20MnCr5 steels after nitriding. Data on ultimate tensile strength and ultimate bending strength. (J28k, Q27, Q5; ST)

217-J.* Degassing and Heat Treatment in the Solid State. R. F. Gunow. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 276-292.

Degassing of Ti and Ti alloys; annealing, hardening, brazing and sintering in vacuum. Annealing of Ti and Zr sheet, strip and forging products. 5 ref. (J2k, J23, 1-73, K8; Ti, Zr, 4-53, 4-51)

218-J. High Strength Stainless Alloys Need Close Control of Hydrogen, Argon Atmospheres. Robert L. Ray. *Western Metalworking*, v. 17, June 1959, p. 54-56.

Bell-type furnace used for hardening in protective atmospheres of hydrogen and argon. Surface variables, dimensional problems, structural properties. (J2k; SS, SGB-a)

219-J. Controlled Carburization Increases Life of Drill Steel. Floyd Anderson. *Metal Treating*, v. 10, May-June 1959, p. 8, 42.

231-J.* (French.) Uniform Structural Changes in Aluminum-Nickel Solid Solutions. Henry Martinod and Jean Calvet. *Comptes Rendus*, v. 248, June 1959, p. 3708-3710.

After water quenching from 635° C. samples are hardened at different temperatures and then oil quenched. During subsequent heating, the degree of softening depends on the degree of perfection of the hardening structure. (J26n, J29, 3-71; Al-b, *Ni*, 14-67)

232-J.* (Italian.) Heat Treatment of Light Metals. *Fonderia*, v. 8, June 1959, p. 259-262.

Directions for heat treatment and its relation to mechanical properties. (J-general, Q-general; EG-a39)

233-J.* Sulphonitriding—the method for Increasing Wear Resistance. Antonin Pospisil and Frantisek Hasil. *Czechoslovak Heavy Industry*, no. 7, 1959, p. 38-42.

New thermal process for surface treatment of steel and cast iron in which sulphur diffuses into material in addition to the usual nitrogen at a temperature over 400° C. (J28, Q9; ST, CI)

234-J.* (German.) Carburizing With the Acetylene Torch. F. Erdmann-Jesnitzer. *Werkstatt und Betrieb*, v. 92, July 1959, p. 459-461.

Carburizing of low-carbon steel with a reducing flame. Depth of case is determined by the temperature of the workpiece. 5 ref. (J28g; CN-g)

235-J.* (German.) Annealing as a Means of Stress-Relief in Alloyed and Unalloyed Steels. M. Kroneis. *Harterei Technik und Warmebehandlung (Supplement to Industrieblatt)*, v. 5, June 1959, p. 277-278.

Expansion of preloaded spring after annealing serves as a measure of residual stress. Decrease of stress is a function of annealing temperature and time. Remarkable relief occurs only in the first hour of heat treatment. (J23, J1a, Q25h, 2-61, 3-67; AY, CN)

236-J.* (German.) Gas Carburization in Electric Furnaces in the Production of Gears. Th. Turk. *Industrieblatt*, v. 59, June 1959, p. 239-245.

Construction of furnaces, furnace atmosphere control, direct hardening, partial carburizing and carburizing times. (J28g, T7a, W27j; ST)

237-J. (English.) Note on the Relief of Welding Stresses in Ships' Hulls and Welded Structures. *Lastechniek*, v. 25, July 1959, p. 146-148.

13 ref. (J1a, T22g, 7-51)

238-J.* (German.) Carburizing of Molten Iron by Means of Solid Carburizing Additives. Roman Krzeszewski. *Giesserei*, v. 46, July 16, 1959, p. 417-421.

Fix's law and Nerst's theory of solubility permit the determination of equations describing the carburizing processes occurring in molten iron when solid carburizing additives are introduced. Application of these equations compared with actual results achieved by carburizing tests. (J3p; CI, 14-60)

239-J.* Reduction of Warpage by Die Quenching of Steel. T. R. Bradley. *Metal Progress*, v. 76, Aug. 1959, p. 71-72.

The trend to higher strengths has resulted in steel parts which are too hard to machine or bend after tempering. Thus, dies which hold the part in shape during quenching are being used more and more. (J26n; ST, 9-74)

240-J.* Reduction of Warpage by the Thermomechanical Method. H. N. Hill, R. S. Barker and L. A. Willey. *Metal Progress*, v. 76, Aug. 1959, p. 73-76.

Cooling to subzero temperatures and reheating rapidly can introduce residual stresses opposite to those produced by conventional quenching. This is the basis of a new method of stress-relieving Al parts of irregular shape. (J29, J26q; Al, 9-74)

241-J. (Itanian.) Controlled Atmospheres. Pt. 5. *Trattamenti Termici*, v. 2, May-June 1959, p. 19-21.

For use in heat treatment. (To be continued.) (J2k)

242-J.* (Italian.) Black-Heart and White-Heart Malleable Cast Iron. *Fonderia*, v. 8, July 1959, p. 275-278.

Properties and production of black-heart, white-heart and pearlitic cast iron. Influence of component elements. (J23b, 2-60; CI-p, *Cr, S, B, Mn*)

243-J.* (Italian.) Development of the Nitriding Process. G. J. Cox. *Trattamenti Termici*, v. 2, May-June 1959, p. 3-13.

Review of research on process conditions and types of steels responding satisfactorily to this treatment. 50 ref. (J28k; ST)

244-J.* (Italian.) Progress in Induction Heating in Japan. S. Ishida. *Trattamenti Termici* v. 2, May-June 1959, p. 15-18.

Hardenability of some types of induction hardening steels; quenching and tendency to rupture; induction hardening and resultant fatigue resistance of variously treated test specimens; gear rolling with induction heating. (J29, G17g, Q7a; ST)

245-J.* (Japanese.) Carburizing Furnaces With Protective Atmosphere. Shinji Hiyama. *Metal Finishing Society of Japan, Journal*, v. 10, May 1959, p. 173-183.

Decarburization of ferrous and nonferrous metal during annealing, normalizing, hardening, is prevented by processing in a protective atmosphere. Oxidation, reduction and neutralization are effectively carried out. (J4a, J2k)

246-J.* (German.) Precipitation Hardening of Al-Ag Alloys. Pt. 2. Effect of Cold Deformation on Electrical Resistance During Aging. Werner Koster and Hans-Peter Rave. *Zeitschrift fur Metallkunde*, v. 50, July 1959, p. 403-407.

Effect of artificial aging after water quenching from 540° C. on electrical resistance; influence of sample thickness,

subsequent cold deformation and heat treatment following deformation. 7 ref. (J27d, P15g, 3-73, 3-68, 2-64; Al-b, *Ag*)

247-J.* Critical Particle Size for Precipitation Hardening. J. D. Livingston. *Metallurgical Society of AIME, Transactions,* v. 215, Aug. 1959, p. 566-571.

The tensile yield stress of various Cu-Co alloys aged at various temperatures is correlated with the precipitate particle size which is determined magnetically. In all cases the peak yield stress is attained at an average particle radius of approximately 70 Å. Results are interpreted in terms of the internal stresses resulting from the coherence between matrix and precipitate. 26 ref. (J27; Cu-b, *Co*)

248-J.* (French-German.) Hardness Conditions of End Quenched Samples in Relation to Large Case Hardened Pinions. Pt. 2. U. Wyss. *Harterei-Technik und Warmebehandlung (Supplement to Industrieblatt.)* v. 5, July 1959, p. 317-319.

End quench tests performed on cylindrical samples permit conclusions as to the hardness conditions in case hardened parts up to considerable depths. (J5, J28, Q29n, T7a; AY)

249-J.* (Czech.) Vermikulite--the New Heat Insulating Additive for Forming and Heat Treatment of Metals. V. Spalensky. *Strojirenstvi,* v. 9, June 1959, p. 445-446.

Insulating additive for use in forming, drawing or heat treatment process. Economy of the furnace heat capacity is achieved. Softening of the steel due to cracks caused by rapid chilling is avoided. Composition of Vermikulite $(Mg,Fe)_3 \cdot (OH)_2 \cdot (Si_4O_{10}) \cdot 4H_2O$. Before use Vermikulite is preheated to 800-900° C. (J2, G-general; AD-q42)

250-J.* (Spanish.) Malleable Casting. Ramon Roman Martinez. *Instituto del Hierro y del Acero,* v. 12, Apr-June 1959 p. 94-105.

Characteristics of various types of malleable cast iron. Effect of C, Si, Mn and other elements on mechanical and casting properties. Malleablizing time as a function of the ratio C to Si. Malleablizing in salt baths. (J23b, 3-73, 2-60, Q27a, J2j; CI-s, 9,*C, Si, Mn*)

251-J. Heat Treatment of Steel. Edwin Gregory. *Edgar Allen News,* v. 38, June 1959, p. 125-126.

Review. (J-general; ST)

252-J.* (German.) Distortion of Bulky Gray Iron Castings Occurring in Flame and Induction Hardening. Kurt Falkenmayer. *Harterei-Technische Mitteilungen,* v. 13, no. 3, 1959, p. 133-199.

During heating a convex warping of the part takes place. This is followed by concave warping during quenching and then by convex warping occurring during the martensite formation and in the cooling of the deeper layers. (J2g, J2h; CI-n, 9-74)

253-J.* (German.) Flame Hardening of Corrosion Resisting Steels. A. Matting and W. Stech. *Werkstatt und Betrieb,* v. 92, Aug. 1959, p. 505-512.

Remanit 1520, 1740 and 1790 V alloy steels were flame hardened and the hardness measured at gradually increasing depths. Hardness as a function of annealing temperature and the sample diameter. 11 ref. (J2h, Q29n, 3-73; SS, SGA-h, SGA-g)

254-J.* (Polish.) Vacuum Decarburization of Ferrochromium. H. Zak and P. Paczula. *Prace Instytutow Hutniczych,* v. 11, no. 2, 1959, p. 75-82.

Effect of reduced pressure on decarburization. 6 ref. (J4a, 1-73; Fe, AD-n32, Cr)

255-J. How Germany Uses Surface Flame Hardening. Pt. 1. W. A. Hawkins. *Metalworking Production,* v. 103, Aug. 28, 1959, p. 1311-1318.

Flame hardening process adopted by Peddinghaus, in which town gas is used instead of more expensive acetylene, proved to be an economical and effective hardening method. (J2h)

256-J.* Heat Treating Today. Pt. 4. Surface Treatments That Change the Properties of Steel. Lester F. Spencer and Charles Weiner. *Tooling & Production,* v. 25, Sept. 1959, p. 56-58.

Basics and principles, including annealing, hardening, tempering, carburizing, nitriding, cyaniding, carbo-nitriding, skin recovery and use of controlled atmospheres. (J-general; ST)

257-J.* Heat Treating the Stainless Steels. Pt. 2. S. W. Cole. *Industrial Heating,* v. 26, June 1959, p. 1146-1150, 1152, 1154.

Effects and processes with specific regard to austenitic stainless steels. Cr-Ni stainless steel alloys cannot be

hardened by heat treatment. Annealing techniques, stabilization and stress relief. (To be continued.) (J23, J1; SS)

258-J.* Heat Treating the Stainless Steels. Pt. 3. S. W. Cole. *Industrial Heating*, v. 26, Aug. 1959, p. 1524-1526.

Annealing procedures and typical mechanical properties of annealed ferritic chromium stainless steel. (To be continued.) (J23n, Q-general; SS-d)

259-J.* Convection and Radiation in High-Speed Heating. Norman H. Davies and Richard J. Reed. *Industrial Heating*, v. 26, Aug. 1959, p. 1546-1550, 1552, 1554, 1556, 1158, 1626.

Convection heat transfer coefficient for 1000 and 2000° F. airstreams of various velocities. Radiation heat transfer coefficient for various metals and surface conditions. Thermal diffusivities; influence of arrangements of heat source and workpiece on heating rate. Advantages of high-speed heating. 21 ref. (J2, P11k, P11m; Al-b, Cu-b, Ti-b, Mg-b, ST, SS)

260-J. (Russian.) Coalescence of Graphite in Malleable Cast Iron. O. M. Galemina. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 168-169.

Influence of the number of graphite inclusions present after graphitization at 950°C. on the speed at which coalescence takes place during heat treatment at 1050°C. (J23b, N8s; CI-s)

261-J. (Russian.) Change and Restoration of the Properties of N36KHT Alloy Steel During Artificial Aging. Van-Zhun', B. G. Livshits and M. P. Usikov. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 170-174.

Changes in electrical resistance and hardness of an Fe-Ni-Cr alloy caused by artificial aging, deformation and a further heat treatment. 7 ref. (J27d, P15g, Q29n, 3-68, 2-64; AY, *Ni, Cr*)

262-J. (Russian.) Kinetics of the Induction Heating of Pearlitic Cast Iron. I. N. Kidin. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 206-213.

Temperature as a function of heating time. The shape of graphs is influenced by the heating speed and transformations occurring in the ferromagnetic phase. 4 ref. (J2g, P12, N8j, 3-67; CI)

263-J. (Russian.) Chemical Processes Occurring During the Heat Treatment of Steel in $NaNO_3$ and KNO_3 Baths. P. Ya. Yakovlev. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 233-238.

Chemical reactions between bath and components of steel, such as Mn, Si, Cr and C. (J2j; ST)

264-J. (Russian.) Oxidation and Nitration of Special Steels in Nitrate-Nitrite Media. P. I. Protsenko and N. P. Popovskaya. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 244-249.

Experimental heat treatment of the special steels KhVG, R9 and R18 in nitrate-nitrite salt baths. Chemical analysis of the surface layer. Effect of treatment on microhardness and corrosion resistance. 8 ref. (J28k, S11b, Q29q, R-general; ST)

265-J. Temperature-Control Methods in the Heat-Treatment of Aluminum Alloys. G. Fitzgerald-Lee. *Foundry Trade Journal*, v. 107, Aug. 27, 1959, p. 79-81.

(J-general, S16b; Al-b)

266-J. (Russian.) Hardening of Alloys by an Increased Heating Rate. I. N. Kidin and M. A. Shtremel. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya*, no. 2, 1959, p. 165-172.

Heating and quenching of Fe-Cr and Fe-Ni alloys. Influences of high heating rates, quenching media and cooling rates on the crystal structure and hardening effect. 12 ref. (J26, 3-67, M27; Fe-b, *Cr, Ni*)

267-J.* Austenitic "Cold Working" for Ultra High Strength. D. J. Schmatz, J. C. Shyne and V. F. Zackay. *Metal Progress*, v. 76, Sept. 1959, p. 66-69.

Materials with higher strength-to-weight ratio motivated search for new heat treating processes for steels. Study of plastic deformation in the austenitic "bay" of the TTT-diagram between pearlite and bainite, then quenching to prevent transformation to nonmartensitic products. (J26p, Q27; AY)

268-J.* (German.) Aging Process in Aluminum-Zinc Alloys. O. Dahl and H. Maacks. *Metall*, v. 13, Aug. 1959, p. 719-729.

Influence of quenching temperature, time-rate of quenching, purity, thermal shock and heating on aging. 36 ref. (J27d, J26n, 2-61; Al-b)

269-J. (Russian.) Heat Conduction Coefficients for the Heating of Steel in Salt

Baths. D. V. Budrin and E. L. Sukhanov. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya*, no. 2, 1959, p. 94-102.
10 ref. (J2j, P11h; ST)

270-J. (Russian.) Simplified Methods for the Computation of Heating Time for Steel Parts in a Salt Bath. A. P. Gulyaev and S. I. Artem'eva. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya*, no. 2, 1959, p. 103-108. (J2j; ST)

271-J. Induction Heating—Fast, Clean, Versatile. D. H. Lapray. *American Machinist*, v. 103, Sept. 21, 1959, p. 138-140. (J2g)

272-J. Developments in Heat-Treatment. Pt. 4. Hardening by Isothermal Heat-Treatment. J. McMullen. *Metalworking Production*, v. 103, Sept. 18, 1959, p. 1471-1473.
Martempering and austempering processes. (J26p)

273-J.* (German.) Carburization in Methanol by Induction Heating. W. Schnorr and W. Stuhlmann. *Harterei-Technik und Warmebehandlung (Supplement to Industrieblatt)*, v. 5, Aug. 1959, p. 399-403.
Carburization of SAE 8620 steel. Effect of temperature and time on distribution of carbon in the surface layer, hardness, structure and depth of hardness. (J28g, J2g, 2-61, 3-67, 2-60, Q29n; CN-g)

274-J.* (German.) Choice of Material, Surface Hardness and Depth of Case With Reference to the Kind of Wear. H. W. Gronegress. *Industrieblatt*, v. 59, Aug. 1959, p. 357-365.
Influence of hardening temperature and holding time and preheating on depth of case. End quench tests with cast steel. Wear resistance as a function of hardness. Dependence of the propagation speed of ultrasonic vibrations on quantity and size of graphite. 22 ref. (J2h, J5, Q9n, Q29n, N8s, Q21f; AY, ST, 5-60)

275-J.* Novel Form of Heat Treatment Reduces Foundry Rejects. *Iron Age*, v. 184, Sept. 17, 1959, p. 116-118.
"Determinant tempering" is performed by subjecting the casting, during its initial cooling from solidification, to an isothermal treatment. The temperature chosen for this isothermal anneal is at the nose of the TTT curve. (J29, N12; ST)

276-J.* Careful Stress Relieving Is the Key to Quality Welding of Alloy Piping. *Welding Design & Fabrication*, v. 32, Sept. 1959, p. 53, 78.
Induction heating of welded joints in Cr-Mo steel and 316 stainless steel pipes for use in steam power generator. (J1a, J2g; AY, SS, 7-51)

277-J.* (German.) Effect of Austenitization Conditions on the Transformation of High Speed Steels. A. Rose, L. Rademacher and J. M. Syk. *Stahl und Eisen*, v. 79, Sept. 1959, p. 1243-1258.
Analysis of technically feasible austenitizing processes with optimum hardening effects on high speed steels. Hardening temperatures of 1180-1310° C. were applied and quenching times varied from 10-300 sec. Minor melting effects were determined in the high-temperature range. Transformation behavior and interdependence of quenching hardness and austenitizing are investigated. (J22, J26; TS-m)

278-J.* (Swedish.) Hardening and Tempering Structures of Soft Steel. Sten Modin. *Jernkontorets Annaler*, v. 143, no. 6, 1959, p. 335-369.
Tensile and yield strength were about three times higher after quenching than after normalizing all steels. On tempering, the tensile strength was continuously lowered, while the yield strength first rose somewhat on annealing to 200-300° C. before starting to sink on tempering at higher temperatures. 14 ref. (J29, Q27a, J26; CN)

279-J.* Breakthrough in Heat Treating Promises Huge Gains in Strength. F. G. McGuire. *Missles and Rockets*, Sept. 28, 1959, p. 10-11.
Missile parts heat treated by new thermomagnadynamic process to produce improved tensile and fatigue properties. (J21, T24e)

280-J.* (Russian.) Changes of the Microstructure of Beryllium Bronze Caused by Aging. Yu. A. Skakov. *Izvestiya VUZ—Tsvetnaya Metallurgiya*, no. 4, 1959, p. 125-130.
Aging at 330 and 530° C. and its effect on the microstructure. Influence of aging time on hardness. 10 ref. (J27d, M27a, Q29n, 2-64, 3-67; Cu-s, *Be*)

281-J.* High-Temperature Carbonization of Steel by High-Frequency Heating in a Solid Medium. S. F. Yur'ev and S. K. Ginzburg. *Metallovedenie i Termicheskaya Obrabotka Metallov*, no. 8, 1959, p. 32-38.
Cementation in a packing material composed of charcoal and up to 16%

$BaCO_3$. Carbon content as a function of depth. Case depth varying with the $BaCO_3$ content in the packing material. Improvement of strength behavior by two subsequent heat treatments. 15 ref. (J28g, J2g, Q27a, 2-64; ST)

282-J.* Special Features of Nitriding of a 0.1% C, 13% Cr Steel. I. V. Samolov. *Metallovedenie i Termicheskaya Obrabotka Metallov,* no. 8, 1959, p. 39-41.

Nitriding of samples with spherical surfaces to study the reasons for defects such as scaling off, unequal depth or partial absence of the case. Good results were obtained on a steel with no less than 0.1% carbon and no more than 13% Cr, and by Cu plating in a thin layer before nitriding. (J28k, 2-61, L17; AY, *Cu,* 9)

283-J.* Low-Temperature Annealing of Carburized and Subsequently Quenched 0.30% C, 0.9% Mn, 0.9% Cr, 0.1% Ti Steel. V. V. Babayan. *Metallovedenie i Termicheskaya Obrabotka Metallov,* no. 8, 1959, p. 41-43.

After case hardening, the steel is heated up to 850° C. and oil quenched. Effect of subsequent annealing on hardness and impact strength. (J28g, Q29n, Q6n, 2-64; AY)

284-J.* Diffusion of Oxygen and Hydrogen Into Steel During Carburizing. O. K. Kotov. *Metallovedenie i Termicheskaya Obrabotka Metallov,* no. 8, 1959, p. 43-45.

Samples were treated in a furnace at 920-1050° C. using spindle oil, synthol or tri-ethanolamine as a carburizing medium. The distribution of carbon, nitrogen, oxygen and hydrogen is shown to a depth of 1.4 mm. (J28g, N1h, 2-66; ST, *C, O, H*)

285-J.* Surface Hardening of Automobile Pinion Gears by Cementation. B. A. Stetsenko. *Metallovedenie i Termicheskaya Obrabotka Metallov,* no. 8, 1959, p. 45-48.

Cementation of a number of pinions and samples in a gaseous medium under equal conditions. Variation of subsequent cooling and heat treatments and their effects on wear resistance, tensile strength and bending deflection. (J28, T21c, 2-64; ST)

286-J.* Heat Treatment of Stamping Punches and Dies. F. I. Golomazov. *Metallovedenie i Termicheskaya Obrabotka Metallov,* no. 8, 1959, p. 51.

Quenching of high-carbon steel in a salt bath composed of $NaNO_3$, KNO_3 and $NaNO_2$. Effects of crystal water present and of quenching time on hardness. (J26n, W28p; CN-r)

287-J. The Heat Treatment of Steel. Pt. 3. Spheroidizing Ball-Bearing Steels, Austempering and Martempering. Edwin Gregory and Eric N. Simons. *Edgar Allen News,* v. 38, Sept. 1959, p. 196-197.

(To be continued.) (J29, W27; ST, SGA-c)

288-J. Which Heat Treatment for the New Metals? Lloyd Allen and John Ham. *Metalworking,* v. 15, Oct. 1959, p. 30-35.

Suggested procedures for reactive metals. (J-general; EG-d)

289-J.* The Heat Treatment of Steel. Edwin Gregory and Eric N. Simons. *Edgar Allen News,* v. 38, July 1959, p. 153-155.

Heat treatment processes and sherardizing of ball-bearing steels and austempering. (To be continued.) (J-general; ST, 4-53, SGA-c)

290-J.* Heat Treatment of Steel. A. K. Banerjee. *Indian & Eastern Engineer,* v. 101, Jan. 1959, p. 33-36.

Methods of heat treatment to improve toughness and hardness. (J-general, Q29n, Q26; ST)

291-J.* (German.) Precipitation-Hardening of Stainless Steels. H. Anders. *Maschinenmarkt,* v. 65, Aug. 1959, p. 45-46.

Annealing, hardening and formation temperatures; weldability is a function of chemical composition. (J27, K9s, 2-60; SS)

292-J.* (German.) Nitriding Titanium Steel Used for Precision Casting. T. Visi. *Periodica Polytechnica (Budapest),* v. 3, no. 2, 1959, p. 163-168.

Advantages in the precision casting production of sewing machine parts with the use of nitriding Ti steels. When the Ti-C ratio is larger than 4 the hardness of the nitrided layer is equal to the cemented layer. The proposed surface thickness of 0.3 to 0.5 mm is reached at 550° C. in 4 hr. (J28k; E15; AY, Ti)

293-J.* The Right Heat Treatment Keeps It Stainless. Charles W. Sherman. *American Machinist,* v. 103, Sept. 7, 1959, p. 132-136.

Annealing, hardening, stress-relieving and tempering of martensitic stainless. Annealing austenitic and ferritic types. Treatment of precipitation hardening grades. (J-general; SS)

294-J.* Heat Treatment of Steel. Pt. 3. E. Gregory. *Edgar Allen News*, v. 38, Aug. 1959, p. 171-172.

Spheroidizing of ball-bearing steels, austempering, martempering and marquenching. (J23r, J26p; ST, SGA-c)

295-J.* Tool Steels and Heat-Treatments for Copper and Copper-Base Alloy Extruding. *Precision Metal Molding*, v. 17, Oct. 1959, p. 41.

Hardness properties, quenching and tempering procedures for H12, H14, H21, H26 toolsteels. (J26, J29, Q29n; TS)

296-J. How Germany Uses Surface Flame Hardening. Pt. 2. W. A. Hawkins. *Metalworking Production*, v. 103, Sept. 25, 1959, p. 1507-1510.

Flame hardening of gears. (J2h, T7a)

297-J. (Dutch.) Heat Treatment Practices of Willem Smit & Co.'s Transformatorenfabriek N.V. in Nijmegen. S. F. A. Winters. *Lastechniek (NVL)*, v. 25, Sept. 1959, p. 234-237.

Examples of induction heat treatment of large welded units. (J2g, J1a; 7-51)

298-J.* The Tempering of 2 1/4% Cr-1% Mo Steel After Quenching and Normalizing. R. G. Baker and J. Nutting. *Iron and Steel Institute*, Journal, v. 192, July 1959, p. 257-268.

Structural reactions and mechanical properties of steel specimens during and after tempering and austenitizing under experimental conditions. (J29, J22, J26, J24; AY, *Cr*, *Mo*)

299-J. (Russian.) Structural Changes in Steel During Resistance Annealing. V. N. Gridnev and V. I. Trefilov. *Izvestiya Adademii Nauk SSSR, OTN, Metallurgiya i Toplivo*, no. 2, 1959, p. 62-69.

Carbon steel is quench hardened and subsequently treated in liquid air. The effect of annealing, performed by resistance heating, on the number of second and third order dislocations and size of mosaic blocks. Changes of tensile strength, ductility and hardness caused by the annealing temperature and heating speed. 17 ref. (J23, 1-68, 2-61, 3-67, M26b, Q27a, Q23p, Q29n; CN)

300-J. (Russian.) Application of an Ionized Gas Current Produced by an Electric Arc for Heating Purposes. I. D. Kulagin and A. V. Nikolaev. *Izvestiya Adademii Nauk SSSR, OTN, Metallurgiya i Toplivo*, no. 2, 1959, p. 78-81.

Parameters influencing the heating power, such as position of electrodes, current density and gas consumption. (J2, E10b)

301-J.* (Japanese.) Warm Working of Medium Carbon Steel. Michio Ono. *Sumitomo Metals*, v. 11, Apr. 1959, p. 36-44.

Steel specimens quenched or tempered; resulting mechanical properties compared. (J26n, Q-general, J29, 3-68; CN-p)

302-J.* (Russian.) Use of a Sylvinite Bath When Heating Parts Before Quenching. A. Ya. Antyshev. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Sept. 1959, p. 60.

Heating of steel parts in a bath of molten sylvinite of 840-860° C. Formation of a brown stain appearing on the surfaces after oil quenching can be avoided by slow addition of 20% caustic soda and 2-4% sodium cyanide. (J2j; ST)

303-J.* (Russian.) Optimum Heat Treatment Conditions for the High Manganese Steel G13-L. Ya. K. Alekseev and P. T. Khokhlov. *Metallovedemie i Termicheskaya Obrabotka Metalloy*, Sept. 1959, p. 60-62.

Modification of heating rates and conditions causes no remarkable change of tensile strength and other mechanical properties which can be improved, however, by a higher cooling rate in quenching. (J-general, Q27a, 3-67; AY)

304-J. Annealing Methods Integrated for Processing Stainless Steel Strip at New J. & L Plant. *Industrial Heating*, v. 26, Sept. 1959, p. 1695-1696, 1698, 1700.

(J23; SS, 4-53)

305-J.* The Influence of Tempering Time on Some of the Mechanical and Physical Properties of Steel. J. L. Aston. *Iron and Steel Institute, Journal*, v. 192, Aug. 1959, p. 377-382.

Effect on strength and ductility in low-alloy steel investigated by mechanical testing, microscopy and X-ray analysis. An apparatus for uniform heat treatment of small steel specimens, lasting only a few seconds, is described. Specimens tempered at higher temperature for a shorter time have better ductility. 5 ref. (J29, Q23q, Q27a; AY)

306-J.* Annealing Nickel, Monel and Inconel. *Inco Technical Bulletin T20*, Sept. 1959, 22 p.

Stress equalizing, stress-relieving and annealing of Monel, "K", "R" and "S" Monel, Inconel, Incoloy, Duranickel, nickel-clad, Monel-clad, and Inconel-clad steel. Effects of pre-annealing treatment, furnace atmospheres and cooling. 22 ref. (J23, J26, J1, Ni-b)

307-J.* Better Use of Atmospheres in Heat Treating and Metal Processing. Pt. 1. Trends in Atmospheres. *Metal Progress*, v. 76, Oct. 1959, p. 146-150.

Typical protective atmospheres; vacuum as an atmosphere; other developments. (J2k, 1-73)

308-J.* Better Use of Atmospheres in Heat Treatment. Pt. 2. What's New in Atmosphere Controls. *Metal Progress*, v. 76, Oct. 1959, p. 150-153.

Survey of typical equipment. (J2k, 1-52)

309-J.* Better Use of Atmospheres in Heat Treating and Metal Processing. Pt. 3. Choosing the Right Atmosphere. L. L. Patton. *Metal Progress*, v. 76, Oct. 1959, p. 154-156.

Characteristics of common atmospheres and some rules for their selection. (J2k)

310-J.* Atmospheres in Missile Heat Treatment. N. K. Koebel. *Metal Progress*, v. 76, Oct. 1959, p. 156-157.

Furnace atmosphere in the production of the Minuteman must be controlled to eliminate total decarburization and hold partial decarburization to under 0.003 in. Equally important, partial carburization must be held under 0.003 in. (J2k, J28g, T24e)

311-J.* Tool Steels and Heat-Treatments for Steel Extrusions. *Precision Metal Molding*, v. 17, Nov. 1959, p. 64.

Heat treatment procedures for H12, H22, H11, H21, Rexalloy A and Rexalloy 33 toolsteels to produce dies free of local stress risers. (J-general, W24n; TS)

312-J.* (Czech.) Properties of Austenitic Electrodes E 391 and E 891. L. Pilous. *Zvaranie*, v. 8, July 1959, p. 206-210.

Homogenizing and annealing temperatures influence the properties of E 391 and E 891 austenitic electrodes. The magnetic phase is almost completely destroyed at temperatures of 550-750° C. (J23, J21, W29h; SS-e)

313-J.* (German.) Stress Properties of Titanium Alloys After Annealing in Different Gases. H. Wiegand and K. H. Illgner. *Metalloberflache*, v. 13, Aug. 1959, p. 234-237.

Reactions taking place between Ti and gases produced in the annealing atmosphere at temperatures of 500° C. Zones influenced are centered mainly in the thin surface layers. Effect of annealing temperature, time and atmosphere on mechanical properties (J23q, N15e, 2-61, 3-67; Ti-b)

314-J.* (German.) Dynamic Strength and Wear Properties of Salt-Nitrited Nodular Cast Iron Gear Wheels. H. Wiegand and H. Hentze. *Metalloberflache*, v. 13, Aug. 1959, p. 238-242.

Improved strength and wear properties result from salt-nitriding; effect of nitriding time in increasing wear and strength values. (J28k, Q29a, T7a, Q9; CI-r)

315-J. High Frequency Resistance Heating for Wire Annealing. Hugh Cameron. *Metal Treating*, v. 10, Sept-Oct. 1959, p. 8-9.

Thermatool annealer utilizes radically new method of heating and annealing any water-quenchable metal wire. (J23, J2; 4-61)

316-J. (Russian.) Induction Heating of Nickel, Titanium and Brass Ingots With Frequencies as Used in Industry. S. S. Zuev and V. V. Krapukhin. *Tsvetnye Metally*, no. 2, 1958, p. 63-68.

(J2g; Ni, Ti, Cu-n, 5-59)

331-J.* (Pamphlet.) Study on Carburizing Ability of Steel. Asei Tsutsui, Takao Furumoto and Mutsuo Ichihara. 23 p. 1959. Toyo Kogyo Co., Ltd., Japan.

Parts of uniform quality may be expected from the continuous gas carburizing process as the carbon penetration curve is uniform. When the carburizing ability of steel increases, the quenching distortion of eccentric test piece becomes large, value of maximum tangential compressive stress in the residual stress decreases and the breaking load and deflection of bending test decreases. (J28g; ST)

JOINING

1-K. A Study of the Deterioration of Adhesives in Metal Bonds at High Temperatures. J. M. Black and R. F. Blomquist. Dept. of Agriculture. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 131500, Mar. 1956, 45 p. $1.25.

Performance characteristics of laboratory formulated phenol-formaldehyde-epoxy resin adhesives. Thermal resistance of adhesive bonds in Al and stainless steel as affected by preparation of the metal surface, curing conditions, aging temperature, aging time, atmosphere during aging and stress during aging. Aging of Al bonds at 300 and 400° F. under stress increased the strength of bonds later tested at -70 and 80° F. by as much as 30%. Cycling of bonded Al and stainless steel between 450 and -55° F. produced no evidence of failure caused by thermal shock or differences in expansion between adhesive and adherend. (K12, Q27a, 2-61; Al-b, SS, SGA-h)

With proper steel and flash buttwelding, will perform like a solid piece. (K3r; ST, 4-53, 4-55)

68-K.* (German.) Electric Arc Welding With High-Duty Electrodes. E. Kauhausen, P. Kaesmacher and F. J. Adamski. *Werkstatt und Betrieb*, v. 91, Oct. 1958, p. 597-603.

High-duty electrodes with cover thickness surpassing by about a half that of standard types tested to compare performances in respect to flash welding capacity, weld appearance, depth of penetration and most favorable width of gap with corresponding data of standard electrodes. (K1a, W29h)

69-K.* (Russian.) New Fluxes for Arc Welding. K. V. Lyubavskii and E. P. L'vova. *Svarochnoe Proizvodstvo*, Oct. 1958, p. 1-5.

New flux FTSK makes possible welding high-alloy steels and alloys. Among its advantages is complete elimination of slag scabs from the surface and no escaping gases during welding. (K1; SS, RM-q)

70-K.* (Russian.) Iron-Nickel Electrodes for Cold Welding of High-Strength Iron and Gray Cast Iron. G. N. Larin, V. V. Bazhenov and L. M. Yarovinskii. *Svarochnoe Proizvodstvo*, Oct. 1958, p. 5-8.

Cold welding may eliminate defects arising in hot welding. Cold welding with austenitic Fe-Ni electrodes has high tendency to form cracks. This can be avoided by introducing light alloy eutectoid in metal seam. 5 ref. (K1, W29h, 1-67; CI-c, CI-n, Fe, Ni)

71-K.* (Russian.) Weldability of Oxygen Melted Converter Steel. A. S. Astaf'ev. *Svarochnoe Proizvodstvo*, Oct. 1958, p. 12-14.

Welds in rimming converter steel have tendency to hot cracks when sulphur in base metal exceeds 0.05%. Impact toughness of articles made from converter steel is much higher after aging, particularly when metal surface was blown with pure oxygen. Mechanical properties of welds are in every respect equal to those of rimming openhearth steel. 3 ref. (K9s, D3f, 9-72; ST-d)

72-K.* (Russian.) Effect of Boron on Tendency of Heat Resistant Austenitic Steels to Crack During Welding. A. V. Russiyan and M. Kh. Shorshorov. *Svarochnoe Proizvodstov*, Oct. 1958, p. 14-18.

Search for new austenitic heat resistant steels and welds to withstand continuous rise in steam pressure and temperature of modern turbines. Increase of B content from 0 to 0.015% lowers the temperature in zone adjacent to welds from 1150 to 1010° and widens temperature intervals of embrittlement as result of decomposition of B compounds along grain boundaries. Flux composition has greatest effect on hot crack formation. 4 ref. (K9s, W11m, 2-60, 9-72; SS-e, *B*)

73-K.* (Russian.) Electroslag Welding of 20 GS Steel. V. M. Semenov. *Svarochnoe Proizvodstvo*, Oct. 1958, p. 21-23.

Electroslag welding of a low-alloy steel for large components of hydroturbines. This steel has good weldability

and good weld properties. Low carbon content permits electroslag welding without preliminary heating which creates danger of crack formation. Steel 20 GS is rapidly becoming the accepted steel for weld-forging and weld-casting. (K6, W11n; AY)

74-K.* (Russian.) Features of Welding the First Layer of Gas Turbine Rotor Butt Seams. V. A. Toropov. *Svarochnoe Proizvodstov*, Oct. 1958, p. 24-26.

Welding of parts for 10-ton rotor of austenitic steel. Tests show that one means of eliminating rupture in metal seams between gaps is to widen these gaps. Also use of lining between parts of butt seam lessens danger of rupture. Metallic coated electrodes were used. 8 ref. (K1a, W11m; SS-e)

75-K.* Adhesive Bonding of Titanium. H. E. Pattee, C. E. Faulkner and P. J. Rieppel. *Light Metal Age*, v. 16, Dec. 1958, p. 22-24, 27, 33.

Effect of surface treatment on the lap-shear strength joints; average lap-shear strengths of joints made with various alloys; effect of surface treatment on hydrogen pickup; production considerations. (K12; Ti-b)

76-K.* (French.) Arc Welding With Coated Electrodes. J. Hinde. *Revue du Nickel*, V. 4, Sept-Oct. 1958, p. 79-89.

Factors deciding choice of metals to be used together, selection of electrodes, welding techniques. 10 ref. (K1a; ST, Ni-b)

77-K.* (German.) Welding of Copper. Otto Horak. *Schweisstechnik*, v. 12, Oct. 1958, p. 136-140.

Problems due to chemical properties of metal, high conductivity, shrinking during cooling, stresses, O content of commercial Cu; tendency to absorb O at increased temperatures; reaction with H, which may result in tears; solubility of gases in molten Cu, leading to pores and similar defects. (K-general; Cu-b)

78-K. One Temperature for Successive Brazes. G. D. Cremer and R. S. Mueller. *Product Engineering*, v. 29, Dec. 8, 1958, p. 84-86.

Tighter production control with special brazes allows multiple brazing without reducing operating temperature of the final assembly. (K8, 2-61, SGA-f)

79-K. (German.) Shrink Fit Assemblies Produced by Means of Liquid Nitrogen. Paul Zorner. *Werkstatt und Betrieb*, v. 91, Oct. 1958, p. 621-624.

(K13r)

80-K. (Russian.) New Method of Plug Welding. A. Ya. Brodskii. *Svarochnoe Proizvodstvo*, Oct. 1958, p. 18-21.

Welding in symmetrical position gives better results than in angular position. New method makes possible welding together of 4 to 6 plates, each 8 mm. thick. 3 ref. (K1)

81-K. (Russian.) Precision Automatic Arc Welding by Nonfusing Electrode in Hydrogen Atmosphere. F. I. Kislyuk, V. V. Gorbanskii and A. F. Khudyshev. *Svarochnoe Proizvodstvo*, Oct. 1958, p. 26-29.

New equipment for welding of infusible and other metals. Conditions established for welding with nonfusing electrodes of difficult-to-weld metals. Technology perfected for welding nonferrous metals with automatic nonfusing electrodes. (K1, 1-52, 18-74; EG-a 38)

82-K. (Russian.) Automatic Welding and Cutting at the Saratov Heavy Machine Building Plant. N. P. Anisimov. *Svarochnoe Proizvodstvo*, Oct. 1958, p. 29-30.

(K1, G22h, 18-74)

86-K.* (German.) Bonding of Heavy Metals. H. Winter and H. Meckelburg. *Schweissen und Schneiden*, v. 10, Nov. 1958, p. 423-433.

Survey of present techniques; adhesives, surface treatments, joining of heavy metals to heavy metals; heavy to light metals; metal to nonmetal. 63 ref. (K11, K12)

87-K.* (German.) Welding as Used in Harbor Structures. Otto Lutgens. *Schweissen und Schneiden*, v. 10, Nov. 1958, p. 434-438.

Quality of materials (low in P and S), preparation of parts and strict control of welding procedures most important. (K-general, T22k)

88-K.* (German.) Welding of Railroad Wheel Rims Using Inert Gas. H. Becker. *Schweissen und Schneiden*, v. 10, Nov. 1958, p. 442-444.

Method of restoring profiles of wheel rims instead of removing metal and thus wasting valuable surface steel. (K1d; T23p)

89-K.* (German.) Problems of Welding Practice. Summary of Meeting of the German Welding Engineering Assoc. at Mannheim. Erich Sudasch. *Werkstatt und Betrieb*, v. 91, Aug. 1958, p. 497-502.

Weldability of steels and low-temperature welding techniques. Automatic cutting of nonferrous metals, corrosion of welds, welding and soldering in design of reactors. Welding chemical apparatus. (K-general, G22g; ST, EG-a38

90-K.* (German.) Fatigue Strength of Filler Metals Used in Welding. Olavi Eiro. *Acta Polytechnica Scandinavica (Finnish Contribution)*, v. 4, no. 3, 1958, p. 5-26.

Hydrogen that enters the filler material in the welding process reduces strength of fresh weld. After a time or after heating to 250° C., strength is regained. High elastic limit among the properties of filler metal. 6 ref. (K1, K9r, Q7a, W29h; ST, *H*)

91-K. Production and Engineering Data. Welding of Cast Stainless Steel. *Industry and Welding*, v. 31, July 1958, p. 38-39.

Procedures, currents, rod sizes, preheats and post heats for 28 cast alloys. (K-general; SS)

92-K. Dip Brazing Magnesium. *Metal Industry*, v. 93, Dec. 19, 1958, p. 513-514. (K8n; Mg-b)

93-K. Multiple Arc Trebles Welding Speed. *Metalworking Production*, v. 102, Dec. 19, 1958, p. 2224-2225.

Tandem-head submerged arc welder uses two 3/32-in. electrodes in leading head, a single 3/16-in. electrode in trailing head. High deposition rates, speeds of 65-70 in. per min. obtained. Set-up and handling time cut on welds up to 75 ft. long. (K1e, 1-52)

94-K. Metal Joining. Peer Fossen. *Missiles and Rockets*, v. 4, Dec. 15, 1958, p. 30, 32-35.

Ultrasonic welding technique permits joining of dissimilar metals at Aeroprojects Inc., West Chester, Pa. (K6r)

95-K.* Automatic Welding on the Right-of-Way. Donald M. Taylor. *Petroleum Engineer*, v. 30, Dec. 1958, p. D-24-D-25.

Welding machine and magnetic belt composed of series of electromagnets cause weld metal to penetrate, adhere and freeze in 4:00 to 8:00 positions on pipe. (K1g, 1-52; 4-60)

96-K.* What Do the Russians Weld With? Peter Trippe, David Swan and Dimitri Vvedensky. *Product Engineering (Design Edition)*, v. 30, Jan. 19, 1959, p. 64-67.

Review of Soviet processes—electroslag welding, submerged-arc and resistance welding processes; evaluation of equipment. (K-general)

97-K.* Joining Metals With Adhesives. Nairn Ringueberg. *Tool Engineer*, v. 42, Jan. 1959, p. 53-56.

Adhesive joining of Al and stainless steel parts to produce rear rotor blades for heliocopter. Requirement for bonding in autoclave or oven. Equipment, tooling needed, advantages. (K12, T24a; Al-b, SS)

98-K.* Steam Generating Plant Production. William Weightman. *Welding and Metal Fabrication*, v. 26, Dec. 1958, p. 426 - 434.

Welding techniques in the fabrication of boiler drums and pressure vessels. Extensive use is made of radiographic examination. (K-general, T26q, S13e)

99-K.* Fabrication of Aluminum Pressure Vessels. J. F. Lancaster. *Welding and Metal Fabrication*, v. 26, Dec. 1958, p. 455-459.

Weldability of $1\frac{1}{4}$% Mn alloys, Al-Mg alloys and the heat treatable Al-Mg-Si alloys. 5% Mg alloys NS6 and NP5/6 are the strongest materials at present available for pressure-vessel work. (To be continued.) (K-general, K9s, T26q; Al-b, Mg-b, *Mn*, Si)

100-K.* Electrical Resistance Welding. D. S. Faulkner. *Wire Production*, v. 7, Oct. 1958, p. 3, 5-9.

Flash and upset welding and advantages. Electric welding machine design proposed. (K3, W29p, 17-51)

101-K.* (German.) Rapid Repair of Cracked or Broken Cast Iron Machine Parts. H. Droscha. *Werkstattstechnik und Maschinenbau*, v. 48, Nov. 1958, p. 604-606.

Cold riveting (Metalok) process which uses cross splines, stoppers, rivets, screws, and sometimes larger size fastener members, for repairing broken machine parts, particularly machine tools. (K13n, W25, 18-71)

102-K.* (Translation—Brutcher, 4412.) Effect of Columbium on the Structure of Welds in Austenitic 18-8 Steel. G. G. Mukhin and N. Yu. Pal'chuk. *Avtomaticheskaya Svarka*, v. 10, no. 2, 1957, p. 1-10.

Occurrence of a previously unknown phase, the H-phase, in welds with over 2% Cb, after ordinary heat treating or quenching or stabilizing, in addition to columbium carbide, columbide Fe_3Cb_2, and silicide $Fe_4Cb_5Si_3$. Effect of Cb on ductility of 18-8 weld metal; conditions under which H-phase is formed and effect of this phase on the impact strength. (K9r, 2-60, 2-64; SS, *Cb*)

103-K. (Translation—Brutcher, 4426.) Stability of Electroslag Welding as Depending on Properties of Flux. Yu. N. Gotal'skii. *Svarochnoe Proizvodstvo*, no. 3, 1957, p. 1-3.

Difference between electroslag welding and conventional submerged arc welding. Effect of electrical conductivity, viscosity and boiling point of flux. Advantages of low-silica as against high-silica fluxes. (K6)

104-K. (Translation—Brutcher, 4433.) Effect of Some Technological and Design Factors on Mechanical Properties of High-Strength Low-Alloy Steel. O. L. Bendryshev. *Metallovedenie i Obrabotka Metallov*, Nov. 1958, p. 51-56.

For high-strength steels electric arc welding with heavily covered electrodes or automatic welding with flux is recommended. Quality is controlled by visual inspection as well as magnetic and X-ray methods. Where it is not possible to place the work in a furnace, local annealing by induction heating at 650-700° is recommended. 8 ref. (K1a, K9; AY, SGB-a)

105-K.* Investigation Into Slag Welding With Plate Electrodes. B. A. Koch. *Engineers' Digest*, v. 19, Dec. 1958, p. 513-515.

Relationships between various parameters of welding conditions; effect of variations on stability and efficiency of process and size and shape of weld. (K6)

106-K.* (French.) Submerged-Arc Welding. L. Adam. *Revue Universelle des Mines*, v. 14, Oct. 1958, p. 317-328.

Principles, theory of passage of current through flux; equipment, current sources, consumable materials; development of techniques involving use of multiple electrodes for surfacing operations; principal applications. (K1a)

107-K.* (French.) Welding With Continuous Electrodes and Magnetic Flux. G. Doneux. *Revue Universelle des Mines*, v. 14, Oct. 1958, p. 349-358.

Conventional continuous arc welding processes compared with those using electrodes with magnetic coatings. New process combines features of both types, has operational similarities to manual arc welding; basic fluxes used in Co_2 atmosphere produce welds with properties equivalent to those produced by basic electrodes. Operation of automatic and semi-automatic machines; applications. (K1a)

108-K.* (Russian.) Experience With Slag Welding 1X18 H-9-T Steel. A. G. Fomin. *Svarochnoe Proizvodstvo*, Dec. 1958, p. 21-23.

Steel composition 0.10% C; 1.10% Mn; 0.54% Si; 17.75% Cr; 0.51% Ti; 0.018% S and 0.028% P. This steel is satisfactorily welded by electro-slag method provided the laminated electrodes are of the same composition. (K6; ST)

109-K. Electric Process Welds Rail Into Continuous Ribbons. *Iron Age*, v. 183, Jan. 15, 1959, p. 92-93.

Rail ends are preheated by electric current to a plastic, molten stage. Then they are welded with an upset forging blow of more than 50 tons to form the flash butt resistance weld. (K5, T23q)

110-K. AWS Standard Welding Symbols. *Metalworking*, v. 15, Jan. 1959, p. 18-19.

Chart of more common symbols, available from American Welding Society. (K-general, S22)

111-K. Non-Manual Pipeline Welding. William B. Handwerk. *Petroleum Engineer*, v. 31, Jan. 1959, p. 40-41.

Four methods have possibilities: submerged arc, flash, induction pressure and consumable electrode welding. (K-general, T26r)

112-K. (French.) Applications of Inert Gas Shielded Arc Welding. A. Moreau. *Revue Universelle des Mines*, v. 14, Oct. 1958, p. 329-342. (K1d)

113-K. (Japanese.) Temperature Distribution in Welding Bead. K. Nakane and T. Fujimoto. *Railway Engineering Research, Journal*, v. 15, June 1958, p. 120-122.

Distribution is calculated mathematically by the equation of thermal conduction. (K9r, P11h)

114-K. (Russian.) Prevention of Deformation of Welded Cranes. N. O. Okerblom and J. P. Baikova. *Svarochnoe Proizvodstvo*, Dec. 1958, p. 1-5.

Tolerances for welding and assembling crane bridge. Mathematical derivation of various moments, moments of inertia beam deflection and bending. (K-general, W12q, 17-55)

115-K. (Russian.) New Injectionless Pressure Regulator for Gas Welding and Hard Surfacing. V. D. Nechaev. *Svarochnoe Proizvodstvo*, Dec. 1958, p. 17-20. (K2h, L24, 1-52)

116-K. (Russian.) Modernization of Butt Welding Machine for Flash Welding of Austenitic Steel Pipe. A. F. Kozhaev. *Svarochnoe Proizvodstvo*, Dec. 1958, p. 27-29. (K3r, 1-52; SS-e, 4-60)

118-K. (Russian.) Seam Welding Machine for Stainless Steel Parts of Unequal Thickness. F. A. Axelrod and M. P. Zaitsev. *Svarochnoe Proizvodstvo*, Dec. 1958, p. 33-35. (K3p, 1-52; SS)

119-K.* Welding and Metal Forming in Russia. Arthur B. Tesmen. *Metal Progress*, v. 75, Jan. 1959, p. 79-83.

Electroslag welding used to fabricate large parts from components while friction welding is more efficient than flash welding. (K6, F22, F24, W22p)

120-K.* (French.) Tests With Welded Titanium Sheet. R. Lachenaud. *Revue de Metallurgie*, v. 55, Nov. 1958, p. 1065-1072.

Ti sheets were welded together in an argon atmosphere, heat treated at 600° C. and examined by macrographs and micrographs. Hardness, tension and flexure fatigue tested. Properties of joints found to be the same as those of the base metal. (K2, K9r, J23, Q-general; Ti-b, Ar, 4-53)

121-K.* Producer Gives Instructions for Welding Moly. R. R. Freedman and J. Z. Briggs. *Welding Engineer*, v. 44, Jan. 1959, p. 38-41.

Welding for aircraft and missile applications must be done in controlled atmosphere. Commercial Ar, He and H may contain enough O to cause porosity and cracking unless special cleansing measures are followed. Brazed joints may be more ductile than welded joints, provided temperatures over 1700° F. are minimized. (K1d; Mo)

122-K.* (German.) Use of a Protective Gas Composed of N and H in Welding Alloy Steels. J. Wingerath and K. Boeckhaus. *Schweissen und Schneiden*, v. 10, Dec. 1958, p. 471-475.

"Formiergas" of a standard composition of 80% N and 20% H has all the properties required for use in welding pipelines and tubing. (K-general; AY, RM-g)

123-K.* (German.) Hydrogen Content and Mechanical Properties of Weld Metal in Arc Welding With Coaded Electrodes. Influence of Storing Time. W. Hummitzsch. *Schweissen und Schneiden*, v. 10, Dec. 1958, p. 476-480.

Welded joints tensile tested to detect influence of hydrogen. In storage the hydrogen escapes and, as a rule, the strength of weldments improve. (K1a, K9r, Q27, W29h; ST, H, 7-51)

124-K.* (Portuguese.) The No. 1 Problem in Arc Welding. Victor E. de Strasser. *Engenharia, Mineracao e Metalurgia*, v. 28, Dec. 1958, p. 337-340.

Effect of gases absorbed by weld metal; hot cracking. (K1, K9; ST, 9-72)

125-K. Welded Aluminium Tanks for Canadian Brewery. *Light Metals*, v. 22, Jan. 1959, p. 11.

Fabrication by inert-gas metal-arc and tungsten-arc methods of welding. (K1d, T26q; Al-b)

126-K. Induction Brazing Overcomes Distortion of Fabricated Carbine Barrel Casings. Peter Trippe. *Metalworking Production*, v. 102, Dec. 26, 1958, p. 2255-2257. (K8k, T2g; ST)

127-K. Welding Heat Exchangers for Nuclear Power Plant. *Metallurgia*, v. 58, Dec. 1958, p. 297-298.

World's largest welding boom in use at Hunterston, Scotland, utilizing arc welding processes. (K1, W29k, W13b)

128-K. Flexible Automation on Welding Lines. *Welding Engineer*, v. 44, Jan. 1959, p. 42-43.

Resistance welding techniques at Norge Division of Borg-Warner Corp. in the production of cabinets, food compartment liners and doors. (K3, T10c, 18-74)

129-K. Typewriter Parts Are Projection Welded. *Welding Engineer*, v. 44, Jan. 1959, p. 44-45. (K3q, T10f)

130-K.* (French.) A Welding Process Applicable to the Fabrication of Steel Pressure Vessels for Atomic Energy Purposes: Argon Arc Welding With a Consumable Electrode. J. Tigeot. *Soudage et Techniques Connexes*, v. 12, Sept-Oct. 1958, p. 325-335.

Neutron irradiation raises transition temperature of carbon steels. Argon arc welding with consumable electrode gives the weld metal good impact values for the construction of nuclear reactor vessels of varying thickness. Costs are only slightly higher than submerged arc welding. (K1d, T26q, 2-67; ST)

131-K.* (French.) Determination of the Total Hydrogen Content of Weld Metal. *Soudage et Technique Connexes*, v. 12, Sept-Oct. 1958, p. 335-338.

Tests by British and Norwegian laboratories to determine H content of one-pass welded beads. Method includes washing, polishing, drying and heating. Gas extracted by heating is analyzed for H content. (K9r, S11r; H)

132-K.* (French.) Cooperative Investigation of the Controlled Thermal Severity Weldability Test for Low-Alloy Steels. *Soudage et Techniques Connexes*, v. 12, Sept-Oct. 1958, p. 345-353.

A restrained fillet weld test consisting of the deposition of a fillet weld under predetermined conditions and examination of transverse sections of the weld for cracks in the heat affected zone of the parent plate. Results from five laboratories show that this test is satisfactory for scientific investigations. 5 ref. (K9r, K9s, 2-61; AY)

133-K.* (French.) Comparison of Methods of Assessing Spot Weld Ductility in Sheet Steels. E. J. French and A. A. Wells. *Soudage et Techniques Connexes*, v. 12, Sept-Oct. 1958, p. 369-392.

Mechanical tests (tensile, shear, torsion, hardness) carried out on spot welds under different welding conditions on four steels. Interpretation of the results compared with theoretical values; relations derived can be used as new bases for assessing spot weld ductility. 17 ref. (K9r, K3n, K9s, Q-general; ST)

134-K.* (German.) Nodular Iron—a New Material. Pt. 2. Weldability. R. Werner and G. Czesany. *Schweisstechnik*, v. 12, Nov. 1958, p. 144-148.

Welding without preheating by electric arc satisfies only limited requirements. For good machinability, warm welding after preheating to 400 to 750° C., preferably with oxy-acetylene torch, is indicated. 4 ref. (K9s; CI-r)

135-K.* (Hungarian.) Weldable Construction Steels Type St. 52. Pt. 2. Istvan Balsay. *Kohaszati Lapok*, v. 91, July 1958, p. 326-333.

Increased tensile strength or higher yield point, by varying composition. Standards specifying composition and properties for the Mn-Si and the Cr-Mn-Cu groups. (K9s, S22, Q27a, 2-60, AY, 17-52)

136-K. Simple Spray-Brazing Process Makes Tough Jobs Easy. Harry E. Miller. *Iron Age*, v. 183, Jan. 29, 1959, p. 85-87.

(K6r)

147-K. (French.) Spot Welding on the "Caravelle". J. Coupain. *Soudage et Techniques Connexes*, v. 12, Nov-Dec. 1958, p. 422-432.

Methods and equipment for spot welding jet airliner airframes. (K3n, T24a, 1-52)

148-K.* Problems of the Reactive Metals. F. G. Cox. *Nuclear Energy Engineer*, Jan. 1959, p. 40-44.

Argon arc and resistance welding are satisfactory for some reactive metals, but others require welding in a vacuum, via the electron gun method. Ultrasonics also are useful in avoiding deformation. (K1d, K3, K6r, Cb, Zr, Be, Mo)

149-K.* (French.) Welding Stainless Steels. Richard E. Paret. *Machine Moderne*, v. 52, Oct. 1958, p. 19-24.

Welding of austenitic, ferritic and martensitic types by autogeneous, electric arc, inert atmospheric, H atomic, submerged arc, electric resistance and pressure welding methods. Evaluation of adaptability and relative merits. (K-general; SS)

150-K.* (French.) Controlled Thermal Severity (CTS) Test. P. H. R. Lane. *Revue de la Soudure*, v. 14, no. 4, 1958, p. 201-212.

Weldability of low-alloy steels was tested by joining sheets of the steel by fillet welds. Transverse sections across the weldments are then tested microscopically for fissures. 5 ref. (K9; AY)

151-K. Ultrasonic Welding of Structural Aluminum Alloys. J. B. Jones and E. E. Weismantel. Aeroprojects, Inc., *U.S. Office of Technical Services*, PB 131680, Jan. 1957, 88 p. $2.25.

Continuous seam-type ultrasonic welding of structural Al alloys shown to be feasible. Ultrasonic welding also produced spot-type solid-state junctions. Metallographic studies indicated good quality solid-state bonding. (K6r; Al-b)

152-K. Development of Brazed Sandwich Construction Materials for High Temperature Applications. C. F. Burrows and F. J. Ragland, Jr. Martin Co. (Wright Air Development Center.) *U.S. Office of Technical Services*, PB 151272, July 1958, 105 p. $2.50.

Base-braze metal combination was Type A-286 steel, an austenitic superalloy containing Ti and Al, brazed with a Ni-Cr-Si-Fe-B alloy. At operational temperatures from 1000 to 1200 F. this combination showed excellent structural and fatigue properties. Satisfactory preformed and resistance welded honeycomb core was made from five corrosion resistant steel alloys. Static flexure, edgewise compression, and flexural fatigue

tests provide fairly significant and reliable data on brazed sandwich construction. (K8, Q-general; SS, SGA-h, 7-59, 7-51)

153-K.* (French.) Hydrogen Content and Mechanical Properties of Arc Welds. W. Hummitzsch. *Revue de la Soudure*, v. 14, no. 4, 1958, p. 213-221.

Influence of hydrogen content on strength of welds produced with different electrodes. Tests performed at different periods (from 4 up to 5100 hr.) after welding showed an increase in strength as the hydrogen was given off by the filler metal during storage. Electrodes with basic coating produced welds of low hydrogen content. (K1a, K9r, Q27a; ST, 7-51)

154-K. (Translation.) Carbon Dioxide Welding of Austenitic Steels. B. I. Medovar and I. N. Rublevsky. *Metal Progress*, v. 75, Jan. 1959, p. 178, 182, 184. (Digest of "The Question of CO_2 Welding Austenitic Steels and High-Temperature Alloys". *Avtomaticheskaya Svarka*, no. 3, 1957, p. 70-84.)

Tests compared CO welding with arc welding. (K1d; SS-e, SGA-h)

155-K. (Translation—BISI, no. 1138.) Practice for Welding Circular Seams on Large Diameter Pipes. L. Hense and H. Scheruhn. *Schweissen und Schneiden*, v. 10, May 1958, p. 162-166.

See item 390-K, 1958. (K1, 4-60)

156-K.* Arc Welding 27 Types of Stainless Steel With 18 Different Coated Electrodes. W. E. McFee. *Industry & Welding*, v. 32, Feb. 1959, p. 30-31.

Flux-coated electrodes shield and protect the molten metal from the atmosphere, prevent oxidation of Cr, stabilize the arc and produce strong corrosion resistant welds. Chart indicates proper electrode selection. (K1, W29h; SS)

157-K.* Joining Aluminum. *Precision Metal Molding*, v. 17, Jan. 1959, p. 52-53.

Soldering, brazing and welding in relation to the great affinity of Al for O, the high thermal conductivity of Al and the total absence of color change during heating. Weldability ratings given for 17 alloys. (K-general, K7, K8, K9s; Al-b)

158-K. High Speed Stud Welding on Bridge Beams. *Industry & Welding*, v. 32, Feb. 1959, p. 26-27.

Shear connectors are stud welded to structural beams and concrete is poured around them providing composite construction. (K1f, T26p)

159-K. High-Strength Welded Fabrications Replace Aircraft Forgings. *Industry & Welding*, v. 32, Feb. 1959, p. 38-39.

Weldments are made from AMS 6434 steel and joined by AISI 502 low-hydrogen type stainless steel electrodes. Weldments cost less than machined forgings while design changes are easier. (K1e; ST, SS, 7-51)

160-K. Welding Hastelloy Alloy X to Inconel and to Mild Steel. Carl Johnson. *Industry & Welding*, v. 32, Feb. 1959, p. 40-42.

Tungsten arc inert gas shielded process. (K1g; Ni-b, CN)

161-K. Tungsten Inert Arc Welding. Frank Kuncz. *Industry & Welding*, v. 32, Feb. 1959, p. 55-56.

Guide to selection of proper type of welding current. (K1g)

162-K. You Can Do More With CO_2 Welding. *Metal Progress*, v. 75, Feb. 1959, p. 110-114, 170, 172, 176, 178.

Improvements in automatic and semi-automatic welding heads, and refinements in shielding techniques add to the versatility of the process. With a reactor in the circuit, good overhead and vertical-up welds are possible. In addition to its shielding function, CO_2 gas raises the temperature of molten weld metal and deepens penetration. (K1d, 1-52)

163-K. Bonding of Polyethylene to Metals. H. Peters and W. H. Lockwood. Digest from "Bonding Polyethyelene to Rubber, Brass and Brass-Plated Metals". Monograph 2932, Bell Telephone System Technical Publications. *Metal Progress*, v. 75, Feb. 1959, p. 157-158.

Bonding polyethylene to rubber, brass or brass-plated metals using a cement based on partially hydrogenated polybutadiene (8% unsaturation.) (K11d; Cu-n, 8-62, NM-d)

164-K. (Russian.) Heat Balance of Gas Shielded Arc Welding. I. D. Kulagin and A. V. Nikolaev. *Izvestiya Akademii Nauk, Otdelenie Teknicheskikh Nauk*, no. 11, 1958, p. 89-91.

(K1d)

165-K.* (Russian.) Crack Formation When Soldering Steel to Brass. A. I. Gubin. *Vestnik Mashinostroeniya*, Dec. 1958, p. 58-61.

Soldering in electric furnaces with protective ordinary atmospheres and in salt

bath. 5 ref. (K7g, 9-72, 3-66; ST, *Cu-n, Ag*, 4-60)

166-K.* Success—Welding Method for Type 347. A.M. Bain, A.H. Clark and M.J. Lavigne. *Canadian Metalworking*, v. 22, Feb. 1959, p. 28-30, 32, 34, 38.

Technique in welding a stainless steel pressure vessel. 4 ref. (K1d, K9r, T26q; SS)

167-K.* Fabrication of Refractory Metals. W.L. Bruckart. *Metal Industry*, v. 94, Feb. 6, 1959, p. 103-106.

Joining, heat treatment and cleaning of Mo. (To be continued.) (K-general, J23, L12; Mo, W)

168-K. With Care, Warpage Can Be Controlled. H. Thomasson. *Canadian Metalworking*, v. 22, Feb. 1959, p. 36, 38.

Cause and cure of nonuniform change of dimensions during welding. (K-general, P10d)

169-K. Automatic Open Arc Welding at 150 Ipm. *Industry & Welding*, v. 32, Jan. 1959, p. 51-52.

Flux-cored electrode and automatic welding equipment gives higher heats, faster speeds and better welds. (K1, W29h)

170-K. Recent Developments in Inert-Gas Welding in the Aircraft Industry. R.C. Hesketh-Jones and R.L. Fannon. *New Zealand Institute of Welding*, v. 13, Dec. 15, 1958, p. 447-450.

Welding gas turbines, welding equipment. (K1d, T24b, W29; Ni-b)

171-K.* (German.) Open Joint Technique in Submerged Arc Welding. W. Schatz. *Schweissen und Schneiden*, v. 11, Jan. 1959, p. 23-29.

Joint preparation, effects of amperage, voltage, width of gap to be filled, welding speed and composition of base material on weld quality. (K1e)

172-K.* Adhesive Bonding of Primary Aircraft Structure. W. S. Hay. Paper from "New Fabrication Techniques". American Society for Metals, Cleveland, 1958, p. 36-47.

Application of nitrile-phenolic and epoxy-phenolic type adhesives to metal-to-metal panels and sandwich panels of Al alloys. (K12; Al-b, 7-59)

173-K.* Some of the Growing Pains of the B-58 Sandwich Construction. E. H. Watts. Paper from "New Fabrication Techniques". American Society for Metals, Cleveland, 1958, p. 48-53.

Problems in adhesive bonding a resin-impregnated fiberglass honeycomb core and two Al alloy faces with nitrile rubber-phenolic resin for the metal-to-metal areas, and epoxy resin for the core area, to provide good filleting and creep resistance at temperature. (K11a, K12; Al-b, 7-59)

174-K.* Accelerated Aging Tests and Life Aging Properties of Aircraft Metal Adhesives. J. P. Thomas. *ASTM Bulletin*, no. 235, Jan. 1959, p. 58-63.

New test methods of high-temperature resistance adhesives predict performance and longevity in service. 10 ref. (K11d, T24a, 2-62; Al-b, 7-59)

175-K.* Properties, Jointing Methods and Applications of Plastic-Coated Steel Sheet. F. H. Smith. *Sheet Metal Industries*, v. 36, Feb. 1959, p. 91-96, 99-100, 118.

Jointing methods include cold seaming, hot air welding, resistance welding, hot bonding, riveting, joining by extrusions (metallic and plastic) and high-frequency welding. (To be concluded.) (K-general; ST, 4-53, 17-57)

176-K.* Fabricating Stainless Steel. Pt. 3. Joining. Richard E. Paret. *Tool Engineer*, v. 42, Mar. 1959, p. 119-124.

Methods for each class of alloy. (K-general; SS)

177-K.* (Dutch.) Survey of Cast Iron Joining Techniques. J. G. van Beijeren Bergen en Henegouwen. *Lastechniek*, v. 24, Nov. 1958, p. 226-229.

Basic properties in relation to welding possibilities. 12 ref. (K-general; CI)

178-K.* (Dutch.) Improvements in the Weldability of Ni-Mo Alloys. C. Vollers. *Metalen*, v. 13, Nov. 15, 1958, p. 384.

Weldability and resistance against intercrystalline corrosion improved by small additions of V. (K9s, 2-60; Ni-b, *Mo, V*)

179-K. (German.) Measurement of Welding Currents. Ebbe Rohloff. *Schweissen und Schneiden*, v. 11, Jan. 1959, p. 17-22.

In resistance welding processes. 9 ref. (K3)

180-K.* (Spanish.) Inspection and Testing of Weldments. *Fusion de Metales*, v. 20, Nov-Dec. 1958, p. 12-24.

Importance of inspection; nondestructive tests; principles of visual inspection; flame characteristics as guide to inspection during welding; magnetic methods. (To be continued.) (K9r, S13; 7-51)

181-K.* Weldable Aluminum Alloys. *Modern Metals*, v. 15, Feb. 1959, p. 40, 42, 44, 48, 50.

History, composition, physical properties, welding methods, bending, deep drawing, welding procedures, performance of welds, testing of welds, applications. (K9s, K9r, 2-60; Al-b)

182-K.* Filler Metals for Joining. Orville T. Barnett. *Welding Engineer*, v. 44, Mar. 1959, p. 36-37.

Composition, properties and applications of solders; soldering technique. (K7; Sn, Pb, Sb, Ag, Cd, Zn, Al, In, SGA-f)

183-K.* (German.) Welding Properties of Chemically Stable Cr-Ni Steels With Mo and Mo-Cu Additions. Alfred Schmidt. *Schweisstechnik*, v. 12, Dec. 1958, p. 153-156.

Good welds are achieved with austenitic Cr-Ni steels. Arc welding with basic electrodes is recommended, and for thin sheets and root joints argon-shielded arc welding. Heat cracking susceptibility, stress-corrosion. (K9s, K1, 2-60; SS-e, *Cr, Ni, Mo, Cu*)

184-K.* (German.) Progress in the Welding Metallurgy of Ferrous Metals. K. L. Zeyen. *Oerlikon-Schweissmitteilungen*, v. 17, no. 32, 1959, 131 p.

Literature survey relating weldability tests, Mechanical properties and behavior of weldments, corrosion and scaling, filler metals and electrodes, defects and the effect of heat treatment, design of welded constructions. 557 ref. (K-general, Q-general, R-general; Fe, ST, 17-51,9)

185-K.* Furnace Brazing With Nickel Alloys at Fabriform Plant. *Industrial Heating*, v. 26, Feb. 1959, p. 417-418, 422.

Stainless steel brazed with Ni-Cr or Ni-Mn brazing material in hydrogen atmosphere. (K8j; SS, Ni-b, *Cr, Mn*, SGA-f)

186-K.* Inert-Gas Metal-Arc Welding Aluminum Using Fine Wire Electrodes. J. E. Tomlinson and A. J. King. *Welding and Metal Fabrication*, v. 27, Feb. 1959, p. 42-50.

Operating characteristics of welding gun with pull-through wire feed system. Range in welding variable using 0.03 and 0.02-in. diameter electrode wires. Appearance and tensile properties of butt, fillet and lap welds. Influence of chilling on penetration. (To be continued.) 8 ref. (K1d, W28h; Al-b, 4-53)

187-K.* Some Facts About Iron Powder Electrodes. A. B. Fieldhouse. *Welding and Metal Fabrication*, v. 27, Feb. 1959, p. 61-70.

Types of iron powder electrodes, effect of iron powder in coverings on arc striking characteristics, arc voltage, electrode burn-off rate, metal recovery and rate of metal deposition. Relationship between weld metal ductility and cooling speed, aging, welding current and hydrogen content. Applications. 5 ref. (K1a, W29h; ST)

188-K.* (German.) Fatigue Strength of Filler Metal. Olavi Biro. *Publications of Valtion Teknillinen Tutkimuslaitos*, no. 41, 1958, p. 3-26.

Fatigue tests of weld-deposited metals obtained from various types of electrodes. Influence of hydrogen. 6 ref. (K1, K9r, Q7a, W29h, 7-51, *H*)

189-K.* (German.) Vacuum-Proof Seals by Glass-Metal and Ceramic-Metal Joints. Albert Hofmann. *Schweiz. Technische Zeitschrift*, v. 55, Dec. 11, 1958, p. 974-976.

Joints obtained by means of adhesives, by melting glass-to-metal, by melting glass-to-ceramic material on one side and to a metal on the other side and by soldering ceramic-to-metal. (K11a, K11b, 7-58; NM-f42, NM-f)

190-K.* (German-French.) Crack Prevention in the Welding of Austenitic Steel Castings. W. A. Stauffer and A. Keller. *Zeitschrift fur Schweisstechnik*, v. 49, Jan. 1959, p. 2-6.

Cracking in welded parts is caused by crack initiation and propagation at the grain boundaries. Cold working previous to welding reduces cracking while new grain boundaries result from recrystallization produced by heat generated in welding. 4 ref. (K-general, N5, M27f; SS-e, 5-60)

191-K.* (German-French.) New Welding Techniques in Nuclear Technology. C. G. Keel. *Zeitschrift fur Schweisstechnik*, v. 49, Jan. 1959, p. 7-9.

Vacuum fusion welding makes use of thermionic emission of electrons to bombard the two pieces to be welded with a beam of electrons. Basic elements are a W cathode to emit a large number of electrons, a focusing system to form the electrons into a beam and a vacuum chamber.

Process can be applied to Zircaloy-2, W, Mo, Ti, Ni and stainless steel alloys. (K6, K9r, 1-73; Zr-b, W, Mo, Ti, Ni, SS)

192-K.* (German-French.) Electroslag Welding. C. G. Keel. *Zeitschrift fur Schweisstechnik*, v. 49, Jan. 1959, p. 15-17.

Characteristics of the process, demonstration of a similar method using a protective gas instead of slag. (K6)

193-K.* (German-French.) Properties and Weldability of New Metals and Alloys. C. G. Keel. *Zeitschrift fur Schweisstechnik, Journal de la Soudure*, v. 49, Feb. 1959, p. 32-36.

Welding characteristics of Zr, Hf, V, Cb, Ta, Cr, Re, Be, U, Ti, Mo and W. Diffusion bonding processes. (To be continued.) (K9s, K5k, Zr, Hf, V, Cb, Ta, Re, Be, U, Ti, Mo, W)

194-K.* (German-French.) Applications of Gas-Shielded Arc Welding. A. Smarcan. *Zeitschrift fur Schweisstechnik, Journal de la Soudure*, v. 49, Feb. 1959, p. 37-40.

Description, data, economy and legal aspects of different welding methods. (K1d; CN, SS-d, 4-53, Al-b)

Study of twelve carbon steels and seven low-alloy steels with tensile strengths ranging between 25 and 98 kg. per sq. mm. and yield strengths between 25 and 89 kg. per sq.mm. Brittle fracture in welded structures; causes of weld failure; Pellini and impact tests and their interpretation; properties of heat affected zones; hard spots, carbon equivalent, effect of hydrogen. 33 ref. (K9s, Q26, 2-61; CN, AY)

237-K.* (Slovakian.) Spot Welded Automobile Wheels. Milan Lipa. *Zvaranie*, v. 8, Jan. 1959, p. 6-9.

Fatigue tests performed to determine best welding parameters. (K3n, Q7, T21c; CN-g, 7-51)

238-K.* How to Do a Better Welding Job. Ray Kolb. *Engineering and Mining Journal*, v. 160, Jan. 1959, p. 71-78.

Base metal, geometry of parts to be welded, selection of electrodes and filler metals. (K1)

239-K.* Inert-Gas Metal-Arc Welding for Aluminum Sheet and Strip. J. E. Tomlinson. *Light Metals*, v. 22, Mar. 1959, p. 73-76.

Adaptation of the Mig process permits electrode wire to be pulled off reel by rolls situated in welding gun, thereby increasing reliability of feed for fine electrode wires. Typical "pull-through" guns illustrated. (K1d; Al, 4-53)

240-K.* Assessment of Gas-Shielded I^2Rt Welding. R. E. Jahn and L. M. Gourd. *Welding and Metal Fabrication*, v. 27, Mar. 1959, p. 92-101.

Increase in electrode deposition when varying electrode extension, type of electrode and plate thickness of mild steel. (K1d; CN)

241-K.* Control of Welding Distortion. E. H. Lee. *Welding and Metal Fabrication*, v. 27, Mar. 1959, p. 104-108.

Causes and types of distortion; various ways of control. (K9, 9-74)

242-K.* Inert Gas Consumable Electrode Welding of Thin Material. T. McElrath. *Welding Journal*, v. 38, Jan. 1959, p. 28-33.

It is possible to weld 0.015 to 1/8-in. thick materials by combination of new short arc techniques, suitable constant-potential power supply units and the ability to feed small-diameter wire. (K1d; CN, SS, Al)

243-K.* Joining Aluminum With High Zinc Solders by Abrasion Soldering. O. R. Singleton, Jr. *Welding Journal*, v. 38, Jan. 1959, p. 34-36.

Above 700° F. Zn solders become molten and alloy with Al when Al surface is subjected to a slight abrading action under the molten solder. (K7; Zn, Al)

244-K.* Electroslag Method of Welding Metals of Large Thickness. M. M. Barash, W. B. Heginbotham and P. B. L. Oxley. *Welding Journal*, v. 38, Feb. 1959, p. 132-134.

Process, applications and mechanical properties of carbon and alloy steel. 10 ref. (K6; CN, AY)

245-K.* Ultrasonic Welding Techniques. J. Bryon Jones and W. C. Potthoff. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 152. American Society of Tool Engineers, Detroit, 1958, 8 p.

Spot type and continuous ultrasonic welding equipment and application. Strength of ultrasonic single spot welds in various materials. (K6r, W29, 1-74; Al-b, Ni-b, Ti-b, Zr-b, Cu-b, Mo-a, SS, ST)

246-K. Development of Brazing Materials for Joining Zircaloy. R. E. Droegkamp. Paper from "Bettis Technical Review, no. 10, Reactor Metallurgy". WAPD-BT-10, Oct. 1958, p. 9-13. U. S. Office of Technical Services, Washington 25, D. C.

Four alloys, when used to induction-braze Zircaloy, form joints which are resistant to attack by 680° F. water. These are Zircaloy-2 with 4% Be, Ni with 7% P (Kanigen), Ni with 20% Pd, 10% Si and Cu with 20% Pd, 3% In. The Zircaloy-2 alloy has the best flow properties, strength and corrosion resistance. Kanigen has the advantage that it can be plated. (K8k; Zr-b, SGA-f, Be, Ni, *P, Pd, Si,* Cu, *In*)

247-K. Plate-Type, UO_2 Bearing Fuel Elements for the PWR Core 2 Blanket. E. F. Losco, R. I. Fischer, N. T. Saunders and R. A. Wolfe. Paper from "Bettis Technical Review, no. 10, Reactor Metallurgy". WAPD-BT-10, Oct. 1958, p. 57-72. U. S. Office of Technical Services, Washington 25, D. C.

Fabrication of plate-type fuel elements containing compartmented ceramic fuel. Method involves eutectic diffusion bonding of the Zircaloy-2 cladding components. Ni is unsatisfactory as a bonding agent because it results in excessive absorption of hydrogen and embrittlement of the cladding during corrosion testing. Cu and Fe do not adversely affect corrosion resistance and appear to be satisfactory bonding agents. 6 ref. (K5k, T11g; Zr-b, Ni, Cu, Fe, 8-66)

248-K.* (Czech.) Cracking of Low-Alloy Steel Weldments. Rene Rohan. *Zvaranie*, v. 8, Feb. 1959, p. 48-51.

Influence of various welding processes and electrodes on crack development in self-hardening alloy steel. Effects of preheating, heating during welding and relief annealing. (K1, K9, AY, 7-51, 9-72)

249-K.* (Slovakian.) Capillary Soldering. Viliam Ruza. *Zvaranie*, v. 8, Feb. 1959, p. 34-40.

Effects of base material, solder, width of gap between parts to be soldered, solder composition on strength. 6 ref. (K7; ST, SGA-f)

250-K.* (Slovakian.) Flash Welding of Aluminum Alloy AK-6. Milan Lipa. *Zvaranie*, v. 8, Feb. 1959, p. 52-54.

Optimum procedures; factors influencing strength of weldments. (K3r; Al-b, *Cu*)

251-K. Fabrication of Aluminium in Nuclear Engineering. *Light Metals*, v. 22, Mar. 1958, p. 87-88.

Applications of the inert-gas tungsten-arc and inert-gas metal-arc techniques. (K1d, T11; Al)

252-K. Semi-Automation in Domestic Iron Production. D. D. Williams. *Welding and Metal Fabrication*, v. 27, Mar. 1959, p. 102-103.

New resistance welding machine welds and flash tests which improves production speed and controls quality. (K3, T10c, 1-52)

253-K. How to Weld Copper to Stainless Steel and Mild Steel. H. B. Bott. *Welding Journal*, v. 38, Mar. 1959, p. 236-238.

(K3p; SS, CN, Cu)

254-K.* Unusual Stud Welding Application. Digest of "The Application of Stud Welding to Vibrating Wire Strain Gages". J. C. Chapman. Paper awarded the 1958 Gregory Award during the National Metal Congress, Cleveland, Oct. 28, 1958. *Metal Progress*, v. 75, Apr. 1959, p. 190, 194.

The wire is anchored to robust studs which are then monolithic with the structure; the studs are correctly oriented without difficulty. The gage post stud is correctly aligned with the welding gun by a tongue within the chuck which projects into the slot milled in the post. The gun is aligned with the template by locating the tripod studs in holes in the template, and the gage post stud is driven. (K1f, X28j)

255-K.* Electron Beam Welding: a New Development for Industry. W. L Steinkamp and W. L. Wyman. *Welding Engineer*, v. 44, Apr. 1959, p. 38-40.

Process advantages and mechanical properties of welds made in stainless steel, Al and Zircaloy-2 by bombardment of parts in a vacuum with a beam of high-energy electron. (K6, 1-73; Zr-b, Al-b, SS)

256-K.* Application Data on Kaiser's New Mig Techniques. M. B. Kasen, George Allen and F. R. Baysinger. *Welding Engineer*, v. 44, Apr. 1959, p. 44-46.

Procedures for welding Al alloy by Qualiweld, Chlorecon and Econoweld processes. Mechanical properties of weldments obtained using argon, helium and nitrogen shielding with and without chlorine additions. (K1d; Al-b)

257-K.* Welding Stainless Steel to Carbon or Low-Alloy Steel. John J. B. Rutherford. *Welding Journal*, v. 38, Jan. 1959, p. 19s-26s.

Development and successful application of the practice of welding stainless to ordinary steels. Difficulties which have arisen, proposed remedies and limitations. 18 ref. (K1; SS, CN, AY, 4-60)

258-K.* Welding Structural Steel. *Australian Welding Journal*, v. 12, Jan. 1959, p. 7-11.

Weldability, fabrication, inspection. (K-general; ST, SGB-s)

259-K.* Electro-Molding Replaces Forged Engine Components. R. L. Peterson. *Welding Engineer*, v. 44, Apr. 1959, p. 52-54.

Mild steel weld made inside mold-like water cooled Cu dams using arc process and protective flux to produce a diesel engine component. (K1e; ST)

260-K.* Argon Pinch-Hits for Helium in Zircaloy-2 Welding Operations. H. E. Soisson. *Welding Engineer*, v. 44, Apr. 1959, p. 59.

Comparison between weldments in Zircaloy-2 produced by tungsten inert-gas process with helium and with argon atmospheres. (K1d; Zr-b)

261-K.* Alloy Welding Fluxes for Low Alloy Steels, Stainless Steels and Hard Surfacing. R. A. Wilson. *Welding Journal*, v. 38, Jan. 1959, p. 20-27.

Compounding four primary, Cr, Mo, V, Ni fluxes and one neutral flux to make alloy combinations. Applications using semiautomatic equipment. (K-general, W29h; AY, SS, *Ni, Cr, Mo, V*)

262-K.* Carbon Dioxide Shielded Metal Arc Welding of Carbon Steel Plate. R. J. Keller. *Welding Journal*, v. 38, Jan. 1959, p. 27s-38s.

Advantages and disadvantages on plate with carbon content up to 0.3% and in thickness up to $1\frac{1}{2}$ in. welded. 10 ref. (K1d; CN, 4-52)

263-K.* Sterling Plus Lithium Alloy Selected for Brazing B-58 Stainless Steel Sandwich Panels. A. A. Lanzara and A. M. Setapen. *Welding Journal*, v. 38, Feb. 1959, p. 118-124.

Corrosion tests, preparation and assembly, brazing and heat treating. (K8, T24a; SS, Ag-b, SGA-f, *Li*, 7-59, 17-57)

264-K.* (Translation.) Welding in CO_2 With Electrode Wire. A. G. Potapevskii. *British Welding Journal*, v. 6, Mar. 1959, p. 129-131. (From *Avtomaticheskaya Svarka*, 1958, no. 2, p. 53-58.)

Influence of welding variables on composition of metal deposited by CO_2 shielded arc welding with mild steel electrode wire. Relation between intensity of metallurgical reactions and metal transfer characteristics. 4 ref. (K1d, W29h; ST)

265-K.* (Translation.) Temperature Distribution Through the Weld Pool in the Automatic Welding of Aluminum. D. M. Rabkin. *British Welding Journal*, v. 6, Mar. 1959, p. 132-137. (From *Avtomaticheskaya Svarka*, 1956, no. 2.)

Temperatures in weld pool of Al measured using chromel-alumel and Pt—Pt/Rh immersion thermocouples. Effects of welding rate, arc voltage and parent metal temperature on the distribution of temperatures. 4 ref. (K1g, K9n, X9q; Al-b)

266-K. (Translation—BWRA.) U.S.S.R. Seven Year Plan as It Applies to Welding. *Avtomaticheskaya Svarka*, v. 65, Aug. 1958, p. 1-3.

Future research program of VNIIESO (All Union Scientific Research Institute for Arc Welding Equipment) and VNIIAUTOGEN (All Union Scientific Research Institute for the Gas Welding and Cutting of Metals). (K-general, A9)

267-K. (Translation—BWRA.) Diffusion Welding in a Vacuum. N. F. Kazakov. *Avtomaticheskaya Svarka*, v. 65, Aug. 1958, p. 4-16.

Diffusion data and microstructures for T5K10, VK8 and T30K4 hard alloys joined to 18KhGT steel. Effects of pressure, temperature, surface cleanliness, composition and properties of metals and alloys on their weldability. 17 ref. (K5k, K9s, M27, 1-73; SS)

268-K. (Translation—BWRA.) Current Sources for Electroslag Welding. Yu. D. Gupalo. *Avtomaticheskaya Svarka*, v. 65, Aug. 1958, p. 17-24.

Welding transformers with flat characteristics are most expedient in electroslag welding since circuit voltage oscillations have a lower effect on edge penetration in the articles being welded. Variations in electrode feed rate have less effect on edge penetration. Higher power factors are also obtained by welding transformers with flat characteristics. 5 ref. (K6, 1-52, W11r)

269-K. (Translation—BWRA.) Influence of Current Type and Polarity on Desulphurization of the Molten Metal in the Electroslag Process. B. I. Medovar. *Avtomaticheskaya Svarka*, v. 65, Aug. 1958, p. 25-31.

Under fluoride fluxes, the sulphur is removed most rapidly by a-c. The desulphurization is almost as rapid on reverse polarity d-c., but is completely absent with direct polarity d-c., when the sulphur content of the metal may even increase somewhat by transfer from the slag. 13 ref. (K6)

270-K. (Translation—BWRA.) Effects of Silicon and Maganese on Weld Formation in Single Side Welding. A. I. Pashchenko. *Avtomaticheskaya Svarka*, v. 65, Aug. 1958, p. 66-73.

Manual welding of type ST 4 steel with UONI-13/45 electrodes. Increase to 0.45-0.50% in the quantity of Si in welds, with quite a high Mn content (0.75-0.85%) does not reduce the plastic properties or impact strength of single side welds, nor does it result in raising the cold-shortness thresholds of welds to higher temperatures. (K1, Q-general, 2-60; ST, *Si, Mn*, 7-51)

271-K. (Translation—BWRA.) The Static Arc Characteristics in Gas Shielded Welding With Consumable Electrodes. V. R. Verchenko. *Avtomaticheskaya Svarka*, v. 65, Aug. 1958, p. 74-77.

Arcs for consumable electrode gas-shielded welding have rising static volt-ampere characteristics. The slope of the characteristics depends on the shielding gas being used, the arc length, the diameter and physical properties of the electrode wire. The steepness of the characteristics increases with increase in the arc length and reduction in the electrode diameter. 5 ref. (K1d)

272-K. (Translation—BWRA.) Experience in the Automatic Welding of Aluminum Containers of 2 Cubic Meters Capacity. I. V. Dovbishchenko and V. G. Sventsinskii. *Avtomaticheskaya Svarka*, v. 65, p. 89-92.

Automatic single side welding of small Al containers by semisubmerged arc through a layer of flux, using twin consumable electrodes. Good mechanical properties and corrosion resistance of welded joints are achieved. (K1e, Q-general; Al, 7-51)

273-K. (Translation—BWRA.) Experience in the Use of GSR 9000-Watt D. C. Generators for Arc Welding. V. M. Timofeev. *Avtomaticheskaya Svarka*, v. 65, Aug. 1958, p. 93-95.

Suitably converted these aircraft generators can be used either for welding with consumable electrodes (flat characteristic) or for welding with nonconsumable electrodes (drooping characteristic). (K1, 1-52, W11q)

274-K.* Adhesion and Surface Roughness. Pt. 1. Polyethylene and Metals. Dean Taylor, Jr., and John E. Rutzler, Jr. *American Chemical Society, Division of Paint, Plastics, and Printing Ink Chemistry*, v. 19, Apr. 1959, p. 219-248.

Adhesion of polyethylene to a metal oxide surface is poorer for rough than for smooth surfaces; only a small portion of the total surface of a metal is involved in adhesive bonding. 7 ref. (K11d)

275-K.* Low-Head Welding of Aluminum. B. Cliffe. *Australian Welding Journal*, v. 12, Jan. 1959, p. 12-15.

Characteristics of Al, weld fluxes, techniques of joining. (K-general; Al)

276-K.* Welding of Alloy Steels. J. W. Shedden. *Australian Welding Journal*, v. 12, Jan. 1959, p. 18-21.

Welding of armor plate materials using "austenitic" or stainless steel electrodes; low-alloy high-tensile steel weldable by the usual run of mild steel electrodes; low-hydrogen electrodes. (K1, W29h; AY, SS)

277-K.* What's Coming in Welding. *Steel*, v. 144, Mar. 30, 1959, p. 74-78.

Electron beam, plasma jet, pilot arc spot, and low voltage inert gas welding; deuterium and high-frequency power sources. (K-general)

278-K.* Welding of Inconel for Nuclear Power Applications. W. A. Fragetta and G. G. R. Pease. *Welding Journal*, v. 38, Apr. 1959, p. 347-356.

Ti-Mn modified Inconel wire, deposited by the inert-gas-shielded

consumable-electrode process, produces overlays on steel, as well as transition welds between Inconel and stainless steels. (K1d, W11p; ST, SS, Ni-b, *Cr, Fe*)

279-K.* (German.) Internal Stresses, Distortions and Dimensional Accuracy in Welding. H. G. Kunz. *Schweissen und Schneiden*, v. 11, Mar. 1959, p. 84-92.

Temperature distribution and deformation during welding; internal stresses and their distribution; warping; distortion and deformation; dimensional stability; longitudinal, transverse and angular contraction. 15 ref. (K9, Q25; ST)

280-K.* Brazed Steel Honeycomb Structures for 800°F. Charles F. Burrows. *Materials in Design Engineering*, v. 49, Apr. 1959, p. 110-112.

Selecting materials, brazing, properties of structures. (K8, Q-general, R-general; SS, 7-59)

366-K. Joining of Beryllium. N. E. Weare and R. E. Monroe. *Defense Metals Information Center*, Memorandum no. 13, Mar. 30, 1959, 26 p.

Since Be is a brittle metal it is difficult to fabricate and join. Limited success is reported on direct welding by tungsten arc, pressure and electron beam processes. Cracking is the major problem encountered. Good joints are achieved by braze welding with Al filler and brazing with Ag and Ag-Cu eutectic alloy. 16 ref. (K-general; Be)

367-K.* Effect of Welding and Stress Relief on the Parent Plate. J. E. Roberts. *British Welding Journal*, v. 6, Feb. 1959, p. 72-81.

For mild steel, notch-ductile steel and low-alloy high-strength weldable steels, properties of the heat affected zone are equal to those of parent plate, provided there is no cracking or excessive hardening which may lead to cracking. Initiation of brittle fracture in a welded structure is strongly dependent on presence of residual stresses. Use of notch-ductile steels reduces risk of such fractures even in presence of residual stress. 11 ref. (K9s, Q26s, Q25h; AY, CN)

368-K.* Welding From the Viewpoint of Lloyd's Register of Shipping. G. M. Boyd. *British Welding Journal*, v. 6, May 1959, p. 205-210.

379-K.* (French.) Recent Developments in Arc Welding Processes. A. Gaubert. *Soudage et Techniques Connexes*, v. 13, Mar-Apr. 1959, p. 85-98.

Automatic and semi-automatic processes for arc welding mild and low-alloy steels in relation to application and optimum results. (K1; AY, CN)

380-K.* (French.) A Transition Weld Between Ferritic and Austenitic Piping in Steam Plant Superheaters. B. Lofblad and G. Lindh. *Soudage et Techniques Connexes*, v. 13, Mar-Apr. 1959, p. 103-111.

Effective joint is made between two dissimilar steels by using a transition piece made of stabilized high-Ni alloy with Cr content similar to that of ferritic steel. Cyclic heating tests and brittleness study of joint. 9 ref. (K1, K9, T26r; SS)

381-K.* (Russian.) Butt Welding of High Carbon to Alloy Steel Wire. A. T. Galaktionov and A. A. Fofanov. *Stal'*, Apr. 1959, p. 374-377.

To prevent often-occurring weld breaks in the welding of high carbon to alloy steel wire, it is necessary to eliminate weld burrs while the fused metal is in a hot and plastic state and to hold the heat to 500-600° C. during cooling. (K1, K9q; AY, CN-r, 4-61)

382-K.* (German.) Pressure Welding. Wilhelm Hofmann and Fritz Burat. *Feinwerk Technik*, v. 63, Mar. 1959, p. 82-85.

Tensile strength of Ag, Fe, Al and Cu weldments as a function of surface enlargement investigated together with the tensile strength at a varying radius of the welded cross section. 8 ref. (K5k; Ag, Fe, Al, Cu)

383-K.* (German.) Welding of Thin Thermo-Elements. Hansgeorg Specht. *Zeitschrift fur Metallkunde*, v. 50, Jan. 1959, p. 36.

Procedure given to make thermocouple junctions with wires of 0.03 to 0.1 mm. diameter and weld them to metal surfaces by condensor discharges. (K6, X9q)

384-K.* Welding Nuclear Power Equipment. Roger Sutton. *Metal Progress*, v. 75, June 1959, p. 124-126.

Weldments for reactor systems must meet more rigid quality standards than required in conventional power-plant applications. Materials and welding processes for fabricating equipment for nuclear systems were discussed at a recent meeting of the American Welding Society in Chicago. (K-general, W11p; SS, Ni-b)

385-K.* New Developments in Welding Stainless Steels. G. E. Linnert. *Metal Progress*, v. 75, June 1959, p. 127-128.

Tests continue on an improved weld metal to replace Type 347. Procedures are disclosed for welding AM-350 and AM-355. Study shows that CO_2 welding of

stainless may be undesirable for some applications because of carbon pickup. (K-general; SS)

386-K.* Resistance Welding of Aluminum Alloys. J. J. Deffenbaugh. *Welding Engineer*, v. 44, June 1959, p. 50-52.
Basic flexible variables and selection of machine for welding Al alloys through comparison with mild steel welding techniques. (K3; Al-b)

387-K.* Good Mechanical Properties Can Be Obtained Easily When Tig Welding Titanium. Helmut van Kann. *Welding Engineer*, v. 44, June 1959, p. 58-61.
German industries studied, tested and approved this technique. (K1d; Ti)

388-K.* Consider Residual Stresses When Welding. R. E. Holt. *Welding Engineer*, v. 44, June 1959, p. 66, 68.
Proper sequence in the welding of channels and I-beams controls stresses. (K-general, Q25)

389-K. Arc Welding Tantalum by the Tungsten Inert Gas Process. Pt. 1. Alan F. Busto. *Fansteel Metallurgy*, May 1959, p. 2-3.
(To be continued.) (K1d; Ta)

390-K. Electro-Slag Welding Comes to UK. *Metalworking Production*, v. 103, May 29, 1959, p. 950-954.
Process and equipment. (K6, 1-52)

391-K. Welding Chrome-Moly to Carbon Steel Calls for Low-Hydrogen Electrodes. *Industry & Welding*, v. 32, June 1959, p. 31, 61.
(K1a, W29h; Cr-b, Mo-b, CN)

392-K. (French.) Body Welding at Simca's Poissy Plant. J. Vandamme and J. Peronnin. *Soudage et Techniques Connexes*, v. 13, Mar-Apr. 1959, p. 127-136.
(K-general, T21a)

393-K. (Italian.) Use of Ultrasonics in the Nondestructive Testing of Weldments. Angelo Brioni. *Calore*, v. 30, Feb. 1959, p. 73-81.
(K9r, S13g; 7-51)

394-K. A Comparison of Argon and Helium Welding Shields. J. Barker. *Nuclear Power*, v. 4, June 1959, p. 119-120.
(K1d)

395-K.* (German.) New Aspects in the Welding and Design of Boiler Components. W. Muller. *Schweissen und Schneiden*, v. 11, May 1959, p. 159-171.
Tubes are classified according to material and designation. Composition and strength properties for steels in boiler tubes; gas welding, electric welding and inert-gas-shielded welding of DIN 10CrMo910 steel. Improvement in weld-root formation is claimed, resulting from the use of protective gas. (K1d, K2, T26q; AY, *Cr, Mo*)

396-K.* (German.) Adhesive Strength of Steel Brazed With Flux-Covered Brass. J. Colbus. *Schweissen und Schneiden*, v. 11, May 1959, p. 175-178.
Joint strength of flux-coated and flux-containing soldering rods is measured in joints of various sheet thicknesses. Flux-containing brazing sticks showed best results. (K8; ST, SGA-f)

397-K.* (German.) Tungsten-Inert Gas Arc Welding of High Performance Blunt Seams in Copper Pressure Vessels of Medium Wall Thickness. L. Poth. *Schweissen und Schneiden*, v. 11, May 1959, p. 194-196.
High-performance welding on Cu is obtained in various sheet thicknesses. (K1d; Cu, 4-53)

398-K.* (Russian.) High-Vacuum Electron Beam Welding of Reactive Metals. A. V. Mordvintsev and N. A. Ol'shanskii. *Svarochnoe Proizvodstvo*, May 1959, p. 4-7.
Hard-to-weld metals, such as Mo, Zr and Ta, which react with oxygen, nitrogen, hydrogen and carbon monoxide during welding at temperatures below their melting point, are successfully welded by this technique. Resulting welds were free from porous defects and gas inclusions. (K6, 1-73)

399-K.* (Russian.) Properties of Welds Produced With SVO8GSA and SVO8G2SA Rods in Carbon Dioxide Atmosphere. N. M. Novozhilov and A. M. Sokolova. *Svarochnoe Proizvodstvo*, May 1959, p. 7-12.
Welds have a high impact strength at room and low temperature and after aging. Amount of nonmetallic inclusions was less than with the ordinary submerged electric arc method. 9 ref. (K1g, Q6n, 2-65; CN, AY, 7-51)

400-K.* (Russian.) Effect of Sulphur on Weld Porosity in Automatic Submerged Arc Welding. L. S. Sapiro. *Svarochnoe Proizvodstvo*, May 1959, p. 12-13.
Deleterious effect of sulphur in welds, causing porosity, is attributed to hydrogen liberation by the sulphur in gaseous form.

Elimination of moisture in the arc zone will produce a nonporous weld even with high amounts of sulphur in the steel. 9 ref. (K1e, 9-68; ST, S, H)

401-K.* (Russian.) Flash-Butt Welding of Heat Resistant Austenitic Steel Tubes. E. S. Slepak and A. S. Gel'man. *Svarochnoe Proizvodstve*, May 1959, p. 20-24.

Short and long tests of butt welded tubes produced a weld with mechanical properties approaching those of base metal. Tensile strength of the weld metal is the same as that of base metal. (K3r, Q-general; SS-e, 4-60)

402-K. (Pamphlet.) Fabrication of Small Piping by Welding and Brazing. A. N. Kugler. 9 p. May 1959. Air Reduction Sales Co., Inc., 150 E. 42nd St., New York 17, N. Y.

(K-general; 4-60)

403-K. (Book.) Aircomatic and Heliwelding of Aluminum. 116 p. 1959. Air Reduction Co., Inc., 150 E. 42nd St., New York 17, N. Y.

Use of inert gas-shielded arc welding processes for high-purity Al and Al alloys in wrought and cast forms. (K1d; Al, 4, 5)

404-K. (Translation—Brutcher no. 4517.) Bonding of Brass to Steel With a Gas Flame. I. A. Nenaezdnikov. *Svarochnoe Proizvodstvo*, July 1958, p. 35-38.

See item 525-K, 1958. (K2h, 9-72; Cu-n, CN, SS)

405-K.* Braze Bonding Stainless Steel Fuel Elements for Nuclear Reactors. P. P. King and R. K. McGeary. *Welding Journal*, v. 38, June 1959, p. 241s-246s.

Technique depends upon electroless Ni-P plating on the tubular structural members to serve as the braze alloy. With thin, uniform coatings (0.0005-0.001 in.) it is possible to produce ductile single-phase bonding alloy at the contact area of the tube parts in as little as 5 min. at 1850° F. (K8, T11g; SS, SGA-f)

406-K.* Vacuum Diffusion Joining of Titanium. E. J. Clark. *Welding Journal*, v. 38, June 1959, p. 251s-258s.

A-110-AT Ti alloy components can be vacuum brazed with fine Ag filler and diffused in one operation to give joints with tensile and shear properties equal to those of the base metal. Where a metal-to-metal fit of parts exists, Ti alloy joints can be vacuum diffusion bonded in the 1800-1900° F. temperature range without filler to give metallographic homogeneity and strength equal to that of the base metal. (K8, K5k, 1-73; Ti-b)

407-K.* Solder Bonding Aluminum to Uranium. H. W. Mishler, J. T. Niemann, R. P. Sopher and D. C. Martin. *Welding Journal*, v. 38, June 1959, p. 268s-272s.

Uranium was plated with Cr, Fe or Ni which served as a diffusion barrier. The solders used were Pb, Sn, Zn and their alloys. No provision was made for removing surface oxides on the base metals. Therefore it was necessary to plate the Al and the U diffusion barrier. The best bonds were produced with Al plated with 0.5 mil of Cu and Ni-plated U given a Cu flash. (K7; Al, U, SGA-f, *Cr, Sn, Zn, Fe, Ni, Al*)

408-K.* Some Considerations on Design for Fatigue in Welded Aircraft Structures. J. Koziarski. *Welding Journal*, v. 38, June 1959, p. 565-575.

Welding permits design of joints that are cleaner, lighter and more efficient than joints designed for riveting. Wherever possible, preference should be given to joints designed to work in compression or tension. Transverse shear welds should be the second choice, and longitudinal shear welds the third choice. 26 ref. (K-general, 17-51, Q7a; 7-51)

409-K.* (German.) Arc Welding of Aluminum Under Inert Gas Shield. W. Mantel. *Aluminum*, v. 35, June 1959, p. 308-315.

Techniques and applications of Tig and Sigma (Mig) welding. (K1d; Al)

410-K.* (German.) Welding of Aluminum. W. Hegmann. *Aluminium*, v. 35, June 1959, p. 316-320.

Heat consumption, fluxes, flame regulation, stresses, gases and filler rods. (K2; Al)

411-K.* (German.) Determination of Flux and Solder Temperatures in Hard Soldering of Aluminum. E. Lueder. *Aluminium*, v. 35, June 1959, p. 327-330.

Al specimens were soldered by AlSi13, pure Zn, Cu, AlZn70, AlZn50, AlZn30 and Ag hard solders. Melting points of solders were determined together with flux temperatures. (K7; Al, *Zn, Si, Ag, Cu, Si,* ; SGA-f)

412-K.* (German.) A New Process of Pretreating Aluminum Prior to Bonding. K. Krekeler, A. Matting and H. Winter. *Aluminium*, v. 35, June 1959, p. 333-338.

Tensile strength of joints in sheet specimens of $AlCuMg_2$ determined after a pretreatment by a bath containing alkali fluoride and 15-20% nitric acid and adhesive joining by Redux 775, Metallon 130, Agomet E, Araldit 1 and 123B and Lipatol MK. Test results were compared to those obtained after surface pretreatment by conventional pickling. (K12, Q27; Al-b, *Cu, Mg,* 7-58)

413-K. Automatic Spotwelding Replaces Riveting. George H. DeGroat. *American Machinist,* v. 103, June 15, 1959, p. 118-119.

Tape control of welding positioners, use of television are new techniques used in building huge Al fuselage sections. (K3n; Al)

414-K. (Russian.) Static Characteristics of Under-Water Welding Arc. T. I. Avilov. *Svarochnoe Proizvodstvo,* May 1959, p. 16-17.

Cooling action of the water which uninterruptedly "washes" the outer arc column increases the current density. Large amount of hydrogen in the arc zone causes higher voltage and the voltage-ampere characteristics usually rise. (K1)

415-K. (Russian.) Prevention of Cracks in Fillet Welds of Low-Alloy Steels. G. V. Nazarov. *Svarochnoe Proizvodstvo,* May 1959, p. 36-37.

Welding cracks in T assemblies were eliminated by reducing welding rod diameter from 5 mm. to 2 mm., employing a double metal deposit, reducing the amp. from 650-750 to 380-400 amp.; voltage from 36-40 to 32-36 v. and maintaining a welding rate of 21 m. per hr. (K3p, 9-72; AY)

416-K.* Aluminum Alloy Rivets Excel for Magnesium Sheet. J. L. Nichols. *Iron Age,* v. 183, June 11, 1959, p. 138-139.

Use of high-purity 5056 Al alloy as a high-temperature fastening material. Excellent compatibility exists with Mg. (K13n, Q-general; Mg, 4-53, Al-b, 7-53)

417-K. Bonding of Various Metals and Alloys by Isostatic Pressing at Elevated Temperatures. J. Fugardi and J. L. Zanbrow. Sylvania-Corning Nuclear Corp. *U. S. Atomic Energy Commission,* SCNC-272, Dec. 1958, 37 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.

Maintenance of an operating temperature of 1200° C. and 12,000 psi. for 20 min. enabled the successful bonding of various materials such as Zircaloy-2 to 8% U-Zr, Zircaloy-2 to 10% Cb-U and Nichrome to 35% UO_2-Cb. (K5k; Zr-b, U, Ni-b, *Cr*)

418-K.* Resistance Welding Thin Metal Sheets. J. A. Donelan. *Welding and Metal Fabrication,* v. 27, June 1959, p. 234-242.

Control of weld current, time and electrode pressure; resistance welding equipment; weldability chart; series and projection welding; electrodes; seam welding and applications. (K3, W29h, K9s; 4-53)

419-K.* Cleanliness of Welds in Alloys for High Temperature Service. D. J. Heath. *Welding and Metal Fabrication,* v. 27, June 1959, p. 243.

Modified welding equipment eliminates oxygen contamination in the weld zone of 80A and 90 Nimonic alloys. (K1d, 1-52; Ni-b, SGA-h)

420-K.* (French.) Burning Phenomena and Quality of Light Alloy Welding. R. Develay, M. Croutzeilles and R. Chevigny. *Revue de Metallurgie,* v. 56, May 1959, p. 409-417.

Blistering on weld beads is investigated in sheet specimens of A-G5, A-SG, A-U46 and A-Z86U Al alloys and pure Al. Effect of Be additions, heat treatment, flux protection and yielding under vacuum, pressure, air, argon, nitrogen, mixtures of nitrogen, mixtures of nitrogen and oxygen with argon, and P_2O_5 on blister formation. (K2h, 2-60; Al-a, Al-b, *Be,* 9-71)

421-K.* (German.) Current Developments in Ultrasonic Treatment of Metal Surfaces. Hans Joachim Gollmick. *Industrieblatt,* v. 59, May 1959, p. 200-204.

Application of ultrasonic methods to cleaning, soldering, brazing, drilling, tinning and descaling. 10 ref. (K7, K8, G17, L10f, 1-74)

422-K. Supersonic Stainless Honeycomb Panels Produced. Bill Durkee. *Western Metalworking,* v. 17, June 1959, p. 41-44.

Die quench brazing, salt bath and electric blanket brazing. (K8, T24a; 7-59, SS)

423-K.* Some Aspects of the Metal Arc Welding of Monel. M. K. Williams. *Welder,* v. 28, no. 137, Jan-Mar. 1959, p. 7-9.

Preparation for welding, welding procedures; corrosion resistance of weld metal; use of Monel and Monel-2 electrodes; overlaying Monel to mild steel welds. (K1g; Ni-b, *Cu,* CN)

424-K.* The Metal-Arc Welding of Stainless Steels. Pt. I. Welding Metallurgy and Techniques. M. C. T. Bystram. *Welder*, v. 28, Jan-Mar. 1959, p. 17-22.

Effects of composition on the metallurgical structures of stainless welds; hot cracking; martensitic cracking; sigma-phase formation; corrosion resistance; recommendations for obtaining high radiographic standards in austenitic welds. (To be continued). (K1g, Q26q, 2-60; SS)

Equipment developed to handle both heavier gage materials and their foils. (K6r; Al, 4-56, 4-53)

456-K. Welding of Containment Sphere for Dresden Nuclear Power Station. Perry C. Arnold. *Welding Journal,* v. 38, May 1959, p. 461-468.

(K1a, K9r, T11)

457-K. Roll-Spot Welding for Ballistic Missiles. James K. Dawson. *Welding Journal,* v. 38, May 1959, p. 475-479.

(K3p, K3n, T24e)

458-K. Alloy Steels for Big Shovel Welded by Semiautomatic Submerged Arc. Alfred Tozer. *Welding Journal,* v. 38, May 1959, p. 480-481.

(K1e, T4a; AY)

459-K.* High Strength Adhesives. E. F. Hess. *Materials in Design Engineering,* v. 50, July 1959, p. 104-107.

Use of modified epoxies, thermoplastic-phenolic and elastomeric-phenolic adhesives for metal-to-metal binding and honeycomb construction. (K12; 7-59)

460-K.* Welding Unusual Metals. D. W. Grobecker. *Metal Progress,* v. 76, July 1959, p. 87-90.

Electron beam welding; diffusion bonding; motor-arc welding; combination welding methods; uranium welding and soldering. (K-general, K6; U, Zr)

461-K.* Welding of Medium-Alloy Chrome-Moly Steels. Kenneth R. Notvest. *Welding Journal,* v. 38, May 1959, p. 222s-227s.

Welding crack-sensitive alloy steels to produce sound, tough welds. Test methods, preheating, properties of a cooling weld, postheating, stress relieving and analysis. 15 ref. (K9, J1, Q29n; AY, *Cr, Mo,* 9-72)

462-K.* (Russian.) Modification of the Weld Metal in the Welding of Aluminum. A. A. Alov and G. V. Bobrov. *Svarochnoe Proizvodstvo,* no. 6, June 1959, p. 1-6.

Method of adding into the molten zone modifying compounds containing 2.5-2.30% Zr and fluxes with 0.42-0 0.63% Zr during automatic arc welding. A relationship exists between grain size and the amount of modifier. 8 ref. (K1e; Al-a, RM-q, *Zr,* AD-p)

463-K.* (Russian.) Titanium-Modified Welds in the Automatic Arc Welding of Medium-Carbon Steels. K. K. Khrenov, L. A. Pozhyak, Yu. A. Yuzvenko and M. S. Samotryasov. *Svarochnoe Proizvodstvo,* no. 6, June 1959, p. 6-8.

Ceramic fluxes containing 0.008-0.018% Ti increase resistance of welds to hot cracks and improve mechanical properties, provided precautions are taken to avoid overheating of the flux. (K1e, 9-72, RM-q, CN, *Ti*)

464-K.* (Russian.) New Austenitic Electrodes for Welding Steel 1Kh13N18B2B. A. V. Russiyan. *Svarochnoe Proizvodstvo,* no. 6, June 1959, p. 9-13.

Austenitic electrodes AZh13-18 and AZh13-15 for EI695R and EI694 steels. After heat treatment and aging, welds possessed satisfactory impact strength. Resistance of the fused-on metal to hot cracks was attained by elimination of boron and by the introduction into the weld bath of small quantities of carbon and columbium. 9 ref. (K1a, W29h, 2-64, Q6n; SS-e, 7-51, *C, Cb,* 9-72)

465-K.* (Russian.) Control and Correction of the Ferrite Quantity in the Weld and Base Metals of Austenitic Steel Joints. *Svarochnoe Proizvodstvo,* no. 6, June 1959, p. 13-15.

Proposed method prevents crack formation in welded joints and assures a

fixed amount of ferrite in the weld and base metal. Excessive brittleness during aging is also controlled. 13 ref. (K1a, Q26s, J27d, 9-72; SS-e)

466-K.* (Russian.) Weld Joints in 10KhGN Steel. M. M. Kraichik. *Svarochnoe Proizvodstvo*, no. 6, June 1959, p. 16-19.

10KhGN medium-carbon low-alloy steel has good weldability, possesses good deformation capacity and provides homogeneous strength along the entire welded seam. Welds have high impact strength up to the critical temperature and high resistance to the formation of cracks. 6 ref. (K9s, Q6n; AY, 7-51, 9-72)

467-K.* (Russian.) Problems of Alloying of Welded Strained Aluminum Alloys. S. V. Lashko-Avaryan and N. F. Lashko. *Svarochnoe Proizvodstvo*, no. 6, June 1959, p. 19-23.

Effect of binary, ternary and complex alloy additions to Al alloys on susceptibility to formation of crystalline cracks. Crack development is caused by the amount, ratio and distribution of solid and liquid phases in the structure of the solidifying metal. 4 ref. (K-general, N12, 2-60; Al-b, 7-51, 9-72)

468-K.* (Russian.) Fatigue Strength of Electro-Slag Welds of 08GDNFL. Cast Steel. V. A. Kokh, B. G. Yugelson, V. A. Bykovandgn Vsevolodov. *Svarochnoe Proizvodstvo*, no. 6, June 1959, p. 24-26.

The ultimate fatigue strength of a joint produced by electro-slag welding of low-carbon, low-alloy steel (Mn, Cu, Ni and V) is at least as high as that of the base metal. Omission of heat treatment after welding has no effect on fatigue strength. (K6, Q7a; CN-g, AY)

469-K.* (Czech.) Aluminum-to-Copper Flash Weldments With Large Cross Section. Ladislav Pliva. *Zvaranie*, v. 8, June 1959, p. 169-176.

Welding parameters, joint design and correct positioning of component parts in the welding equipment. 11 ref. (K3r; Al, Cu)

470-K.* (Russian.) Method of Evaluating Porosity in Weld Metal. G. D. Nikiforov. *Svarochnoe Proizvodstvo*, June 1959, p. 26-29.

Prepared samples are weighed in water and air and the density calculated. Technique is very sensitive and enables the detection of porosity which would have been revealed only by microsections. (K9r, 9-68; Al)

471-K.* (Slovakian.) Heat Flow in Electroslag Welding. Augustin Schweighofer. *Zvaranie*, v. 8, June 1959, p. 163-166.

Steel plates 170 mm. thick were electroslag welded without preheating and, for comparison submerged-arc welded after preheating. Heat maxima and cooling rates are given for both processes. (K6, K1e, P11h; ST, 4-53)

472-K.* Heat-Extractive Brazed Bimetals Show Promise for Missile and Industrial Applications. Robert C. Bertossa and Steven Rau. *Welding Journal*, v. 38, July 1959, p. 273s-281s.

Feasibility of applying vacuum-brazing techniques to the protection of refractory metals under short-term exposures to temperatures up to and exceeding 3600° F. The heat-sink clad-metal method involves the brazing of relatively thick high-thermal-conductivity Cu to a thinner Ta sheet. The Ta furnishes high-temperature strength and resistance to abrasion. The Cu serves as a heat sink to conduct heat generated on the exposed Ta surface away from the outer shell. (K8, 1-73; Ta, Cu, 4-53, 7-52)

473-K.* Certain Structural Properties of Ultrasonic Welds in Aluminum Alloys. J. Byron Jones and W. C. Potthoff. *Welding Journal*, v. 38, July 1959, p. 282s-288s.

Ultrasonic welds have higher shear strengths than fusion-type welds in structural Al alloys in thickness up to about 0.071 in. and are reproducible within narrow strength scatter bands and require less-critical sheet-surface preparation. (K6r; Al-b, SGB-s)

474-K.* An Evaluation of the Diffusion-Bonding Characteristics of Zircaloy-2. W. Feduska. *Welding Journal*, v. 38, July 1959, p. 289s-295s.

Experiments aimed at joining Zircaloy-2 components by a diffusion-bonding technique show that Cu, Ni, nickel-phosphorus, Mn and Si are the most promising diffuser elements. 6 ref. (K5k; Zr-b, *Cu, Ni, P, Mn, Si*)

475-K.* Plasma-Energy Transfer in Gas-Shielded Welding Arcs. H. C. Ludwig. *Welding Journal*, v. 38, July 1959, p. 296s-300s.

High-current welding arcs are influenced by the self-magnetic field produced within the discharge acting to compress

or pinch the conducting plasma. The thermal expansion of the plasma opposes the magnetic compression. The geometric form of the discharge is controlled by the interaction of these opposing forces. (K9n, K1d)

476-K.* New Developments in the Welding of Aluminum. R. L. Hackman. *Welding Journal*, v. 38, July 1959, p. 676-684.

The inert-gas consumable-electrode process may be utilized to weld very thin or thick material with equal ease. Both the inert-gas consumable-electrode and tungsten-arc processes may be used for spot welding. Any choice between the two depends upon requirements of the particular application. (K1, K3n; Al)

477-K. Fabrication and Construction of Piping System for the Dresden Nuclear Power Station. G. B. Grable and A. M. Croswell. *Welding Journal*, v. 38, July 1959, p. 657-664.

Materials, forming operations, heat-treating and welding procedures. (K-general, T11, J-general; 4-60)

478-K. (Czech.) Submerged Arc Welding of Pressure Vessels of Thin Sheet. Josef Svercl and Stanislav Vyslouzil. *Zvaranie*, v. 8, June 1959, p. 179-181.

(K1e, T26q; ST, 4-53)

479-K. (Slovakian.) Results Obtained in Studies on Heat Flow in Electroslag Welding. Julius Lombardini. *Zvaranie*, v. 8, June 1959, p. 167-168.

Structure and quality control by correct choice of welding process. (K6, P11h, N8m; ST, 4-53)

480-K. (Slovakian.) Choice and Classification of Structural Steels With Reference to Welding Operations. Alois Zapletalek. Zvaranie, v. 8, June 1959, p. 187-189.

(K-general, S22; SGB-s, AY)

481-K.* Dip Transfer CO_2 Welding of Mild and Low Alloy Steels. *Welding Design & Fabrication*, v. 32, July 1959, p. 54-57.

With dip transfer, metal is transferred entirely by a wiping action at the time of short circuit, rather than being projected through an arc stream. Dip transfer is suited to the welding of sheet 0.253 in. and smaller. Heavier sections can be welded since deposition rates as high as 6 lb. per hr. are achieved in the vertical position using small-diameter wires. (K1d; CN, AY)

482-K.* Welding of Dissimilar Metals. *Welding Engineer*, v. 44, Mid-June 1959, p. 5-13.

Filler metals for welding dissimilar metals require high tolerance for dilution by elements (Fe, Ni, Cr, Cu) without formation of brittle or crack-sensitive alloys, moderate coefficient of thermal expansion, ability to withstand high service temperatures over long periods without suffering harmful effects, good oxidation and corrosion resistance, high strength and ductility at both high and low temperatures. (K-general; SGA-f)

483-K.* Submerged-Arc Welding on the Pipe Line. William B. Handwerk. *Welding Journal*, v. 38, July 1959, p. 672-675.

Process is currently being used to double joint large-diameter pipe, resulting in better uniformity of weld, controlled welding conditions and greater daily construction footage. (K1e, T26r)

484-K.* (French.) Large Aluminum Weldments. D. Slater. *Revue de la Soudure Lastijdschrift*, v. 15, no, 2, 1959, p. 106-109.

Tig welding of large reactor components under simultaneous heating to provide perfect melting and perfect joints. Importance of working sequence, geometry of parts and harmful effect of Cu. (K1g, 3-73, 3-69, T11; Al-b, *Cu, Mg*)

485-K.* (Norwegian.) Steels Suited for Welded Constructions. Erling Braaten. *Teknisk Ukeblad*, v. 16, Apr. 16, 1959, p. 325-330.

Mechanical testing, structure testing and chemical analysis to determine weldability. Standard composition of a steel with good welding properties. 8 ref. (K9s, Q-general, 2-60; CN-p, 7-51)

486-K.* Aluminum Foil Laminating. *Light Metal Age*, v. 17, June 1959, p. 8, 10, 30.

Laminating Al foil to paper or paper board. Coating and printing foil laminates. (K11, L26b; Al, 4-56)

487-K. Some Experiences on the Joining of the Refractory Metals. A. F. Taylor and J. F. Stockdale. *United Kingdom Atomic Energy Authority*, IGR-TN/S-439, 1959, 20 p.

Methods of joining thin sections (up to 0.060 in.) of Ti, Zr, Cb, Ta, Mo and U, with emphasis on variations of the normal argon-arc welding techniques. Satisfactory fusion and spot welds were made

in all metals except Mo, which could only be joined satisfactorily by brazing. 7 ref. (K-general, K1d, K8; Ti, Zr, Cb, Ta, Mo, U, EG-d37)

488-K.* (German-French.) Unionarc-Welding. Karl W. Ramseyer. *Zeitschrift fur Schweisstechnik - Journal de la Soudure*, v. 49, July 1959, p. 193-208.

Process and applications. (K1d, T26q; ST)

489-K.* (Italian.) Welding, Heat Treatment and Polishing Stainless Steels. Plinio Corbellini. *Fonderia*, v. 8, June 1959, p. 253-257.

Directions for gas welding, arc welding and annealing. Rust caused by Fe particles found on the surface after cleaning with steel brushes or as a result of grinding or polishing. (K2, K1, J23, L10; SS, 4-53)

490-K.* (Russian.) Weldability of Low-Alloy Bessemer Steels. A. S. Astaf'ev. *Stal'*, June 1959, p. 553-560.

Low-alloy steels made in bessemer converters by blowing oxygen through ORSK-KHALIL cast iron proved to be suitable for welded structural assemblies, provided proper welding rods are used. (K9s, D3b; AY)

491-K. Modern Spot-Welding Machines for the Wire and Sheet Metal Industries. E. Robe. *Draht (English Edition)*, no. 41, June 1959, p. 67-69.

Equipment for the welding of steel wire and strip. (K3n, 1-52; ST, 4-53, 4-61)

492-K. (French.) Choice and Classification of Steels Used in Welded Constructions. *Revue de la Soudure Lastijdschrift*, v. 15, no. 2, 1959, p. 82-86.

(K-general, S22; ST)

493-K.* (French.) Construction of High-Efficiency Steam Superheaters. P. de-Marneffe. *Revue Universelle des Mines*, v. 15, July 1959, p. 649-661.

Superheater tubes of austenitic stainless steel are bent to small radii under inhomogeneous heating. Fissures and zones of reduced corrosion resistance are avoided in welding by the correct choice of electrodes. 9 ref. (K1a, R2h, G6, W29h; SS-e, 4-60, 9-72)

494-K. (Italian.) Construction of Large Aluminum Tanks. *Alluminio*, v. 28, no. 6, 1959, p. 291-320.

Welding directions, composition and properties of materials. (K-general, T26q; Al)

495-K.* High-Temperature Brazing With Palladium-Containing Filler Alloys. E. R. Perry. *Australasian Engineer*, v. 51, May 7, 1959, p. 53-56.

These alloys possess excellent flowing and wetting properties and are capable of penetrating into the spaces between the parts to be joined to a greater depth than is attainable with alloys which do not contain Pd. Even when the recommended brazing temperatures are greatly exceeded, there is little attack of the parent metals. (K8, 2-62; Pd-b, Ag, Mn, Cu, SGA-f)

496-K. A Gas-Shielded Consumable-Electrode Arc Welding Process for Butt Welding Croloy 2-1/4 Piping. R. M. Hargrove. Babcock & Wilcox Co. *U. S. Atomic Energy Commission*, BAW-1072, Mar. 10, 1959, 36 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Satisfactory results are obtained in horizontally fixed pipe when weld beads are started at the top and end at the bottom, alternating from side to side, with overlapping starts and stops. A mixture of helium and carbon dioxide gases with 3/64-in. diameter wire produces the best results. (K1d; AY, 4-60)

497-K.* (English.) Application of the Thermodynamics of Irreversible Processes to the Welding Arc. Egon F. Hollander. *Czechoslovak Journal of Physics*, v. 9, no. 2, 1959, p. 229-236.

Derivation of a thermodynamic equation for the spontaneous regulation of the arc occurring in the Sigma welding process. 12 ref. (K1d, K9n)

498-K.* (French.) Fatigue Tests of Welds in Pressure Vessels. P. H. R. Lane. *Soudage et Techniques Connexes*, v. 13, May-June 1959, p. 197-202.

Four different kinds of welds connecting tubes to a carbon steel pressure vessel tested under pressure and resulting cracks examined. The majority of fissures originated on the internal surface of the vessel. In some cases fractures started on the extreme side of weld angle and in several cases were extended along the entire surface of internal welds. 4 ref. (K1, T26q, 9-72; CN-b)

499-K. (French.) Construction of Pressure Vessels With Titanium Sheet Linings. F. F. Ates. *Soudage et Techniques Connexes*, v. 13, May-June 1959, p. 231-237.

Steel pressure vessel lined with Ti sheet joined by spot welding in an argon atmosphere. Defects resulting from welding are infrequent. (K3n, T26q; ST, Ti, 4-53)

500-K.* (German.) Gas-Fusion Welding of Aluminum. W. Hegmann. *Aluminium*, v. 35, July 1959, p. 396-400.

Welding gas, heat consumption, distortions, stresses, cracks, fluxes and flame adjustment. (K2m, 9; Al)

501-K. The Phillips Enclosed-Welding Process. J. A. N. Clevers. *Phillips—Serving Science and Industry*, v. 6, no. 1, 1959, p. 14-21.

Method especially applied for the butt welding of profiles with a large cross section. (K1a)

502-K. (French.) From Bare to Coated Wire. Study of Short-Circuit Metal Transfer. J. Pintard. *Soudage et Techniques Connexes*, v. 13, May-June 1959, p. 165-179.

Electrode polarity, arc length and current density in relation to bare and coated electrodes. (K9n, K1)

503-K. (French.) Welding Safety in Oil Tanks. G. Fleury. *Soudage et Techniques Connexes*, v. 13, May-June 1959, p. 180-182. (K-general, A7p, T26q)

504-K.* (English.) Welding Cracks in the Heat Affected Zone of Air Hardening Alloy Steel. H. Sekiguchi and T. Kobayashi. *Lastechniek*, v. 25, July 1959, p. 142-146.

Underbead, toe, transverse and longitudinal cracks appear during martensite formation. Underbead cracks are caused by hydrogen adsorption. Crack prevention by using austenitic electrodes, preheating, simultaneous heating and post heating. 4 ref. (K1a, K9, 9-72, 2-64; AY, *Ni, Cr, Mo*)

505-K. Welding of Type 347 Stainless Steel. V. N. Krivobok. Paper from "Minutes of the Seventh Annual Atomic Energy Commission Welding Conference". U.S. Atomic Energy Commission, TID-7562, Jan. 1959, p. 1-55.

Tensile testing at 1000 to 2000° F. in 100° increments on four weld metal compositions: 19-9 Cb (7% ferrite present standard): 19-13 Cb (0.12% carbon fully austenitic); 19-13 MnCb (5% Mn fully austenitic); 19-10 ELC (4% ferrite Type 308 ELC) Stress-rupture properties; hot ductility tests. 6 ref. (K-general, Q27, Q3q; SS)

506-K. Welding of Uranium. Robert A. Noland and C. C. Stone. Paper from "Minutes of the Seventh Annual Atomic Energy Commission Welding Conference". U.S. Atomic Energy Commission, TID-7562, Jan. 1959, p. 57-76.

Current welding techniques and their application to the fabrication of fuel plates composed entirely of uranium sections. (K-general, T11g; U)

507-K. Zirconium Welding. E. F. Cook. Paper from "Minutes of the Seventh Annual Atomic Emergy Commission Welding Conference". U.S. Atomic Energy Commission, TID-7562, Jan. 1959, p. 145-173.

Suggested procedure joins available widths of Zr sheet to form continuous strip material and cold rolls to foil thickness. The inert-gas tungsten-arc process is applied to fusion butt welding of reactor grade Zr sheet, 0.035 in. thick by 6 in. wide, to form continuous strip material to be used for foil fabrication. 8 ref. (K1g, F23; Zr, 4-53, 4-56)

508-K. Practical Considerations in the Welding of Heavy Aluminum Plate. Willis Groth. Paper from "Minutes of the Seventh Annual Atomic Energy Commission Welding Conference". U.S. Atomic Energy Commission, TID-7562, Jan. 1959, p. 173-180.

Effects of electrical variables on deposit quality, selection of improved filler materials for welding of heat treatable alloys such as 6061 Al. Data on inert-gas process. (K1g; Al-b, 4-53)

509-K.* (German.) Welding and Machining of Clad Sheets for Chemical Plant. H. Dahms. *Schweissen und Schneiden*, v. 11, June 1959, p. 221-223.

Welding and annealing of flame-cut clad sheets. Improper welding and annealing leads to grain disintegration between sheet and cladding followed by fracture. (K-general, G17, T29, J23, 4-53; 8-66)

510-K.* (German.) Examples of Welded Components Made of Nonferrous Metals. R. Kocher. *Schweissen und Schneiden*, v. 11, June 1959, p. 224-227.

Properties and welding techniques applied to Ni-Mo, Ni-Cu alloys and Ti used as materials in cylindrical shells, pressure vessels and heat exchangers. (K1, T26q; Ni-b, *Mo, Cu*, Ti)

511-K.* (German.) Welding Under CO_2 Atmosphere. H. Seifert. *Schweissen und Schneiden,* v. 11, June 1959, p. 228-230.

Welding of carbon or low-alloy steel when the welding wire is the electrode. Economy of the process increases with seam thickness. Arc scattering is controlled by deoxidizing additives in the wire. (K1d; CN, AY)

512-K.* (German.) Welding in the Manufacture of Wheels for Road Vehicles. H. Kotthaus. *Schweissen und Schneiden,* v. 11, June 1959, p. 231-232.

Spot welding techniques replace riveting. (K3n, T21c)

513-K.* (German.) Spot Welding of Agricultural Machine Parts. K. Neumann. *Schweissen und Schneiden,* v. 11, June 1959, p. 233-235.

Current spot welding techniques applied to fabrication of agricultural equipment. (K3n, T3)

514-K.* (German.) Gas Pressure Welding of Reinforcing Steel. K. H. Tiefholz. *Schweissen und Schneiden,* v. 11, June 1959, p. 236-237.

Method applied to bridge construction work. Lengths of about 90 ft. of bar steel can be welded together with only a slight decrease in mechanical properties of the base material. (K2, T26p; ST)

515-K.* (German.) Thermit Fusion Welding of Machine Parts. E. Tull. *Schweissen und Schneiden,* v. 11, June 1959, p. 237-240.

525-K.* Welding of X56 Pipe. Norman F. Blundell. *American Society of Mechanical Engineers,* Paper no. 59-PET-12, 1959, 4 p.

Up to 320 heats of steel used in making X56 pipe were tested for yield strength, ultimate strength, elongation, carbon and Mn content. Test weldments were made with X25 pipe. (K9s, Q27a; CN-p, 4-60)

526-K.* Weld Hardening of High Strength Steels and Prediction of Optimum Welding Conditions. Hiroshi Kihara, Haruyoshi Suzuki and Fumihiro Kanatani. *National Research Institute for Metals, Transactions,* v. 1, no. 1, 1959, p. 39-64.

Measurement of thermal cycles in heat affected zone of arc welds made in low-alloy high-strength steels. Effect of plate thickness and welding conditions on cooling rate. Relationship between cooling rate and maximum hardness. Nomographs for prediction of optimum welding conditions. 16 ref. (K1a, K9n; AY, SGB-a)

527-K. Welding of Stainless Steel Which Contains More than 1% Boron. Nicolas Balai. Paper from "Minutes of the Seventh Annual Atomic Energy Commission Welding Conference". U. S. Atomic Energy Commission, TID-7562, Jan. 1959, p. 15-31.

Useful and economical high-strength corrosion resisting stainless steels containing high percentages of boron were developed as neutron absorbing materials in nuclear reactors. Welding techniques permit the incorporation of the low-ductility 1 and 2.% boron stainless alloys into various EBWR neutron absorbers inside the reactor pressure vessel and in the fuel storage rack. (K-general, T11; SS, *B*)

528-K. Joining of Zircaloy to Austenitic Stainless Steel. Kenneth H. Koopman. Paper from "Minutes of the Seven Annual Atomic Energy Commission Welding Conference". U. S. Atomic Energy Commission, TID-7562, Jan. 1959, p. 32-56.

Diffusion bonding in a vacuum furnace at 1000 to 1020° C. gives good quality joints between Zircaloy-2 and Type 304 austenitic stainless steel which might be usable for joining some pressurized-water-reactor components. Thermal cycling tests between 100 and 550° F. for 4000 to 10,000 cycles indicated that diffusion-bonded joints do not leak or develope cracks. 6 ref. (K5k; Zr-b)

529-K. Fabrication of Thin-Wall Molybdenum Shapes by Welding. W. F. Brown. Paper from "Minutes of the Seventh Annual Atomic Energy Commission Welding Conference". U. S. Atomic Energy Commission, TID-7562, Jan. 1959, p. 155-173.

Fabrication procedure suitable for the production of thin-walled Mo components such as tubes, crucibles, furnace liners, high-frequency furnace susceptors and heat exchangers. Sheet material 0.015 in. thick was used, and welding was done in air using the automatic inert-gas tungsten-arc process. 8 ref. (K-general; Mo)

530-K.* A Laboratory Prototype Electron-Beam Welder. A. Lesnewich. Paper from "Proceedings of First Symposium on Electron-Beam Melting." Alloyd Research Corp., Watertown, Mass., 1959, p. 48-49.

Welder with maximum potential of 15,000 volts and power output up to 7.5 kw. Electron beam control and vacuum systems. Welding stainless steel foil and plate. (K6, 1-52; SS, 4-53, 4-56)

531-K.* A Commerical Electron Beam Welder. Theodore H. Crane. Paper from "Proceedings of First Symposium on Electron-Beam Melting". Alloyd Research Corp., Watertown, Mass., 1959, p. 84-88.

Electron beam welder; it operation and applications. (K6, 1-52)

532-K.* (Dutch.) Weldments Performed With Copper Bottom and Side Walls. *Metalen,* v. 14, July 15, 1959, p. 200-202.

Hand welding with coated electrodes. Bottom and walls keep the liquid metal in place at the same time as allowing the slag to flow off through a small gap. (K1a, T23q; ST, 4-55, 4-60)

533-K.* (Italian.) Correct Selection of Electric Welding Processes. Oscar Grossi. *Macchine,* v. 14, July 1959, p. 729-735.

Selection is determined by nature of material, thickness, shape and number of parts to be welded. (K1, K3)

534-K.* (Slovakian.) Importance of Welding in the Iron and Steel Industry. Jozef

Cabelka. *Zvaracsky Sbornik*, v. 8, no. 1, 1959, p. 3-28.

Repair of steel mill equipment and products by welding. Process directions and choice of filler materials. (K-general, 18-72, D-general, W-general)

535-K.* (Slovakian.) Non-Oxidizing Ceramic Fluxes for Submerged Arc Welding. K. V. Lubavskij and E. P. L'vava. *Zvaracsky Sbornik*, v. 8, no. 1, 1959, p. 29-36.

High-alloy, stainless and heat resistant steels were welded using ceramic sintered fluxes prepared with a halide base and containing Al_2O_3. Filler metals of favorable shape and low O, N and H contents were obtained. (K1e; AY, SS, SGA-h, RM-g, AD-n32)

536-K.* (Slovakian.) Properties of Electroslag Weldments. Julius Lombardini and Julius Zeke. *Zvaracsky Sbornik*, v. 8, no. 1, 1959, p. 50-63.

Effects of composition and structure of filler metal on mechanical properties. Structure is influenced by welding velocity —the time the liquid metal is given to segregate impurities on the bath surface. Coarse grain is eliminated by modifying the base and filler metals or by previous heat treatments. (K6, Q-general, N3, 2-60, 2-64; ST, 7-51)

537-K.* (Slovakian.) Weld Repair of Steel Mill Rolls, Crane Wheels and Forging Dies. Karol Sniegon. *Zvaracsky Sbornik*, v. 8, no. 1, 1959, p. 64-81.

Methods developed at the Welding Institute, Gliwice, Poland, with special reference to automatic welding with an alloying flux; hand welding with the alloying elements contained in the electrode coating. (K1, 18-72, W23k, W12q, W22a; ST)

538-K.* (Slovakian.) Repair Weldments on Locomotive Spoke Wheels. Pavel Hrbal. *Zvaracsky Sbornik*, v. 8, no. 1, 1959, p. 82-107.

Materials used for wheels were tested after experimental welding. Effects of composition of base and filler metals on mechanical properties, such as impact strength, bend strength and fatigue behavior. (K1a, T23, Q-general, 2-60, 18-72; CN, 7-51)

539-K.* (Slovakian.) Factors Influencing the Shape of the Bead in Submerged Arc Welding. Eduard Pikna. *Zvaracsky Sbornik*, v. 8, no. 2, 1959, p. 194-219.

Effects of amperage, arc voltage, welding velocity, composition and granulation of flux, electrode diameter, inclinations of workpiece and electrode, clearance between parts to be welded, poling temperature of workpiece on shape of the bead. (K1e)

540-K.* (Slovakian.) Weldability Tests With Thin Steel Sheets. Anton Hrabovec. *Zvaracsky Sbornik*, v. 8, no. 2, 1959, p. 220-246.

Low-carbon steel sheets of various quality were gas welded, welded with one or two tungsten electrodes in argon or hydrogen, or welded with a carbon electrode in air or CO_2. Effects of welding processes and conditions on mechanical properties of the weldments. 46 ref. (K1, K2, K9s, Q-general; ST, 4-53, 7-51)

541-K.* (Slovakian.) Effects of Oxygen and Hydrogen in the Welding of Copper. Pavel Slysko. *Zvaracsky Sbornik*, v. 8, no. 2, 1959, p. 247-254.

Gas welding of Cu containing oxygen with an oxidizing and a reducing flame. An oxidizing flame causes a eutectic structure Cu-Cu_2O; with a reducing flame, hydrogen adsorption causes pores, bubbles and cracks. (K2h; Cu, *O*, *H*, 9-68, 9-72)

542-K. Advanced Techniques for the Production of Missile Components. L. E. Laux and C. S. Hill. *Machinery*, v. 95, July 15, 1959, p. 67-73.

New developments for tooling and procedures for assembly of steel honeycomb structures by adhesive bonding and brazing. (K12, K8, T24e; ST, 7-59)

543-K. (German.) Welding in the Repair and Fabrication of Rolling Mill Parts. K. Weber. *Schweissen und Schneiden*, v. 11, June 1959, p. 244-245.

(K-general, W23, 18-72)

544-K. (Russian.) Resistance Welding of Rails. I. Z. Genkin. *Svarochnoe Proizvodstov*, July 1959, p. 12-15.

Equipment and techniques for resistance welding of rails into very large units (12.5 to 25 m.) producing rolling stock of high durability and quality. (K3r, T23q; CN)

545-K. (Russian.) Spot and Seam Welding of Light Alloy Structures. B. D. Orlov and Chuloshnikov. *Svarochnoe Proizvodstvo*, July 1959, p. 16-19.

Welding method employs fillers which increase the corrosion resistance of

welds and in many cases improve the structural strength of the assembly. 10 ref. (K3n, K3p; CN)

546-K. (Russian.) Projection Welding of Hot Rolled Steel. A. S. Gel'man, E. S. Slepak, S. M. Lashchiver and P. V. Mumrikov. *Svarochnoe Proizvodstvo*, July 1959, p. 19-22.

Method is very effective when applied to hot rolled steel structures requiring strong joints and high electrode resistance. (K3q; CN)

547-K. (Russian.) New Impulse Resistance Welders for Spot and Seam Welding of Thin Components. N. L. Kaganov. *Svarochnoe Proizvodstvo*, July 1959, p. 31-34.

Three types of newly developed welders at the Moscow Engineering College. (K3n, K3p, 1-52; CN)

548-K. (Russian.) Resistance Welding in Steel Sheet Production. A. M. Kogos, B. A. Ryss, A. S. Gel'man and N. S. Kabanov. *Svarochnoe Proizvodstvo*, July 1959, p. 34-39.

Equipment and techniques for resistance butt welding of strip steel under mill working conditions. (K3r; CN, 4-53)

549-K. (Russian.) Quality Control of Spot and Seam Welds. S. T. Nazarov. *Svarochnoe Proizvodstvo*, July 1959, p. 39-40.

Ultrasonic inspection with a defectoscope detects nonfusion as well as penetration of the fused metal during welding. (K3n, K3p, K9, S13g; CN)

550-K. (Russian.) New Resistance Welders for Light-Gage (Thin) Materials. D. A. Lyukevich and N. M. Tarasov. *Svarochnoe Proizvodstvo*, July 1959, p. 41-42.

(K3, 1-52)

551-K. (Russian.) Resistance Seam-Butt Welding of Pipes by High-Frequency Current. B. D. Zhukovskii. L. M. Zilbershtein and P. V. Golovein. *Svarochnoe Proizvodstvo*, July 1959, p. 42-44.

(K3n, K3p; 4-60, CN)

552-K. (Russian.) Resistance Spot and Seam Welding of Titanium Alloy OT-4. F. E. Tret'yakov and G. P. Tsar'kov. *Svarochnoe Proizvodstvo*, July 1959, p. 47-48.

Procedure for welding of sheets from 0.6 to 3.0 mm. thick. (K3n, K3p, Ti-b, 4-53)

553-K.* (Czech.) Friction Welding. J. Mandaus and J. Voboril. *Strojirenstvi*, v. 9, Jan. 1959, p. 33-40.

Bend and tensile strength are influenced by the degree of compression reached during welding. Mechanical properties and structure of weldments are influenced by heat treatment. Evaluation of steel friction weldments. (K6; ST)

554-K. Advances in Fabrication Techniques Revealed at Southern Metals Conference. Notes on Papers Presented at the Southern Metals Conference, Sponsored by Savannah River Chapter A.S.M., Augusta, Ga., May 1959. *Metal Progress*, v. 76, Aug. 1959, p. 128, 130-134.

Review of progress in ultrasonic electron beam and plasma jet welding. (K6, K6r)

555-K.* (Czech.) Weldability of Cast Steel With 13% Chromium. V. Pilous and F. Jandos. *Slevarenstvi*, v. 7, May 1959, p. 191-194.

Mechanical properties after casting; microstructure after annealing at 750° C. 6 ref. (K9s, M27, 2-64; SS, *Cr*, 5)

556-K.* (Czech.) Base-to-Electrode Metal Proportions in Submerged-Arc Welds. J. Lukasek. *Strojirenstvi*, v. 9, Feb. 1959, p. 126-129.

Compatability between base metal and electrode material is improved by introduction of additional electrodes connected to the base material. Welding with three consecutive arcs; positioning of electrodes with respect to base material; influence of welding velocity on weld profiles. (K1e)

557-K.* (Czech.) Submerged Arc Welding. A. Krnak. *Strojirenstvi*, v. 9, July 1959, p. 509-516.

Advantages and limitations of the method. Criteria for the selection of optimum seams. (K1e)

558-K.* (German.) Welding of Nickel and Its Alloys. W. Strassburg and Hinde. *Chemische Rundschau*, v. 12, Aug. 1, 1959, p. 412.

Composition and mechanical properties of Ni and Ni alloys. Electrodes and welding processes suited for the individual base materials. (K1; Ni, Ni-b)

559-K. Three-Step Method Bonds Fluorocarbons Firmly. *Iron Age*, v. 184, Aug. 13, 1959, p. 88-89.

Surfaces are treated with a vapor blast; washing and etching dip-tank setup follows and then application of high-temperature polymer coating to areas to be bonded. (K11d; NM-d34)

560-K. Super-Strength Rocket Chambers. *Ryan Reporter*, v. 20, no. 3, n.d., p. 8, 10.

Spot welded Ryan rocket chambers of foil-gage steel withstand test pressures of 305,000 psi. (K3n, T24e; SS, 4-56)

561-K. Ultrasonics Gain Speed in Joining Thin Aluminum. *Steel*, v. 145, Aug. 31, 1959, p. 67.

Ultrasonic seam welder manages Al sheet up to 0.010 in. thick at speeds over 30 ft. per min. (K6r, K3p; Al, 4-53)

562-K.* Arc Welding Tantalum by the Tungsten Inert Gas Process. Pt. 2. Alan F. Busto. *Fansteel Metallurgy*, July 1959, p. 2-3.

Cleaning, fixtures and welding equipment; choice of shielding gas. (K1d; Ta)

563-K.* A Breakthrough for Tantalum Welding. Burton Payne. *Welding Design & Fabrication*, v. 32, Aug. 1959, p. 36-39.

Corrosion resistance, physical and mechanical properties of Ta; resistance, submerged-arc, tungsten-arc inert-gas and electron-beam welding techniques. Ta-lined pressure vessels. (K-general, K6; Ta)

564-K.* Techniques for Torch Brazing Aluminum. Howard E. Adkins and Robert A. Ridout. *Welding Engineer*, v. 44, Aug. 1959, p. 30-32.

Brazability of various wrought and cast Al alloys. Cleaning and brazing procedures. Joint clearances; tip selection; flux removal. (K8g; Al-b)

565-K. (German.) Welding Methods Applied in the Construction of Chemical Industrial Equipment. Paul Richter. *Schweisstechnik*, v. 13, May 1959, p. 57-60.

(K-general, T29m)

566-K.* New Welding Processes. Better Weld Quality for Less Dollars. John J. Chyle. *SAE Journal*, v. 67, Aug. 1959, p. 47-52.

New developments in pressure welding and fusion welding improve weld quality. (K6)

567-K.* (Czech.) New Austenitic Steels for Welded Structures. F. Sicha. *Strojirenstvi*, v. 9, June 1959, p. 449-452.

Plate thickness is limited to 50 mm. Steels have high brittle fracture resistance and good weldability without preheating. (K9s, Q26s; SS-e, SGB-s)

568-K.* (German.) Oxyacetylene Welding of Austenitic Steel. J. Beckstroem. *Journal de la Soudure—Zeitschrift fur Schweisstechnik*, v. 49, May 1959, p. 133-139.

Importance of the ratio C_2H_2 to O_2 which should be equimolecular. The mixture of gases should be as complete as possible. Whenever those conditions are not given, structural defects caused by the formation of oxides or carbides can occur. (K2h; SS-e)

569-K.* (German.) Welding of Manganese Hard Steel. Georg Neuhofer. *Schweisstechnik*, v. 13, May 1959, p. 54-56.

Procedures necessary in the repair welding of a power shovel scoop to avoid cracks. Strain relief by hammering. (K1a, G23n, 2-62; AY, *Mn*, 7-51)

570-K. How to Get the Most From Semi-Automatic Welding Machines. *Welding Engineer*, v. 44, Aug. 1959, p. 33-35.

Wire feed, welding current and wire extension and their relation to deposition rate. (K1g, 1-52)

571-K.* (French.) Sheathing of Fuel Elements With the Help of Heating Dies. M. Gauthron. Paper from "Symposium on Solid State Diffusion". Centre d'Etude Nucleaires de Saclay, Gif-sur-Yvette (S-et-O), France, 1959, p. 95-101.

The Zr sheath is heated by a low-voltage current and pressed to the fuel bar when passing a die. An inert gas atmosphere or a vacuum is maintained between sheath and bar. Subsequent heat treatment at 1000° C. causes the formation of a diffusion zone. (K5k, T11g, 2-64, 1-73; U, Zr)

572-K.* (Italian.) Metallurgical Problems in the Welding of Dissimilar Steels. Karl Bjorkroth. *l'Acciaio Inossidabile*, v. 26, July-Aug. 1959, p. 140-156.

Techniques and materials for welding stainless to carbon or low-alloy steels; use of stainless steel electrodes for welding clad steel sheet. (K-general; SS, AY, CN, 4-53, 8-66)

573-K.* (Italian.) High-Temperature Brazing With Alloys Containing Palladium. E. R. Perry. *Nickel*, no. 79, Apr. 1959, p. 15-20.

Advantages of high-temperature brazing. Properties and applications of alloys containing Pd. (K8; Ag-b, *Pd*, SGA-f)

574-K.* Welding Nimonic. R. Levick and P. A. Morgan. *Aircraft Production*, v. 21, July 1959, p. 251-257.
Fusion and resistance welding processes. (K3; Ni-b)

Survey. (K-general, K9s)

576-K. (Dutch.) Developments in the Field of Weldable Materials. Pt. 2. H. G. Geerlings. *Metalen*, v. 14, Aug. 15, 1959, p. 224-228.
Shape of samples used in impact tests and strength values required for individual materials. Problems of brittle fracture. (K9s, Q6n, Q26s, 2-61; ST, Al)

577-K. (Book.) AWS Training Manual of Arc Welding. A. L. Phillips. 140 p. 1959. American Welding Society, 33 W. 39th St., New York 18, N. Y.
Process analysis, techniques and equipment used in manual metal-arc welding with covered electrodes. (K1a)

578-K.* How to Get Better Stainless Steel Welds. W. L. Wilcox. *Welding Engineer*, v. 44, Sept. 1959, p. 32-34.
Coated stainless steel electrodes; color coding systems; avoiding weld porosity and underbead cracking. (K1a; SS, 9-68)

579-K.* Spot Welding Procedures and Design. Pt. 1. Lester F. Spencer. *Welding Engineer*, v. 44, Sept. 1959, p. 35-39.
Electrode tip diameter and overlap, edge distance and spot weld spacing for ferrous and nonferrous metal. 18 ref. (K3n, 17-51; ST, Al-b, Mg-b, Cu-b, Ni-b)

580-K.* Understanding Weld Distortion and Shrinkage. George W. Gardner. *Welding Engineer*, v. 44, Sept. 1959, p. 40-42.
Examples of distortion in welded assemblies. Welding techniques, joint design, post treatment and other methods of minimizing distortion. (K9, 9-74; ST, SS, 17-51)

581-K.* Dip Brazing With Paste Filler Metal Offers New Possibilities for Brazing Aluminum. A. M. Stapen. *Industrial Heating*, v. 26, June 1959, p. 1115-1116, 1118, 1120, 1122, 1274.
Techniques and advantages of dip brazing Al with new powdered filler alloy applied as an aqueous paste using a molten flux bath. Tensile strength of up to 45,000 psi. has been obtained in joints in 6061 Al. (K8n; SGA-f, Al)

582-K.* Structural Uses of Welded High-Tensile Steel. G. Roberts. *West of Scotland Iron and Steel Institute*, v. 66, 1958-1959, p. 122-130.
Carbon content in these steels is restricted to 0.30% to provide greater ductility. The tensile strength is maintained by increased Mn content or by small Cr additions. Welding characteristics—arc energy, deposit areas, electrode diameter, fillet length, welding current and speed and plate thickness are given for BS 968 steel. (K9s, Q27a, 2-60; AY, *C, Mn, Cr*)

583-K. Baking "the Biggest" Metal Sandwich. *Metalworking Production*, v. 103, Aug. 14, 1959, p. 1244-1245.
Brazing PH15-7Mo stainless steel honeycomb panels. (K8j; SS, 7-59)

584-K. The ABC of Welding 'T-1' Steel. *Steel*, v. 145, Sept. 1959, p. 164-165.
(K-general; AY)

585-K. Nickel-Alloy Lining Slashes Isomerization Unit Costs. John F. De Lorenzo. *Welding Engineer*, v. 44, Sept. 1959, p. 58, 60.
Hastelloy B liner welded inside carbon steel vessel by coated electrode and inert-gas-shielded metal-arc processes. (K1a, K1d; ST, Ni-b)

586-K. (German.) Spotwelder for Use in the Automobile Industry. *Zeitschrift fur Schweisstechnik*, v. 49, Aug. 10, 1959, p. 241-242.
(K3n, 1-52, T21c)

587-K.* Progress Report on Welded Repairs to API 5LX52 Pipe. T. A. Ferguson. *American Society of Mechanical Engineers*, Paper no. 59-PET-34, 1959, 7 p. $.80.
Hydrostatic tests evaluating repairs on three corrosion pitted joints. (K-general, 18-72, Q10b, ST, 4-60)

588-K.* Zirconium Welding. B. L. Baird and E. F. Cook. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 148-158.
General survey of resistance, flash and tungsten arc welding. Recommended techniques and effect of process variables on mechanical and physical properties. 8 ref. (K-general; Zr)

589-K.* New Welding Processes. John J. Chyle. Digest of "Prediction in New Metal Joining Processes". Paper Presented at the Society of Automotive Engineers National Aeronautical Meeting, New York, Mar. 31, 1959. *Metal Progress*, v. 76, Sept. 1959, p. 174, 176.

Lists 15 kinds of pressure welding, 12 kinds of fusion welding and 10 methods of brazing, plus 20 variants related to heat source or protective atmosphere. (K8, K3, K4, K6)

590-K.* Progress in the Fusion Welding of Nonferrous Alloys. J. G. Young. *Sheet Metal Industries*, v. 36, Aug-Sept. 1959, p. 557-566, 576.

Welding processes and equipment for Al, Cu, Pb, Mg, Ni, Ti and their alloys. (K-general; EG-a38, Al, Cu, Pb, Mg, Ni, Ti)

591-K.* Inspecting and Testing Mild Steel Welds. R. N. Robb. *New Zealand Engineering*, v. 14, May 15, 1959, p. 163-168.

Dangerous welding variations in mild steel structures dictate careful use of welding equipment, electrodes and technique of a standard quality. Destructive tests; properties of welds. (K9r, S13; CN, 7-51)

592-K.* The Influence of Selected Fabrication Variables on Metal-to-Metal Bonding. G. Epstein and S. Litvak. *American Chemical Society (Division of Paint, Plastics and Printing Ink Chemistry*, Paper no. 2, v. 19, Sept. 1959, p. 239-246.

Fabrication variables include surface conditions, air entrapment in liquid epoxy-base adhesives, degree of cure of primer and pressure during cure of assembly. Tensile-shear strength of bonds for Ti alloys, steel, Be and Ni with several commercial adhesives. (K12; ST, Ti-b, Be, Ni)

593-K.* Rectification of Important Steel Castings by Welding. G. Mukherji. *Indian Railway Technical Bulletin*, v. 16, May 1959,

Repair of castings used as vital stress bearing members in a railroad coach. The welding of high-tensile steel castings and testing and evaluation of weldability are based on hardness of the steel. (K1, K9s, 18-72; ST)

594-K.* Bonding Rare Metals. R. F. Wegman and M. J. Bodnar. *Machine Design*, v. 31, Oct. 1, 1959, p. 139-140.

Tensile strengths achieved in the bonding of stainless steel to Be, Cb, Cu-Be, Mo, Pd, Re, Ta, W, Zr and 720 alloy and Cr, Au, Ag, Ti and stainless steel 347 to themselves with Epiphen 825 A and Laminac 4116. (K12, Q27a; SS, Be, Cb, Cu-b, Au, Mo, Ta, W, Zr, Cr, Ag, Ti, Pd, Re)

595-K.* (German.) Rectifying Effect on Alternating Current Arc Welding. F. Bollenrath, K. H. Lindackers and E. Roeder. *Schweissen und Schneiden*, v. 11, July 1959, p. 267-270.

A rectifying effect is caused in a-c. arc welding by the temperature differential at the electrode and at the welded material. The rectifying coefficient is dependent on and proportional to the temperature differential. Detrimental effects on the weld result from the rectifying effect. Partial elimination can be achieved by superimposed high frequency; high voltage. (K1, K9n)

596-K.* (German.) Welding and Weld Inspection of the Wilhelmshaven-Cologne Oil Pipe Line. H. Winter. *Schweissen und Schneiden*, v. 11, July 1959, p. 270-279.

Elongation limit of 36.6 kg. per sq.mm. and rupture strength of 50.6 kg. per sq.mm. were required for steel pipe and electrode. Comparative analysis of U. S. and German steels and electrode properties, both used in pipeline welding and construction. Upward and center-line welding were used. (K1, S13, T26r)

597-K.* (German.) Vertical Downward Welding in the Production of Large Storage Tanks. A. Buchholz. *Schweissen und Schneiden*, v. 11, July 1959, p. 285-288.

Experimental weldments produced by the vertical downward welding method proved superior to those resulting from the upward welding technique. Shrinkage and strength data were also superior. (K1g, T26q)

598-K. How Good Is Electron-Beam Welding? *American Machinist*, v. 103, Sept. 21, 1959, p. 113-114.

Compared with other kinds of welding. (K6)

599-K. A New Technique for Welding—Electron Beam. *Australasian Manufacturer*, v. 44, Aug. 22, 1959, p. 44-46, 48-51.

Review article. (K6)

600-K. Submerged-Arc Welding Operations on Exhaust Manifolds. *Machinery*

(*London*), v. 95, Sept. 16, 1959, p. 541-543. (K1e, T21c)

601-K.* Joining Dissimilar Metals. J. G. Young and A. A. Smith. *Welding and Metal Fabrication*, v. 27, July 1959, p. 275-281.

Resistance welding, pressure welding, solid state bonding and brazing. Effects of temperature, corrosive environment, eutectic formation, solution potential, electrode potential, joint geometry, composition and microstructure. (K-general, K6, K8, 2-61, 2-66)

602-K.* Storing Methane at -260° F. *Welding and Metal Fabrication*, v. 27, July 1959, p. 282-283.

Fabrication of cylindrical storage tanks having an outer shell of welded steel plate and an inner tank of NP 5/6 Al alloy plate with insulation between by inert-gas-shielded welding. (K1d, T26q; Al, ST, 4-53)

603-K.* (German.) Arc Welding and Arc Cutting. Herbert Rotter. *Industrieblatt*, v. 59, Aug. 1959, p. 366-371.

Description of the argonarc, sigma, Tig, Mig, submerged arc, Unionarc processes. Wiring and kind of current used for individual materials. Relationship between melting efficiency and current intensity. 8 ref. (K1, G22h)

604-K.* (German.) Adhesive Joining. K. Illmer and W. Mensing. *Industrieblatt*, v. 59, Aug. 1959, p. 376-382.

Bonding of light metals using various bonding materials. Relationship between strength of a metal and bonding strength. Fatigue strength of joints. Importance of surface preparation. Behavior under sudden and steady loads. Influence of service temperature on strength. 18 ref. (K12, Q7a, Q27a, Q6n, Q3m, 2-61; EG-a39, 7-59)

605-K. Growth of the CO_2 Welding Process. David F. Ritchie. *Canadian Metalworking*, v. 22, Sept. 1959, p. 16-18, 20.

Advantages include improved shielding techniques, more versatile wire feed equipment, better arc control, improved wire chemistry and more efficient welding techniques. (K1d)

606-K. "Enclosed" Welding. Can This Concept be Widely Applied? J. A. N. Clevers and G. Zoethout. *Canadian Welder*, v. 50, Sept. 1959, p. 14-15.

The weld deposit from low-hydrogen electrodes contains fewer impurities than the metal deposited with all the types of electrodes used hitherto. By using such electrodes it is possible to deposit a subsequent layer without slag inclusions and without removing any preceding layers. (K1e, W29h)

607-K.* Cracking of Low-Alloy Steel Weld Metal. Pt. 2. T. E. M. Jones. *British Welding Journal*, v. 6, July 1959, p. 315-317.

Principal factors involved are cooling rate of weld, which is affected by the size of the electrode, plate thickness, preheating, impurities such as high hydrogen potential in the electrodes, head size, weld restraint and low ductility of the weld metal. (K9s, 3-69; AY, 9-72)

608-K.* Strength of Components Repaired by Welding. S. Wise. *British Welding Journal*, v. 6, Aug. 1959, p. 345-350.

Effect of different types of weld on the fatigue resistance of engineering components made of mild or high-tensile steel. Fatigue failure may occur owing to the incorrect application of welding during repair work because of the lower fatigue strength of welds or because of changes in the stress distribution in the structure caused by welding. (K-general, 18-74, Q7a; CN, 7-51)

609-K.* Diffusion Bonding of Carbide to Steel. J. F. Kuzmick and G. B. Goodfellow. *Carbide Engineering*, v. 11, Aug. 1959, p. 11-14.

Bonded joint between cemented carbide tip and steel shank of cutting tool formed by heating, under pressure, a sintered wafer of "Plymet" material. (K5k; SGA-j, 6-69)

610-K.* Honeycomb Panels Get Braze in Electric Blanket Setup. R. E. Crump. *Iron Age*, v. 184, Sept. 17, 1959, p. 112-113.

New portable method of brazing honeycomb structures without use of furnace also reduces warm-up time and gives an even braze without problem of conductor expansion. (K8; 7-58)

611-K.* Brazing Graphite to Nilo-K Tubes. B. Stapleton. *United Kingdom Atomic Energy Authority (Industrial Group)*, I. G. Report 140 (RD/CA), 1959, 8 p.

Technique for making leak-tight brazes. (K8; Fe-b, Ni, Co, NM-k36)

612-K. Development of High-Strength Filler Wires for Welding SAE 4130, 4140 and 4340 Steels. H. W. Mishler and R. P. Sopher.

Battelle Memorial Institute. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 131074, Apr. 1957, 76 p. $2.

Filler wires for welding high-strength low-alloy aircraft steels by the inert-gas tungsten-arc and inert-gas consumable-electrode processes. Some filler wires had a composition similar to the base material, while others were of a different composition. Major factors considered were the weld-metal porosity, weld-metal cracking tendency, heat treatment response compared with base metal, strength of heat-treated weld joint, weld-metal toughness, and weld-metal hardening ability. (K1d, W29h; ST, 7-51, 9-68)

613-K.* Will Brazed Molybdenum Replace the "Superalloys" in Jet Engine Parts? G. S. Hoppin. *Welding Design & Fabrication*, v. 32, Sept. 1959, p. 46-48, 78-79.

Metallurgical problems; room and elevated-temperature strength of joints in Mo alloy (0.5% Ti) sheet brazed with Pd, Ni, Fe, Ag or Cu-base filler metals. (K8j, Q27a, 2-62; Mo-b, *Ti*, 7-52; SGA-f)

614-K.* Flash Butt Welding Cuts Jet Ring Costs 65%. H. J. Novak. *Welding Design & Fabrication*, v. 32, Sept. 1959, p. 56-57.

Welding AISI 430, 403 and 410 alloys to make jet engine ring assemblies. (K34; SS)

615-K.* Metallurgy of Bonding in Brazed Joints. Pt. 2. Migration of the Filler Metal Into the Base Metal. Nikoljas Bredzs and Harry Schwartzbart. *Welding Journal*, v. 38, Aug. 1959, p. 305s-314s.

The principal mechanism of transfer of filler metal through the filler metal-base metal interface is by grain-boundary penetration, which is a rapid process. The mechanism of grain-boundary penetration and its interrelationship with other metallurgical phenomena involved are explored theoretically and experimentally. 11 ref. (K8k, N1)

616-K.* Process Welding of Nodular and Gray-Iron Castings. Benjamin Townshend and Ellis O. Porter. *Welding Journal*, v. 38, Aug. 1959, p. 329s-334s.

Sound welds can be produced in restrained joints of nodular or gray cast iron using the shielded metal-arc process with the commercially available 55 Ni, 45 Fe electrodes and a preheat temperature of 600° F. A buttering technique followed by an intermediate heat treatment was found to result in weld joints comparable in strength to the base material. (K1d; CI-r, CI-n)

617-K.* Welding of Reinforcing Bars for Concrete Construction. J. F. Rudy, F. Suyama and H. Schwartzbart. *Welding Journal*, v. 38, Aug. 1959, p. 335s-340s.

Arc welding of reinforcing bars containing 0.21 to 0.84% C, up to 1.67% Mg, up to 0.081% P, and up to 0.067% S. The most successful joint design was a butt weld with edge preparation and weld-deposition techniques chosen to provide 100% penetration, slag-free deposits. (K1; 4-67, CN, NM-f43, SGB-s)

618-K. Reclamation of a 30-Ton Steel Casting. G. Gordon Musted. *British Welding Journal*, v. 6, Aug. 1959, p. 351-353.

Method employed to salvage a 30-ton cast steel drop hammer frame. The casting was made fit for further service by the combined use of oxy-acetylene cutting and heating, metal-arc and submerged-arc welding. (K1, 18-72, G22g; ST, 5-60)

619-K. Reproducibility of the CTS Weldability Test for Low-Alloy Steels. *British Welding Journal*, v. 6, Aug. 1959, p. 354-361.

Controlled thermal severity test is considered to be satisfactory for the scientific investigation of phenomena associated with heat affected zone cracking, and as a comparative test for steels, electrodes and welding procedure. 5 ref. (K9r; AY)

620-K. Powdered Metal Bonds Carbide to Steel. *Tooling & Production*, v. 25, Oct. 1959, p. 52.

Plymet diffusion bonding. (K5k; ST, 6-69)

621-K. Techniques for Resistance Welding Tiny, Dissimilar Metal Parts. *Welding Design & Fabrication*, v. 32, Sept. 1959, p. 44-45.

Joining Ni, W and Cr-Cu components for electron tubes. (K3n; Cr-b, *Cu*, Ni, W)

622-K. Welding of Fuels and Controls for Dresden Nuclear Power Station. C. N. Spalaris and J. W. Weyers. *Welding Journal*, v. 38, Aug. 1959, p. 760-765.

Processes, materials and quality-control methods for fabricating Zircaloy-2 clad, uranium dioxide containing fuel elements and boron-bearing stainless-steel control rods. (K-general, T11g; Zr-b, U, SS)

623-K. Welded Clad Steel Pipe for Reactor Construction. William H. Funk. *Welding Journal*, v. 38, Aug. 1959, p. 766-771.

Uses of gas-shielded tungsten-arc process. (K1d, T11; ST, 8-66)

624-K. Practical Approach to Determine Weld Size Provides Adequate Strength for All Types of Connections and, at the Same Time, Avoids Overwelding. Omer W. Blodgett. *Welding Journal*, v. 38, Aug. 1959, p. 775-782.

Salient features of weld design. (K-general, 17-51)

625-K.* Aluminum Brazing Paste Saves $175,000 at Martin. Don Wernz and Mel Schwartz. *Steel*, v. 145, Oct. 12, 1959, p. 112-114.

"Alumibraze", filler for water-based brazing paste for Al, is used for dip brazing complex parts in salt-bath flux. (K8n; Al)

626-K. Tungsten Inclusions in Welds Made by the Argon-Arc Process on 18/8/1 Stainless Steel. R. W. A. Grocock. *United Kingdom Atomic Energy Authority (Industrial Group)*, I. G. Report 39 (RD/CA), 1959, 8 p.

Satisfactory welds can be obtained without tungsten contamination under wide range of adverse conditions. (K1d, 3-69, W29h; SS, *W*, 9-69)

627-K. (Pamphlet.) How to Weld USS "T-1" Steel. 24 p. n. d. U. S. Steel Corp., 525 William Penn Place, Pittsburgh 30, Pa. Free.

Use of electrodes with "low-hydrogen" coatings for manual arc welding; control of the amount of heat put into the weld; use of the straight-forward stringer bead method. (K1a; 2-64, AY)

628-K. (Pamphlet.) Adhesive Bonding of Aluminum. 19 p. 1959. Reynolds Metal Co., Richmond 18, Va.

Principles and procedures involved in structural adhesive bonding of Al including joint design, types of adhesives and processing of joints. (K12; Al)

629-K. (Russian—Book.) Electric Resistance Welding. A. M. Toker, Editor. 125 p. 1958. Trudrezervizdat, Moscow. (Available from Library of Congress, Washington, D. C.)

Resistance welding methods commonly used in Soviet industry including spot, seam, flash and projection welding. The use of condensers in resistance welding is a recent development in Soviet welding technology. (K3)

630-K.* (Swedish.) Fusion Welding of Aluminum. Evert Rodenius. *Metallen*, v. 15, no. 3, 1959, p. 109-125.

Directions for gas welding, coated-electrode welding, Tig and Mig welding. Pretreatments and post-treatments of welds. Factors influencing weldability, such as melting point and heat capacity, heat conductance, oxidation resistance, tendency to porosity, expansion and hot brittleness. (K2, K1, K9s, P12, P11, R1h, K9, Q26s; Al)

631-K.* Plasma—Substitute for the Oxy-Fuel Flame. James A. Browning. *Welding Journal*, v. 38, Sept. 1959, p. 870-875.

Theory involved in the operation of the plasma-flame torch. (K9n, G13)

632-K.* Spot Welding of a 12%-Cr Martensitic Stainless Steel. E. F. Nippes, W. F. Savage, L. C. Ianniello and W. A. Owczarski. *Welding Journal*, v. 28, Sept. 1959, p. 360s-366s.

Optimum spot welding conditions for 0.007, 0.015 and 0.022-in. type 422 modified stainless steel sheet. 9 ref. (K3n; SS-c, 4-53)

633-K.* Welded Aluminum Transformer Cases Cut Cost 75%. *Western Metalworking*, v. 17, Sept. 1959, p. 49-50.

Welding 5356 Al to 4043 Al. (K2d; Al)

634-K.* (German.) Welding Aluminum With the Use of Protective Gas. Rashofen-Berndorf. *Schweisstechnik*, v. 13, June 1959, p. 65-72.

Advantages of the protective gas arc welding method are oxygen-free welds even with alloys possessing high Mg content while flux-solvent-free welding eliminates weld treatment and cleaning after welding completion. High heat concentration of the arc enables high welding velocities and a narrow heating zone and thus only small structural changes of the parent metal. (K1a; Al-b, *Mg*)

635-K.* (Swedish.) Fusion Melting of Aluminum and Aluminum Alloys. Evert Rodenius. *Metallen*, v. 15, no. 1, 1959, p. 6-14.

Gas welding and arc welding methods. The affinity of Al to acids, the high conductivity for heat, the low specific weight and the high melting point of Al-oxide as factors determining the choice of pretreatments and welding parameters. (K1, K2, 2-66, P11h; Al)

636-K.* (Russian.) Weldability of Heat Resisting Steels With 12% Chromium. M. Kh. Shorshorov, V. V. Belov, V. N. Zemzin

and I. D. Smornova. *Svarochnoe Proizvodstvo,* Sept. 1959, p. 6-10.

Effect of heating and cooling processes occurring in welding on tensile strength, hardness, area reduction, creep strength and structure. 6 ref. (K-general, Q27a, Q29n, Q23p, Q3m, N8, 2-61, 3-67; SS, SGA-h)

637-K.* (Russian.) Arc Welding of Heat Resisting Austenitic Steel EI 572. V. A. Toropov. *Svarochnoe Proizvodstvo,* Sept. 1959, p. 11-15.

Influences of electrode composition, heat treatment and artificial aging on the structure of base and filler metal and on their impact strength and creep strength, both measured at elevated temperatures. 8 ref. (K1a, N8, Q6n, Q3m, 2-60, 2-62; SS, SGA-h)

638-K.* (Russian.) Effect of Ferrite on the Properties of Filler and Base Metal in Weldments Performed With Cr-Ni Austenitic Steels. A. E. Runov and K. V. Lyubavskii. *Svarochnoe Proizvodstvo,* Sept. 1959, p. 15-19.

Testing of steel 1Kh20N12T in the cast state and of 1Kh19N10B type filler metal, both containing various amounts of ferrite. Effect of heat treatment on creep strength, impact strength and quantity of ferrite present. 10 ref. (K1a, Q3m, Q6n, N8, 2-61, 2-64; SS-e)

639-K.* (Russian.) Capacitor Discharge Resistance Welding of Small Sections of 1Kh18N9 Steel. D. M. Shashin and N. Yu. Pal'chuk. *Svarochnoe Proizvodstvo,* Sept. 1959, p. 19-21.

The short heating times of the method allow the realization of weldments showing high corrosion resistance. With tubing, exact centering and perfect geometry of the joint are essential. (K3, R6g, 3-67, T7; SS)

640-K.* (Russian.) Strength of Spot Welded Structural Units From D16AT and B95AT Light Metal Alloys. N. Kh. Andreev. *Svarochnoe Proizvodstov,* Sept. 1959, p. 21-22.

Comparative testing of spot welded, adhesive joined and riveted assemblies by exposing to alternate static loads. (K3n, K12, K13n, Q7b; EG-a39, 7)

641-K.* (Russian.) Welding of Studs to Alloy Steel, Cast Iron and Nonferrous Metals. D. I. Vainboim. *Svarochnoe Proizvodstvo,* Sept. 1959, p. 35-37.

Stud welding performed without a protective medium, in an argon atmosphere, under a flux or using ceramic rings. Use of metal rings providing additions to the weld metal. Brazing with metal caps put on the stud supplying the solder. (K1f, K8; AY, CI, EG-a38)

642-K.* (Russian.) Hard Soldering of Alloys and Steels Containing Chromium. E. A. Kolenko. *Svarochnoe Proizvodstvo,* Sept. 1959, p. 40.

Soldering by heating the assembly, together with a solder containing Cu and Ag, and with a flux of Ni_2O_3, in a hydrogen atmosphere. The Ni_2O_3 is reduced to Ni that diffuses into the filler metal. By this method, vacuum tight and high-strength joints can be achieved. (K7g, Q27a; Cr-b, AY, *Cr,* 7-51)

643-K. Which Welding Process for the New Metals? I. D. Holster, Jr. *Metalworking,* v. 15, Oct. 1959, p. 25-28.

Selection of welding procedure for PH stainless steels, ultra-strength steels, Be, Zr, Mo, Ta and Cb. (K-general; Be, Zr, Mo, Ta, Cb, SS, SGA-h)

644-K.* (German.) Welding of Cast Iron. W. Schumacher. *Industrie-Anzeiger,* v. 81, Sept. 8, 1959, p. 16-19.

Arc welding of type GS 45 cast iron. Strength properties were investigated after heat treatment at 600 to 900° C. and after cooling. The annealing process lowers the mechanical properties of the welding material, mainly the hardness, and increases the weldability. (K1g, 2-64; CI)

645-K.* An Engineer's Guide to Blind Riveting Practices. Charles E. Heilig, Jr. *American Machinist,* v. 103, Sept. 7, 1959, p. 137-144

Hole sizes and grip length for various joint thicknesses. Strength of Al, carbon steel and Monel rivets. Comparative advantages of common fastening and joining methods. Design of blind riveted joints. (K13n, 17-51, Q27a; Al-b, Ni-b, ST, 7-53)

646-K.* (Dutch.) Welding With Contact Electrodes. W. Moerman. *Lastechniek (NVL),* v. 25, Sept. 1959, p. 213-215.

Quantity of metal deposited in welding as a function of current intensity. (K1, W29h)

647-K.* (Dutch.) Testing. C.A.A. v.d. Woude. *Lastechniek (NVL),* v. 25, Sept. 1959, p. 217-220.

Mechanical and nondestructive tests of weldments. Tests and controls performed before, during and after welding. Reasons for failure. (Kgr, Q-general; ST, 7-51)

648-K.* (Dutch.) Repair Welding of Iron Castings. J. L. Linssen and A. Spee. *Lastechniek (NVL)*, v. 25, Sept. 1959, p. 220-222.

Arc welding and gas welding with and without preheating, using cast iron welding rods or electrodes with thin coatings containing C and Si, or coated electrodes with a Ni-Fe, Monel or Ni core. (Kla, (K2, 18-72, K9p, W29h; CI, *C*, *Si*, Ni, Ni-b, *Fe*, *Cu*)

649-K.* (Dutch.) Resistance Welding. J. Seldenthuis. *Lastechniek (NVL)*, v. 25, Sept. 1959, p. 222-226.

Influence of compression, current density and welding time on structure, amount of impurities and mechanical properties of the weld seam or spot. (K3, 3-74, 3-67, M27c; ST, 4-53, 7-51)

650-K.* (Dutch.) Fully Automatic Weld Deposition of a Layer of Stainless Steel on Very Thick Steel Sheet. P. Tichler. *Lastechniek (NVL)*, v. 25, Sept. 1959, p. 229-231.

Automatic sigma-welding process in which the electrode is moved in a zig-zag pattern. Effects of transverse movement and welding speed on bead shape. (K1d, L24, 3-67; ST, 4-53, *SS*)

651-K.* (Dutch.) Welding of a Copper Lined Pressure Vessel. J. H. A. Wennik. *Lastechniek (NVL)*, v. 25, Sept. 1959, p. 246-248.

Methods for Cu-to-Cu and Cu-to-steel weldments. (K1, T26q; ST, Cu)

652-K.* (French.) The Possibilities of Flash Welding for Aeronautics. Claude Elghozl. *Technique et Science Aeronautiques*, no. 2, Mar-Apr. 1959, p. 97-114.

Flash welding for structural steels; Al alloys, Ti and refractory alloys. (K3r; Al-b, Ti-b, AY, SGB-s)

653-K.* Joining of Beryllium. N. E. Weare and R. E. Monroe. *Light Metal Age*, v. 17, Aug. 1959, p. 10-12.

Electron-beam welding, fusion welding, pressure welding, brazing and braze welding. Problems involved include brittleness and toxicity of Be and its compounds; high resistivity of BeO, cracking, oxidation and porosity. (K-general; Be)

654-K. Mash Welder Joins Rings in One Operation. Bruce R. Bagley. *American Machinist*, v. 103, Sept. 7, 1959, p. 120. (K3s; ST)

655-K. (Russian.) Kinetics of the Process of Melting and of Metal Transport in Arc Welding. A. A. Erokhin and V. A. Petrunichev. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo*, no. 2, 1959, p. 70-77.

The behavior of a drop of liquid metal traveling from the electrode to the workpiece is investigated by means of motion pictures. 4 ref. (K1, K9n)

656-K. Fabricator Scores Breakthrough in Joining Titanium Clad Steel. *Steel*, v. 145, Oct. 19, 1959, p. 152-153.

Reaction vessels fabricated by welding base metal, coating weld with Ag inlay and capping joint with welded Ti strip. (K6, T26q; ST, *Ti*, Ag, 8-66)

657-K.* Shielded Arc Welding With Argon and Tungsten Electrode. A Schmid. *Brown Boveri Review*, v. 46, Mar. 1959, p. 210-220.

Welding Al and light alloys; effect of process variables. (K1d; Al, EG-a39)

658-K.* Welding of Low-Alloy Steels. Helmut Thielsch. *Canadian Metalworking*, v. 22, Oct. 1959, p. 34-36.

Optimum methods of welding structural, high-strength, high and low-temperature steels. Advantages and disadvantages of MIG welding, submerged arc, resistance and flash welding. (K1e, K1g, K3; AY)

659-K.* Corrosion-Resistant Multiple Brazing. G. D. Cremer and R. S. Mueller. *Design News*, v. 14, Aug. 31, 1959, p. 62-63.

Structures, materials and design factors. The insitu braze technique is explained. (K8; SGA-h, SGA-g)

660-K.* Maintenance Applications of Welding. R. J. Osborn. *Iron and Steel Engineer*, v. 36, Sept. 1959, p. 107-116.

Welding applications at the rolling mills, Steel Division, Ford Motor Co., Dearborn, Mich. Factors in the selection of thermit or arc welding processes. (K1, K4)

661-K.* Cyclic Welding Method Salvages Heavy Mill Equipment. R. L. Rectenwald. *Iron and Steel Engineer*, v. 36, Sept. 1959, p. 117-125.

"Cyclic" refers to repetitive steps of welding and stress relieving with close observance of selection of preheat temperatures, cooling rates and welding temperatures to produce desirable microstructures and physical properties during and following welding. (K-general, W23, 18-72)

662-K.* Metal-Plastic Combination Material. *Iron and Steel Engineer*, v. 36, Oct. 1959, p. 158, 160.

For some applications thermo-setting, laminated plastics combined with metals have properties that are superior to either constituent. In addition to strengthening the metal with which it is combined, a plastic laminate decreases material weight without sacrificing strength, reduces quantity of metals required, improves fabrication characteristics and forms, in effect, a new material with a wider range of properties than either material possesses alone. (K11d)

663-K.* Some Developments in Metal Welding Processes. John J. Chyle. *Machinery (London)*, v. 95, Sept. 2, 1959, p. 377-384.

Principles, equipment and potential application of high frequency resistance, foil seam, magnetic force, percussion, friction, thermopressure, electro-slag and electron beam welding processes. Diffusion bonding and plasma arc heating. (K-general).

664-K.* Fusion Welding of Precipitation-Hardening Steels. R. Meredith. *Welding Journal*, v. 38, Oct. 1959, p. 963-968.

From a weldability standpoint, 17-7, 17-4, AM350 and 15-7 Mo precipitation hardening materials are superior to 4130, 4340 and 4140. Under adequate conditions, very thin-gage large assemblies can be fabricated from precipitation-hardening stainless steels by fusion welding with good aerodynamic surfaces free from distortion. (K1; SS, *Cr, Mo*)

665-K.* Ultrasonic Welding of Aluminum. F. Collins, J. Dowd and M. Brennecke. *Welding Journal*, v. 38, Oct. 1959, p. 969-975.

Ultrasonic welding produces strong joints in Al alloys. Among its advantages are the ability to weld thinner gages, ease of surface preparation and the absence of melted or heat affected zones. Power consumption is low and no power correcting capacitors are needed. Strength is compared with resistance welds. 5 ref. (K6r; Al-b)

666-K.* Dip-Transfer Carbon-Dioxide Welding. R. Tuthill. *Welding Journal*, v. 38, Oct. 1959, p. 976-981.

Significance of dynamic characteristic of power supply and its effects on results in low-current CO_2 gas-shielded consumable-electrode welding of steel. (K1d; ST)

667-K.* Welding of Nickel-Molybdenum Alloys. G. Slaughter, P. Patriarca and R. Clausing. *Welding Journal*, v. 38, Oct. 1959, p. 393s-400s.

Hastelloy, Alloys B and W are weldable by the inert-gas-shielded tungsten-arc process and exhibit no difficulties with regard to cracking and porosity. Effects of age hardening on ductility and tensile strength. 18 ref. (K1d; Ni-b, *Mo*)

668-K.* Electron-Beam Welding. G. Burton and W. Frankhouser. *Welding Journal*, v. 38, Oct. 1959, p. 401s-409s.

Butt-joint weld penetration up to 0.250 in. are possible in Zircaloy-2. Chemical analyses, metallography, corrosion tests and mechanical properties. 6 ref. (K6; Zr-b)

669-K.* Welding of Beryllium. E. Brundige, R. Kirby, G. Hanks and J. Taub. *Welding Journal*, v. 38, Oct. 1959, p. 410s-413s.

Satisfactory fusion welding of Be without the use of filler metal was found to be impractical, due to cracking either in or adjacent to the weld zone. Acceptable welds were made with braze-welding techniques. One process involves the use of the inert-gas-shielded tungsten-arc welding process with pure Ag as the filler metal. In the second process, the inert-gas-shielded metal-arc welding technique was employed, with Al-12% Si alloy as the consumable electrode. (K1d; K6q; Be)

670-K. Extrusions in Tank Fabrication. M. Coen. *Welding Journal*, v. 38, Oct. 1959, p. 982-986.

Extrusions as used for main supporting members in the fabrication of Al vessels subjected to pressure. Inert gas metal-arc welding. (K1d; Al-b, 4-58)

671-K. Utilizing Two Welding Processes in Tandem. E. C. Alexander and J. D. Nicol. Union Carbide Nuclear Co. *U. S. Atomic Energy Commission*, KY-314, Sept. 30, 1959,

9 p.. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .50.

Use of two welding processes, semi-automatic shielded-arc magnetic flux and submerged-arc processes in tandem reduces the time required for welding ASTM 285 steel by 50%. (K1e, K1d; AY)

672-K.* (Czech.) Induction Soldering in Furnaces With Shielding Atmosphere. V. Ruza. *Zvaranie*, v. 8, Aug. 1959, p. 230-236.

Advantages of soldering methods within a shielded atmosphere for hard steel soldering where Cu solders are used. Main advantages are possibility of exact soldering temperature, shorter soldering time and complete mechanization of process while no additional surface treatment is necessary. (K7g; ST)

673-K.* (Czech.) Welding of Toros Steel. A. Brebera. *Zvaranie*, v. 8, Aug. 1959, p. 236-238.

Cold twisting of steel Types 10002 P, 10452 and R 40 improves qualities of concrete reinforcing steels. Before twisting, the bars are welded and then introduced into the twisting machines. Since the welds are cold worked after welding, the properties are improved. (K1, 3-68; ST, SGB-s)

674-K.* (French.) Control of Spot Welding in Aircraft Construction. H. Lefebvre. *Soudage et Techniques Connexes*, v. 13, July-Aug. 1959, p. 261-274.

Control procedures before, during and after spot welding of Al and Al alloy components of the "Caravelle" jet airliner. (K3n, T24a; Al)

675-K.* (French.) Improving the Weldability of Aluminum-Magnesium Alloys. R. Chevigny. *Soudage et Techniques Connexes*, v. 13, July-Aug. 1959, p. 296-298.

Addition of 0.10-0.30% Cr to ordinary Al-Mg alloys improves resistance to shrinkage cracking in assemblies subjected to severe post-welding tensions. (K9s, 2-60; Al-b, *Mg, Mn, Cr*, 9-72)

676-K.* (French.) Quality Control of Welded Construction in Piping for Conveying and Distributing Petroleum Products and Combustible Gases. H. Gerbeaux. *Soudage et Techniques Connexes*, v. 13, July-Aug. 1959, p. 299-308.

Nature of steel, quality of electrodes, analysis of site welding operations to insure safety of pipelines. (K1, S13, T26r; ST, 7-51)

677-K.* (Slovak.) New Welding Flux Materials of the VUS Type. S. Horvath and E. Pikna. *Zvaranie*, v. 8, Sept. 1959, p. 261-269.

Standarized annealing was applied to compare the weld properties of the flux and its behavior in relation to the parent metal. Yield point and elongation limit of the fluxes are well within the allowed limits of the parent metal. (K1e, 2-64; RM-q)

678-K.* (Slovak.) The Welding of 10523 Type Steel and Applications in Structural Steelwork. F. Lehar. *Zvaranie*, v.8, Sept. 1959, p. 270-276.

Evaluation of automatic and manual welding properties; mechanical values of different joints. Maximum allowed welding thickness was fixed at 40 mm., with no required preheating. Fatigue stresses and limits were determined for the main structural beams together with dynamic stresses. (K1g; T26p; SS, SGB-s)

679-K.* (Slovak.) Gas Shielded Arc Welding With Argon. J. Novotny. *Zvaranie*, v. 8, Sept. 1959, p. 276-282.

Tig welding with reference to electrodes, use of a-c. current and advantages over other techniques. (K1d; Al)

680-K. Use Normal Joining Methods to Assemble Coated Metals. *Iron Age*, v. 184, Oct. 22, 1959, p. 211-214.

Plastic-coated metals can be joined in the same manner as any unfinished steel part. (K-general; 8, NM-d, ST)

681-K. Fundamentals of Diffusional Bonding. Pt. 4. L. S. Castleman and L. Seigle. Sylvania Electric Products, Inc. *U. S. Atomic Energy Commission*, SEP-253, June 30, 1959, 24 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .75.

Interdiffusion in the Al-U system and effects of applied pressure. Kinetics of growth of the UA_3 phase are determined from 400 to 600° C. and at pressures of 1 1/4, 5 and 10 tons per sq. in. The origin of the macroscopic defects occurring in the UA_3 layer during interdiffusion is clarified. 15 ref. (K5k; Al, *U*)

682-K.* Welding as Applied to Steel Castings. F. Cleggett. *Australian Welding Journal*, v. 2, July 1959, p. 7-9.

Selection of electrode and correct procedure in relation to the weldability of

carbon and low-alloy steel castings. (K1d, K9s; CN, AY, 5-60)

683-K.* Resistance Welding of Nickel and High-Nickel Alloys. *Inco Technical Bulletin T33,* Sept. 1959, 34 p.

Spot, seam, flash and projection welding and resistance brazing of Monel "K", Monel, Ni, Duranickel, Inconel and Inconel "X" to themselves and other metals. Cleaning procedures, selection of proper process, process variables and equipment, defects and their causes, testing and inspection methods. 14 ref. (K3, S13; Ni-b, 7-51)

684-K.* Luminous Wall Furnace Gives Fastest Braze Cycle for B-70 Honeycomb Panels. Jack Rose. *Western Metalworking,* v. 17, Oct. 1959, p. 43-46.

Brazing of AM 350 CRES steel and PH 15-7 Moly in sizes up to 10 by 14 ft. to meet specifications of 200,000 psi. yield strength and 2% elongation. (K8, W29m; SS, 7-59)

685-K.* Solved: Welding Problem for Thin-Wall, High Strength Steel Missile Tank. Ellis P. Owen. *Western Metalworking,* v. 17, Oct. 1959, p. 52-53.

Procedure for welding 4140, 4340 and AMS 6434 steel in 3/16 and 5/16-in. thickness. Tank withstood hydrostatic pressure of 3000 psig. for 10 hr. Quenching after welding produced untempered martensite which decreased the weld strength. (K1, 3-74, Q10b; AY, 7-51)

686-K.* Electron Beam Welding. *Machine Production,* v. 18, Oct. 1959, p. 17-18.

New process joins the edges of workpieces by fusion welding, or melting, which is accomplished by a bombardment of a focused beam of electrons produced by an electron gun. The weld area can be controlled by varying electron velocity or the number of electrons gun filament. (K6)

687-K.* Structural Foil for Hot Parts. M. J. Breitenbach and Brooks Lake. *Society of Automotive Engineers,* Preprint no. 99T, 1959, 15 p.

Spotwelded, foil-gage, single-skinned, corrugation stiffened "MiniWate" structure eliminates blind spotwelds, simplifies inspection and yields high-strength structure. 7 ref. (K3n; 4-56)

688-K.* (Czech.) Induction Soldering of Metals. V. Ruza. *Zvaranie,* v. 8, July 1959, p. 211-217.

High heat concentration is achieved by high-frequency induction soldering so that very short soldering times (10 to 60 sec.) are needed and low surface oxidation occurs. Easy and reliable control of the solder and soldered material enables complete mechanization. (K6e)

689-K.* (German.) CO_2 Gas Shielded Welding in the Fabrication of Pressure Vessels. R. Faulstich. *Schweissen und Schneiden,* v. 11, Aug. 1959, p. 319-322.

Edge preparation and grease and rust removal are required before welding. A 30^{o} angle is suggested for V-type welds; nozzle distance from melt is 15 mm.; shorter arc is achieved by maintaining a proper ratio between electrode advance and current density. (K1d, T26q)

690-K.* (German.) Welding of Malleable Cast Iron. H. Hofe. *Schweissen und Schneiden,* v. 11, Aug. 1959, p. 326-327.

Connection weldings were constructed with arc welding and the stress properties, elongation, rupture and yield determined. In cast irons with low pearlitic content no influencing of the structure is apparent. (K1, K9r; CI-s)

691-K.* Simple Outgassing Determinations Aid High Temperature Vacuum Brazing. E. G. Huschke, Jr. Paper from "Fifth National Symposium on Vacuum Technology Transactions—1958". (American Vacuum Society, Inc.). Pergamon Press Inc., New York 22, 1959, p. 50-57.

High-temperature brazing of Ti and Al-bearing jet engine materials. Maximum allowable pressures for vacuum brazing these alloys are a function of alloy content; gas evolution of materials heated in vacuum varies greatly with melting practice on both sheet metals and brazing alloy powders; the amount of gases evolved from three different sheet thicknesses of a heat of an alloy were found to be proportional to the surface areas. 7 ref. (K8, 1-73, 2-62, 2-60; Ti-b, Ni-b, *Al*)

692-K.* Design Evaluation Considerations for Vacuum Brazing. Robert C. Gross. Paper from "Fifth National Symposium on Vacuum Technology Transactions—1958". (American Vacuum Society, Inc.). Pergamon Press Inc., New York 22, 1959, p. 175-180.

Positive features include the protection for heat-sensitive base metals, freedom from venting in joint design, wetting

(coating) and flow characteristics of filler metals promoted by their lower viscosity in liquidus state, virtual elimination of voids, gaseous inclusions and porosity by purge effects. 9 ref. (K8, 1-73)

693-K.* Dip Brazing Technics in Electrically-Heated Salt Bath Furnaces. L. B. Rosseau. *Metal Treating*, v. 10, Sept-Oct. 1959, p. 2-3, 30, 34-35, 38, 40, 44, 56-57.

Techniques, advantages, limitations and current equipment. (K8n)

694-K.* Diffusion Bonds Zircaloy and Stainless. J. M. Gerken. *Metalworking Production*, v. 103, Oct. 23, 1959, p. 1706-1707.

Diffusion bonding technique for joining tubing of Zircaloy 2 and 18:8 stainless steel. Joint shape and bonding methods for maximum strength under hydraulic pressure test. (K5k; Zr-b, SS, 4-60, 3-74)

695-K.* Eliminating Contamination Is a Prime Consideration When Welding Titanium. T. M. Laurenson. *Welding Engineer*, v. 44, Oct. 1959, p. 46-49.

Thorough cleaning of joints and filler material before welding is very important. For scale-free material, a simple degreasing operation is sufficient to remove dirt and oil, followed by light wire-brushing. Only argon or helium of the highest grade purity should be used, and the gas dew point should not be higher than -60° F. (K1d, L12; Ti)

696-K.* Resistance Spot-Welding of Tantalum Studied at Battelle. J. J. Vagi and R. L. Koppenhofer. *Welding Engineer*, v. 44, Oct. 1959, p. 52-53.

Cast nugget-type structures and solid state bonds with recrystallization where no apparent melting occurs are two kinds of bonds that can be produced. Severe electrode sticking occurs when making the cast nugget-type bond joints. (K3n; Ta)

697-K.* Tig Process Produces Strong, Ductile Welds on Tantalum. Alan F. Busto. *Welding Engineer*, v. 44, Oct. 1959, p. 54-56.

In many cases the use of a welding chamber is impractical because of the weldment's size or shape. In such cases the heated surfaces can be protected by proper gas-backed fixturing. (K1g; Ta)

698-K.* (German.) Welding of Cast Steel. W. Schumacher. *Industrie-Anzeiger*, v. 81, Sept. 18, 1959, p. 1201-1203.

Strength properties of welded Mo containing cast steel determined the optimum annealing properties. Best results were achieved by normalizing, welding, final treatment at 600° C. and cooling. (K1a, J23, Q23b; ST, 5-60)

699-K. How to Weld Zirconium and Its Alloys. L. E. Stark. *Welding Engineer*, v. 44, Oct. 1959, p. 50-51.

Arc welding must be conducted in a high-purity inert atmosphere. When welding is exceptionally critical, a dry-box should be used. Welding Zr outside a dry-box will satisfy many nuclear applications, and almost all nonnuclear applications, if Grade A helium or argon of guaranteed high purity is employed. (K1d; Zr)

SECTION L

CLEANING, COATING and FINISHING

1-L.* Vacuum Deposition of Metals. G. B. Remond and A. R. Johnson. *Metal Finishing Journal*, v. 4, Oct. 1958, p. 393-397.

Process is divided into five operations: preparation and cleaning of the article to be coated; loading work chamber; evacuation of work chamber; evaporation of coating material; protective lacquering and tinting. (L25)

2-L.* Automatic Cadmium Plating. *Metal Industry*, v. 93, Oct. 17, 1958, p. 333-334.

Plating plant employing a completely hydraulic system of operation. Process sequence is under the control of an electronic timer. (L17, W3g, 18-74; Cd)

3-L.* (German.) Descaling in the Salt Bath. The Sodium Hydride and Kolene-15 Processes. Rudolf Kuhn. *Draht*, v. 9, Oct. 1958, p. 390-391.

The sodium hydride process, using a bath of melted NaOH and NaH where the latter is produced by electrolysis, is best suited for descaling chromium and Cr-Ni steels, Ti and Ti alloys. When the scale results from stress annealing, the Kolene-15 process is applicable for the same materials. (L12)

4-L.* (Japanese.) Anodic Oxidation of Titanium. Pt. 3. Kyuya Nagasaki and Haruo Ishida. *Light Metals*, no. 31, July 1958, p. 60-65.

Leakage current of oxide film obtained by anodic oxidation of Ti was measured and its relation to working voltage and formation voltage was analyzed. 4 ref. (L19; Ti-b)

5-L. Effect of Operating Variables on Physical Properties of Copper Electrodeposits From Acid Copper Sulfate Baths. R. Wick. Frankford Arsenal. *U. S. Office of Technical Services*, PB 131579, 18 p. $.50.

Conditions of bath concentration, temperature, and current density to produce maximum ductility and strength in heavy electrodeposits of Cu. Specimens approximately 0.015 in. thick were electrodeposited from the acid copper sulphate baths under 54 combinations of bath concentration, current density, and temperature. Tensile strength increased with increased current density and decreased with increased bath temperatures. Optimum deposits were obtained at 25 to 40° C. and 3 amp. per sq. dm. in a bath 1.0*N* in copper sulphate and 1.5*N* in sulphuric acid. (L17a, 2-61, 2-66; Cu)

6-L. Continuous Galvanizing Line for Steel Strip. *Corrosion Prevention and Control*, v. 5, Aug. 1958, p. 43-45.

Line, 700 ft. long, comprises five main sections—entry, furnace, coating, cooling and delivery. Features include reducing oxide by cracked ammonia gas while annealing or normalizing and controlling temperature to galvanizing bath. (L16, L12j, 1-61; ST, 4-53)

7-L. Two Shipyards Install First U.K. Airless Shot Blast Plants. *Industrial Finishing*, v. 10, Aug. 1958, p. 27-29.

Centrifugal shot-projection units with proper abrasive remove scale and etch surface, insuring permanent bond between metal and coating. (L10c; ST, 18-67)

8-L. Hot Dip Galvanizing Conference. *Industrial Finishing*, v. 10, Aug. 1958, p. 36-40.

Summaries of technical papers presented at Fifth International Galvanizing Conference. (L16; Zn)

9-L. Automatic Polishing, Washing and Plating of Hub Caps at the Basildon Works of the Ford Motor Co. Ltd. *Metal Finishing Journal*, v. 4, Oct. 1958, p. 381-385, 388.

(L10, L12, L17, 18-74, T21c; *Ni*)

10-L. Some Comments on the Theory and Use of Solvent Driers. *Metal Finishing Journal*, v. 4, Oct. 1958, p. 386-388.

(L12h, W4k; NM-k35)

11-L. Hot Dip Galvanizing. *Wire Industry*, v. 25, Sept. 1958, p. 846, 851.

Abstracts of four papers on bath heating. (L16; *Zn*)

12-L. (French.) Sand-Blasting and Pickling. H. Bablik and F. Gotzl. *Metallurgie et la Construction Mecanique*, v. 90, Oct. 1958, p. 773-775.

Importance of surface preparation in hot galvanizing. Formation of coatings; comparison of surface finishes obtained. (L10c, L12)

13-L. (German.) Removal of Skin and Sand Particles From Iron Castings. Rudolf Kuhn. *Giesserei*, v. 45, Oct. 23, 1958, p. 670-671.

Electrolytic cleaning in a salt bath. (L13n; Cl)

14-L.* New Process for Simultaneous Degreasing and Phosphating. W. Rausch. *Industrial Finishing (London)*, v. 10, Nov. 1958, p. 51-53, 55.

Process in which solutions of sodium dihydrogen phosphate are used to give degreasing and formation of a protective phosphate coating. (L14b, L12k; ST)

15-L.* Where Do We Stand in Ceramic Coatings? N. I. Cannistraro. *Metal Progress*, v. 74, Nov. 1958, p. 111-113, 189-190.

Ceramic coatings add heat and corrosion resistant qualities to low alloys, protect against shock, abrasion and fatigue. (L27; SGA-h)

16-L.* (German.) Fundamental Questions Regarding Grinding and Polishing. Werner Wrobbel. *Metallwaren-Industrie und Galvanotechnik*, v. 49, Sept. 1958, p. 370-374.

Economics of automation of grinding and polishing operations. Typical products amenable to 70-100% automatic surface finishing. Items requiring up to ten operators, fully automatic machinery. Transfer lanes are preferred over automatic machines because of greater flexibility. Unit operation times for various materials and sizes are tabulated and calculations of loading times and line speeds explained. Automatic finishing requires more skilled operators, except for loading, and does not allow for correction of defective pieces. (L10, G18, 18-74)

17-L.* (German.) Tumbling of Stamped Parts. M. Dreher. *Metallwaren-Industrie und Galvanotechnik*, v. 49, Sept. 1958, p. 375-380.

Buffing and tumbling of stamped articles compared. Latter process found well suited to polishing of Cu-flashed surfaces, prior to plating. Thickness of Cu coating, particularly near edges, is not reduced, allowing a time saving of up to 30% in plating bath. Excellent results obtained with steel, Cu, Ni or Cd-plated materials, giving high gloss and increased surface hardness. Other applications: surface preparation for paint or varnish, final finishing of tinned kitchenware. (L10d; *Cd, Cu, Ni*, ST, 4-59)

18-L.* (German.) Gold Plated Surfaces the Electron Microscope. K. J. Schulze. *Metallwaren-Industrie und Galvanotechnik*, v. 49, Sept. 1958, p. 381-384.

Rolling alone produces relatively poor surface and requires thick coating. Mechanical polishing reduces coating thickness, particularly near the edges; scratches difficult to eliminate. Best results obtained by additional cold heavy Au plating of a polished gold surface, by tumbling or fine machining with diamond tools. (L10, L17, M27; Au, 8-62)

19-L.* Plasma Arc Torch Ushers in New Fabricating, Coating Methods. *Iron Age*, v. 182, Dec. 4, 1958, p. 136-137.

Metal or substance to be worked is prepared in wire or powder form, passed through an intense arc that is struck inside the torch where temperatures above 15,000°

F. are reached. Heat of the arc converts the material passing through into a fluid or plastic state, which is carried out of the torch by inert gases moving at high velocity and deposited. (L29n, W29d)

20-L.* Plant for Pre-Painted Steel Strip. *Machinery (London)*, v. 93, Nov. 5, 1958, p. 1061-1066.

Production of steel and Al strip which is continuously coated on both sides with paint or lacquer. (L26; ST, Al-b, 4-53)

21-L.* Sprayed and Diffused Metal Coatings. R. E. Mansford. *Metal Industry*, v. 93, Nov. 14, 1958, p. 413-416.

Aluminizing of alloy steels and Cu; hard facing; composite and heat resistant coatings. Compositions of Fe-Cr-Al alloys and properties influencing coating. 11 ref. (L15, L23, L24; SS, Cu, *Al, Ni, Cr*)

22-L.* (German.) Bond Strength of Heavy Zinc Coats on Hard Drawn Wire From Low-Carbon Rimming Steel. Dietrich Horstmann. *Stahl und Eisen*, v. 78, Oct. 16, 1958, p. 1456-1462.

Three openhearth steels and one air-refined special steel were hard drawn and Zn coated. Resistance of coating is increased by N and P while C, Mn, Cu, and Cr showed no influence. A light roughening of the surface produced by anodic or blast cleaning improves adhesion of the coating. Raising bath temperature and longer dipping times were unfavorable. (L16; CN-g, *Zn* 4-61)

23-L. Chromate Conversion Treatments. Pt. 1. D. J. Fishlock. *Product Finishing*, v. 11, Nov. 1958, p. 53-62.

Development and application. 9 ref. (L14c; *Zn, Cd*)

24-L. Electroplating Explained—Course for the Working Plater. Pt. 6. Electricity in the Plating Shop. *Product Finishing*, v. 11, Nov. 1958, p. 80-84.

(L17, 16-61)

25-L. (German.) Grinding and Polishing. Walter Burkart. *Metallwaren-Industrie und Galvanotechnik*, v. 49, Sept. 1958, p. 367-369.

Influence of automation on finishing techniques; greater stress on surface quality in Germany as compared with U. S. research, particularly electron microscope work; special grinding and buffing wheels for automatic machinery. (L10b, G18, W2p, W25c, 18-74)

26-L.* Process Control in the Manufacture of Enamels. A. W. Murdoch. *Industrial Finishing* v. 10 Aug. 1958, p. 31-34.

Present enamels are more opaque and can, therefore, be applied more thinly, have high resistance to corrosion attack, greater color range and stability, and are more resistant to abrasion and scratching than any other finish. These achievements have been made possible by process control of the basic material, frit. (L27, 17-54)

27-L.* Applying Paint to Galvanised Iron. *Industrial Finishing*, v. 10, Aug. 1958, p. 34-35.

Phosphate wash coating insures adhesion of paint to galvanized iron when long exposure is not permitted or convenient. (L14b, L26n; ST, 8-65)

28-L.* Electrodeposition of Titanium on Base Metals. Merle E. Sibert. *Industrial Finishing*, v. 10, Aug. 1958, p. 41-48.

Thin Ti layers are applied to steel by molten $NaCl\text{-}K_2TiF_6$ salt electrolysis. Rapid, inexpensive process since high currents and voltages are employed and only small amount of Ti is involved. Mechanism is basically diffusion of Ti into steel, producing firm bond and corrosion resistant properties. 8 ref. (L17, L15, ST, *Ti*)

29-L.* Some Considerations in Relation to the Hot-Dip Galvanizing of Guard Rails. H. Bablik, F. Gotzl and E. Nell. *Metal Finishing Journal*, v. 4, Aug. 1958, p. 297-300.

Tests show that thickness of coating is independent of Al content in bath when reapplied to prime surface of guard rail; although, when applied to the original surface, Al content must be 0.04% or less to obtain proper coating. (L16; ST, *Zn, Al*)

30-L.* Electropolishing and Related Techniques. A. A. Tomkins. *Metal Finishing Journal*, v. 4, Aug. 1958, p. 305-312, 316.

Basic chemical and electrochemical methods of polishing which may replace mechanical polishing. Metals to consider; solution and operating conditions of bath;

practical application; economy of process. 6 ref. (L12, L13)

31-L.* Properties and Applications of Flame-Sprayed Refractory Coatings. Lloyd Manuel. *Metal Finishing Journal*, v. 4, Aug. 1958, p. 313-316.

Used for abrasion resistant thermal barriers of jet engines, rockets and various types of reaction motors. Alumina and zirconia have low thermal expansion coefficients and their resistance to impact and abrasion can be improved by impregnating phenolics, furanes, silicones or epoxy resins. (L27)

32-L.* (Japanese.) Microscopic Observation of Surfaces of Thick Deposits by the Sargent Bath. Teiichi Hayashi and Shushi Takagi. *Nagoya Government Industrial Research Institute, Reports*, v. 7, Sept. 1958, p. 45-51.

Optical microscopy and electron microscopy of deposits using a Sargent bath (250 g. per l. CrO_3, 25 g. per l. H_2So_4). At low temperature and low current density numerous narrow cracks are found. The higher the temperature the fewer and wider the cracks become. Crackless deposits are found at 70° C. (L17a, M21; Cr, 9-72)

33-L. Non-Metallic Coatings for Corrosion Protection. W. N. B. Armstrong. *Canadian Mining and Metallurgical Bulletin*, v. 51, Nov. 1958, p. 719-720.

Materials used as primers and finishes for steel, Al, Mg, Zn. (L26; ST; Al, Mg, Zn)

34-L. Isolation of the Alloy Layer From the Coatings on Tinplate. K. Bright and S. C. Britton. *Chemistry and Industry*, no. 42, Oct. 18, 1958, p. 1362-1363.

Process involves protecting one face of the tinplate and successively removing the Sn alloy and steel from the other face by a sulphur and bentonite solution. 5 ref. (L12, *Sn*, ST, 8-62)

35-L. Bibliography on Electroplating of Cobalt and Cobalt Alloys. *Cobalt Information Center*, Technical Report no. 1, Feb. 1, 1957, 16 p.

Bibliography covering 1900-1957. (L17; Co, 11-65)

36-L. Lead Pigments in Corrosion-Resistant Paints. *Corrosion Technology*, v. 5, Nov. 1958, p. 353.

Red lead appears to impart better rust-inhibitive properties, compared with other pigments, to paints based on chlorinated rubber and epoxy resins. (L26n, R-general; Pb, NM-g30)

37-L. Nickel Plating in Special Applications. H. C. Castell. *Engineering*, v. 136, Oct. 31, 1958, p. 574-576.

Heavy Ni plating for salvage and protection; electroformed Ni; Ni plate for corrosion and abrasion properties. (L17, L18; Ni)

38-L. Contour Spray Painting. P. C. Bardin. *Industrial Finishing*, v. 35, Nov. 1958, p. 30-32.

(L26n)

39-L. Protective Organic Coatings for Steel. Pt. 2. Louis J. Nowacki and E. R. Mueller. *Industrial Heating*, v. 25, Nov. 1958, p. 2308, 2310, 2312, 2314, 2316.

Finishing systems, including undercoats, topcoats, surface preparation, application of coatings. (L26n, L26p; ST)

40-L. Conveyor Runs Structurals Through Paint Line. R. H. Eshelman. *Iron Age*, v. 182, Nov. 27, 1958, p. 70-71.

Carries random sizes without need for turning or shifting. (L23, W12r; ST, 4-57)

41-L. Use of Sequestering Agents in Metal Cleaning and Deposition. R. L. Smith. *Metal Finishing Journal*, v. 4, Nov. 1958, p. 429-431.

14 ref. (L12g)

42-L. New Black Nickel Plating Process. *Metal Finishing Journal*, v. 4, Nov. 1958, p. 436-437.

Chloride solution used for electrodeposition. (L17a; Ni)

43-L.* Anodized Aluminum Extrusions. Fred G. Shuler. *Precision Metal Molding*, v. 16, Nov. 1958, p. 43, 48.

Sulphuric acid coating method. Best finish and colors are obtained with 1100,

3003, 6053, 6061, 6062, 6063 and 6043 alloys; 6063 and 6463 are most widely used, 6463 gives brightest finish. (L19; Al, 4-58)

44-L.* How to Finish Sinterings in a Barrel. *Precision Metal Molding*, v. 16, Nov. 1958, p. 45.

Special compounds are available for sinterings. For powdered iron parts the compounds also contain lubricant and rust inhibitor. Special compounds have also been developed for nonferrous parts and infiltrated sinterings. (L10d; Fe, 6-72)

45-L.* (German). High Productivity of the U. P. Hard Facing Method as Applied for Guide Rollers in Mining and Agriculture. W. Gunther. *Fertigungstechnik*, v. 8, no. 10, 1958, p. 454-459.

Composition of welding rods, hardness of deposited layer, equipment used. (L24, W29h, T28, T3)

46-L.* Thermal Shock Resistant Nickel Plating on Copper. L. Missel. *Metal Finishing*, v. 56, Sept. 1958, p. 49-51.

Heat generated by air friction of missiles at high velocities causes rapid deterioration of surfaces of Cu parts. Special process produces thin, hard, resistant outer coating which extended useful life of Cu parts. (L17a, T24e; Cu, 8-62, 17-57)

47-L.* Plating Room Layout. G. R. Kentta. *Metal Finishing*, v. 56, Sept. 1958, p. 52-56.

Prime factor is type of operation; still tank, trolley hoist, semi-automatic or full-automatic. Other considerations include process cycle, plating room floors, racks, tank construction and protection, ventilation, heating and control of solutions, waste disposal and water conservation. (L17, W3g, 18-67)

48-L.* Electropolishing—What, How and Why. Pt. 2. John F. Jumer. *Metal Finishing*, v. 56, Sept. 1958, p. 60-63.

Solutions and operating conditions for various metals and alloys: Al, Cu, Ni and alloys, carbon steel, stainless steel. (L13; Al, Cu, Ni, SS, CN)

49-L.* Science for Electroplaters. Pt. 40. Dibasic (Dicarboxylic) Acids. L. Serota. *Metal Finishing*, v. 56, Sept. 1958, p. 67-70.

Bath solutions using oxalic, succinic, citric, and tartaric acids; their uses. Effects of various factors: solution concentration, temperature, current density, pH, voltage, time, etc., on coating thickness and rate of deposition. (L17; Al, Cu, Ni, W, Zn, Sn, Pb, Cu-n)

50-L.* Anodized Aluminum Wire. Paul Smits. *Modern Metals*, v. 14, Aug. 1958, p. 30-34.

Oxide coating created by this process forms a good electrical insulator, even at high temperature. Anodized wire saves space, weight, resists solvents, dissipates heat, gives uniform covering, cuts gloss. (L19, T1; Al, 4-61)

51-L.* (English.) Polishing Special Steels. *Aciers Fins & Speciaux Francais*, no. 29, July 1958, p. 21-22.

Principles and details of polishing operations in working stainless steel. (L10, G19q; SS)

52-L.* Anodizing Bath for Magnesium Alloys. M. W. Davies. *Corrosion Technology*, v. 5, Sept. 1958, p. 281-284.

Protective coatings available for Mg alloy. "New Chrome" process which uses alternating current in a bath containing potassium hydroxide, potassium fluoride, sodium phosphate and potassium chromate to produce extremely hard smooth green coatings. Resistance of New Chrome and H.A.E. treated specimens to corrosion by salt spray or atmospheric exposure. Superiority of New Chrome coatings. (L19q, R3p; Mg-b)

53-L.* Shot-Blasting in the Shipyard. *Corrosion Technology*, v. 5, Sept. 1958, p. 285-287.

Development and operation of shot blasting machine especially designed for use on ships' plates. Suitable coatings for protection of steel surfaces following shot blasting. (L10c, 1-52, L26, R4b; ST, 4-53)

54-L.* Stress in Nickel Electrodeposits. T. P. Hoar and D. J. Arrowsmith. *Institute of Metal Finishing, Transactions*, v. 36, Autumn 1958, p. 1-6.

Stress developed in Ni electrodeposits in earliest stages up to stage of steady

stress production was continuously measured for a plain Watts bath and for baths containing typical stress-reducing agents. Tensile stress developed in plain Watts bath was reduced and finally made compressive as the concentration of stress-reducing agent increased. The instantaneous stress becomes nearly constant with thickness and is not influenced by temperature or current density of deposition. Results interpreted by vacant-site and dislocation theory. 14 ref. (L17a, L17c, Q25h, 2-66; ST, *Ni*)

55-L.* Electrodeposition of Platinum From Chloroplatinic Acid. Ralph H. Atkinson. *Institute of Metal Finishing, Transactions*, v. 36, Autumn 1958, p. 7-16.

Electrodeposition of Pt from aqueous solutions containing chloroplatinic acid (15 to 25 g. per l.) and hydrochloric acid (10 to 390 g. per l.) was investigated at rates of deposition from 0.1 to 1.1 x 10^{-3} in. per hr. and at temperatures from 45 to 75° C. in successful attempt to define conditions for production of ductile plates. Quality of plates assessed by micro-examination, by their hardness and by simple rolling test. (L17, Q23p, 3-67; Pt)

56-L.* Some Observations on Silver Anodes. R. R. Benham. *Institute of Metal Finishing, Transactions*, v. 36, Autumn 1958, p. 22-26.

Effects of grain size, anode current density and presence of impurities on behavior and appearance of anodes. Flaking found to occur to greater degree in high-speed solutions. High-purity anodes of large grain structure satisfactory in the conditions employed by many electroplaters but a pure annealed anode having small equi-axed grains found to give good results over wider range of conditions. (L17, 2-59, 3-69, W3h; Ag)

57-L.* Effects of Impurities in a Bright Nickel Bath on the Covering Power of a Chromium Bath. Robert H. Rousselot and Georges E. Rousselot. *Metal Finishing*, v. 56, Dec. 1958, p. 46-50.

Behavior of impurities, control tests, experimental procedures, results of Cu, Zn, Cr, Fe and Pb impurities. (To be continued.) (L17a, 3-69; *Ni, Cr*)

58-L.* Stripping Metallic Coatings. J. B. Mohler. *Metal Finishing*, v. 56, Dec. 1958, p. 60-63.

General and quantitative stripping of brass, Cd, Cu, Cr, Au, Pb, Ni and many other plates. 4 ref. (L17, L13; ST, Mg, Al, Ag, Ni, Cd, Sn-b, Zn, Cu)

59-L.* (German.) Reconditioning of Stamping, Punching and Drawing Tools by Electric Arc Hard Facing. Werner Schrodl. *Werkstatt und Betrieb*, v. 91, Nov. 1958, p. 687-688.

Deposited weld layer replaces worn edges and provides a hard layer of excellent wear resistance. Volume of current used in relation to the rod diameter. (L24, W24n)

60-L.* (Japanese.) Study on Tungsten Plating Solution. Tadayoshi Inui. *Metal Finishing Society of Japan, Journal*, v. 9, Aug. 1958, p. 288-292.

Variation in the electrical resistance during electrolysis of alkaline, neutral, weak acid or organic acid solutions. Plating W from alkaline solution in which WO_2^{++} ions are formed, deposited at cathode and reduced to metallic state by the hydrogen generated. (L17a; W)

61-L.* (Russian.) Progress in the Field of Electrolytic Polishing. Yu. V. Baimakov and K. P. Batashev. *Khimicheskaya Nauka i Promyshlenost*, v. 3, no. 4, 1958, p. 464-470.

Electrolytes are orthophosphoric, sulphuric and other acids as well as alkaline and cyanide solutions. The greater the electrolytic concentration, the quicker the solution of the protruding uneveness of the metal. Only metals with a homogeneous crystalline structure lend themselves to polishing. (L13p)

62-L.* (Russian.) Number of Crystals Formed in Reverse Electrodeposition of Silver. A. T. Vagramyan and A. P. Popkov. *Zhurnal Phizicheskoi Khimii*, v. 32, Sept. 1958, p. 1964-1966.

In the deposition of Ag with preliminary anodic polarization of the electrode, the number of crystals formed at the cathode rises sharply as compared with that formed on its direct current polarization. (L17; Ag)

63-L.* (Russian.) Anomalous Temperature Dependence of Electrodeposition Rate of Copper. G A. Emelyanenko. *Zhurnal Phizicheskoi Khimii*, v. 32, Sept. 1958, p. 2119-2122.

At elevated temperatures cuprous oxide is formed at the Cu-Cu sulphate solution interface. The appearance of anomalous temperature dependence of the rate of electrolysis is connected with this formation. (L17c; Cu)

64-L. Finishing Zinc Base Die Castings. Lester Spencer. *Metal Finishing*, v. 56, Dec. 1958, p. 56-59, 63.

14 ref. (L26; Zn, 5-61)

65-L. Science for the Coatings Technologist. Pt. 11. Paint Additives: Driers and Anti-Skinning Agents. E. S. Beck. *Metal Finishing*, v. 56, Sept. 1958, p. 64-66, 79.

(To be continued.) (L26n; NM-g)

66-L. Science for Electroplaters. Pt. 42. Amines. L. Serota. *Metal Finishing*, v. 56, Dec. 1958, p. 66-69.

(L17a)

67-L. (Russian.) Innovations in the Field of Electrodeposition. A. T. Vagramyan and N. G. Kudryabtsev. *Khimicheskaya Nauka i Promyshlenost*, v. 3, no. 4, 1958, p. 471-476.

Replacement of toxic electrolytes (such as cyanides) with nontoxic; automatic control of quality of deposits. (L17)

68-L.* (Book-German.) Surface Pretreatment of Ferrous and Nonferrous Metals. Willi Machu. 960 p. 1957. Akademische Verlagsgesellshaft Geest & Portik K-G., Sternwartenstrasse 8, Leipzig, Germany. DM56.

Comprehensive treatment of surface cleaning before protective coating, plating or painting. Degreasing with alkaline, alkaline organic and inorganic compounds and with substances of the benzene series. Mechanical and thermal cleaning. Pickling and polishing processes. (L10, L12, L13)

69-L. (Translation—SLA, INSDOC-T-2183.) Possibilities of Securing Improved and More Efficient Pickling Processes in the Steel Industry by Means of Polarization Measurements. K. H. Brakstad. *Jernkontorets Annaler*, v. 140, 1956, p. 612-619.

See item 655-L, 1956. (L12g; ST)

70-L.* Clear Anodizing Magnesium. *Precision Metal Molding*, v. 16, Dec. 1958, p. 45.

New anodic treatment developed by Dow leaves the metal without surface discoloration. Anodic coating is applied in the same bath as the older D-17 treatment but at 40 volts instead of 70 to 90. Parts treated include die castings, permanent mold castings, sand castings, forgings and fabricated sheets. (L19; 5-60, 5-61, 5-63, 4-51, 4-53, Mg-b)

71-L. Heat and Abrasion Resistant Paints for Rocket Launchers. Rock Island Arsenal. *U. S. Office of Technical Services*, PB 131543, Aug. 1957, 19 p. $ .75.

Test materials included ceramic, silicone, dibutyl titanate, epoxy and Teflon coatings. Sprayed-on olive drab ceramic and Teflon coatings appeared superior to silicone types. The ceramic type remained nearly intact on Al panels heated nearly to the melting point. Zinc dibutyl titanate also showed good resistance. (L26p, L27, T2p, 2-62, 17-57)

72-L.* (German.) Porosity of Enamel on Dry Enameled Castings Influenced by Properties of Iron. *Sprechsaal*, v. 91, Aug. 5, 1958, p. 355.

Porosity that usually appears when the cast iron contains an excess of sulphur or inclusions, or after excessive pickling, was observed also on metallurgically intact castings with 3.28% C, 2.92% Si, 0.78% Mn, 0.04% S, 1.15% P. Oxygen thought to be not harmful because it combines with graphite, forming carbon oxides that have the same volume as oxygen. (L27, 9-68; CI)

73-L.* How Welding Combats Chemical Corrosion. F. Schneider and R. J. Walker. *Canadian Metalworking*, v. 21, Dec. 1958, p. 34, 36, 38, 40, 46.

Stainless steel overlay on mild steel plate used in pulp digesters. (L24; ST, SS)

74-L.* (German.) Distribution of Electroplate on the Surface. E. Raub. *Metalloberflache*, v. 12, Dec. 1958, p. 353-360.

Parts with recessed profiles showed a more equally distributed copper plate than nickel plate, provided the profile permits good circulation of liquid. Sometimes stirring is successful. (L17; *Cu, Ni*)

75-L. Shot-Blasting Proves Practical in High-Speed Rod Line. *Iron Age*, v. 182, Dec. 18, 1958, p. 89-91.

Pilot model at John A. Roebling's Sons Corp. (L10c; ST, 4-55)

76-L. Sprayed Electrolytic Zinc Coatings. R. Bourcelot. *Metal Industry*, v. 93, Nov. 28, 1958, p. 453-454.

Application and properties, particularly the use of electrolytic Zn in the tropics. (L23; *Zn-a*)

77-L. Sprayed Aluminium Improves Compressor. Loyd E. Batchelor. *Metalworking Production*, v. 102, Dec. 5, 1958, p. 2137-2138.

Precoat and final coat are applied as the compressor housings are rotated in special metal spraying machine. (L23, W11m; Al-b)

78-L.* (French.) Application of Faraday's Law to the Study of Anodic Dissolution of Metals. Michel Froment. *Corrosion et Anticorrosion*, v. 6, Nov. 1958, p. 412-420.

In electrolytic polishing, important role played by anodic tension and surface condition of metal during anodic dissolution noted. 41 ref. (L13p)

79-L.* (German.) Zinc and Cadmium Coatings as Protection Against Corrosion. J. Elze and W. Wiederholt. *Metallwaren-Industrie und Galvanotechnik*, v. 49, Oct. 1958, p. 419-432.

Zn is more durable in industrial and city atmospheres while Cd is superior in conditions where condensation develops. Both are well suited for coating steel. 5 ref. (L17; ST, *Cd, Zn*)

80-L.* (German.) Protective Painting in Galvanizing and Pickling Shops. K. A. van Oeteren. *Metallwaren-Industrie und Galvanotechnik*, v. 49, Oct. 1958, p. 446-449.

Surface pretreating and protective painting with compounds based on chlorinated rubber, polyvinyl chloride-polyvinyl acetate, synthetic rubber, polyurethane, epoxy resin, silicone, butyl titanate, neoprene, zinc powder, polyesters. (L26)

81-L.* (Italian.) Zinc Plating Baths—Composition, Operation and Control. Pt. 2. C. Quattrone. *Galvanotechnica*, v. 9, Sept. 1958, p. 233-237.

Zn salts furnish Zn ions necessary for metal deposition. NaCN forms complex soluble salts with Zn. NaOH contributes to dissolving of anodes, allows for strong current density, increases anodic and cathodic current output. Beyond limits, it diminishes current output at cathode and penetrating capacity. (L17a; Zn)

82-L.* (Japanese.) Vacuum Coating of Aluminum. H. Hoshi. *Metals*, v. 28, Nov. 1958, p. 828-832.

Vaporization is provided by a high-frequency furnace or a resistance heating crucible. Coating system is either fixed, rotating or roll. (L25; Al)

83-L.* (German.) Brush Plating for Local Metal Deposition. Willibald Machu. *Metallwaren-Industrie und Galvanotechnik*, v. 49, Nov. 1958, p. 467-481.

Development, operation and applications. Usefulness for filling corroded or pitted surfaces, building up of worn parts. 9 ref. (L17)

84-L.* (Italian.) Research on the Electrodeposition of Copper. Pt. 1. Influence of Gelatine on Phenomena of Overvoltage. H. M. Sammour. *Metallurgia Italiana*, v. 50, Sept. 1958, p. 389-396.

Potential-current curves for cathodic deposition of Cu from sulphate, sulphamate, perchlorate and fluoborate baths, in presence and absence of gelatine, for a moderate range of current density. Effect of variables such as gelatine concentration, free acid content, temperature and stirring. Results discussed in light of theory of adsorption and the Hofmeister series of lyotropic action of ions on gelatine. 35 ref. (L17a; Cu)

85-L.* (Italian.) Research on Electrodeposition of Copper. Pt. 2. Microhardness and Structure of Electrolytic Deposits of Copper. H. M. Sammour. *Metallurgia Italiana*, v. 50, Sept. 1958, p. 397-401.

Electrodeposits of Cu on rotating cylindrical Cu cathodes were prepared from acidified copper sulphate and perchlorate baths at low and moderately high current densities. Effect of addition of gelatine, raising the temperature and increasing acid content of solution on microhardness and microstructure. A correlation was found between these properties. 8 ref. (L17, M27, Q29q; Cu)

86-L.* (Spanish.) Chemical Nickel Plating. L. A. Rubio. *Instituto del Hierro y del Acero*, v. 11, July-Sept. 1958, p. 202-210.

Experimental study using acid and alkaline baths to coat Fe, Cu and Al articles. Influence of concentration of Ni ion, hypophosphite, pH and temperature on speed of formation of coatings, their appearance and physical characteristics. In case of Al, quantity of Ni deposited was three times as much as on Fe and Cu under equal conditions, and adherence was poor, especially in areas where non-metallic inclusions were present. 4 ref. (L28; Ni)

87-L. Hot-Dip Galvanizing Cast Iron. Morgan H. Davies. *Foundry Trade Journal*, v. 105, Dec. 4, 1958, p. 685-687.

Principles of galvanizing, methods used for cast iron, gray and malleable. (L16, 1-66; CI, *Zn*)

88-L. Flow Method Puts Quality Coat on Large Parts. E. A. Zahn. *Iron Age*, v. 182, Dec. 25, 1958, p. 50-51.

Low and high-pressure flow coating equipment and method. (L26n)

89-L. Shot Blasting Cuts Costs of Cleaning Hot Rolled Steel. *Metal Forming and Fabricating*, v. 20, Nov. 1958, p. 22-23. (L10c, W2r; ST, 4-53)

90-L. Preflux Solutions From Galvanizers' Sal Skimmings. P. M. Sullivan, D. H. Chambers and P. J. Berney. *Metal Industry*, v. 93, Dec. 12, 1958, p. 493-496.

Water-leaching and acid-leaching procedures; solutions produced by control of pH, specific gravity and chlorine content. 4 ref. (L16, A11d; RM-q, *Zn*)

91-L. Improving Your Wrinkle Painting. Harold D. Kaiser and Thomas G. O'Brien. *Products Finishing*, v. 23, Dec. 1958, p. 24-29.

Controlling baking cycles and methods of application to produce finishes of uniform color and texture. (L26n)

92-L.* Some Developments in Barrel Nickel Plating. B. E. Bunce. *Electroplating and Metal Finishing*, v. 11, Nov. 1958, p. 389-397.

Solutions, equipment and operating data for barrel Ni plating. Various solution compositions, effects of certain brightening and levelling agents and influence of $MgSo_4$ and NaCl on the conductivity. Importance of resistance across barrel panels; barrel designs and electrical cable insulations. 13 ref. (L17, W3b; Ni)

93-L.* Nickel-Chromium Plate Protects Molybdenum. *Industrial Finishing*, v. 10, Dec. 1958, p. 36.

High-temperature Ni plating over Cr base on Mo. (L17, 1-66; Mo, *Ni*, *Cr*)

94-L.* Hydraulic Jet Descaling — a New Method to Remove Scale From Hot Steel. Benjamin G. Harmon and Rovert Proctor. *Iron and Steel Engineer*, v. 35, Dec. 1958, p. 97-108.

Improves product quality, reduces water requirements for descaling. Depends on loosening of brittle scale by differential cooling. (L12h; ST, 4-51)

95-L.* An Engineering Approach to the Selection of Pipe Line Coating. J. A. Schauers. Paper from "Second Annual Appalachian Underground Corrosion Short Course, Proceedings". West Virginia University, Bulletin, Series 58, no. 4-1, Oct. 1957, p. 62-66.

Soil and water survey, coating selection, preparation and application. Cathodic protection of coated steel pipe line. (L26, R10d; ST, 4-60)

96-L.* Coal Tar Coatings — Both Hot and Cold. Malcolm Mitchell. "Second Annual Appalachian Underground Corrosion Short Course, Proceedings". West Virginia University, Bulletin, Series 58, no. 4-1, Oct. 1957, 142-151.

General characteristics and application of coal tar enamels for protection of underground pipe. (L26a; ST, 4-60)

97-L.* Use of Wax Coating for Protecting Underground Pipe. Ted Kennedy, Jr. Paper from "Second Annual Appalachian Underground Corrosion Short Course, Proceedings". West Virginia University, Bulletin, Series 58, no. 4-1, Oct. 1957, p. 152-165.

Characteristics and field application of hot and cold wax coatings in general use. Protective wrappers, test to identify and evaluate wax coatings. (L26q; ST, 4-60)

98-L.* (Japanese.) Influence of Purity of Base Metal in Plating. Matsuhei Kishi. *Metal Finishing Society of Japan, Journal*, v. v. 9, Sept. 1958, p. 325-329.

Adhesive properties of Ni plated on Al plates of different compositions with anodized or plain surfaces. Electron-microscope and metallographic observations relating structure and porosity of oxide film formed by anodizing in phosphoric acid bath with adhesion of the Ni plating and with Al purity. 5 ref. (L17c, L19q, 3-69; Al, *Ni*)

99-L.* (Japanese.) One Consideration on Mechanism of Brightening Studies on Bright Copper Cyanide Plating Bath. Pt. 4. Minoru Nakamura. *Metal Finishing Society of Japan, Journal*, v. 9, Sept. 1958, p. 330-334.

Upper limits of range of brilliance coincided with potential of hydrogen gas generation and lower limit coincided with that of brightener crystallization. 7 ref. (L17a; Cu)

100-L.* (Japanese.) Some Investigations on Co-Ni Alloy Bright Plating. Saburo

Ehara, Yoshiyuki Kishi, Kiyoshi Maruyama and Hirotoshi Kase. *Metal Finishing Society of Japan, Journal*, v. 9, Sept. 1958, p. 334-338.

Effectiveness of formate and boric acid as buffers in plating solution. Variation in hardness of bright deposits of Co-Ni alloy with current density and with addition of organic brightener and $MgSo_4$. Electron diffraction examination of Co-Ni alloy deposit. 6 ref. (L17; Co-b, *Ni*)

101-L.* (Japanese.) Study on Cu-Sn Alloy Electrodeposition. Haruo Inagaki. *Metal Finishing Society of Japan, Journal*, v. 9, Sept. 1958, p. 338-341.

Electrodeposition of Cu-Sn alloys from solution containing various ratios of copper cyanide and sodium stannate. Effect of plating solution composition and other plating variables on analysis of deposited alloy. X-ray diffraction determination of phase composition. (L17, M22g; Cu-b, *SN*)

(L17a; Pb-b, *Sn*)

117-L. (Russian.) Automatic Control of Anodic Electrolytic Cleaning. V. V. Kozhevnikov. *Metallurg*, v. 3, Nov. 1958, p. 40-41.

Automatic cleaning and inspection of strip steel doubled production and improved quality. (L13n, S13, 18-74; ST, 4-53)

118-L. (Russian.) Diminution of Tin Coating Thickness in Hot-Tinning of Black Sheet. V.G. Borisenko and V.K. Barzii. *Stal'*, v. 18, Oct. 1958, p. 920-922.

Influence of surface microrelief, small diversity in thickness of sheets coated simultaneously, Sn temperature and speed of strip travel on the thickness of Sn coating shows the possibility of considerable reduction of Sn consumption if the Sn plates are produced under optimum conditions. Coating thickness can be reduced by 6-10%. (L16; ST, *Sn*)

119-L.* Mechanical Descaling for Wire Drawing. G. McH. Sturgeon. *Iron & Steel*, v. 31, Dec. 1958, p. 563-568.

The two main methods of mechanical descaling are deformation of the rod by flexing, twisting or stretching and direct treatment of the surface, of which shot blasting is the only example at present important. The first of these two methods does not remove all of the scale and it is necessary to supplement it with some secondary treatment. Mode of operation of various commercially available descaling machines. 26 ref. (L10, F28; 4-55)

120-L.* Mechanism of Electrolytic Metal Deposition. B. E. Conway and J. O'M. Bockris. *Royal Society Proceedings*, v. 248, Nov. 25, 1958, p. 394-403.

Aqueous solutions of cupric, nickelous and silver ions examined by deriving and comparing the relevant potential energy profiles with the purpose of indicating the rate-determining step. 24 ref. (L17b; Cu, Ni, Ag)

121-L.* (German.) Distribution and Effect of Aluminum in a Zinc Plating Bath for Sheet Metal. Rolf Haarmann and Dietrich Horstmann. *Stahl und Eisen*, v. 78, Dec. 11, 1958, p. 1808-1811.

If Al is added to the bath, the thickness of Zn coating obtained decreases with an Al content up to 0.2% while its uniformity increases. Defects in the coating were observed with higher Al. As the Al in the bath increases, the adhesion improves, which is thought to be a consequence of the counteraction of Al against the formation of Fe-Zn alloy. (L16a, 2-60; ST, *Zn, Al*, 4-53)

122-L.* (German.) Glossy and Thick Rhodium Coatings, R. Levy. *Werkstoffe und Korrosion*, v. 9, Nov. 1958, p. 686-689.

Rh coating used for glossy decorative plating of Ag in thicknesses up to 1 micron; used industrially on Cu, brass, etc., in thicknesses up to 20 microns. Resulting surface dull but hardness similar to Cr plate. Methods explored to retain gloss with thicker coatings. 5 ref. (L17; *Rh*)

123-L.* (Japanese.) Heat Resisting and Chemical Resisting Paints. O. Fujisawa. *Metals*, v. 28, Dec. 1958, p. 922-926.

Al and Zn powder paints are heat resisting, but TiO_2, CrO_2, Fe_2O_3, graphite, Cd-red and Cd-yellow are better. Fading depends on base metal, Cu and galvanized iron being poor. Inorganic paints are more acid and alkali resisting than organic paints. (L26n; NM-g30)

124-L.* (Russian.) Electroplating of Silver During Reversion of Direct Current. H. A. Maichenko, I. N. Levkhovilski and A. N. Buyanova. *Zhurnal Prikladnoi Khimii*, v. 31, Oct. 1958, p. 1511-1520.

Productivity is increased 2 to 2.5 times, at the expense of higher density currents. Deposits are of fine crystalline structure; uniformity is improved; hardness is increased almost 1.5 times. (L17; *Ag*)

125-L.* (Russian.) Precipitation of Copper From Acid Electrolytes With the Aid of Periodically Reversed Current. V. V. Ostroumov and J. F. Plochothichkova. *Zhurnal Prikladnoi Khimii*, v. 31, Oct. 1958, p. 1520-1526.

Possibility of obtaining bright Cu without use of bright forming organic additives. Deposits may be obtained with maximum reflective capacity on substratum of bright Ni. (L17; Cu, *Ni*)

126-L.* Controlled Vibrations Speed and Simplify Parts Finishing. W. E. Brandt. *Iron Age*, v. 183, Jan. 15, 1959, p. 79-82.

Controlled vibratory tumbling to finish interior and exterior surfaces in record time. (L10d)

127-L.* (Polish.) Cleaning 1H13 Steel in Fused Salts. E. Gasior. *Prace Instytutow Ministerstwa Hutnietwa*, v. 9, no. 2, 1957, p. 61-69.

Structure and chemical properties of scale formed on steel (0.12% C, 12.64% Cr) during annealing in air at 900° C. Structure and chemical composition depend on oxidation conditions. Scale is characterized by presence of Cr_2O_3, mainly in forms of Cr spinel which makes acid pickling impossible. 11 ref. (L12n; SS)

128-L. Setting-Up a Metal-Spraying Workshop. M. Lacorne. *Iron and Steel*, v. 31, Dec. 1958, p. 569 - 571.

Reclamation work on coke wagons by sand blasting, infrared heating to prevent oxidation, and metal spraying of Al and Zn. (L23, T23p, 18-72; Al, Zn)

129-L. High-Temperature Coatings—2000°F. Range, and Up! James F. Rice. *Pacific Factory*, v. 90, Nov. 1958, p. 28-29, 51.

PT-404 resin coating withstands +2000° F. (L26p, NM-g33, SGA-h)

130-L. Finishing Office Equipment. *Product Finishing*, v. 11, Dec. 1958, p. 83-87.

Electrodeposition, film-covering processes and painting at Remington Rand Ltd., Weybridge, England. (L-general, T10f)

131-L. (Dutch.) Defects in Vitreous Enamel Coatings on Cast Iron, Caused by Casting Factors. A. Bordes. *Metalen*, v. 13, Nov. 29, 1958, p. 396-401.

Defects caused by gases on the surface resulting from carbon, oxides and hydrogen in the iron; by stresses originating in the cooling of the casting; by unsufficient adhesion of coating. 7 ref. (L27, 9, E-general; CI)

132-L. (Russian.) Influence of Naphthalene Sulphonic Acid on Electroplating of Nickel. A. V. Pamfilov and O. E. Panchuk. *Ukrainskii Khimischeskii Zhurnal*, v. 24, no. 3, 1958, p. 266-273.

Bright Ni plating. 7 ref. (L17; Ni)

133-L.* Non-Electric Gold Plating. Harold Robinson. *Precision Metal Molding*, v. 16, Dec. 1958, p. 43.

Atomex process is affected by ionic displacement. Attacked chemically, the base metal surface sheds atoms into the bath, takes back atoms of Au from the bath. Coatings are thinner, denser, with the same properties as electroplates, but with 35% less Au, and with a firmer bond. (L28; Au)

134-L.* Precision Barrelling. *Automobile Engineer*, v. 48, Dec. 1958, p. 536-540.

Abrasive agents, including preformed chips, tablets; effect of varying load levels and water levels in the barrel; barrelling of fixtures; use of process on a mass production basis. (L10d; NM-j)

135-L.* Offshore Corrosion Costs Cut by Cold Galvanizing. *World Oil*, v. 148, Jan. 1959, p. 234, 238, 242.

Applying an inorganic silicate filled with metallic Zn to sand blasted metal surfaces, followed by a "curing" solution, gives excellent long-wearing protection in highly corrosive areas; better than conventional galvanizing. (L29, R3p, R4b, T28; ST, *Zn*)

136-L. (Translation.) Brightening Effect of Organic Additions to Nickel Plating Baths. E. Bertorelli, I. Bellobono and C. Bordonali. *Industrial Finishing*, v. 10, Dec. 1958, p. 47-48, 50. (From *Galvanotechnica*, v. 8, no. 8.)

See item 85-L, 1958. (L17a; Ni)

137-L.* Hot Lacquers and Factors That Affect Their Use. Fred E. Kern. *Industrial Finishing*, v. 34, Aug. 1958, p. 41-46.

Compared with lacquers sprayed at room temperature; advantages affecting application and finish. (L26n; 1-66)

Effect of different purifying and wetting agents on an electrolyte contaminated by organic substances. Purifiers with wetting agents as well as wetting agents alone have a harmful influence on the precipitation. 10 ref. (L17a; *Rh*)

149-L. Inexpensive Chromates Give Zinc Surfaces Color Appeal. *Steel*, v. 144, Jan. 12, 1959, p. 74-75.

Zinc chromate conversion coatings provide Zn surfaces with corrosion resistant coating which can be colored evenly. Cost is 1/50 of a cent a sq.ft. and 24 hues are available. (L14c; Zn)

150-L.* Preparation of Steel Surfaces for Repainting. John Hurst. *Corrosion Technology*, v. 5, Oct. 1958, p. 313-315, 342.

Method of cleaning and preparing intact paintwork for further coatings. Cleaning and preparing of contaminated surfaces and use of paint remover. (L10, L12, R10b; ST, 17-52)

151-L.* Metal Spraying in Relation to the Corrosion Process. J. R. Franklin. *Corrosion Technology*, v. 5, Oct. 1958, p. 323-325.

Metallizing protects iron and steel from various corrosive environments. Layout with recommended metallizing systems for corrosion protection against specified conditions. (L23, R10b; Fe, ST, 18-67)

152-L.* Chromizing of Metal Powder Parts. Richard P. Seeling. Paper from "Proceedings of the 14th Annual Meeting".

Metal Powder Assoc., New York, 1958, p. 102-106.

Chromizing of metal powder parts differs in several respects from the treatment of solid metals. In addition to resistance to corrosion, heat and wear, there is a simultaneous increase in strength and ductility. Chromallizing can also produce oxidation resistance in nonferrous sinterings such as heavy metal, carbides and refractory metals. (L15; 6-72, Cr)

153-L.* Electrophoretic Coatings. D. J. Fishlock. *Metal Industry*, v. 93, Dec. 26, 1958, p. 537-538.

Electrophoretic deposition of metallic or nonmetallic coatings on metals, ceramics or graphite. Advantages. (L29p)

154-L.* Molybdenum Coatings. H. W. Schultze, R. R. Freeman and J. Z. Briggs. *Materials in Design Engineering*, v. 49, Jan. 1959, p. 76-81.

Adhesion, hardness, ductility, strength, wear resistance, corrosion resistance and physical properties. Electronic, automotive, aircraft, nuclear reactor and other applications. Summary of major types of Mo coating processes. (L17, L23, L25, L29; Mo)

155-L.* Thermal Insulation Ceramic Coatings. Alan V. Levy. *Society for Automotive Engineers*, Preprint no. 4T, Jan. 1959, 10 p.

Composition, density, thermal properties, thickness, porosity, hardness, resistance to thermal shock, resistance to mechanical vibration of reinforced ceramics and flame-sprayed coatings of alumina or zirconia. Applications utilizing thermal insulating and protective properties. (L27, 2-62; SGA-h)

156-L.* Anodic Oxide Film Formation on Zirconium. Kinetics With and Without Concurrent Oxygen Evolution. George B. Adams, Jr., Tien-Shaey Lee, Samuel M. Draganov and Pierre Van Rysselberghe. *Electrochemical Society, Journal*, v. 105, Nov. 1958, p. 660-665.

Comparative studies to determine whether differential formation fields measured below O evolution potentials agreed with those measured at high voltages. Results show that Zr is anodically oxidized to the corresponding oxide at unit current efficiency below the reversible O evolution potential. 9 ref. (L19; Zr, *O*)

157-L.* Cathode Potentials During the Electrodeposition of Molybdenum Alloys From Aqueous Solutions. D. W. Ernst and M. L. Holt. *Electrochemical Society, Journal*, v. 105, Nov. 1958, p. 686-692.

Electrolysis of aqueous ammoniacal citrate solutions containing sodium molybdate and the sulphate of a codepositing metal, Fe, Ni and Co. Reduction of molybdate ion in this type of bath is probably not accomplished in one step with six electrons, but with one, two or three electrons, depending on the codepositing metal and its oxidation state in the bath. 12 ref. (L17; Mo, *Fe, Ni*, Co)

158-L.* Second International Conference on Metal Spraying. *Electroplating and Metal Finishing*, v. 12, Jan. 1959, p. 21-25.

Abstracts of papers on metal spraying procedures in Norway, Spain, France, England, South Africa and Australia. Applications. (To be concluded.) (L23)

159-L.* Plating Process Co-Deposits Oxides or Carbides. A. E. Grazen. *Iron Age*, v. 183, Jan. 29, 1959, p. 94-96.

Finely divided particles of SiC, WC, aluminum oxide, zirconium oxide and similar additives are dispersed in Ni, Cu, Au, Cd and other metals. Either as a plated film or electroform, the composite material forms a tough surface with high wear resistance. (L17, L18; Ni, Cu, Au, Cd, *Si, C, W, C, Zr, O*, NM-a, 8-62)

160-L.* Metal Spraying: Effect of a Molybdenum Deposit on Adhesion and on Fatigue of Ferritic Steels. D. Birchon. *Metallurgia*, v. 58, Dec. 1958, p. 273-285.

A thin layer of Mo sprayed on a steel base is shown to enhance adhesion on fine machined and shot blasted surfaces. Although a marked reduction in fatigue strength occurs on polished specimens, controlled shot blasting in combination with a Mo underlay provides adhesion comparable to that on a rough threaded surface, coupled with superior fatigue properties. 16 ref. (L23, Q7, SS-d, *Mo*, 8-67)

161-L.* Protection of Cargo Tanks With Epoxy Resin Based Coatings. Tseng Yung Yang. *Corrosion Prevention & Control*, v. 5, Dec. 1958, p. 59-61.

Application of epoxy coatings to internal al surface of railroad cars. Performance. of coating in car carrying petroleum products. (L26p, T26q, R7d; ST)

162-L.* Technical Developments of 1958. Nathaniel Hall. *Metal Finishing*, v. 57, Jan. 1959, p. 38-47, 107-108.

Review of patent and journal literature on cleaning, pickling, polishing, anodizing, electroplating, electroforming, metallizing, vapor coating, conversion coating, testing, and waste treatment. 417 ref. (L-general)

163-L.* Organic Finishing Developments of 1958. Daniel A. Marino. *Metal Finishing*, v. 57, Jan. 1959, p. 48-51.

Application methods, materials for coatings, specialized coatings, wash primers, water thin paints, hazards. 116 ref. (L26)

164-L.* Hard Nickel Plating in Russia. Sulfate-Oxalate Bath. A. J. Steiger. *Metal Finishing*, v. 57, Jan. 1959, p. 52-53.

Deposition of smooth, hard Ni in electrolyte containing nickel sulphate and ammonium oxalate. Influence of bath composition, temperature, current density, and pH on deposition rate and characteristics of deposits. Optimum plating conditions. (L17a, 2-60, 2-61; Ni)

165-L.* Effects of Impurities in a Bright Nickel Bath on the Covering Power of a Chromium Bath. Pt. 2. Robert H. Rousselot and Georges E. Rousselot. *Metal Finishing*, v. 57, Jan. 1959, p. 58-60.

Effect of Sn, Cd and Mo on covering power; maximum allowable concentrations of Cu, Zn, Fe, Cr, Pb, Sn, Cd or Mo in Ni baths. Removal of inorganic impurities by displacement, electrolytic purification or reduction. (Concluded.) (L17a, L17b, 3-69; Cr, Ni, *Cd, Cu, Fe, Mo, Zn*)

166-L.* (German.) Anodizing and Painting Aluminum for Buildings. Pt. 2. G. E. Gardam and A. W. Brace. *Aluminum*, v. 34, Dec. 1958, p. 702-709.

Workshops and equipment for acid finishing, anodizing, containers for dying and sealing. Testing of anodic coatings. (L19, L12g, W4)

167-L.* (German.) Effect of Iron-Saturated Zinc Melts on Steels Containing Titanium. Dietrich Horstmann. *Archiv fur das Eisenhuttenwesen*, v. 29, Dec. 1958, p. 731-735.

The behavior of steel. Attack of the melt on soft iron represented by the layer of Fe-Zn alloy appears graphically as a straight line within the temperature range around 500° C., and as a parabola in the higher and lower temperature ranges. The Ti content widens the limits of the straight-line range. 10 ref. (L16; ST, *Ti, Zn, Fe*)

168-L.* (German.) Chromized Steel Screws. E. Taubert. *Draht*, v. 9, Dec. 1958, p. 505-507.

In the chromizing process a corrosion resistant case with 35% Cr on the surface and 0.1-0.12 mm. deep is formed. Because of its elasticity and adherence, the case endures deformation. Screws found to be heat resistant. (L15, T7f; ST, *Cr*)

169-L.* (Italian.) Anodic Oxidation of Architectural Aluminum. *Alluminio*, v. 27, Oct. 1958, p. 459-468.

Types of Al alloys suitable for architectural anodization; standards of thickness of anodic films; pretreatment of surfaces; anodic bath specifications; coloring and color fixing; methods of testing anodic coatings; temporary protection during installation; maintenance. 14 ref. (L19n, S21, T26p, 17-57; Al-b)

170-L.* Some Properties and Applications of Chemically Reduced Nickel. A. C. McL. Aitken. *Electroplating and Metal Finishing*, v. 11, Dec. 1958, p. 427-431.

Nickel-phosphorus alloy chemically reduced by the Kanigen process which was developed to deposit metallic Ni containing about 8% by weight of P without the use of an externally applied voltage to suitably prepared surfaces of metallic or nonmetallic materials. Tensile, fatigue and hardness tests on specimens in polished, polished and pickled, and polished, pickled and plated conditions. (L28, Q-general; Ni, *P*, 8-69)

171-L.* Fault-Finding in the Plating Department. P. Green. *Electroplating and Metal Finishing*, v. 11, Dec. 1958, p. 432-435.

Common causes of rejects in pickling and bright dipping prior to plating, polishing, preparation for plating (cleaning and pickling) and afterplating treatment. (L17, L12)

172-L.* Sprayed Coatings for Ships. Use of Zinc and Aluminium for Corrosion Protection. Manley H. Clark. *Iron and Steel*, v. 32, Jan. 1959, p. 11-12.

Coatings of sprayed Al, sealed and cover-coated with Al vinyl paints, give the greatest protection to steel exposed to salt water immersion, alternate immersion and air (tide level conditions), salt air and industrial atmospheres contaminated with S compounds. (L23, R3, R4b; Al, 8-67)

173-L. The Theory of Formation of High Resistance Anodic Oxide Films. L. Young. *Canadian Journal of Chemistry*, v. 37, 1959, p. 276-285.
20 ref. (L19; 14-62)

174-L. The "S" Chemical Brightening Bath. J. G. Simmons. *Light Metals*, v. 22, Jan. 1959, p. 27-29.
Process for Al and its alloys in diluted HF1 and certain salts. (L12; Al-b)

175-L. Anodizing and Coloring Aluminum in Britain. Tom Bishop. *Metal Progress*, v. 75, Jan. 1959, p. 87-89.
Preferred anodic coating for architectural applications is 0.001 in. thick, but for some uses thickness of 0.0006 in. is satisfactory. Procedures for pretreatment, anodizing and coloring to produce a light-fast finish. (L19, T26n, 17-57; Al)

176-L. How to Prevent Underfilm Corrosion. *Steel*, Jan. 9, 1959, p. 66-68.
Premature coating failures can be prevented by a new cold phosphating process that passivates the surface and makes it nonconductive. (L14b, R10c)

177-L. Automated Phosphating Line Pays Off in First Year. *Steel*, v. 144, Feb. 2, 1959, p. 82-85.
Cranes automatically cycle through five dip tanks to phosphate coat large mill bearings. (L14b, T7d, 18-74)

178-L.* Hardfacing by Rod and Metal Powders. E. Wallace. *Welding and Metal Fabrication*, v. 27, Jan. 1959, p. 5-13.
Advantages of hard facing include longer life of wearing parts, reduced maintenance cost and reduction in use of new parts by using reconditioned components. Typical properties of Co-Cr-W, Co-Cr-Ni-Mo-Fe, Ni-Cr-Co-W, Ni-B-Si and Ni-Cr-B-Si hard facing alloys. 6 ref. (L24; Co, Cr, W, Ni, Mo, Fe, B, Si, 8-68)

179-L.* Selective Electrolytic Etching of Germanium and Silicon Junction Transistor Structures. I. A. Lesk and R. E. Gonzalez. *Electrochemical Society, Journal*, v. 105, Aug. 1958, p. 469-473.
Electrolytic dissolution of Ge and Si is applied to the selective etching of n-p-n and p-n-p junction transistor structures. By employing the electrical properties of p-n junctions internal to the pellet as well as the electrolytic behavior of the n and p-type Ge or Si, part of the emitter or collector (or both) of a transistor pellet may be etched away, leaving the rest of the pellet intact. (L13q, T1k; Ge, Si)

180-L.* Aluminized Steel, Properties and Uses. K. G. Coburn. *Journal of Metals*, v. 11, Jan. 1959, p. 38-39.
Aluminized steel is manufactured in two grades of coating analysis. Type 1 has a Si-Al alloy coating best suited for high-temperature service or many applications where a combination of heat and corrosion is involved. Type 2 is applied from a bath of commercially pure Al and has excellent resistance to atmospheric corrosion. (L16; ST, *Al*)

181-L.* 30,000 Degrees With the Plasma Jet. *Journal of Metals*, v. 11, Jan. 1959, p. 40-42.
Plasma-type torch produces a stream of intensely hot, ionized gas. Such a jet is formed by passing a gas or a vapor through an electric arc. The arc is struck between a tungsten cathode and (usually) a water-cooled copper anode. Plasma-jet coatings bring the possibility of effectively coating metals and other materials with refractory metals and compounds, such as borides, carbides, nitrides, silicides and oxides. (L29)

182-L.* (French.) Aluminium Surface Finishes, Their Application in U. S. Architecture. R. F. Hafer. *Revue de l'Aluminium*, no. 259, Nov. 1958, p. 1137-1146.
Pickling, anodic treatment, organic finishes, enamel coating for protective and decorative purposes. (L12g, L19, L26; Al-b, SGA-g)

183-L. Development and Practical Application of Shot Blasting in the Shipyard. *Corrosion Prevention & Control*, v. 5, Dec. 1958, p. 40-43.
(L10c, 1-52; ST, 4-53)

184-L. Temporary Protection for Shot Blasted Steel. K. V. Hodgson. *Corrosion Prevention & Control*, v. 5, Dec. 1958, p. 44.
(L26n, T22g; ST)

185-L. Bituminous-Epoxy Coating for Marine Protection. *Corrosion Prevention & Control*, v. 5, Dec. 1958, p. 48.
(L26a, L26p, T22, R11)

186-L. The Painting of Shot Blasted Steel. *Corrosion Prevention & Control*, v. 5, Dec. 1958, p. 51-52.
(L26n; ST)

187-L. Automation Applied to Barrel Plating. William J. Rein. *Electroplating and Metal Finishing*, v. 11, Dec. 1958, p. 442-447.
A new high-speed bright Cd plating solution is employed and the work is

weighed out into containers on receipt, using a previously prepared chart relating weight to surface area, to insure a uniform barrel loading of 75 sq.ft. of surface. (L17, 18-74)

188-L. Direct Chloride Tinning Process Has Universal Application. E. S. Hedges. *Industrial Finishing (London)*, v. 11, Jan. 1959, p. 28-30.

Relies on shot blasting, followed by tumbling or water barrelling. Zinc chloride, sodium chloride and hydrochloride acid is flux covering bath. (L16; Sn)

189-L. Paint Application by Flow Coating. B. van der Bruggen. *Industrial Finishing (London)*, v. 11, Jan. 1959, p. 36-38, 40. (L26, W4, 17-51)

190-L. Review of French Anodising Patents. V. F. Henley. *Light Metals*, v. 21, Dec. 1958, p. 387-388.

Brief digests and evaluation of some 16 patents. (To be continued.) (L19, 11-59)

191-L. Dipping and Flow Coating Methods. J. Arthur Weed. *Metal Finishing*, v. 57, Jan. 1959, p. 61, 73. (L26n)

192-L. Science for Electroplaters. Pt. 43. Diamines. L. Serota. *Metal Finishing*, v. 57, Jan. 1959, p. 62-64.

Ethylenediamine tetra-acetic acid (EDTA) and its sodium salts as chelating agents. Applications of EDTA in cleaning baths, plating processes and composition analysis. (L12k, L17, S11)

193-L. Tinning of Wire for Soldering. *Wire Industry*, v. 26, Jan. 1959, p. 71, 74.

Compares methods of obtaining Sn coating and properties. (L16, 1-66, K7; Cu-b, Sn, 4-61)

194-L. (German.) Protective Plastic Coatings. *Giesserei-Praxis*, Nov. 10, 1958, p. 428.

Part to be coated is heated to 200-350° C. and the powdered plastic material is sprayed across a gas-air flame, or the coating is applied by dipping the preheated part into the powder. (L26p, 5)

195-L. (German.) Protective Coatings. *Giesserei-Praxis*, Dec. 24, 1958, p. 485-486.

Dipping, electroplating, metal spraying and diffusion of painting, phosphating and pickling. (L-general)

196-L. (German.) Automation of Surface Treatment. Alois Hoch. *Galvanotechnik*, v. 50, Jan. 15, 1959, (L13, L17, W3, 18-74)

197-L. (German.) New Equipment for Automatic Electroplating. Wilfried Sturtzkopf. *Galvanotechnik*, v. 50, Jan. 15, 1959, p. 24-27. (L13, L17, W3, 18-74)

198-L. (German.) Automatic Buffing. Hans Leich. *Galvonotechnik*, v. 50, Jan. 15, 1959, p. 28-31.

Relationship between rpm. and polishing effect. Results with varied wheel diameter. (L10a, W2n, 18-74)

199-L.* (Dutch.) Surface Defects in Enameled Castings Caused by Casting Procedures. A. Bordes. *Metalen*, v. 13, Dec. 31, 1958, p. 432-435.

Thin-walled parts of gray iron should be cast at sufficiently high temperatures to avoid spots of white iron. Defects caused by carbon, sulphur and hydrogen. (L27; CI, 9-71)

200-L.* (German.) Automatic Equipment for Electroplating. Georg Geilert. *Galvanotechnik*, v. 50, Jan. 15, 1959, p. 10-19.

Plant for bright Ni and bright Cr plating. Cu and Zn plating equipment. (L13, L17, W3, 18-74; Cr, Cu, Ni)

201-L.* (German.) Automatic Electrotinning With Subsequent Heating. J. Korpiun and W. Fricke. *Galvanotechnik*, v. 50, Jan. 15, 1959, p. 19-23.

After electroplating, the part is heated until the Sn deposit becomes liquid, which produces a bright surface. (L13, L17, 18-74)

202-L.* Ultrasonic Plating. *Metal Industry*, v. 94, Jan. 9, 1959, p. 27-28.

Effect of ultrasonic agitation of plating solutions on formation of Cd, Cu, Ag, Cr or Ni deposits. (L17a, 1-74; *Cd, Cu, Ag, Cr, Ni*)

203-L.* Barrel Finishing With Specific-Shape Abrasive Media. Donald Mosher, Frank Soper and Thomas Loli. *Tool Engineer*, v. 42, Feb. 1959, p. 81-84.

Selection of size, shape, type and amount of media to obtain cutting action and precision required for finishing specific parts. (L10d)

204-L.* (French.) Manufacture and Welding of Clad Steel Plates. H. Gerbeaux. *Soudage*

et Techniques Connexes, v. 12, Nov-Dec. 1958, p. 441-459.

Covering steel plates with corrosion resistant linings by welding and other methods. 5 ref. (L22, L24; ST, 4-53)

205-L.* (German.) Automation of Electrical Cleaning and Coating. W. Gehring. *Galvanotechnik*, v. 50, Jan. 15, 1959, p. 4-9.

Plant for electrical cleaning; installation for Zn plating small parts in large quantities. (L13, L17, 18-74)

206-L.* (German.) Protection of Steel by Zinc and Aluminum Spraying. T. K. Ross, E. L. Smith and R. E. Mansford. *Werkstoffe und Korrosion*, v. 9, Dec. 1958, p. 755-760.

Properties of coatings obtained by the powder and wire methods. Good protection is achieved against atmosphere and corrosion under water when the metals are used on soft steel. Electrochemical behavior of base metal and coating. 17 ref. (L23; *Zn, Al*)

207-L. (Book.) Analysis of Electroplating and Related Solutions. K. E. Langford. 423 p. Dec. 1958. Robert Draper Ltd., 85 Udney Park Rd., Teddington, Middlesex, England. $9.

Some 300 methods for determination of principal constituents and impurities; sampling, control of cleaners, pickles, dips, etches, phosphating solutions and electrobrighteners; analysis of plating salts and water, physical and physicochemical methods of analysis; preparation of standard solutions for volumetric analysis. (L-general, S11, 11-68)

208-L. (Book.) Metal Finishing Guidebook Directory. 27th Ed. 762 p. 1959. Metals and Plastics Publications, Inc. 381 Broadway, Westwood, N.J. $2.

Information for finishing plant engineering, mechanical surface preparation, chemical surface preparation, plating solutions and operating data, special plating procedures, special surface treatments, organic finishing; control, analysis, testing; tables and data sheets. (L-general, 11-68, 11-67)

209-L. (Translation—BISI, no. 888.) Removal of Scale From Steel Plates. Wilhelm Radeker and M. Wild. *Stahl und Eisen*, v. 78, Jan. 23, 1958, p. 100-103.

See item 231-L, 1958. (L10c, L12g, ST, 4-53, 9-52)

210-L. (Translation—BISI, no. 1068.) Corrosion Resistant Steel Bolts. G. Becker. *Draht*, v. 9, Jan. 1958, p. 13-15.

See item 277-L, 1958, (L15, T7f; ST, Cr)

211-L. (Translation—Brutcher, no. 4450.) Effect of Conditions of Electrolysis on Structure and Wear Resistance of Iron Deposits. Yu. N. Petrov. *Metallovedenie i Obrabotka Metallov*, Dec. 1958, p. 53-56.

Optimum conditions of electrolysis that assure dense, fine crystalline and wear resistant deposits that satisfy needs of maintenance and repair. Organic additives such as sugar, glycerin, gelatin, dextrin and weak citric acid, of various concentrations and varied current density, introduced in chloride electrolyte, produce fine and dense crystalline structures. (L17a, M27, Q9n, Q29n; Fe)

212-L.* The "Spray Fuse" Hard Facing Process for Stellite Cobalt-Base Powders. S. R. Gault and D. A. Ironside. *Machinery (London)*, v. 94, Jan. 28, 1959, p. 189-197.

Components are sprayed with powder and the overlay is then fused. The porous metallized deposit is converted into a sound, homogeneous Stellite coating, securely bonded to the base metal and comparable in its basic characteristics to the hard-facing deposit produced by the arc and oxy-acetylene methods. (L24; Co-b)

213-L.* High-Strength Steel Can Be Cadmium Plated Without Embrittlement. D. J. Cash and W. Scheuermen. *Metal Progress*, v. 75, Feb. 1959, p. 90-93.

Cadmium is plated from a cyanide bath at 70 amp. per sq. ft. to give a porous plate which permits hydrogen to diffuse out of the surface in subsequent bake. A sustained load specimen, of much higher sensitivity, replaces the unnotched tensile test piece. This new specimen is designed so it must fail when plated with the older standardized procedures. (L17c, Q26s; ST, SGB-a, Cd)

214-L.* (French.) Pickling and Pickling Solutions. (Conclusion.) F. Margival. *Peintures, Pigments, Vernis*, v. 34, Oct. 1958, p. 450-459.

Use of emulsified solvents; solutions and procedures for acid cleaning of ferrous metals, Cu, Al, Ni and their alloys, Mg, Pt, Au alloys and Pb; corrosion inhibition additives; ultrasonic cleaning; rinsing and drying; solutions and procedures for removal of Ag, Au, Ni, Cu and Cr plate from metal objects. 60 ref. (L12)

215-L.* (German.) High-Temperature Corrosion Protection by Ceramic Coatings.

Armin Petzold. *Werkstoffe und Korrosion*, v. 9, Dec. 1958, p. 761-765.

Protection of carbon steel up to 700° C. and alloy steel up to 1000° C. against oxidation and intercrystalline corrosion by high-temperature enamels. Heat resistant Al_2O_3, ZrO_2, TiO_2, mullite, porcelain or Ni-MgO-cermet coatings. (L27; ST)

216-L.* (Italian.) Bright Nickel Plating of Leaded Bronze and Brass and Aluminum Bronze Castings. Gianluigi Galli. *Galvanotecnica*, v. 9, Oct. 1958, p. 249-252.

Effects of porosity of castings, passive film resulting from mechanical finishing and content in addition elements on adherence of Ni coating; preliminary Cu plating as aid to adherence; adherence over welds made with Sn or Pb-Sn alloys/ in bronze and brass castings. (L17c; *Ni*, Cu-n, Cu-s)

217-L.* (Italian.) Phosphatizing Sandblasting. T. A. Turco. *Galvanotecnica*, v. 9, Oct. 1958, p. 256-258.

Surface conditions provided by simultaneous sandblasting and coating with phosphate are ideal for application of protective paint. Wood, metal and plastic particles for blast cleaning. (L10c, L14b)

218-L. Plating of Titanium and Its Alloys. T. A. Dickinson. *Metal Finishing Journal*, v. 5, Jan. 1959, p. 24-25, 28.

Techniques used to deposit Cr, Cu and Ni on Ti. (L17; *Cr*, *Cu*, *Ni*, Ti)

219-L. Science for Electroplaters. Pt. 44. Amides. L. Serota. *Metal Finishing*, v. 57, Feb. 1959, p. 71-73.

Plating baths. (L17a)

220-L. Spray Painting Die Cast Toys. *Precision Metal Molding*, v. 17, Jan. 1959, p. 69-70.

Electrostatic system applied to Zn die cast bodies. (L26n; Zn, 5-61)

221-L. Barrel Finishing Tiny Parts. *Precision Metal Molding*, v. 17, Jan. 1959, p. 71.

Races for miniature ball bearings, some so small that 500 can be loaded into a thimble, are finished successfully, on a mass production basis, in precision barrels. (L10d)

222-L. Applications of Composite Electrochemical Materials. J. A. Edwards. *Product Finishing*, v. 12, Jan. 1959, p. 66-69.

Adherent coatings are applied at temperatures below 200° F. and consist of heterogeneous systems of dissimilar metals or metals and nonmetallics. Composite materials include combinations of Ni, Co, Ni-Co-Cu, Fe, brass, Cd, Ag, Au, Pt and Zn with additions of carbides and oxides. (L17; Ni, Co, Cu, Fe, Cu-n, Cd, Ag, Au, Pt, Zn, NM-a35, NM-a34)

223-L. Recent Developments in Phosphate Treatments. H. A. Holden. *Product Finishing*, v. 12, Jan. 1959, p. 76-79.

Current applications. (L14b)

224-L. Processing and Painting of Sheet-Metal Components.. W. Stein and E. Podmore. *Sheet Metal Industries*, v. 36, Jan. 1959, p. 37-47, 61.

Preparation, cleaning and organic finishing of mild steel, bare and pretreated, Al and its alloys and brass. (L12, L26; CN, Al-b, Cu-n)

225-L. (German.) Amino Treated Epoxy Paints in Industry and Shipbuilding. A. J. Wildschut. *Werkstoffe und Korrosion*, v. 9, Dec. 1958, p. 741-746.

Al plates treated with mixed aqueous solution of water glass, sodium perborate, lithium borate and sodium phosphate showed better adhesiveness than those treated with mono-aqueous solution of these salts. (L27; Al-b, *Pb*)

228-L. (Japanese.) Effect of Iron-Aluminum Powder on Aluminum-Diffusion Coating. Shigetomo Ueda. *Metal Finishing Society of Japan, Journal*, v. 9, Dec. 1958, p. 456-459.

Packing, aging and fineness of Fe-Al powder used as diffuser. (L15; Al)

229-L. (Japanese.) Hard Anodizing. Rihei Tomono. *Metal Finishing Society of Japan, Journal*, v. 9, Dec. 1958, p. 460-465.

Alumilite and Hardas processes (temperature of electrolytic solution, current and voltage); pre and after-treatment, wear resistance, thickness and hardness. (L19; Al-b)

230-L. (Japanese.) Titanium Plating. Kaoru Aotani. *Metal Finishing Society of Japan, Journal*, v. 9, Dec. 1958, p. 469-474.

Advantages, difficulties, electrochemical study of the plating analyzed. Water solution bath is inefficient but fused salt bath seems to be suitable. 43 ref. (L17; Ti)

231-L.* Diffusion Coatings for Metals. R. L. Samuel. *Metal Finishing Journal*, v. 5, Jan. 1959, p. 5-11, 28.

Structure and physical properties including corrosion and oxidation resisting properties of Zn diffusion (Sherardizing), Al diffusion (Calorizing), Cr diffusion (chromizing), Si diffusion (siliconizing) coatings. 34 ref. (L15; Al, Cr, Si, Zn)

232-L.* (German.) High-Silicon Cases on Iron and Steel Parts Produced by Gas Diffusion. Rudolf Keilitz. *Freiberger Forschungshefte*, no. B31, 1958, p. 189-216.

Production of wear and acid resistant cases in an inert or reducing atmosphere carrying silicon tetrachloride vapor. 13 ref. (L15; CI, ST, *Si*)

233-L.* (Japanese.) Vibrating Electropolishing Process in Phosphoric Acid Solution. Pt. 2. Takakado Nakayama. *Light Metals*, v. 8, Nov. 1958, p. 41-45.

Best frequency is 120 to about 200 rpm. and current density is 20 to about 40 amp. per sq. dm., when reflectivity is 87 to about 88.5%. The effect of rotating anode is almost similar to that of vibrating anode; effect of stirring is also similar. (L13)

234-L.* (Japanese.) Enameling Aluminum Alloys. Toshio Yamada and Takashi Sugiyama. *Light Metals*, v. 8 Nov. 1958, p. 57-60.

Pretreatment of Al alloys for borosilicate system frit. Chemical and anodic methods compared. Anodic oxidation treatment with metasodium silicate, sodium perborate, lithium borate and kalium borate and the chemical treatment of Alrok method is useful. (L13n, L27; Al-b)

235-L.* (Russian.) Role of Cuprous Oxide in the Establishment of an Anamalous Temperature Relation in the Electrodeposition of Copper. G.A. Emel'yachenko. *Zhurnal Fizicheskoi Khimii*, v. 32, no. 11, 1958, p. 2479-2482.

Dependence of electrolysis ratio on temperature is due to the passivation of many parts of the electrode surface caused by formation of Cu_2O. 4 ref. (L17, 2-61; Cu)

236-L.* Improve Fatique Strength With Abrasive Tumbling. *Iron Age*, v. 183, Feb. 19, 1959, p. 129-131.

By inducing a compressive stress in metal surfaces, it actually boosts fatigue strength. (L10d, G23q, Q7a, 2-64; ST, TS)

237-L.* (German.) Automatic Cadmium Plating in Barrels. W.J. Rein. *Metalloberflache*, v. 13, Jan. 1959, p. 8-11.

Sequence of processes. (L17, 18-74; Cd)

238-L.* (German.) Behavior of Copper Anodes in Solutions of $CuSO_4$ and in Diluted H_2SO_4. P. Bedorf. *Metalloberflache*, v. 13, Jan. 1959, p. 1-4.

Development of anode mud determined by current density, temperature, Cu content of electrolyte, acid content of electrolyte and the removal of Cu salts from the anode surface. Purity, fine-grained structure and surfaces free from inclusions are essential. 4 ref. (L17a, W3h; Cu-a)

239-L.* (Russian.) Polarization and Throwing Power in Acidified Copper Solutions. I.M. Dudareva. *Zhurnal Fizicheskoi Khimii*, v. 32, no. 11, 1958, p. 2500-2506.

Relationship dependence obeys the laws of diffusion kinetics and is related to change in the activity of the Cu^{2+} ions. The distribution of the thickness of the deposit on the cathode is improved with decrease in $CuSO_4$ and increase in the H_2SO_4 contents. The throwing power of an electrolyte of the composition 0.5 $MCuSO_4$ +2.0 MH_2SO_4 is comparable with copper cyanide electrolytes. 6 ref. (L17b; Cu)

240-L.* New Tubing Fights Corrosion. J.B. Ulam. *Iron Age*, v. 183, Feb. 19, 1959, p. 123-125.

"Composite tubing" features dissimilar metals which are metallurgically bonded into an inseparable jacket-and-liner relationship. Developed by combining two well-known techniques (Ulam process for cladding metals and Ugine-Sejournet method of hot extrusion). (L22, Q-general, R-general; CN, SS, 4-60, 9-72)

241-L. Light-Fast Organic Dyes for Anodizing. R.C. Spooner. *Metal Industry*, v. 94, Feb. 6, 1957, p. 107-108.

(Concluded.) 14 ref. (L19)

243-L. Finished in a Barrel. *Precision Metal Molding*, v. 17, Feb. 1959, p. 51.
Case histories of both simple and complex parts that can be barrel finished. Data cover kind of media used, media size, type and amount of compound. (L10d)

244-L.* The Preparation of Metals for Protective Finishes. R.E. Shaw. *Metallurgical Reviews*, v. 3, no. 12, 1958, p. 327-356.
Wire brushing, grit, vapor or shot blasting, pickling, flame cleaning, steam cleaning, degreasing, and phosphate coating of hot rolled steel. Effect of treatments on paint adherence and life. Mechanical or chemical pretreatment of Al, Cu, Mg, Sn, and Zn surfaces. 73 ref. (L10, L12, L14, L19; ST, Al-b, Cu-b, Mg-b, Sn-b, Zn-b)

245-L.* (German.) Developments in Metal Spraying. Pt. 4. H. Reininger. *Metalloberflache*, v. 13, Jan. 1959, p. 17-21.
Wire and powder spray methods using compressed air or compressed gas. Surface preparation before metal spraying by means of sand blasting, degreasing and descaling and by ultrasonic cleaning. (L23, L10f, L12)

246-L.* (German.) Electroplating Tests With a Hull Cell. *Metalloberflache*, v. 13, Jan. 1959, p. 22-25.
Suggestions for the design of a standard tank and its use. Tabular surveys and graphs on the correlations between anode to cathode distance, amperage and cathodic current density. (L17c)

247-L.* Roll Bonding Aluminum-Tin Bearing Alloys to Steel—a Modified Technique Employing Segregated Alloy Billets. P.W. Goad. *Australian Institute of Metals, Journal*, v. 3, Nov. 1958, p. 260-266.
Equipment and power costs are greatly reduced as lower rolling reductions are needed; bonding conditions and bond strength are unaffected by the composition of the bearing alloy; the highest possible bond strengths are obtained with room-temperature bonding. 9 ref. (L22; Al-b, *Sn*, SGA-c)

248-L.* (English.) Polishing of Stainless Steels. *Aciers Fins & Speciaux Francais*, no. 30, Dec. 1958, p. 74-76.
Abrasives, supporting disks and polishing operations used in France. (L10b; SS, NM-j)

249-L.* Electrodeposition of Molybdenum. T.T. Campbell. *Electrochemical Society, Journal*, v. 106, Feb. 1959, p. 119-123.
Nonaqueous media used, such as liquid ammonia, formamide, acetamide, hydrazine and other organic solvents; preparation of pure anhydrous molybdenum halides. 4 ref. (L17a; Mo)

250-L.* Zirconium Coating of Uranium by the Iodide Process. W.L. Robb. *Electrochemical Society, Journal*, v. 106, Feb. 1959, p. 126-129.
Process consists of thermally decomposing zirconium iodide vapors on the surface of U metal heated to about 1100° C. in vacuum. Prior to coating, the U metal surface is cleaned by iodizing it and then vaporizing the uranium iodide. 5 ref. (L15; U, 8-74, *Zr*)

251-L.* Electrolysis of Organic Solvents With Reference to the Electrodeposition of Metals. Abner Brenner. *Electrochemical Society, Journal*, v. 106, Feb. 1959, p. 148-154.
Electrodeposition of metals from nonaqueous media; electrolysis of nonaqueous solvents. 33 ref. (L17a, P15m)

252-L.* Chromatic Conversion Treatments. Pt. 2. D. J. Fishlock. *Product Finishing*, v. 12, Feb. 1959, p. 87-93, 116.
Coating of Zn, Cd, Cu, brass, bronze, Sn, Ag, Cr and ferrous metals. 12 ref. (L14c)

253-L.* (Japanese) Chlorate-Accelerated Phosphate Coating. Masao Mukai, Yoshio Kawai and Shiroh Ueda. *Metal Finishing Society of Japan, Journal*, v. 9, Oct. 1958, p. 371-375.
Bath compositions and properties of phosphate coatings on steel surfaces. Chlorates are preferable to nitrates as accelerating agents. 5 ref. (L14b; ST)

254-L. Automatic Bright Zinc and Cadmium Plating for Corrosion Protection. K. N. Sinclair. *Corrosion Prevention & Control*, v. 6, Jan. 1959, p. 43-44.
(L17c; *Zn, Cd*)

255-L. Swedish Contribution to the Protection of Steel Through Painting. Pt. 1. Summary of Work Done by the Corrosion Committee During the Past 25 Years. Per-Ake Wallgren. *Federation of Paint and Varnish Production Clubs, Official Digest*, v. 31, Jan. 1959, p. 23-51.
8 ref. (L26n; ST, NM-g30, 1-54)

256-L. Electroplating of Aluminum Alloys. *Metal Finishing Society of Japan, Journal*, v. 9, Oct. 1958, p. 361-365.

Bath compositions for the Zn immersion treatment of Al-Si, Al-Cu-Si and Al-Mg alloys. 7 ref. (L17; Al-b, *Cu, Si, Mg*)

257-L. On the Mechanism of Anodic Oxidation of Tantalum. B. Verkerk, P. Winkel and D. G. de Groot. *Philips Research Reports*, v. 13, Dec. 1958, p. 506-508.

A thin layer of radioactive Ta is applied to a Ta sheet. After oxidation the oxide layer is dissolved in successive stages and the activity distribution is measured. Transport of Ta ions is not governed by a pure vacancy mechanism nor by a pure interstitial process. (L19, 1-59; Ta)

258-L. Automation in Sheet-Metal Printing and Lacquering. *Sheet Metal Industries*, v. 36, Feb. 1959, p. 116-118.

Combination of fully automatic, fully continuous feeder, rotary offset printing machine (multiculor) and lacquering machine. (L26b, 4-53)

259-L. Automatic Polishing With Special Reference to the Use of Liquid Polishing Compositions. H. Silman and R. G. Hughes. *Sheet Metal Industries*, v. 36, Feb. 1959, p. 119-133.

Polishing wheels, abrasive belt polishing, polishing compositions, abrasives, composition applicators, liquid compositions, automatic polishing machines, adjustable lathes and semi-automatic machines. (L10b, W2p)

260-L.* (French.) High Polymers for Protection Against Corrosion. A. Bonaldi and L. Jacque. *Corrosion et Anticorrosion*, v. 6, Dec. 1958, p. 431-436.

Temporary and permanent coatings; methods of application; properties of numerous plastics, thermoplastics and plastic-base anti-rust paints. (L26p, R10f, NM-d37)

261-L.* (French.) Recent Progress in the Techniques of Nickel Plating. L. Ades. *Corrosion et Anticorrosion*, v. 6, Dec. 1958, p. 440-443.

Levelling agents; ultrasonic bath agitation; new bath compositions; nickel-on-nickel process; properties of deposits obtained with new methods. 7 ref. (L17; Ni)

262-L.* (French.) Dip Coating in Fluidized Plastic Powder. W. Motz. *Corrosion et Anticorrosion*, v. 6, Dec. 1958, p. 446-450.

Properties of a fluidized powder, of a pseudo-liquid; procedure and apparatus, types of plastics suitable for this process; advantages of this type of coating. (L26p)

263-L.* (French.) Modern Hot Tin Plating Processes. P. Dehais. *Corrosion et Anticorrosion*, v. 6, Dec. 1958, p. 451-456.

Theory of Sn plating; cycles and baths for plating steel and cast iron, including pretreatment; problem of surface graphite in plating cast iron. (L16; CI, ST, *Sn*)

264-L.* (French.) The Role of Rhodium in the Battle Against Corrosion. R. Levy. *Corrosion et Anitcorrosion*, v. 6, Dec. 1958, p. 463-466.

Physical properties of Rh; principal steps in decorative and industrial electrodeposition; properties of deposits; applications of Rh plating. (L17; *Rh*)

265-L. (French.) Galvanizing of Gray Cast Iron. Pierre Deboute. *Fonderie*, no. 156, Jan. 1959, p. 21-24.

Surface preparation and galvanizing processes; causes of defects such as poor adherence of Zn coating. (L16; CI-n, *Zn*, 9)

266-L.* (German.) Electroplating of Zinc Die Castings. W. Roggendorf. *Galvanotechnik*, v. 50, Feb. 15, 1959, p. 71-74.

Directions for consecutive Cu-Ni-Cr plating and for simple Cr plating. (L17; 5-61, *Cr, Ni*, Zn)

267-L.* (German.) Electrodeposition of Titanium From Aqueous Solutions of Potassium-Titanium Fluoride. Willibald Machu and Venice Kamel. *Werkstoffe und Korrosion*, v. 10, Jan. 1959, p. 14-26.

Metal deposition by formation of TiO^{++} ions and their reduction by nascent H. Simultaneous deposition of Ti and passivation of Al and Ti hydroxides on Al cathodes. Effect of additions (gelatin, thiourea) on suppression of the formation of hydroxides and oxides in the deposition. 9 ref. (L17; *Ti*)

268-L.* (Italian.) Electrodeposition of Cadmium. C. Quattrone. *Galvanotechica*, v. 9, Nov. 1958, p. 277-279.

Plating bath components and their functions; process conditions. (L17; *Cd*)

269-L.* (Italian.) Influence of the Underlying Metal on the Adherence of Anti-Rust Paints. T. A. Turco. *Galvanotecnica*, v. 9, Nov. 1958, p. 280-281.

Problems of rust-proofing ferrous and nonferrous metals with paint; vehicles, pigments, primer coats and their function. (L26)

270-L.* Finishing Costs Tumble. Malcolm M. Maynes. *Automatic Machining*, v. 20, Mar. 1959, p. 40-42.

Tumbling barrels, abrasive media, compounds, drying. (L10d; NM-j)

271-L.* Studies of the Current Efficiency in the Electrodeposition of Manganese. Kimi Tiba. *Electrochemical Society of Japan, Journal*, v. 26, no. 7-9, 1958, p. E114-E117.

Current efficiency increased with increasing concentration of manganous sulphate; there is the certain range of ammonium sulphate content adequate to manganous sulphate concentrations in the electrolyte. Current efficiency seemed to be more sensitive to current density than to the content of ammonium sulphate added. By applying an adequate current density at both pH 3 and pH 7 of the catholyte, maximum current efficiency can be attained and a slightly higher current density is applicable at pH 3 than at pH 7. (L17; Mn)

272-L.* Vinyl-Coated Steel Sheets: Color, Pattern, Protection. *Iron Age*, v. 183, Mar. 12, 1959, p. 128-130.

Layer of semi-rigid vinyl sheeting bonded to conventional steel sheet. Liquid vinyl can be roller coated. (L26p, ST, 4-53)

273-L.* Better Finishes Mean New Uses for Aluminum Die Castings. F. M. Metrailer. *Iron Age*, v. 183, Mar. 12, 1959, p. 134-136.

Acid cleaning, ball burnishing, Cr plating. (L-general; Al, 5-61)

274-L.* Anodised Aluminum Windings. *Light Metals*, v. 22, Feb. 1959, p. 55.

Production of insulation on Al strip and foil by anodizing. Resulting windings are heat resistant. (L19, T1b; Al-b, Cu, Zn, 4-53, 4-56, 17-57)

275-L.* (German.) Production of Electrodeposited Hard Cu Layers. H. Spahn and H. Tippmann. *Metalloberflache*, v. 13, Feb. 1959, p. 38-39.

Addition of phenosulphonic acid to the electrolyte to increase hardness of resulting Cu layer. (L17, Q29; Cu)

276-L.* (German.) New Development in Metallizing. Pt. 4. H. Reininger. *Metalloberflache*, v. 13, Feb. 1959, p. 49-52.

Properties of coatings producted by metal spraying of Al, Cu, Zn. (L23; Al, Cu, Zn)

277-L. (German.) Carbonate in Cyanidic Baths. F. Elser. *Metalloberflache*, v. 13, Feb. 1959, p. 52-55.

Small additions of carbonates such as soda or potash increase bath conductivity. 15 ref. (L17a)

278-L.* (German.) Hard Chromium Plating of Tools and Machine Components. Pt. 1. E. Zmihorski. *Metalloberflache*, v. 13, Feb. 1959, p. 56-59.

Influence of deposit thickness, current density and surface roughness of the part on the adherence of Cr layer. Pretreatment, current density and position of part for immersion into the bath. (L17, W25; Cr)

279-L.* How to Choose the Right Cleaning Process. Pt. 2. D. J. Fishlock. *Metalworking Production*, v. 103, Feb. 13, 1959, p. 277-282.

Emulsion, solvent and ultrasonic cleaning methods. (L10f, L12)

280-L.* How a Missile Maker Finishes Magnesium. E. I. Weed. *Modern Metals*, v. 15, Feb. 1959, p. 52-63.

Chromating, varnishing and enameling for electronic components. (L-general, T1; Mg-b)

281-L.* New Process Plates Chromium on Aluminum. *Modern Metals*, v. 15, Feb. 1959, p. 58.

Chrom-Lume process deposits Cr directly on Al to produce a strong adherent bond and a wider measure of ductility for greater stress absorption. (L17; Al, *Cr*)

282-L.* Flow-Brightened Electro-Tin in Electronic Equipment. B. Keysselitz. *Tin and Its Uses*, no. 45, Winter 1958, p. 10-13.

Tin plating radio and TV chassis for tropical service. (L17, T1; Sn)

283-L.* Submerged-Arc Welding Reclaims Blooming Mill Rolls. J. J. Matusek. *Welding Engineer*, v. 44, Mar. 1959, p. 38-39.

High-carbon low-alloy rolls resurfaced for use as roughing rolls. Preheating used to counteract cracking. (L24, K1e, W23k; CN-r)

284-L.* (Italian.) Notes on Blast Cleaning. *Fonderia*, v. 7, Oct. 1958, p. 427-433.

Advantages of shot over sand blasting; compressed air and centrifugal spraying methods; shot peening; types of shot; selection of shot. (L10c, G23n, W2a)

285-L.* Mechanical Blast-Cleaning of Carbon and Alloy Steel Strip. Gilbert D. Dill. *Iron and Steel Engineer*, v. 36, Feb. 1959, p. 149-153.

Cleaning of hot rolled stock before fabricating products or before cold reduction. Blast etching to provide special finishes. Economies. (L10c; ST, 4-53)

286-L.* Processes for Pickling Titanium and Its Alloys. D. J. Fishlock. *Metal Finishing Journal*, v. 5, Feb. 1959, p. 55-58.

Finishing Ti and high-Ti alloys, including 2% Al, 2% Mn; 4% Al, 4% Mn; 5% Al, 2% Sn; and 6% Al, 4% V alloys. (L12g; Ti-b, *Al, Mn, Sn, V*)

287-L.* Colmonoy Sprayweld Process and Its Applications. W. J. Burling Smith. *Welding and Metal Fabrication*, v. 27, Feb. 1959, p. 54-60.

Surface preparation, spraying, fusing alloy to base with oxy-acetylene torch, furnace or induction heating. Typical composition, physical properties, resistance to corrosion, resistance to wear, machinability and applications for sprayed Ni alloys. (L23; Ni-b)

288-L.* (German.) Adhesion of Enamel on Cast Iron. Alexander Hauttmann. *Giesserei*, v. 46, Feb. 26, 1959, p. 105-114.

Influence of chemical composition and grain structure of the cast iron base; influence of the molding sand and facing agents, cooling, descaling; type of enamel and layer thickness. (L27, 2-59; NM-g34, 8-71, CI)

289-L.* (German.) Advantages of Hard-Chromium Plating Over Metal Spraying and Welding. Werner Schmitt. *Werkstatt und Betrieb*, v. 92, Feb. 1959, p. 77-80.

Advantages of electroplated Cr are hardness, wear and corrosion resistance, good adherence, low plating temperature and small variations in thickness. 26 ref. (L17c; Cr, 8-62)

290-L.* (German.) Roll-Bonding Technique and Possible Applications. H. F. W. Suppus. *Werkstattstechnik*, v. 49, Jan. 1959, p. 31-34.

Production methods of roll-bonding. Unbonded areas are inflated. Applications include heat exchangers, beams, vehicle bodies. 4 ref. (L22, 8-66; Al)

291-L. Cleaning Time Halved by Huge Blast Barrel. *Foundry*, v. 87, Mar. 1959, p. 168.

A 72-cu. ft. barrel cleans loads averaging more than 5000 lb. each. (L10d)

292-L. Epoxy Resins for Resistant Surface Coatings. *Industrial Finishing (London)*, v. 11, Feb. 1959, p. 25-27.

Properties and applications as metal finishes and tools. (L26p; NM-d, 17-57)

293-L. Full Body Dip System at American Motors. Vene W. Westfall. *Plating*, v. 46, Mar. 1959, p. 241-246.

Automobile bodies coated with corrosion resistant paint by submerging in tank. (L16, T21a)

294-L.* New High-Purity Aluminum Coatings. J. J. Utz and S. Kritzer. *Materials in Design Engineering*, v. 49, Feb. 1959, p. 88-89.

Electrolytic Al is being considered as a replacement for Cd to protect steel surfaces against corrosion. Adherent coatings have been produced on Cu, Mg, Ag, Au, Fe, Zn and Ni surfaces. Both corrosion resistance and electrical insulation are excellent. (L17; ST, Al-a, Cu, Mg, Ag, Au, Fe, Zn, Ni)

295-L.* Ceramic Coatings for Insulation. Alan V. Levy. *Metal Progress*, v. 75, Mar. 1959, p. 86-87.

Two types of coatings to withstand 3000° F. and above have been developed. One type is a flame-sprayed ceramic oxide; the other is a metal-reinforced ceramic which is applied by troweling a ramming mix into a metallic matrix attached to the structural base metal. (L27, 2-62)

296-L.* Coating for Re-Entry. W. L. Aves. *Metal Progress*, v. 75, Mar. 1959, p. 90-94, 189-190.

A new concept in a laminated coating for high-temperature protection appears to have solved corrosion and erosion problems of re-entry into the atmosphere. Alternate layers of Mo and alumina provide excellent protection from rocket blast at 4500° F. By varying thickness and constitution of the layers, many combinations,

each with unique properties for a specific application, can be devised. (L23, L27; Mo, Al, 2-62)

297-L.* Missile-Maker's Titanium Plating Process. C. W. Handova. *Products Finishing*, v. 23, Feb. 1959, p. 40-42.

Plating Ti with Ni, Cu, Ag and Au to provide a tough, electrically conductive coat. (L17, L16, Ti, *Ag, Au, Cu,* Ni)

298-L.* Electroless Copper Plating in Printed Circuitry. E. B. Saubestre. *Sylvania Technologist*, v. 12, Jan. 1959, p. 6-11.

Deposition of Cu films on plastic printed circuit boards by chemical reduction or "electroless" plating. Reducing agents, sensitizers and coppering solutions. Coppering of unclad laminates. 14 ref. (L28, T1; Cu)

299-L. (Translation.) Metal Smoothing: Radial Heat-Pressure Process for Boosting Wear Resistance. B. M. Askinazi. *Machine Design*, v. 31, Feb. 5, 1959, p. 29-32. (From *Metallovedenie i Obratka Metallov*, Sept. 1958, p. 49-53.)

See item 816-L, 1958. (L13p; ST)

300-L. (Translation—BISI no. 871.) Fundamentals of Acid Copper Plating and of the Cupatier Process. W. Strauss and E. Roth. *Metalloberflache*, v. 11, Sept. 1957, p. 281-285.

See item 29-L, 1958. (L17; Fe, Cu)

301-L. (Translation—Brutcher no 4421.) Universal Electrolyte for the Polishing of Stainless and Heat Resisting Steels, Low-Carbon Steels and Titanium Alloy VT-5. G. I. Parfessa and V. A. Sidlyarenko. *Avtomaticheskaya Svarka*, v. 11, no. 7, 1958, p. 83-84.

Recommended electrolyte compositions; voltages; current densities; cathode-anode distances. (L13p; SS, Ti-b, CN-g, 7-51)

302-L.* Building Up of Metal Components. Marcel Doncourt. *Iron and Steel*, v. 32, Feb. 1959, p. 68-70.

Application of carbon steel and Mo metallization to the repair of rolling mill rolls. Advantages in comparison with building up by arc welding include quick operation, no risk of cracking or flaws and the possibility of using a wide range of metals. (L24, L23; AY, *Mo,* W23k, 18-72)

303-L. Coating of Uranium Dioxide Powders With Metallic Tungsten Films. Joseph H. Oxley, James F. Hannah, John M. Blocher, Jr., and Ivor E. Campbell. Battelle Memorial Institute. *U. S. Atomic Energy Commission, BMI-1297*, Oct. 8, 1958, 10 p. (Available from U. S. Office of Technical Services, Washington 25, D.C.) $.50.

Modified vapor-deposition technique employing the powder to be coated as the bed in a fluidized-bed reactor. Coating is achieved by hydrogen reduction of tungsten hexachloride in a fluidized bed at a reaction temperature of about 400° C. High conversions of tungsten hexachloride to deposited metal are obtained at an excess H ratio of about 125 to 1. (L25; U, W)

304-L. Pickling of the Zircaloys Prior to Corrosion Exposure. S. Kass, D. J. Fontanese, A. E. Oaks and D. B. Scott. Bettis Plant, Westinghouse Electric Corp. *U. S. Atomic Energy Commission, WAPD-TM-141*, Sept. 1958, 61 p. (Available from U. S. Office of Technical Services, Washington 25, D.C.) $1.75.

Since accelerated corrosion is influenced by the incomplete removal of the etchant or permitting the etchant reaction product to dry upon the Zr alloy surfaces, common ion neutralizing and sulphuric acid rinses subsequent to pickling are used to facilitate surface cleaning and minimize acid entrapment. (L12g, R-general; Zr-b)

305-L.* (Italian.) Finishing Operations on Stainless Steels Containing Nickel and Chromium. *Nickel*, Oct. 1958, p. 14-18.

Solutions and procedures for degreasing and pickling with and without dipping; mechanical polishing; solutions for detection of presence of iron or iron oxide particles on steel surface. (L10, L12; SS, *Cr, Ni*)

306-L.* Dissolution of Ferric Hydroxide in Sequestered Alkali. H. F. Ferlin, P. Snikeris and J. V. Karabinos. *Illinois State Academy of Science, Transactions*, v. 51, no. 1-2, 1958, p. 79-82.

Solubility of precipitated ferric hydroxide in sodium hydroxide solutions containing various sequestering agents and under a variety of conditions in relation to the derusting of iron and steel. (L12k, P12e; Fe, ST, *O,* NM-a34)

307-L.* Deposition by Thermal Evaporation of Thin Films of Titanium and Zirconium for Tritium Targets. V. D. Scott and L. W. Owen. *British Journal of Applied Physics*, v. 10, Feb. 1959, p. 91-93.

Equipment and procedure for applying thin films of Ti and Zr as Tr carriers to backings of Cu, Au and Pt. A large proportion of the coatings prepared absorbed high atom ratios of Tr, Ti being more satisfactory in this respect than Zr. 8 ref. (L25; Ti, Zr, 14-62)

308-L.* (German.) New Surface Protection Method for Aluminum. *Chemische Rundschau*, v. 66, Feb. 1, 1959, p. 65.

Change of the aluminum oxide skin into a protective chemical compound by dipping. All alloys except those with high Cu content can be coated in this manner. (L14; Al-b)

309-L.* (Italian.) Surface Treatment of Zinc Alloy Die Castings. Gianluigi Galli. *Galvanotecnica*, v. 9, Dec. 1958, p. 301-308.

Pretreatment to obtain optimum surface conditions for deposition of Cu, bronze or brass plus plus Ni-Cr. Porosity, adherence and corrosion resistance of deposits. 9 ref. (L10, L12, L17; 5-61, Zn-b, *Cu, Ni, Cr*)

310-L.* (Italian.) Electrodeposition of Cadmium. C. Quattrone. *Galvanotecnica*, v. 9, Dec. 1958, p. 309-311.

Preparation of bath; effect of metallic impurities and organic substances in bath; elimination of impurities or mitigation of effects; polishing and stabilizing of deposits; bath control. (L17a, 3-69; Cd)

311-L.* (Japanese.) Bright Copper Plating From a Cyanide Bath in the Presence of Potassium Tartrate. Pt. 2. Effect of Inorganic Addition Agents and Impurities. Teiichi Ito. *Nagoya Goverment Industrial Research Institute, Reports*, v. 8, Feb. 1959, p. 138-142.

Effect of various inorganic addition agents. Potassium ferricyanide increases the bright range of current density. Lead is effective for leveling action. 5 ref. (L17a; Cu)

312-L. Pickling Installations for Wire and Strip. Friedmund Rub. *Draht*, v. 10, Feb. 1959, p. 53-59.

Installation design; pickling methods, including electrolytic pickling; materials flow; safety considerations. (L12g, W3; 4-53, 4-61)

313-L. Aluminum Finishes for Use in Electronics. Walter E. Pocock. *Electronics*, v. 32, Feb. 20, 1959, p. 58-59.

Finishes for Al will protect it against corrosion, alter its resistivity, improve its solderability or change its color. Production methods and application data. (L-general; Al-b)

314-L. Metal Spraying in Northern Latitudes. Sigurd B. Giertsen. *Electroplating and Metal Finishing*, v. 12, Mar. 1959, p. 99-101.

Problems peculiar to cold climates. (L23)

315-L. Blast Descaling. *Production*, v. 42, Oct. 1958, p. 80-81.

Continuous shot blasting line replaces batch pickling operation, descales steel plate and coils. (L10c, 1-61; ST, 4-53)

316-L. Barrel Finishing Stainless Steel Hex Nuts. Charles G. Tuvek. *Products Finishing (London)*, v. 23, Feb. 1959, p. 50.

Procedure for producing high luster and color. (L10d, T7f; SS)

317-L. (Russian.) Hard Surfacing of Cylindrical Products by Automatic Single-Electrode Submerged-Arc Welding. F. F. Benua. *Svarochnoe Proizvodstvo*, Feb. 1959, p. 25-28.

Method for producing weld deposited coatings spirally upon cylindrical surfaces by submerged arc welding. (L24, K1e)

318-L.* Tough New Coating Can Be Tailored to Fit. W. E. Kemp. *Pipe Line Industry*, v. 10, Mar. 1959, p. 48-50.

Poly-epoxy resin, wedded cousin of coal tar and epoxy resin, brings control of flexibility, hardness, abrasion resistance to pipe lines. (L26b, L26p, T26r; ST)

319-L.* Finishing Tinplate in the Flat. J. T. Leonard. *Product Finishing*, v. 12, Mar. 1959, p. 54-61, 76.

Review of methods, equipment and materials for lithography and interior coating. (L26b; ST, 4-53, *Sn*, 8-65)

320-L.* Re-Finishing Oil Drums. *Product Finishing*, v. 12, Mar. 1959, p. 72-76.

Surface preparation, coating with epoxy-phenolic lacquer and drying. (L26n, W12c; ST)

321-L.* (Czech.) Hard Facing of Pilger Rolls. Osvald Pejcoch and Jaroslav Kuznik. *Hutnicke Listy*, v. 14, Feb. 1959, p. 173-184.

Lifetime of carbon steel pilger rolls is increased by hard facing with graphite-coated Cr-Ni steel electrodes. 9 ref. (L24, W23k; CN, SS)

322-L.* (German.) Anti-Corrosion Behavior of Zinc-Rich Paints. Hans Sagel. *Werkstoffe und Korrosion*, v. 10, Feb. 1959, p. 66-70.

Decrease in corrosion of structural steel and sheet exposed to atmospheric conditions is achieved by painting the surfaces with zinc-rich paints composed of zinc dust (60% metallic Zn), polystyrol and solvents. 16 ref. (L26n; ST, Zn, NM-g30, SGB-s)

323-L. Neoprene and "Hypalon" for Large and Small Pipes. *Corrosion Technology*, v. 6, Mar. 1959, p. 71-72, 89.

Lining of large pipes with access to the interior; small pipes which cannot be entered for application and inspection. (L26r; 4-60)

324-L. Sheet Neoprene Linings for Chemical Plant. *Corrosion Technology*, v. 6, Mar. 1959, p. 75-76.

Surface preparation for neoprene coating; chemical properties, applications of the coatings. (L26r)

325-L. Spray and Brush-Applied Neoprene Coatings. P. G. Blackburn. *Corrosion Technology*, v. 6, Mar. 1959, p. 77-78.

(L26r)

326-L. Radyne-Stellite Sprinkle-Fuse Hardfacing Process. *Machinery (London)*, v. 94, Mar. 18, 1959, p. 610.

Suitable for hard facing such parts as valve seats, pump sealing rings and thrust washers. Provides resistance to abrasion, corrosion and heat. (L24)

327-L. Organic Coatings for Metal Products. Robert J. Fabian. *Materials in Design Engineering*, v. 49, Mar. 1959, p. 113-128.

Manual on characteristics and applications of alkyds, ureas, melamines, acrylics, bitumens, cellulosics, coumarone-indenes, epoxies, fluorocarbons, phenolics, polyamides, rubbers, silicones, styrene-butadienes, urethanes and vinyls. 14 ref. (L26, NM-g)

328-L. Electrodeposition of Copper. Survey of Progress, 1958. *Product Finishing*, v. 12, Mar. 1959, p. 89-90.

16 ref. (L17; Cu)

329-L. (Russian.) Corrosion Prevention by Copper and Nickel Plating of Magnesium Alloys. V. I. Lainer and G. S. Konstantinova. *Vestnik Mashinostroeniya*, v. 39, Feb. 1959, p. 62-65.

Techniques and solutions to prevent surface corrosion. 5 ref. (L 17, R-general; Mg-b, *Ni, Cu*)

330-L. (Russian.) Improvements in Electroplating. G. B. Taurit. *Vestnik Mashinostroeniya*, v. 39, Feb. 1959, p. 65-69.

Higher Cu concentration in the solution and an elevated bath temperature raise current density and current yield. (L17; *Cu*)

331-L. (Russian.) Leveling of Ferrous Metal Surfaces by Galvanic Copper and Nickel Plating. N. A. Solov'ev. *Vestnik Mashinostroeniya*, v. 39, Feb. 1959, p. 69-71.

Cu and Ni plating remedies such flaws as porosity, cavities and other surface imperfections. (L17; *Cu, Ni*, 9-71)

332-L. Electroforming of Linear Accelerator Structures. J. A. Pope. Stanford University. (Office of Naval Research.) *U. S. Office of Technical Services*, PB 131944, June 1957, 22 p. $.75.

Electroforming method is preferred over mechanical fabrication techniques because it allows baking the structure at high temperatures for outgassing and sealing off the vacuum-tight accelerator tube. (L18, X27; Cu)

333-L. Cleaning and Passivation of Corrosion-Resisting Steels. L. Lowry and J. Thompson. Naval Gun Factory. *U. S. Office of Technical Services*, PB 131964, n.d., 28 p. $.75.

Removing surface contaminants such as scale, flux, slag, metallic lubricant and iron from the surface of corrosion resisting steels and passivating in nitric acid solutions as a final cleaning operation. (L12g, R10c; SS)

334-L.* (German.) Hot Chromizing. Jan Raczka. *Freiberger Forschungshefte*, v. B30-2, 1958, p. 96-118.

Malleable cast iron hot chromized by powder mixture composed of Cr, C, Mn, Si, P, S, Al, Cu and Fe. Tensile strength and elongation of whiteheart cast iron decreased slightly. Strength of blackheart cast iron also decreased somewhat. 18 ref. (L15, Q-general; CI-s, *Cr, C, Mn, Si, P, S, Al, Cu, Fe*)

335-L.* (German.) Electrolytic Polishing of Aluminum and Iron. E. Lichtenberger-Bajza. *Metalloberflache*, v. 13, Mar. 1959, p. 65-71.

Carbon steel, toolsteel, low-alloy steel and stainless steel treated in four different baths. Resulting surface layers investigated by electrical methods. Data for Al and several Al alloys containing Mg and Zn. 8 ref. (L13p; CN, TS, AY, SS, Al-b, *Mg*)

336-L.* (German.) Surface Enlargement of Aluminum by Etching. G. Hahn. *Metalloberflache*, v. 13, Mar. 1959, p. 72-75.

Surface enlargement of Al foil for electrolytic condensers is not practical by mechanical means. By chemical or electrochemical etching an area increase of 5 to 9 times can be achieved, depending on surface condition and impurities. 6 ref. (L13q; Al, 4-56)

337-L.* (German.) Hard Chromium Plating of Light Metal Cylinders. P. Csokan. *Metalloberflache*, v. 13, Mar. 1959, p. 81-83.

Pickling with a mixture of HF and HNO_3 eliminates necessity of prezincing. A fluoride film prevents oxidizing before the hard Cr plating. (L17, L12g; Al-b, *Cr*)

338-L.* (German.) Practical Results in the Surface Treatment of Aluminum. A. Domony, E. Lichtenberger-Bajza and P. Csokan. *Metalloberflache*, v. 13, Mar. 1959, p. 84-87.

Effect of Al composition, surface roughness and water impurities on layers obtained by the boiling water treatment. Thickness, structure, corrosion resistance and electrical capacitance of these layers. 15 ref. (L14, L19; Al)

339-L.* (German.) Modern Silver Plating. Silvrex Method. W. Metzger. *Metalloberflache*, v. 13, Mar. 1959, p. 91-93.

Hard coatings resistant to corrosion, wear and tarnishing can be obtained with a special electrolyte containing inorganic and organic compounds. Current density can vary within a wide range. (L17; Ag)

340-L.* Preparatory Treatments for Protective Coatings. Pt. 1. Derusting and Descaling. *Corrosion Prevention & Control*, v. 6, Feb. 1959, p. 41-43.

Various mechanical and chemical methods; bath constituents. (L10, L12)

341-L.* With Platinum-Like Properties Tin-Nickel Electroplate Is Used for Watches, Telescopes and Drawing Instruments. *Industrial Finishing (London)*, v. 11, Mar. 1959, p. 27-28.

Alloy of Sn and Ni in the proportion of 65% Sn, 35% Ni. (L17, T9, T10, 17-57; *Sn, Ni*)

342-L.* Effect of Surface Preparation on the Adhesion of Bearing Metal to Steel. C. J. Thwaites. *Metallurgia*, v. 59, Mar. 1959, p. 121-124.

While shot-blasting may provide adequate adhesion, preparation by pickling is to be preferred where maximum bond strength is required. (L10c, L12g, T7d; ST)

343-L.* Oxide Adherence and Nickel Flashing in Vitreous Enameling. H. Crystal and G. Bullock. *American Ceramic Society, Journal*, v. 42, Jan. 1, 1959, p. 30-39.

Influence of iron deposition and nickel flashing on adherence of oxides to enameling-grade sheet steel. 74 ref. (L27, L17; ST, *Ni*)

344-L. Roll-Bonding Hafnium, Titanium, and Zircaloy-2. E. S. Byron and S. W. Porembka. Paper from "Bettis Technical Review, no. 10, Reactor Metallurgy". WAPD-BT-10, Oct. 1958, p. 14-22. U. S. Office of Technical Services, Washington 25, D. C.

Roll-bonding is a possible method of cladding certain control rod materials. Samples of Hf, Ti and Zircaloy-2 were roll-bonded in various combinations and at various temperatures and percentage reductions. Hf-Ti bonds are the only ones that failed consistently during bend testing, while the Zircaloy-Ti bonds displayed good corrosion resistance, ductility and shear strength. (L22, T11j; Zr-b, Hf, Ti)

345-L.* (Slovakian.) Use of Powder Filled Electrodes in the Facing of Rolls. Ladislav Lakatos. *Zvaranie*, v. 8, Jan. 1959, p. 12-16.

Optimum welding procedures determined by experimental welds. The homogeneity of filler metal was tested by spectral analysis. (L24, W23k, W29h; AY)

346-L. Effect of Halide Addition to the Sulfuric Acid Pickling Bath. M. Haftel and W. L. Reichel. Industrial Test Laboratory, Philadelphia Naval Shipyard. *U. S. Office of Technical Services*, PB 131794, Feb. 1957, 27 p. $.75.

Reduces acid attack on base metal, especially for special treatment steel; concentrations of 0.1% recommended. (L12g, 2-60; ST)

347-L.* Coatings for Vacuum Metallizing on Plastics. M. A. Self and John Scharnberg. *Plastics Technology*, v. 5, Mar. 1959, p. 32-35, 54.

Current application techniques and formations. (L23, 1-73; Al, NM-d)

348-L.* (Japanese.) Studies on Ceramic Coatings: Coatings for High-Temperature Protection of Molybdenum. Hirokichi Tanaka, Ryozo Hayami, Masatane Kadota and Hideo Tanigawa. *Osaka Industrial Research Institute, Bulletin*, v. 8, Oct. 1957, p. 217-225.

Evaluation of frit-type coating with high glass content and chromium-frit type with low glass content. 5 ref. (L27; Mo)

349-L. (Book.) Finishing Handbook and Directory. Christopher S. Woollard, Editor. 509 p. 1959. Sawell Publications Ltd., 4 Ludgate Circus, London, E.C.4., England.

Glossary, bibliography, directories, tables and technical chapters. (L-general, 11-67)

350-L.* Plated Aluminum Die Castings for Washing Machine Agitator Parts. F. M. Metrailer. *Metal Products Manufacturing*, v. 16, Apr. 1959, p. 77-79.

Bright Ni plating of Al alloy. (L17; *Ni*, Al-b, 5-61, 8-62)

351-L.* The Influence of the Physical Metallurgy and Mechanical Processing of the Basis Metal on Electroplating. Pt. 5. Effect of Polishing on the Durability of Nickel Plated Mild Steel. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society*,1958, p. 45-52.

Greased belt polished surfaces cause superior corrosion resistance to dry belt surfaces of comparable surface roughness and, within types of polishing, fine finishes (10 μin.) show better durability than coarse finishes (40 μin.) The highest corrosion rate was observed with the coarse dry belt surface. 10 ref. (L10b, R-general; CN, 8-62, Ni)

352-L. Ion Exchange and the Pickling of Magnesium Sheet. Robert E. Anderson. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society*, 1958, p. 55-59.

Pickling bath contains about 28% acetic acid and 8% sodium nitrate. As the bath is used the acid is converted to magnesium acetate. This change in solution composition gives progressively slower pickling rates and variation in the nature of the surface produced. Ion exchange strips the Mg from the spent pickle solution and returns the re-formed acid to the line for re-use. 9 ref. (L12g, L17a, A11d; Mg, 4-53)

353-L.* Cleaning, Pickling and Preparatory Surface Treatment. William P. Innes. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society*, 1958, p. 81-88.

Degree of cleanliness depends on the finishing operation being performed, the basis metal, the type and condition of the soil and the equipment available. A higher degree of cleanliness is generally required for electroplating than for phosphating, chemical polishing, electropolishing or chromating. 10 ref. (L12)

354-L.* Typical Plating Solution. Cyanide Zinc. Edward F. Foley, Jr. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society*, 1958, p. 89-92.

Equipment, bath composition, make-up, operation and control of the bath. Major contaminants encountered in commercial Zn plating are Cu, Cd, Pb, Cr, Ni and carbonate. Effect of contamination and recommended remedies. (L17, 3-69; Zn, *Cu, Cd, Pb, Cr, Ni*)

355-L.* Alloy Plating Systems for Aircraft Engines. Bruce E. Scott. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society*, 1958, p. 93-96.

Pb-In, Pb-Sn, Ag-Pb, Ni-P, Cd-Sn and Ni-Cd systems in relation to heat and corrosion resistance. 13 ref. (L17, T24b, R-general, 2-62; Pb, In, Sn, Ag, Ni, P, Cd)

356-L.* Hard Anodizing of Aircraft Fuel Metering Components. Harold J. Wiesner and Henry A. Meers. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society*, 1958, p. 105-117.

High Cu-Al alloys such as X-2219, 2024 and 2017 may be satisfactorily hard coated in a solution containing sulphuric acid, oxalic acid at temperatures below 50° F. 10 ref. (L19; Al-b, *Cu*)

357-L.* Pitting in Thick Chromium Deposits. Donald R. Millage and Wilbur E. Hague. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society*, 1958, p. 118-122.

Porosity of the base metal is the basic cause of hydrogen pits in thick Cr plate that has been deposited from a chromic acid solution containing a surface-active agent. If the same base metal is plated in a chromic acid solution that does not contain a surface-active agent, the thick Cr plate will attempt to bridge the defective area of the base metal. 21 ref. (L17; *Cr*, 9-68)

358-L.* Pattern Plating With Electrodeposits. Samuel S. Frey. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society,* 1958, p. 150-156.

Creation of electrodeposits possessing patterns without any masking device. Patterns are developed in a Ni deposit from proprietary Ni baths or a Watts-type bath with a few simple additives. Kraq-o-lite designates the process involved in making these patterns in Ni. The Ni deposit bearing the pattern can be put on a variety of metals and can be coated over with an assortment of electrodeposits. 6 ref. (L17; Ni)

359-L.* (German.) Surface Protection of Steel Drums. B. Hottenroth. *Chemie-Ingenieur-Technik,* v. 31, Jan. 1959, p. 36-43.

Types of corrosive attack; sheet steel properties; inner and outer coatings of phosphate, paints and plastics; production methods; chemical and mechanical testing techniques. 56 ref. (L26, L14b, R10; 4-53, ST)

360-L.* (Swedish.) Enamelling of Cast Iron. Rudolf Marker. *Gjuteriet,* v. 49, no. 2, 1959, p. 33-34, 36, 38.

Effect of composition, melting and casting techniques, molding and mold materials, cleaning and repair welding on the quality of enamel. 5 ref. (L27, E-general; CI-n)

361-L.* Application of New Metal Coating Which Withstands 2000° F. James F. Rice. *Industrial Heating,* v. 26, Mar. 1959, p. 554, 556, 558, 560-561.

High test qualities of the new coating are attained by a special blending of two resins with a ceramic powder compound. From ambient to 1000° F. the resins provide the protection. At about 1000° F. the resins burn out, by which time the ceramics have fused, thus enabling the coating to be protective up to 2000° F. (L27; 8-71, 2-62)

362-L.* Cermets: Two New Forms. William H. Herz. *Materials in Design Engineering,* v. 49, Apr. 1959, p. 98-99.

Cermet coatings produced by flame spraying; spray forming of cermet parts. (L27; 6-70)

363-L.* Recent Developments in Chromium Plating. D. E. Weimer. *Metal Finishing Journal,* v. 51, Mar. 1959, p. 89-97.

Self-regulating catalysts, high-speed solutions, spray suppressants, crack-free deposits. 14 ref. (L17; Cr)

364-L.* Galvanized Sheet for Outdoor Applications. M. H. Davies. *Metal Finishing Journal,* v. 5, Mar. 1959, p. 98-100.

Hot dip galvanizing, painting of galvanized sheet, service life of sheets. (L16, L26n, R3; ST, *Zn,* 4-53, 8-65)

365-L.* Processing and Painting of Sheet-Metal Components. W. Stein and E. Podmore. *Metal Finishing Journal,* v. 5, Mar. 1959, p. 101-112.

Description of the Sendzimir process. Results of tests for adhesion and deformability of resultant Zn coatings. (L16, 1-61; ST, *Zn*, 4-53)

401-L.* Electroplating on Certain Transition Metals. (Groups IV, V, VI). E. B. Saubestre. *Electrochemical Society, Journal*, v. 106, Apr. 1959, p. 305-309.

Adherence plate produced by cathodic treatment prior to plating. Treatment eliminates etching and permits better control of dimensional tolerances. Parts heated after plating require special procedure. Procedure used when coating of Ni and Cu on Ti, Zr, Cb, Ta, Mo and W. Study of Cb and Cb-Ti alloys showed advantages of using anodizing procedure. 39 ref. (L17; Ni, Cu, Ti, Zr, Cb, Ta, Mo, W)

402-L.* A Radioisotopic Study of Leveling in Bright Nickel Electroplating Baths. Seward E. Beacom and Bernard J. Riley. *Electrochemical Society, Journal*, v. 106, Apr. 1959, p. 309-314.

Radioactive addition agent used in bath substantiated a part of leveling theory by preferential deposition or nine points of irregular surface. 19 ref. (L17a, 1-59; Ni)

403-L. Dialysis for Solution Treatment in the Metal Finishing Industry. Robert Dvorin. *Metal Finishing*, v. 57, Apr. 1959, p. 52-54, 62.

Recent development of acid-resistant membranes makes this technique possible. (L-general, A8b)

404-L. Electrolytic Removal of Impurities. *Metal Finishing*, v 57, Apr. 1959, p. 62.

Low current density electrolysis removes Zn and Pb from copper cyanide baths, Sn and Cu from cyanide zinc baths, and Cu, Fe, Pb, Zn from nickel baths. (L17a, 3-69; Zn, Pb, Sn, Cu, Zr, Fe, Ni)

405-L. Science for Electroplaters. Pt. 46. Organic Salts. L. Serota. *Metal Finishing*, v. 57, Apr. 1959, p. 71-74, 76.

Procedures and conditions when various salts are used as buffers, detergents, foaming and complexing agents. (L17a)

406-L. (German.) Equipment for the Mechanical Descaling of Sheet Metal and Profiles. *Industrie-Anzeiger*, v. 81, Mar. 1959, p. 5-6.

(L10, 1-52)

407-L. (German.) Automatic Electroplating of Automobile Bumpers. L. Walter. *Metalloberflache*, v. 13, Apr. 1959, p. 103-105.

(L17, T21c)

408-L. (German.) Developments in Metal Spraying. H. Reininger. *Metalloberflache*, v. 13, Apr. 1959, p. 116-118.

Corrosion protection; selection of material in relation to environment. (To be continued.) (L23)

409-L. (German.) Equipment for Hard-Chromium Plating of Tools and Machine

Parts. Pt. 3. E. Zmihorski. *Metalloberflache*, v. 13, Apr. 1959, p. 118-119. (L17, T7, 1-52)

410-L. Coatings for Protecting Molybdenum From Oxidation at Elevated Temperature. E. S. Bartlett, H. R. Ogden and R. I. Jaffee. *Defense Metals Information Center*, Report no. 109, PB 151064, Mar. 6, 1959. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Coatings based on Cr, Si, Ni, precious metals, ceramic materials and refractory oxides. The usual methods for coating Mo include electroplating, flame spraying, vapor deposition, cladding, enamelling and liquid phase diffusion. Gas-turbine buckets coated with Cr-Ni electrodeposits plus flame-sprayed Ni-Si-B plus Nichrome V cladding plus flame-sprayed Co-Cr-W-B alloy show promise for temperatures from 1800 to 2000° F. 46 ref. (L-general; Mo, Cr, Ni, Si, B, W)

411-L.* (English.) Adherence Between Glass and Metal. Jan Berk and Jan de Jong. *Trabajos de al Tercera Reunion Internacional sobre Reactividad de los Solidos*, v. 2, no. 2-3, 1958, p. 55-70.

Reactions occurring in the enameling of metal parts. Glass adheres to metal by the presence of an oxide layer on the metal, intermolecular adhesion, uninterrupted chemical bond or anchor points on the surface keying the glass mechanically to the metal. 4 ref. (L27)

412-L.* (Japanese.) Cleaning of Rust Resistant Steel Exposed to Radiation. M. Mukai, T. Saji and H. Yamazoe. *Chemical Society of Japan, Journal*, v. 62, Feb. 1959, p. 192-201.

Cleaning effect of H_3PO_4 (DPA) studied by autoradiography. Specimens are dipped in a bath containing a solution of Sr^{90} salt. Radioactivity on a smooth surface can be removed easily up to 80-90%. DPA is superior to H_2SO_4 or HNO_3 in the removal of secondary radioactivity. (L12; ST)

413-L.* (Japanese.) Bright Cadmium Plating. Tadao Hayashi and Takeo Ishida. *Metal Finishing Society of Japan*, Journal, v. 10, Jan. 1959, p. 26-35.

Effect of addition agents on the deformation of bright deposits from Cd-NaCN baths. Addition of metallic salts of Ni, Co, Fe, Cu, Zn and Hg does not change the deposition potential. When both organic and inorganic additives are used remarkably oriented crystal growth and brightness are achieved. (L17; Cd)

414-L.* Electrochemistry of Nickel. Pt. 1. Codeposition of Nickel and Hydrogen From Simple Aqueous Solutions. John Yeager, J. P. Cels, Ernest Yeager and Frank Hovorka. *Electrochemical Society, Journal*, v. 106, Apr. 1959, p. 328-336.

Electrodeposition of metals in chloride and sulphate solutions and their polarization curves. Effects of current density, pH temperature and salt concentration. 33 ref. (L17; Ni)

415-L.* Electrochemical Kinetics of the Anodic Formation of Oxide Films. Pierre Van Rysselberghe and Herman A. Johansen. *Electrochemical Society, Journal*, v. 106, Apr. 1959, p. 355-358.

Electrochemical approach involves use of current-overvoltage relationships at metal-oxide and at oxide-solution interphase. Ti, Hf and Ta are analyzed in terms of proposed theoretical treatment. 11 ref. (P15; Ti, Hf, Ta)

416-L.* Radioisotopic Study of Leveling in Bright Nickel Electroplating Baths. Seward E. Beacom and Bernard J. Riley. *General Motors Engineering Journal*, v. 6, Apr-May-June 1959, p. 20-26.

Confirmation is obtained for a theory which partially accounts for leveling action. 5 ref. (L17a, 1-59; Ni)

417-L. Flow Coat Finishing Today. E. A. Zahn. *Metal Progress*, v. 75, May 1959, p. 84-86.

Refinements now enable the process to handle many finishing operations more efficiently than in the past. Less than 10% as many gallons of paint are required in comparison with dipping. Use of vapor tunnels, common with low-pressure flow coating but not often found with dipping, has virtually eliminated top-to-bottom gradient in film thickness. (L26n)

418-L. Preparation of Stable Layers of Uranium, Neptunium, Plutonium and Americium by Electrolytic Deposition. G. I. Khiebnikov and E. P. Dergunov. *Soviet Journal of Atomic Energy*, v. 4, Apr. 1958, p. 494-495.

5 ref. (L17; U, Pu, Am, Np)

419-L.* Specifications for Protective Plating. Pt. 1. E. A. Ollard. *Corrosion Prevention & Control*, v. 6, Mar. 1959, p. 36-39.

Recommendations for protective decorative coating on various parts of consumer goods, including hub caps, irons, car

door handles, ash trays, clocks, instruments, cameras, coffee pots, refrigerators, switchgears and mincers. (L17, T10)

420-L.* Spray Painting Methods. *Corrosion Prevention & Control*, v. 6, Mar. 1959, p. 45-48.

Various spraying methods; advantages. (L26)

421-L.* Use of the Plasma Arc Torch for Applying Refractory Materials. *Machinery (London)*, v. 94, Apr. 29, 1959, p. 963-964.

Description of apparatus and suggested applications. (L29; EG-c31, EG-d, 6-69)

422-L.* Observations on the Process of Nickel Deposition by Thermal Decomposition of Nickel Carbonyl at Low Pressures. L. W. Owen. *Metallurgia*, v. 59, Apr. 1959, p. 165-173.

Influence of temperature, pressure, rate of flow and plating gas composition on deposition process and properties of coating. Control of thickness and distribution on simple shapes. Adhesion, appearance and porosity of coatings. 7 ref. (L25k, 2-61, 3-74; *Ni*)

423-L.* Flow Coating Nike Missile Parts. D. A. Harrington and E. A. Lgare. *Metal Progress*, v. 75, May 1959, p. 87-90.

A system for automatic processing and flow coating is suitable for large missile fins, yet is flexible enough for numerous small parts. Paint utilization is over 95% and quality of coating is good. The application suggests advantages of the flow coat method for finishing in other industries. (L26n)

424-L.* (German.) A Ternary Carbide Formed by the Reaction of Molten Zinc on Iron-Carbon Alloys. Leo J. Hutter and Hans H. Stadelmaier. *Zeitschrift fur Metallkunde*, v. 49, Nov. 1958, p. 600-601.

A carbide of the composition Fe_3ZnC and of a fcc. lattice was found in the delta1-layer of a Zn coating. 6 ref. (N1; Fe-b, *C*, 8-65, *Zn*)

425-L.* In 90-Second Fiery Blast Into Space, Rokide Coating Will Protect Engine of X-15 Rocket Ship Against Hot Gases and Erosion. Roland J. Westerhold. *Grits and Grinds*, v. 50, Apr. 1959, p. 3-7, 10-12.

Coatings are applied by heating the end of a ceramic rod and projecting the molten particles at high velocity. They are flexible, tough and heat resistant. (L27)

426-L.* Refractory Ceramic Coatings. David J. Larin and E. E. Mueller. *Trend in Engineering*, v. 11, Apr. 1959, p. 19-23.

Spraying, flame spraying, vitreous coating, molybdenum disilicide coating, cermet coating and flame plating for high-temperature applications. 13 ref. (L27; NM-g34, 2-62)

427-L. Laboratory Evaluation of Graphite Crucible Coatings for Vacuum Melting Uranium. Orville R. Magoteaux, Delmer L. Elston and Charles F. Hall. National Lead Co. of Ohio. *U. S. Atomic Energy Commission*, NLCO-759, Mar. 11, 1959, 39 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Flame-sprayed magnesium zirconate ($MgZrO_3$) proved the best coating. Average carbon pickup was limited to 73 ppm. for derby uranium charges; with slug uranium no pickup occurred. The flame spray method provided a uniform coating thickness and virtually eliminated moisture and volatiles in the coatings. (L23, W18h, C5k, 1-73; U)

428-L.* (German.) Hot Tinning of Iron Castings. Ernest S. Hedges. *Giesserei*, v. 46, Apr. 23, 1959, p. 233-236.

Direct chloride process. Pretreatment of the surface by blasting with white cast iron shot and immersion in a solution of chlorides. Temperature of tin baths and preparation of a flux covering the bath surface. (L16; CI, *Sn*)

429-L.* (English.) Industrial Applications of the Electrolytic Polishing of Stainless Steel. *Aciers Fins & Speciaux*, no. 31, Mar. 1959, p. 62-66.

Applications in the automobile industry include perforated and ribbed grills, wheel trim, windshield wipers. Final surface condition required and initial surface condition are significant factors in determining possible applications. (L13p, T21c; SS)

430-L.* Protective Anodising. F. C. Porter. *Corrosion Prevention & Control*, v. 6, Mar. 1959, p. 40-44.

Properties, application, recommendation and test methods for Al and its alloys. 13 ref. (L19; Al)

431-L.* Carbide Deposit Ups Tool Life. R. H. Eshelman. *Iron Age*, v. 183, May 21, 1959, p. 152-153.

Hard surfacing tools by means of spark deposition increases resistance to abrasion. (L24, T6n, T6r; ST, *W*, 6-69)

432-L.* Stainless Steel and Other Product Finishing Problems. Frank H. Slade. *Product Finishing (London)*, v. 12, Apr. 1959, p. 68-77.

Techniques of Cr and Ni plating; corrosion of plated mild steel in comparison with stainless steel. (L17, R-general; SS, Cn, *Cr*, Ni)

433-L. Metal Degreasing and Drying Developments. *Corrosion Prevention & Control*, v. 6, Mar. 1959, p. 59.

New enclosed plant automatically rotates and cleans small parts. New additive for trichloroethylene removes water after aqueous process. (L12)

434-L. Electroplating and Metallizing Printed Wiring. Joseph F. Dytrt. *Industrial & Engineering Chemistry*, v. 51, Mar. 1959, p. 286-287.

(L17, L23, T1)

435-L. (Book.) Technical Proceedings of the 45th Annual Convention of the American Electroplaters' Society. 184 p. 1958. American Electroplaters' Society Inc., 443-445 Broad St., Newark 2, N. J.

Papers, presented at Cincinnati, Ohio, May 19-22, 1958, abstracted separately. (L17)

438-L. Metal Substrates. Arnold J. Eickhoff. Paper from "Field Applied Paints and Coatings". National Academy of Sciences, National Research Council, Washington, D. C., 1959, p. 53-64.

Mechanism of corrosion; effectiveness of paint in preventing corrosion of steel. (L26n, R-general; ST)

439-L. High Temperature Applications. Milton A. Glaser and R. E. Caplan. Paper from "Field Applied Paints and Coatings". National Academy of Sciences, National Research Council, Washington, D. C., 1959, p. 75-82.

Evaluation of silicone and silicone aluminum paints. (L26n, 2-62; Al, NM-g30)

440-L. Aluminum-Electrocladding Studies for Proposed OMR Fuel Elements. G. V. Alm and M. H. Binstock. Atomics International. *U. S. Atomic Energy Commission*, NAA-SR-2704, Oct. 1, 1958, 44 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Dense, adherent claddings of Al up to 25 mils thick are produced on Ni-plated uranium fuel cores by electrodeposition. A continuously regenerative etheral bath containing lithium hydride and aluminum chloride is used. Metallurgical bonding of Al electrocladdings to Ni-plated uranium is effected by a thermopneumatic pressing process. Date are given on cladding continuity, bond integrity and cladding microstructure. 9 ref. (L22, L17, T11g; U, *Al*)

441-L.* (French.) Cladding With Alloy Steels. H. Lejay. *Genie Chimique*, v. 81, Jan. 1959, p. 1-7.

Cladding of carbon steel plate by forge welding, pretreatment of metals, intermediate layers, post-treatment. Advantages of use of clad metals in petroleum industry, chemical industries in general and atomic energy installations. (L22, K5, T29, T11; CN, AY)

442-L.* (French.) Surface Treatments. Pt. 4. Pickling of Steels. J. Bigeon. *Industrie Chimique*, v. 46, Jan. 1959, p. 2-8.

Formation and nature of mill scale; removal by sand, shot, torch, acids; passivation by inhibitors during pickling; pickling; pickling accelerators. (To be continued.) (L10, L12, R10c; ST)

443-L.* (German.) Surface Melting of Electrodeposited Tin Coatings Using Medium Frequency. F. Alf. *Industrie-Anzeiger*, v. 81, Mar. 24, 1959, p. 17-20.

Corrosion protection and appearance of Sn coatings are improved by surface melting. Various processes and equipment. (L17; ST, *Sn*)

444-L.* (Russian.) Electrochemical Degreasing of Cold Rolled Steel Sheets. V. P. Kochergin, M. E. Prostakov and A. A. Tarasova. *Stal'*, Mar. 1959, p. 252-254.

It is possible to remove fatty films from the surface of rolled metal by the application of oil emulsions and emulsol within the space of 1-3 sec. Temperature

of alkaline solution must not be lower than 80° C. 9 ref. (L12; 4-53)

445-L.* Chromallized Steel. *Design News*, v. 14, Apr. 27, 1959, p. 16-17.

As chromium diffuses into the base metal at high temperatures (1650 to 2000° F.) it forms a continuous, ductile, high-Cr surface alloy which is an integral part of the base metal. The new surface will not spall, chip or flake off. (L15; Cr)

446-L.* Degreasing and Pickling. *Corrosion Prevention & Control*, v. 6, Apr. 1959, p. 52-56.

Processes for scale removal by acid pickling. (L12, L12g)

Use of water and methanol rinses, air and hydrogen firing and ultrasonic rinses to remove acetic acid labeled with carbon—14 from electron-tube cathode sleeves. Effect of temperature and number of water dips on removal of radioactive sodium sulphate. 6 ref. (L12e, L10f, 1-59; Ni)

475-L.* (French.) Application of Faraday's Law to the Study of the Anodic Dissolution of Metals. (Conclusion.) Michel Froment. *Corrosion et Anticorrosion,* v. 7, Apr. 1959, p. 134-145.

Anodic dissolution of Al-Ni alloys. Influence of surface condition of metal, bath temperature, bath composition, especially water content, on initial valence. 11 ref. (L13p; Al, Mg, U, Ti, La, Ce, Zn, Be, Al-b, *Ni*)

476-L.* (French.) Hot Galvanizing Practice. R. Haarmann. *Corrosion et Anticorrosion,* v. 7, Apr. 1959, p. 146-152.

Basic procedure, recent technical developments, corrosion behavior of galvanized surfaces. Additional protection is afforded by overcoat of paint. (L16, R-general; ST)

477-L.* (German.) Painting and Cathodic Protection. K. A. van Oeteren-Panhauser. *Metalloberflache,* v. 13, May 1959, p. 135.

Protection of steel structures and tanks by the use of electrodes of a more base metal and by anodes connected to a low-negative voltage. Importance of additional protection afforded by paints. (L26n, R10d; ST)

478-L.* (Hungarian.) Hard Chromium Plating of Aluminum Engine Cylinder Bores. Pal Csokan. *Kohaszati Lapok,* v. 92, Feb-Mar. 1959, p. 82-89.

New method results in excellent wear resistance properties. Data on cleaning, pickling, Cr-plating and honing. 24 ref. (L17, T21b; Al, Cr)

479-L. The Iron Age Metal Cleaning and Finishing Handbook. *Iron Age,* v. 183, June 4, 1959, p. 125-148.

Tables and glossary. (L-general)

480-L. Spray Phosphoric Acid Pickling. H. J. McVey. *Porcelain Enamel Institute, Proceedings,* v. 20, 1958, p. 26-28.

New method of spray phosphoric acid pickling offers continuous sludge-free operation with constant solution composition, a high rate of pickling with uniform and consistent metal loss. (L12; ST)

481-L. Thicker Coatings Add New Dimension to Markets for Vacuum Metallizers. *Steel,* v. 144, June 1, 1959, p. 96-97.

Technique deposits up to 0.004 in. Al or Cd on a variety of metals. Coating is tough, ductile and resists corrosion. It can be anodized, colored, buffed. (L25g; ST, Al, Cd, 17-57)

482-L. (German.) Structure and Protection of Sprayed Metal Coatings. T. Kenderi. *Metalloberflache,* v. 13, May 1959, p. 133-134.

Structure is understood as an irregular cohesion-diffusion lattice. Factors influencing the quality of coating; rules for

subsequent treatment such as sealing of pores, stress relief and improvement of mechanical properties. (L23, M26; 8-67)

483-L. (German.) Developments in Metal Spraying. Pt. 4. H. Reininger. *Metalloberflache*, v. 13, May 1959, p. 147-150.

Literature survey on scaling protection by Al spraying, sprayed-on bearing linings, repair of machinery by metal spraying and inspection methods. 119 ref. (L23, T7d, T7)

484-L. (Japanese.) Ultrasonic Cleaning. Naoyuki Watanabe. *Metals*, v. 29, Feb. 1959, p. 126-128.

(L10f)

485-L.* (Japanese.) Zinc Immersion Treatment of Aluminum Prior to Coating and Its Effect on Surface Roughness. Naoharu Kinoshita, Masao Watanabe and Isoji Toyoshima. *Metal Finishing Society of Japan, Journal*, v. 10, Feb. 1959, p. 48-58.

Al specimens were treated with hot alkali, acid and Zn salts. The final surface roughness of subsequent coating is the same as that of the initial surface. (L12, S15; Al)

486-L.* (Japanese.) Chromizing. *Metals*, v. 29, Feb. 1959, p. 135-136.

Steel parts are placed in air-tight chamber, covered by Cr rich powder and heated in furnace at 800-1200° C. for 4 to 20 hr. Depth of Cr diffusion is from 1/80 to 1/8 mm. and diffusion is remarkably homogeneous. (L15; ST, Cr)

487-L.* (German.) Arc Metal Spraying With Steel Wire. H. Krautmacher and W. Pungel. *Draht*, v. 10, Apr. 1959, p. 132-139.

Coatings produced by autogeneous and arc metal spraying processes with reference to hardness, structure and adherence. (L23; CN)

488-L.* Adhesion of Evaporated Aluminum Films With Underlayers of Nickel, Cobalt and Chromel. C. Weaver and R. M. Hill. *Philosophical Magazine*, v. 4, Feb. 1959, p. 253-266.

Vacuum evaporation of film onto glass slides. Variation of adhesion with aging at 25 or 120° C. and with underlayer thickness. Formation of intermetallic compounds at interface. 10 ref. (L27g, Q10c, 2-65; Al, Ni, Co, Cr, 14-62)

489-L.* Preparation of Smooth Single Crystal Surfaces of Silver by an Evaporation Technique. D. W. Pashley. *Philosophical Magazine*, v. 4, Mar. 1959, p. 316-323.

Electron diffraction study of layers of Ag evaporated onto mica cleavage surface. Relation of Ag film smoothness and orientation with mica substrate temperature, rate of deposition and deposit thickness. 14 ref. (L25g, M26c; Ag-a, 14-61, 14-62)

490-L. Applications and Problems of Metal Spraying. J. F. Attwell. *Electroplating and Metal Finishing*, v. 12, May 1959, p. 176-178.

Process and equipment used in the Union of South Africa. (Conclusion.) (L23)

491-L. Metal Finishers Meet at I.M.F. Annual Conference. *Industrial Finishing (London)*, v. 11, May 1959, p. 22-23, 25-29, 51-52.

Summary of 24 technical papers presented at the Annual Conference of the Institute of Metal Finishing, Brighton, England, Apr. 8-11. (L-general)

492-L.* (Russian.) New Method of Pickling Stainless Steel Tubes. N. V. Bogoyablenskaya and Ya. H. Lipkin. *Stal'*, Apr. 1959, p. 347-351.

Application of 1.5% HF acid with 8-8.5% of HNO_3 acid for pickling is superior to the prevailing practice. A light gray and smooth surface is produced without overpickling, pitting or corrosion fissuring and with a minimum of metal loss. 21 ref. (L12g; SS, 4-60)

493-L.* Observations on the Process of Nickel Deposition by Thermal Decomposition of Nickel Carbonyl at Low Pressures. L. W. Owen. *Metallurgia*, v. 59, May 1959, p. 227-233.

Variables controlling the process and properties of coatings obtained (appearance, microstructure, microhardness, ductility). The adhesion and porosity of the coatings on various metallic bases are assessed together with control of thickness applied and the distribution on various shapes. 18 ref. (To be continued.) (L25; Ni)

494-L.* (French.) Surface Treatments. Pt. 5. J. Bigeon. *Industrie Chimique*, v. 6, Mar. 1959, p. 85-86.

Descaling of stainless steels of various composition with acid baths, the composition of which is determined by the components of the steel and the solubility of their oxides in individual acids. Reduction of

metallic oxides in liquid caustic soda at 350-385° C. Electrolytic polishing in electrolytes composed of H_2SO_4 and phosphoric acid on citric acid of HF. (L12, L13p; SS)

495-L.* Improvements in Plating Zinc Die Castings. *Metal Progress*, v. 75, June 1959, p. 78-81.

A double layer of Ni of the duplex type in place of regular bright Ni gives Cr-plated Zn die castings with improved corrosion resistance. Bright crack-free Cr in place of regular Cr also increases durability of the finish. (L17; Zn, *Ni, Cr*, 5-61)

496-L. Fixturing Aluminum Die Castings in a Tumbling Barrel. John J. Morrison. *Die Casting Engineer*, v. 3, June 1959, p. 11-12.

(L10d; 5-61, Al)

497-L. Rectifiers in the Electroplating Industry. Pt. 2. Still Tank Plating. George Schore. *Metal Finishing*, v. 57, June 1959, p. 82-86.

Automatic operations and conditions for the electroplating of Ni, Cu, Zn, Cd, bronze, brass, Ag, Sn, Au, Al and Mg. (L17; Ni, Cu, Zn, Cd, Cu-s, Cu-n, Ag, Au, Al, Mg)

498-L. Dip Dyeing of Finishes for Vacuum Metallizing. Robert J. Perkel. *Metal Finishing*, v. 57, June 1959, p. 87-89.

(L16)

499-L. Science for Electroplaters. Pt. 48. Electrodeposited Metals. L. Serota. *Metal Finishing*, v. 57, June 1959, p. 90-93, 96.

Mechanism of electrodeposition, cathode film, limiting current, crystal growth, crystal structure and basis metal effect. (L17, N12d)

500-L. New Possibilities With Porcelain Enamel Finishes. *Metal Progress*, v. 75, June 1959, p. 67-77.

Novel features include more colors to choose from; better chemical and heat resistance; one-coat finishes; thinner coating and lower firing frits; continuous productions lines with automatic spraying and dipping. (L27)

501-L. Minimum Paint Film Thickness for Economical Protection of Hot Rolled Steel Against Corrosion. Wouter Bosch. *Official Digest*, v. 31, May 1959, p. 602-609.

6 ref. (L26, R-general; ST)

502-L. (French.) Phosphate Coatings. *Metallurgie et la Construction Mechanique*, v. 91, Apr. 1959, p. 285-287.

Types of coatings and their properties; use as undercoating for paint, protection against corrosion and in minimizing wear between bearing surfaces. (L14b)

503-L. (German.) Surface Roughness and Corrosion Protection by Paints. K. A. van Oeteren-Panhauser. *Deutsche Farben-Zeitschrift*, v. 13, Apr. 1959, p. 138-141.

Thickness of coat is determined by the surface roughness. Instruments for roughness measurements; tabular survey on roughness produced by various working processes. (L26n, R-general, S15)

504-L.* (German.) Electroplating on Soft Soldered Parts. Albert Keil and Hermann Grossmann. *Galvanotechnik*, v. 50, Apr. 15, 1959, p. 197-199.

No differences are observed in the electroplating properties of assemblies produced with Pb, Cd, Zn, and Sn solders provided the metals are properly degreased and cleaned. 5 ref. (L17; Pb, Cn, An, Sn, SGA-f)

505-L.* (German.) Electrolytic Descaling of Iron and Steel in Alkaline Solution. Erich Lutter. *Galvanotechnik*, v. 50, Apr. 15, 1959, p. 200-202.

Process is characterized by rapidity; bright surfaces, no metal loss or dimensional changes, absence of embrittlement. (L13n; ST, Fe)

506-L. (Japanese.) Adhesion of Organic Films to Anodized Surfaces. Matsuhei Kishi. *Metal Finishing Society of Japan, Journal*, v. 10, Apr. 1959, p. 139-143.

Adhesion of acetyl cellulose coating on anodized Al plate under various anodizing conditions. The adhesive strength of the coating on Al plate anodized in phosphoric acid bath at room temperature is several times greater than castings anodized in oxalic acid or sulphuric acid baths. (L19, L26p; Al)

507-L. (Japanese.) Durability of Sprayed Metal Coatings and Sealing Treatments. Yukio Sakae and Yoshio Harada. *Metal Finishing Society of Japan, Journal*, v. 10, Apr. 1959, p. 149-153.

Porosity of sprayed coatings of Zn, Al, Cu, Sn, Pb, brass and 18-8 stainless steel. Coatings as treated by heat curing, and air drying type sealing materials. (L23; 8-67, 9-68, Pb, Cu-n, SS, Sn, Cu, Al, Zn)

508-L. (Japanese.) Adhesion of Sprayed Metal Coatings. Yoshio Harada and Jiroh Mizokawa. *Metal Finishing Society of Japan, Journal*, v. 10, Apr. 1959, p. 154-158.

Adhesion of Al, brass and Cu coatings on steel. Steel base is pretreated by sand or grit blasting or emery paper to make the surface rough. Powder spraying proved superior to either arc or flame spraying. Mo is excellent as a bonding undercoat. (L23; ST, Cu, Cu-n, Al)

509-L. (Japanese.) Vibration Electropolishing Method for Aluminum in Phosphoric Acid. Pt. 4. Takakado Nakayama. *Light Metals*, v. 9, Jan. 1959, p. 64-67.

Relation between current density and bath voltage. (L13p; Al)

510-L. (Japanese.) Electropolishing of Aluminum in Phosphoric Acid by Vibration. Pt. 3. Takakado Nakayama. *Light Metals*, v. 9, Jan. 1959, p. 53-63.

An anode of 99.99% Al vibrating at 0-300 rpm. and a fixed cathode are located in a H_3PO_4 bath and polished at various current densities at several temperatures. Bright surface of the anode is obtained when the bath voltage becomes higher at increasing current density and electrolysis time. (L13p; Al)

511-L.* (Russian.) Physicochemical Phenomena in Metal Spraying. A. F. Krupin. *Svarochnoe Proizvodstvo*, May 1959, p. 17-20.

Metallographic, petrographic and other analyses of oxide inclusions in sprayed metal layers reveal mainly a magnetic oxide (Fe_3O_4). Quantity of oxides decreases in proportion to increase in carbon content or other deoxidizing agents. To reduce oxidation it is essential to use a rod containing deoxidizing agents in an inert atmosphere. 7 ref. (L23; 9-69, CN, AY, 8-67)

526-L.* Hot-Dip Galvanizing of Sheet and Strip. J. Hawkins and E. J. Williams. *Australian Institute of Metals, Journal*, v. 4, May 1959, p. 49-60.

Basic procedures in a hot strip mill; removal of oxide scale and contaminants; pickling; types of high-speed galvanizing systems. 4 ref. (L16, L12; ST, 4-53, *Zn*)

527-L.* Electroplating of Automobile Components. J. M. Butler. *Australian Institute of Metals, Journal*, v. 4, May 1959, p. 61-70.

Layout of a machine designed for automatic plating of Cu, Ni and Cr, in that order, on steel. The complete process sequence; make-up and control of the various solutions used, (L17, T21; ST, *Cu, Ni, Cr*)

528-L.* Priming of Steel. J. R. Rischbieth. *Australian Institute of Metals, Journal*, v. 4, May 1959, p. 35-48.

Correct surface preparation and pretreatment of steel before painting. Pigments are classified into five groups—inert, anodic inhibition, cathodic inhibition, anodic pigments and cathodic pigments. Mechanism of corrosion prevention of the pigment vehicle system. 41 ref. (L26n, L12; ST)

529-L.* The Mechanism of Electropolishing. K. J. Lorking. *Australian Institute of Metals, Journal*, v. 4, May 1959, p. 22-26.

Macro and micropolishing processes on copper anodes in orthophosphoric acid solutions. Macropolishing is accomplished when the rate of diffusion of ions is greatest from high spots on the anode surface. Micropolishing or removal of irregularities of the order of 10^3 Angstroms or less occurs when a film of oriented polar chains of molecules forms on the surface. The looser packing of the chains at peaks facilitates solution of the Cu and produces the polishing effect. 19 ref. (L13p; Cu)

530-L.* The Nature of Industrially Polished Metal Surfaces. L. E. Samuels. *Australian Institute of Metals, Journal*, v. 4, May 1959, p. 1-11.

The primary mechanism of polishing appears to be one of cutting; gross surface flow, even flow by normal plastic deformation, does not seem to make a significant contribution. Quantitative data on the depth of the layer are given for brass specimens finished by a representative range of industrial methods. 35 ref. (L10b; Cu-n)

531-L.* The Preparation of Metals for Electroplating. J. J. Dale and I. J. Howell. *Australian Institute of Metals, Journal*, v. 4, May 1959, p. 27-34.

Adhesion depends on the nature of the two metals concerned and the surface condition of the basis metal as affected by its mechanical history, up to and including polishing, and by the chemical and electrochemical effects of cleaning and etching. Optimum procedures. 26 ref. (L10, L12)

532-L.* The Chemical Control of Plating Electrolytes. K. E. Langford. Paper from "Control in Electroplating". Robert Draper Ltd., Teddington, England, 1959, p. 3-19.

574-L.* Choosing Surface Finishes for Small Tubing. James H. Black. *Materials in Design Engineering,* v. 50, July 1959, p. 101-103.
Advantages of a pickled finish. A number of bright smooth finishes are also available, the so-called "bright finish" being the most popular and widely used. (L-general, L12g; 4-60)

575-L.* Double Plate Method of Chrome Plating. M. R. Caldwell. *Precision Metal Molding,* v. 17, July 1959, p. 47-49.
Improved corrosion resistance of plate by undercoating from two types of nickel baths which produce different grain structure. (L17; *Ni, Cr*)

576-L. (Book.) Control in Electroplating. 92 p. 1959. Robert Draper Limited, Kerbihan House, 85 Udney Park Rd., Teddington, Middlesex, England. 15s.

Papers and discussions from symposium held Nov. 1958 by London Branch of the Institute of Metal Finishing. Papers abstracted separately. (L17b, L17a)

577-L. (Translation—Brutcher no. 4573.) Chromizing and Boronizing of Steel During High-Frequency Induction Heating. A. N. Minkevich and G. N. Ulybin. *Metallovedenie i Termicheskaya Obrabotka Metallov*, v. 5, April 1959, p. 48-51.

For the chromizing of no. 20 steel at 1050 to 1200° C. a paste consisting of 75% powdered Cr + FeCr and 25% cryolite, bonded with hydrolized ethyl silicate produced a diffused Cr coating in 2 min., instead of 8 hr. Boronizing of U10 and no. 45 steels at 1200 C. for 2 min. with a paste of 50% boron carbide and 50% cryolite, bonded with hydrolized ethyl silicate, produced a diffused boron coating 0.12 mm. deep with a hardness of 1000 HV_{10}. 9 ref. (L15, 1-69; CN)

578-L. (Translation—Brutcher no. 4572.) Surface Impregnation of Steels With Boron in a Gas Atmosphere. A. F. Zhigach, I. S. Antonov, M. A. Pshelkina, G. I. Yukin, A. C. Dobrodeev and V. N. Matveev. *Metallovedenie i Termicheskaya Obrabotka Metallov*, v. 5, April 1959, p. 45-47.

Impregnation of steels by a boro-ethane (B_2H_6) gas mixed with hydrogen at 800-850° C. for 5 hr. Boron impregnated surfaces have a high micro-hardness of 3000. (L15; CN, *B*)

579-L.* The Influence of Cathode Film Thickness of Leveling. Seward E. Beacom. *Plating*, V. 46, July 1959, p. 814-818.

Shadowgraphic method determined effects of solution temperature, current density and addition agents in Ni plating solution. Current density is directly proportional and temperature inversely proportional to film thickness. 19 ref. (L17b; Ni)

580-L.* The Nature, Cause and Effect of the Porosity in Electrodeposits. Pt. 3. Microscopic Detection of Porosity. Fielding Ogburn and D. W. Ernst. *Plating*, v. 46, July 1959, p. 831-833.

Successive parallel sectioning to base metal determined size and shape of pores or other defects. 6 ref. (L17, 9-68)

581-L.* (German.) Protective Efficiency of Copper Flash Produced With Acid or Cyanide Electrolytes on Steel Before Nickel Plating. Heinz W. Dettner. *Metalloberflache*, v. 13, July 1959, p. 193-194.

Corrosion tests on Ni plated samples with Cu flashes produced with different electrolytes. Corrosion is promoted by cavities under the Cu plating resulting from surface defects. These cavities are filled with Cu when an acid electrolyte is used. 4 ref. (L17, R-general; ST, Ni, *Cu*)

582-L.* (German.) Smooth Chromium Deposits From Electrolytes With Chromic Acid. Bruno Galler. *Metalloberflache*, v. 13, July 1959, p. 221.

Smooth Cr plate up to 240 microns thick by addition of a new type of wetting agent. (L17a; Cr)

583-L.* (German.) Chromium Baths. Jesse E. Stareck. *Metalloberflache*, v. 13, July 1959, p. 221.

A constant concentration of strontium sulphate and of an alkali metal fluosilicate is controlled by the addition of alkali metal compounds. (L17a; Cr)

584-L.* (German.) Titanium, Zirconium, Hafnium, Tantalum, Columbium, Chromium, Molybdenum and Tungsten Electroplating With a Salt Bath. Merle Eugene Sibert. *Metalloberflache*, v. 13, July 1959, p. 222.

Composition of a new type salt bath for electroplating. The graphite crucible holding the bath serves as an anode. A neutral atmosphere eliminates the penetration of O, N or C into the bath. (L17a; Mo, W, Ti, Zr, Hf, Ta, Cb, Cr)

585-L.* (Russian.) Electrolytes for Electrochemical Polishing of Steels. G. P. Maitak and G. S. Tret'yakova. *Zhurnal Prikladnoi Khimii*, v. 22, May 1959, p. 1062-1064.

Plain carbon and stainless steels are successfully polished at 18-25° C. in electrolytic baths consisting of varying proportions of H_2SO_4 and H_3PO_4. These electrolytes are preferable to H_2SO_4-H_3PO_4-H_2CrO_4 acids. 8 ref. (L13p; CN, AY)

586-L.* (French.) Corrosion Resistance by Chromium Plate Without Fissures. P. Morisset. *Centre d'Information du Chrome Dur—Bulletin de Documentation*, v. 104, June 1959, p. 31.

Production of plate 1-2 microns thick by means of baths with the ratio CrO_3: SO_4H_2 = 125 to 200 and at temperatures of 50-55° C. (L17b; Cr)

587-L.* (French.) Repair Metallization Followed by Hard Plating. R. De Buyer.

Centre d'Information du Chrome Dur—Bulletin de Documentation, v. 104, June 1959, p. 31.

Repair of a shock absorber piston and a large casting by metal spraying, mechanical polishing of the deposited metal and Cr plating. (L23, L17; ST, CI, *Cu, Cr*)

588-L. Spiral Setup Plates Wire Fast. *Iron Age,* v. 184, July 9, 1959, p. 98-99.

Fast electroplating of steel wire with Cu, Ni or other metals produces wire having high tensile strength and good conductivity. Process is based on a spiral handling system. (L17, P15g; ST, 4-61, *Ni, Cu*)

589-L. Automatic Additions of All Chemicals to the Nickel Plating Baths. Mitchell G. Osman. *Plating,* v. 46, July 1959, p. 819-822.

Control of stresses and physical properties of plate through regulation of salt concentration, impurities and pH. (L17b; Ni)

590-L. Lead Anodes for Chromium Plating. Henry R. Friedberg. *Plating,* v. 46, July 1959, p. 834-836,

Effects of shape and type of construction of lead anodes on bath performance. (L17, W3L, 3-73; Cr, Pb)

591-L. (Russian.) Causes of Brightness of Electrolytic Nickel Deposits. A. V. Pamfilov and P. M. Morgart. *Zhurnal Prikladnoi Khimii,* v. 22, May 1959, p. 1066-1071.

Brightness is caused by leveling of the submicroscopic roughness and is not due to grain structure. 11 ref. (L17; Ni)

592-L.* (French.) Anodic Oxidation of Aluminum Containing Silicon. H. Richaud. *Memoires Scientifiques de la Revue de Metallurgie,* v. 56, June 1959, p. 30-34.

Anodic oxidation in a H_2SO_4 bath. The surface color allows conclusions to be drawn as to the thickness of the oxide layer, which varies according to Si content, deformation degree and heat treatment. (L19n, 2-60, 3-68, 2-64; Al-b, *Si*)

593-L.* (French.) Porosity Tests With Protective Paint Coats. G. Blet. *Memoires Scientifiques de la Revue de Metallurgie,* v. 56, June 1959, p. 41-46.

Sheet iron was phosphate coated, primed and then painted. Porosity tests by examining the insulation properties of the paint. (L26n, L14b, 9-68; Fe)

594-L.* Experiences With Corrosion-Resistant InKrom Steel Screws. E. Taubert. *Draht (English Edition),* no. 41, June 1959, p. 60-62.

The InKrom process takes place at high temperature through the halogen compounds of Cr. The surface zone merges gradually and the Cr is firmly interlaced in the lattice structure of the basic metal, thus preventing defoliation. Mechanical effects, such as blows or bending, do not in any way impair the corrosion-protective properties. (L15, T7f; *Cr,* ST, SGA-g)

595-L.* Control of Electrodeposition Processes by Examination of the Deposits. T. E. Such. *Electroplating and Metal Finishing,* v. 12, July 1959, p. 256-259.

Methods for testing ductility, hardness and stress of electrodeposits. Effect of thickness and contamination of coating. (L17c, Q23p, Q25, Q29n; 8-62)

596-L.* Electroforming Waveguides. J. R. Balmer and T. W. A. Bailey. *Electroplating and Metal Finishing,* v. 12, July 1959, p. 267-270.

Methods of interior finish of waveguides. The function of mandrels and electroplating in plating waveguide interiors. Effect of impurities in deposits and variations in cathode current density on electrical resistivity. (L18, 3-69; Ti)

597-L.* (French.) Protection of Metals by Paints. Georges Nedey. *Nature,* no. 3288, Apr. 1959, p. 172-177.

Paints for protection against atmospheric corrosion, waste water, chemicals, sea water and organisms. (L26n, R-general)

598-L.* Metallizing in the Process Industries. Walter B. Meyer. *American Society of Mechanical Engineers,* Paper no. 59-SA-47, 1959, 9 p. $.80.

Metal spraying, chemical and physical properties, adhesion, corrosion characteristics and practical applications of sprayed metal deposits. Ceramic coatings. (L23, L27, R-general; 8-67)

599-L.* Barrel Finishing of Castings. L. D. Stevens. *Foundry,* v. 87, Aug. 1959, p. 65-67.

Barrel finishing reduces costs by cutting man-hour requirements. It can be used to remove surface imperfections, deburr, polish, radius, burnish and grind. (L10d; 5)

600-L.* Chemically Deposited Nickel Coating. *INCO*, v. 27, Apr. 1959, p. 32-35.

Mechanical properties, corrosion resistance, appearance and application of Kanigen coating. (L28; Ni)

601-L.* (German.) Effects of Process Final Annealing on the Adherence of Zinc Plate to Steel Wire. Dietrich Horstmann. *Stahl und Eisen*, v. 79, no. 14, July 9, 1959, p. 1002-1005.

Adherence decreases when process annealing precedes galvanizing. Zn plate on wire galvanized after drawing (with or without final annealing) shows good adherence properties which improve with increased phosphorus and nitrogen content. (L16, Q10c, 2-64, 2-60; ST, 4-61, 8-65, *Zn*)

602-L.* Hardfacing With Cobalt-Base Alloys. G. Grainger. *Cobalt*, no. 3, June 1959, p. 3-15.

Composition, properties of Stellite alloys and various methods of application. 5 ref. (L24; Co-b)

603-L.* A New Highly Efficient Bath for Nickel Plating. Rudolf Misurec and Zora Sovikova. *Czechoslovak Heavy Industry*, no. 7, 1959, p. 14-19.

Leveling action bath for bright nickel-plating developed in Czechoslovakia. The leveling action is caused probably by the varying thickness of the diffusion layer at various points of the cathode (i. e., on peaks and in recesses), as well as by the different concentration of the leveling agent in the diffusion layer of the cathode owing to the precipitation of the addition agent from the bath by adsorption or by simultaneous deposition on the coating. (L17a; Ni)

604-L.* Chromizing in a Vacuum. Frantisek Princ and Vaclav Navara. *Czechoslovak Heavy Industry*, no. 7, 1959, p. 20-27.

Process is especially economical when components made of brass are replaced by chromized components made of steel. The cost of chromized steel components is about 60-70% of that of brass. (L15, 1-73; ST, *Cr*)

605-L.* Flame-Sprayed Coatings. Frantisek Princ. *Czechoslovak Heavy Industry*, no. 7, 1959, p. 28-35.

Review of preliminary surface treatment processes, spraying techniques and equipment and chemical treatment and sealing of coatings. (L23)

606-L.* Surface Finishing Stainless Steels. Lester F. Spencer. *Metal Finishing*, v. 57, July 1959, p. 48-53, 58.

Operation sequence and procedures for producing desired grade of finish on various types of stainless. (L10; SS)

607-L.* Plating on Inconel. Ed Calderon. *Metal Finishing*, v. 57, July 1959, p. 64, 69.

Method for Ag plating directly on Inconel-X turnbuckles which prevented galling and seizing of threads. (L17; Ni-b, *Ag*)

608-L.* Science for Electroplaters. Pt. 49. Copper Plating. L. Serota. *Metal Finishing*, v. 57, July 1959, p. 72-74, 81.

Composition of baths, alkalies and acids; throwing power and various additives. (L17; Cu)

609-L.* Industrial Metal Finishing With Paints and Organic Coatings. J. J. Stordy and G. J. Appleton. *Metal Finishing Journal*, v. 5, June 1959, p. 223-236.

Pretreatment, painting and various spray coating processes. (L26)

610-L.* Zinc Coatings on Iron and Steel. Pt. 1. The Problem of Corrosion and Its Prevention. A. K. Parker. *Metal Finishing Journal*, v. 5, June 1959, p. 241-242, 245.

Electrochemical process of corrosion and protection given by galvanizing. (L16, R1a; ST, Fe, *Zn*, 8-65)

611-L.* (French.) Chemical Polishing. *Galvano*, v. 28, June 1959, p. 289-295.

Choice of polishing bath as determined by material composition. (L12f, 2-60)

612-L.* (Hungarian.) Determining Lowest Specific Energy Consumption in the Electrolysis of Zinc. Pt. 1. Zoltan Horvath. *Kohaszati Lapok*, v. 42, Apr. 1959, p. 135-142.

Computations show that bath voltage is reduced when electrolyte has good conductivity. Best results are obtained with high temperature, high H_2SO_4 concentration, low Zn content and low current densities. (L17; Zn)

613-L.* (Hungarian.) Electrolytic Polishing of Aluminum Floodlight Mirrors. Endrene Lichtenberger. *Kohaszati Lapok*, v. 42, Apr. 1959, p. 155-160.

Reflecting properties of Al alloy mirrors are greatly raised by the use of

electrolytic polishing rather than conventional mechanical methods. 22 ref. (L13p, P17a; Al-b)

614-L. Acid Pickling. G. F. Whitmore. *Institute of Vitreous Enamellers Bulletin,* v. 9, June 1959, p. 127-136. (L12g)

615-L.* (German.) Electrolytic Polishing of Metals. R. Weiner. *Industrieblatt,* v. 59, June 1959, p. 254-259.

Current distribution, bath control, current supply, quality of materials to be polished in relation to Au, Ag, Cu, Al, Fe and steel alloys. 9 ref. (L13p; Au, Ag, Cu, Al, Fe, AY)

616-L. Better Buffing Thru Better Buff Design. Pt. 2. Stanley P. Sax. *Metal Finishing,* v. 57, July 1959, p. 54-58.

Recommended operation procedures and buffing wheel size, speed, and materials. (Conclusion.) (L10a, W2b, 17-51)

617-L.* The Formation of Hard Films on Zinc and Zinc Alloy Surfaces by Electrolytic Processes. H. Fry. *Metal Finishing Journal,* v. 5, May 1959, p. 181-189.

Technique produces coatings on high-purity Zn and Mazak 3 alloy by means of a Ni cathode for anodizing in silicate-borate-tungstate solution and Zn counter-electrode for electrolyses with a.c. (L19; Zn)

618-L.* New Thermo-Chemical Techniques. Pt. 2. Powder Metallurgical Applications. P. Galmiche. *Metal Finishing Journal,* v. 5, May 1959, p. 191-195, 204.

Protection against wear by heating powder metal parts in granulated Cr with small additions of ammonium fluoride. Protection of sintered Fe and steels and dynamically free metal powders by means of Cr. Purification by Onera process of plastic Cr powder and dense machinable sintered products. 12 ref. (L15; 6-72, ST, Fe, *Cr*)

619-L.* Descaling Wire Rods by Shot-Blast. K. J. Sorace. *Metal Progress,* v. 76, July 1959, p. 98-100.

A continuous line for drawing wire at 300 ft. per min. depends on a shot-blast method for descaling. Costs are comparable to conventional methods and the pollution problem (from acid pickling baths) is avoided. (L10c, F28, 1-61; ST)

620-L. Removal of Tritium Contamination From Surfaces of Metals. A. E. Symonds, Jr. E. I. du Pont de Nemours & Co. *U. S. Atomic Energy Commission,* DP-367, Apr. 1959, 19 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Heat treatments greatly enhance the removal of tritium contamination from metals that were exposed to heavy water used as a reactor moderator. Heat treatment for 30 min. at 300° C. is effective in removing general contamination. Quench treatments following the heating significantly improve the decontamination process. 7 ref. (L12, 2-64)

621-L.* (English.) Effects of Fe-Al Powder in Aluminum Diffusion Coating. Shigetomo Ueda. *Waseda University, Castings Research Laboratory, Report,* no. 9, Nov. 1958, p. 65-70.

Effects of packing, aging and fineness of Fe-Al powder as a diffusion agent. When the packing ration is 2-3 g per cc., the coating characteristics are not affected. Power of the agent decreases rapidly with number of repetitive uses. (L15; Fe, Al, 6)

622-L.* (German.) Current Practice in Anodizing. G. Elssner. *Aluminium,* v. 35, July 1959, p. 374-382.

Effect of bath concentration and temperature, current density and anodizing time on the thickness and hardness of anodized coatings; coloring and sealing techniques. (L19; Al-b)

623-L.* (German.) Sealing of Anodized Aluminum by Means of Boiling Water. F. Modic. *Aluminium,* v. 35, July 1959, p. 382-383.

Two processes can be used to avoid undesirable effects of abrasiveness on the surface of anodized films after water sealing. Either a post-treatment with a mild polishing or by dipping the anodized parts in a 20 to 30% solution of nitric acid at 20-25° C. (L19; Al-b)

624-L.* (German.) Regeneration of Chromating Baths by Ion Exchange. H. Keller. *Aluminium,* v. 35, July 1959, p. 384-385.

Changes in thickness, color and corrosion resistance derive from chemical reactions between metal surfaces and bath solution since Al ions enter the solution and form foreign metal ions. Defects are avoided by continuous ion exchange produced by an H-ion exchanger. 8 ref. (L14c)

625-L.* (German.) Electroless Nickel Plating. L. Bosdorf. *Aluminium*, v. 35, July 1959, p. 391-393.

Currentless Ni plating of Al surfaces can be obtained by forming a metallic intermediate layer. Ni plating of anodized Al surfaces is also possible. 6 ref. (L28; Al, *Ni*)

626-L. "Microstoning" Generates Precise Finishes. Rupert Le Grand. *American Machinist*, v. 103, July 27, 1959, p. 96-98.

Process generates controlled micro-inch finish on practically any material and corrects geometrical errors caused by previous machining. (L10h)

627-L. Better Durability for Electroplated Zinc Die Castings. W. H. Safranek, H. R. Miller and C. L. Faust. *Automotive Industries*, June 15, 1959, p. 70-74, 114.

Greater resistance to corrosion is achieved by using Duplex Ni and bright crack-free Cr. 5 ref. (L17, R-general; Zn, *Ni, Cr*, 5-61)

628-L. A Review of Barrelling and Abrasive Blasting. *Corrosion Prevention & Control*, v. 6, June 1959, p. 61-67.

Applications of barreling and shot and vapor blasting processes. (L10c, L10d)

629-L. Clad and Laminated Metals and Their Design Potentials. *Electrical Manufacturing*, v. 63, June 1959, p. 78-83, 135.

Methods of cladding Au, Ag or Pt on a base metal. (L22; *Au, Ag, Pt*)

630-L. Protection With Cold Galvanizing. *Industrial Finishing*, v. 11, July 1959, p. 16, 18.

(L16, 1-67)

631-L. Aluminizing Resists Refinery Corrosion. C. F. Tisinai and C. H. Samans. *Petroleum Refiner*, v. 38, June 1959, p. 153-160.

Aluminizing carbon steel or low-alloy steel is an inexpensive method of protection against refinery sulphidation and oxidation. (L15, R7; CN, AY, *Al*)

632-L. (Translation—BWRA.) Electrical Impulse Hard Facing by Metal Deposited in Liquid. M. S. Baranov. *Avtomaticheskaya Svarka*, v. 66, Jan. 1959, p. 86-98.

Hard surfacing carbon steel in an electrolyte solution using resistance-arc or resistance-spark processes. Electrical discharge characteristics and their control. Influence of welding conditions on quality of deposited metal. (L24, K1; CN)

633-L.* Bright, Non-Brittle Acid Copper Deposits. Larissa Domnikov. *Metal Finishing*, v. 57, Aug. 1959, p. 66-67, 71.

Cu plating of low-carbon steel in baths containing $CuSO_4$ and thiourea. Effect of bath composition and plating parameters on brightness and quality of deposit. 20 ref. (L17; CN-g, *C*)

634-L.* Science for Electroplaters. Pt. 50. Copper Plating. Pt. 2. L. Serota. *Metal Finishing*, v. 57, Aug. 1959, p. 72-73, 75.

Effect of surface leveling produced by additions of phenol-sulphonic acid, glue, thiourea or dextrin plus a wetting agent, to the Cu bath. (L17a; Cu)

635-L.* Direct Chrome-to-Aluminum Plating. *Precision Metal Molding*. v. 17, Aug. 1959, p. 49.

The Chrom-Lume process in which a Cr deposit is bonded directly to Al without the use of intervening metals, such as Cu, Ni or Zn. Coating has strong adhesion and good resistance to abrasion, bending and torsional and impact loading. (L17; Al, *Cr*)

636-L. Growth of Chromium Coatings From Liquid Metallic Solutions. S. T. Wlodek and J. Wulff. Massachusetts Institute of Technology. *U. S. Office of Technical Services*, PB 151126, Oct. 1957, 81 p. $2.25.

Deposition of Cr coating on Mo by selective freezing from molten alloys of Cu-Cr or Sn-Cr. Influence of bath composition, homogenizing temperature, cooling rate and forced convection. Theoretical analysis of nucleation, growth and morphology of coatings. Solubility of solid Mo in liquid Cu and Sn and solid Cr in liquid Sn. (L16, N12e; Mo, *Cr*)

637-L.* (German.) Study on Porcelain Enamel Coated Aluminum. Pt. 1. M. Ishihara, F. Mochizuki and Y. Kawarasaki. *Light Metals*, v. 9, Mar. 1959, p. 67-73.

Enameling process using a Pb-base frit. (L27; Al)

638-L.* (Japanese.) Vibratory Electrolytic Polishing in Phosphoric Acid. Pt. 5. Takakado Nakayama. *Light Metals*, v. 9, Mar. 1959, p. 38-54.

Vibration applied to the anode prevents gas bubbles adhering to the anode surface, which makes the electrolytic action non-uniform and prevents the anode from becoming overheated. (L13p)

639-L. Electrodeposition of Chromium Alloys. Charles Levy. *Metal Finishing*. v. 57, Aug. 1959, p. 59-62.
Literature review on Cr-Fe, Cr-Ni, Cr-Co, Cr-W, Cr-Mo and other binary and ternary alloy deposits. 67 ref. (L17; Cr-b, *Fe, Ni, Co, W, Mo*)

640-L. Analysis of Sulfuric Anodizing Solutions. J. B. Mohler. *Metal Finishing*, v. 57, Aug. 1959, p. 63-65.
(L19n)

641-L. Patents. *Metal Finishing*, v. 57, Aug. 1959, p. 76-81.
Review of recent patents in the field of metal finishing. (L-general, 11-59)

642-L. New Developments in High Temperature Ceramic Coatings. Frederick D. Shaw. *Metal Treating*, v. 10, July-Aug. 1959, p. 2-3, 34-35.
Coatings are now utilized on low-carbon or low-alloy steels, stainless steels of either American Iron and Steel 300 or 400 series and premium temperature alloys. (L27; 2-62, CN-g, AY, SS, SGA-h)

643-L. Electroplating on Titanium. Nelson F. Murphy. *Products Finishing*, v. 23, Aug. 1959, p. 68, 70, 72.
(L17; Ti)

644-L. Glass-Bonded Refractory Coatings for Iron or Nickel-Base Alloys. T. E. Cook and B. W. King. *Defense Metals Information Center*, DMIC Memo. 16, Apr. 25, 1959, 17 p.
Recommended coatings for some 25 Fe and Ni-base alloys. Coating compositions: procedures for metal preparation and application. 40 ref. (L27; Fe-b, Ni-b, NM-f42)

645-L.* Porcelainized Cast Aluminum. E. J. Tangerman. *Product Engineering (Design Issue)*, v. 30, Aug. 17, 1959, p. 47-50.
Low-temperature frits can now be applied to permanent-mold castings as well as to sheet Al and may soon work on die castings as well. Most acceptable alloys are 3002, 3003, 6061, 43 cast alloys and some lots of 6063. (L27; Al, 4-53, 4-63)

646-L.* (Japanese.) Characteristics of Chromizing. Shigetamo Ueda. *Metal Finishing Society of Japan, Journal*, v. 10, May 1959, p. 187-189.
Determination of hardness of 12-13% Cr coatings produced by diffusion processes on low-carbon steel. (L15, Q29; *Cr*, CN-g)

647-L. What to Look for in Anodizing Equipment. Gilbert Tramer. *Modern Metals*, v. 15, July 1959, p. 48, 50, 54.
(L19, 1-52)

648-L.* (German.) Reactions Between Nickel Electrolyte and Nickel Anode. O. Storing. *Galvanotechnik*, v. 50, July 15, 1959, p. 348-361.
Solubility of Ni is influenced by anions (mainly Cl), organic inhibitors, temperature and current density. The more compact the anode structure, the higher the polarization. Current efficiency depends on H^+-ion concentration, anodic current density and is influenced by bright Ni additions. (L17; Ni)

649-L.* (German.) Electroplating of Soldered Parts. Helmut Dahlman. *Galvanotechnik*, v. 50, July 15, 1959, p. 362-364.
Pickling and other pretreatment processes prior to electroplating of electronic equipment parts; Ag plating; rinsing; final Ag plating. (L17, L12; Cu-n, 7-52, *Ag*)

650-L.* (German.) Electrolytic Tinplating. Eduard Weber. *Galvanotechnik*, v. 50, July 15, 1959, p. 374-377.
Current intensity depends on strip dimensions and speed of strip movement. (L17, 3-73; *Sn*, 4-53, ST)

651-L.* Sprayed Metallic Coatings for Automotive Aluminum Castings. Herbert S. Ingham. *Society of Automotive Engineers*, Preprint no. 65B, June 1958, 11 p.
Spraying Mo on steel. Characteristics of coating. (L23, Q9n; Al-b, *Mo, ST*, 5)

652-L.* Recent Tests on Economical Cleaning of Unalloyed Low-Carbon Steel in Sulphuric Acid, Using a Wetting Agent. C. A. Fischer. *Wire Industry*, v. 26, July 1959, p. 647-649, 676.
Pickling reaction with sulphuric acid. Experiences with the addition of rock salts or synthetic wetting agents. Comparison between hydrochloric acid and sulphuric acid pickling. (L12g; CN-g, 4-61)

653-L.* Precision Barrel Finishing. Lester F. Spencer. *Machine Design*, v. 31, Sept. 3, 1959, p. 156-160.
Finer control with different sizes and types of abrasives results in considerable improvement of surface finishes, radii

contour and color. Metal parts can be finished requiring a 3 to 7-micro-in. rms. finish and a 0.0002-in. tolerance on radii. (L10d, 17-55)

654-L.* Vinyl Clad Steel. Glenn E. Wintermute. *Society of Plastics Engineers, 13th Annual National Technical Convention,* v. 3, n. d., p. 339-346.

Metal preparation, adhesive application of adhesive, solvent evaporation, heat reactivation, application of vinyl and cooling. Coatings have good durability, scratch, wear and abrasion resistance and are chemical, stain, weather and corrosion resistant. (L26p; ST)

655-L. Trouble-Shooting in the Plating Shop. C. F. Corfe. *Electroplating and Metal Finishing,* v. 12, Aug. 1959, p. 291-295, 298.

Plating defects correlated with problems in the pre-plating and plating processes. (L17, 9)

656-L. Smooth Copper and Nickel Deposits. D. R. Newman. *Electroplating and Metal Finishing,* v. 12, Aug. 1959, p. 296-298.

Use of diaphragm tanks in conjunction with a high rate of filtration. (L17a; Cu, Ni)

657-L. 7,500-Ton Press Ram Uses a 1500-Lb. Aluminum Bronze Overlay. Victor Nigriny. *Welding Design & Fabrication,* v. 32, Aug. 1959, p. 29-53.

(L24, K1e, W24-g; ST, Cu-s, *Al*)

658-L.* Control of Electrodeposition Processes by Examination of the Deposits. T. E. Such. *Electroplating & Metal Finishing,* v. 12, no. 6, June 1959, p. 215-218.

Study of the appearance of the electrodeposit with regard to brightness and optimum current density. Covering power determined by means of electrocathode test; qualitative tests for adhesion. (L17)

659-L.* A Test of the Degree of Sealing of Anodic Coatings on Aluminum. D. E. Bury and H. P. Godard. *Electroplating & Metal Finishing,* v. 12, no. 6, June 1959, p. 219-220.

Test appears suitable for control of sealing by determining resealing weight gain, using production material. The value of 2% maximum resealing weight gain was set as the acceptance limit. (L19; Al)

660-L.* Vacuum Evaporated Cadmium Deposits. D. J. Fishlock. *Electroplating & Metal Finishing,* v. 12, no. 6, June 1959, p. 222.

Coating of high-tensile steels with Cd by evaporation to avoid embrittlement associated with electrodeposition. (L25g; *Cd,* ST)

661-L.* Thermo-Lay Strip—a New Development in Composite Metal Fabrication. Allen C. Gilbraith. *Electroplating & Metal Finishing,* v. 12, no. 6, June 1959, p. 223-224.

Electrodeposition followed by heat treatment to achieve a metallurgical bond to the base metal strip, and finally rolling to finished thickness and temper, results in a dense, wear resistant surface of improved corrosion resistance. (L17, 2-64; 4-53)

662-L.* Porcelain Enamels for Aluminum and Magnesium. N. H. Stradley. *American Ceramic Society Bulletin,* v. 38, Aug. 1959 p. 401-404.

Characteristics of Pb-bearing and leadless glass systems. Alloy selection and surface treatment. Enamel preparation, application and firing. Properties of porcelain enamels. 8 ref.

(L27; Al-b, Mg-b)

663-L.* (French.) Protection of Uranium by Nickel Plating and Subsequent Diffusion. G. Chauvin, H. Coriou and J. Hure. Paper from "Symposium on Solid State Diffusion". Centre d'Etude Nucleaires de Saclay, Gif-sur-Yvette (S-et-O), France, 1959, p. 119-131.

Uranium bars are Ni plated in a bath containing no boric acid and then heat treated to allow the two metals to partly diffuse. 32 ref.

(L17, 2-64, T11g; U, *Ni,* 8-74)

664-L.* (German.) Electroplating of Tantalum. T. E. Brehmer. *Galvanotechnik,* v. 50, Aug. 15, 1959, p. 410-413.

Coating of Ta with a metallic layer is of importance because of the poor welding and soldering properties of Ta. Electroplating with other metals, using the base metal as a cathode. (L17; Ta)

665-L.* (German.) The Chromium Coating of Diamond Turned Brass Parts. P. P. Nowak. *Galvanotechnik,* v. 50, Aug. 15, 1959, p. 413-415.

Coating defects caused by surfaces resulting from turning. The thickness of Cr coating has to be increased to compensate for the high wear rate. If Pb and Sn

are contained in the brass, Cu coating is suggested before the Ni coating is applied. Bright-nickeling electrolytes are specified, since an additional polishing would destroy the turning effect. (L17; Cu-n, *Cr, Ni*)

666-L.* (German.) Chemical Conversion Coating of Aluminum. E. Herrmann. *Galvanotechnik*, v. 50, Aug. 15, 1959, p. 420-423.

The use of a 3% solution of CrO_3 is suggested for the removal of oxide films from Al parts before protective coatings are applied. (L14; Al)

667-L.* Electrolytic Pre-Treatment of Metals for Metallographic Examination. *Mining Journal*, v. 252, June 19, 1959, p. 671-673.

Electrolytic polishing compared with mechanical polishing techniques. Structural etchings on electrolytically polished specimens are carried out in a shorter time since the shattered surface layers do not have to be removed. (L13p)

668-L.* Plasma Arc Process Coats and Forms Refractory Materials. *Space Aeronautics*, v. 32, July 1959, p. 105-109.

New process to apply coatings and fabricate complex shapes with special plasma arc torches. The plasma is obtained by heating gas to a temperature high enough so that it is ionized. Temperatures above 20,000° F. have been obtained inside the arc column. (L29, G13)

669-L. (Pamphlet.) Industrial Nickel Plating. 17 p. 1959. International Nickel Co., Inc., 67 Wall St., New York 5, N. Y. n. p.

Mechanical properties of Ni deposits; plating before and after fabrication; corrosion resistance of Ni and Ni-plated steel in wide variety of corrosion environments. Applications. (L17, R-general, Q-general; ST, Ni)

670-L. (Book.) Metallizing Handbook. v. 1 and 2. H. S. Ingham and A. P. Shepard. 310 p. 1959. Metallizing Engineering Co., Inc., Westbury, L. I., N. Y.

Surface preparation; selection of metal; physical properties of sprayed metal; spraying; corrosion resistant coatings; production metallizing; miscellaneous metallizing applications. (L23)

671-L.* Precision Plating Lowers Grinding Costs. *Metalworking Production*, v. 103, Aug. 14, 1959, p. 1231-1234.

Semi-automatic deposition of 0.012-in. Ni coating on carbon steel rod. (L17b; CN, *Ni*)

672-L. (Russian.) Surface Structures After Various Shot Blast Treatments of Steels of High Hardness. Yu. G. Myasnikov and Yu. S. Terminasov. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 154-159.

Spring steel is shot blasted for various periods of time and the number of lattice dislocations and block formations is investigated by X-ray patterns. 6 ref. (L10c, M26b; ST, SGA-b)

673-L. How to Write Specifications for Anodized Finishes. R. V. Vanden Berg. *Product Engineering (Design Issue)*, v. 30, Sept. 28, 1959, p. 44-51.

(L19, S22; Al-b)

674-L. (French.) Adherence of Electrodeposits. P. Badet. *Galvano*, v. 28, July 1959, p. 335-338.

(L17; *Cu, Ni*)

675-L.* Electrodeposition of Copper-Zinc Alloys From the Pyrophosphate Bath. V. Sree and T. L. Rama Char. *Electroplating and Metal Finishing*, v. 12, Sept. 1959, p. 326-330.

Use of pyrophosphate bath for codeposition of Cu with Zn. Optimum conditions for obtaining satisfactory alloy plates in the composition range 60-100% Cu. Anode behavior of cast alloys; X-ray patterns of deposits; advantages over cyanide baths. (To be concluded.) (L17a; Cu-n)

676-L.* Metallic Finishes for Services' Equipment. D. W. Smith. *Electroplating and Metal Finishing*, v. 12, Sept. 1959, p. 331-337.

Finishes for protection of Al alloys against corrosion; corrosive effects of temperature and moisture. Protective coatings are applied by spraying and electrodeposition. (L23, L17; Al)

677-L. The Reclamation of Worn Components for Glass Bottle Manufacturing Machines. P. H. Marshall. *Electroplating and Metal Finishing*, v. 12, Sept. 1959, p. 338-339, 346.

Reclamation of cast and forged machine parts by metal spraying. Machining and blasting prior to metal spraying. (L23, T7, 18-72)

678-L.* Crack-Free and Duplex Chromium. D. E. Weimer. *Electroplating and Metal Finishing*, v. 12, Sept. 1959, p. 340-343, 348.

Analysis of processes and applications; results of accelerated corrosion tests. (L17, R11; Cr, 8-62)

679-L.* Aluminum Enamelling. C. Vickers. *Vitreous Enamellers Institute, Bulletin*, v. 9, July-Aug. 1959, p. 137-142.

Advantages, disadvantages, methods and practicality of enamelling various Al alloys. Advantages include the fact that finished sheet can be bonded more successfully to other materials by reason of its more flexible nature. Enameling can often be applied to thinner gage Al than is the case with steel. (L27; Al-b, 4-53)

680-L.* (English.) Study on Vacuum Deposition of Metals. Pt. 2. On the Formation of Alloys by Successive Deposition of Constituent Metal Vapors in Vacuum. Y. Fujiki. *Physical Society of Japan, Journal*, v. 14, July 1959, p. 913-917.

Alloy phases formed in a vacuum by successive deposition of metal vapors were investigated for Au-Pb, Bi-Pb, Cu-Sn, Ag-Sn and Cd-Sn systems. By electron diffraction, it was determined that the temperature of the primary surface layer is raised by deposition of a second layer; metal pairs having higher latent heats of condensation may form alloys more easily. (L25g, 1-73; Au-b, Bi-b, Cu-b, Ag-b, *Sn, Pb*)

681-L.* Vapor-Phase Plating With Molybdenum and Tungsten. H. W. Schultze. *Metal Progress*, v. 76, Sept. 1959, p. 74-80.

Deposits of metals or their refractory compounds produced from chlorides and carbonyls of Mo and tungsten at temperatures below the melting point of the metals. Coatings produced on ceramics, glass, refractories and graphite. (L25; Mo, W)

682-L.* Plating With Duplex Chromium. Edgar J. Seyb, Jr. *Precision Metal Molding*, v. 17, Sept. 1959, p. 71-73.

Special operating procedure using SRHS formulation CR-110 provides deposits with a unique over-all crack pattern. This is plated over a crack-free CF-520 deposit, resulting in a combination which provides greatly improved corrosion resistance. (L17, R-general; Cr)

683-L.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Hot-Dip Galvanizing of Wire. J. Paul Tierney. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 483-485.

Cleaning, galvanizing and wiping; influence of steel type on coating properties. (L16, L12, 1-61; ST, *Zn*, 4-61)

684-L.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Hot-Dip Galvanizing of Pipe. J. L. Roemer, Jr. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 485-488.

Cleaning, fluxing and coating steel pipe. (L16, L12; ST, 4-60, *Zn*,)

685-L.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Electrogalvanizing of Sheet. H. H. Greene. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142, Reinhold Publishing Corp., New York 22, 1959, p. 488-491.

Cleaning, electroplating and phosphating operations; characteristics of electrogalvanized steel strip. (L17, L12, L16; ST, *Zn*, 4-53)

686-L.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Zinc Coating of Steel Wire by Electrodeposition. J. E. Crowley. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142, Reinhold Publishing Corp., New York 22, 1959, p. 491-499.

Sequence of operations in electrodeposition line; features of Zn anode, magnetite anode and Ag-Pb anode processes; properties of Zn-coated steel wire. (L17, 1-61; ST, *Zn*, 4-61)

687-L.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. General Electroplating With Zinc. R. E. Harr. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142, Reinhold Publishing Corp., New York 22, 1959, p. 500-503.

Comparative capabilities of acid and of alkaline-cyanide plating solutions. Equipment; thickness of electroplated coatings. (L17; ST, *Zn*,)

688-L.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Hot-Dip Galvanizing of General Products. K. S. Frazier. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 453-465.

Protective action and life of hot-dip Zn coatings applied to steel. Factors influencing coating properties. (L16; ST, *Zn*)

689-L.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Metallizing With Zinc. Sam Tour. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 503-511.

Metal spraying equipment, spraying Zn on steel for corrosion protection and as base for paint. (L23; ST, Zn)

690-L.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Sherardizing. C. T. Flachbarth and W. H. Taylor. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 511-513.

Steel articles coated by heating in contact with Zn vapor. Structure of coating. (L15; ST, *Zn*)

691-L.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Zinc-Rich Paints. G. W. Ashman. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 513-523.

Protection of iron and steel with paints containing metallic Zn. Coating properties. (L26n; ST, Zn, Fe, NM-g30)

692-L.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Hot-Dip Galvanizing of Sheet by Conventional Pot Methods. Nelson E. Cook. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 465-468.

Galvanizing cut length steel sheets; limitations of process. (L16; ST, *Zn*, 4-53)

693-L.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Hot-Dip Galvanizing of Sheet in Continuous Lines by the "Cook-Norteman" Process. Nelson E. Cook. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 468-471.

Application of tight Zn coating to pre-fluxed and preheated steel strip. Induction heating of Zn baths. (L16, 1-61; ST, *Zn*, 4-53)

694-L.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Hot-Dip Galvanizing of Sheet in Continuous Lines by the "Sendzimir" Process. Kasimir Oganowski. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 472-479.

Oxidation and reduction processes for cleaning steel strip. Temperature control; galvanizing. (L16, L12, 1-61; ST, *Zn*, 4-53)

695-L.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Hot-Dip Galvanizing of Sheet by Continuous-Line Operations at the United States Steel Corp. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 479-483.

In-line cleaning, bright annealing and galvanizing of steel strip. (L16, L12, J23a, 1-61; ST, *Zn*, 4-53)

696-L.* (German.) Correct Choice of Flux for Hot Galvanizing. H. Bablik, F. Gotzl and R. Kukaczka. *Metall*, v. 13, Aug. 1959, p. 730-734.

Importance of washing, subsequent to pickling, on the quality of Zn plate. Effect of surface tension of the flux over the range of 20-455° C. Temperature distribution in the flux layer covering the bath surface. (L16; ST, 4-53, RM-q)

697-L.* (German.) Mechanism of the Protection of Zinc and Cadmium by Chromate Coatings. J. Elze. *Metall*, v. 13, Aug. 1959, p. 740-742.

Tests on the porosity of protective layer. Exposure to distilled water, solutions containing $ZnSO_4$, sea water and a phthalate buffer solution of acidity similar to that of fresh water (pH 6), free of chlorides. Protection takes place by the retardation of anodic or cathodic reactions. 4 ref. (L14c, R10; Zn, Cd)

698-L. Ceramic Coated Furnace Rolls Insure Better Silicon Strip. *Steel*, v. 145, Sept. 28, 1959, p. 134, 137.
(L27, W27p)

699-L. Future of Aluminum Enamelling. P. E. Gilroy. *Vitreous Enamellers Institute, Bulletin*, v. 9, July-Aug. 1959, p. 150-154.
Application and limitation of the process. (L27; Al)

700-L.* Fundamental Considerations in Polishing and Buffing. Lester F. Spencer. *Metal Finishing*, v. 57, Sept. 1959, p. 60-67.
Types of finishes; factors influencing surface finishing; buffs and polishing wheels; adhesive and abrasive compounds. Finishing of carbon and stainless steels, Mg alloys, Al, Cu and Ni and their alloys. (L10a, L10b; Al, Cu, Ni, CN, SS)

701-L.* Plating Time Determinations. Edward F. Duffek. *Metal Finishing*, v. 57, Sept. 1959, p. 77.
Test panel and "copper coulometer" methods of time and thickness determinations. Sample equations; table of common electroplated metals and their weights per unit area for 0.0001 in. (L17b)

702-L.* Electropolishing of Aluminum, Review and Literature Survey 1946 to 1958. Anton F. Mornheim. *Metal Finishing*, v. 57, Sept. 1959, p. 80-84.
Some 108 literature and patent abstracts from American, English, French, German, Japanese, Russian and other sources. (L13p, 10-54; Al)

703-L.* Science for Electroplaters. Pt. 50. Copper Plating. Pt. 2. L. Serota. *Metal Finishing*, v. 57, Sept. 1959, p. 85-88.
Anode sludge formation; influence of anode quality and impurities in acid bath on deposition. Electroforming procedures; molds and mandrels; applications. (L17, L18; Cu)

704-L.* (German.) Electrolytic Conductivity of the Binding Substance in Zinc Powder Protective Paints. Martin Kuhn, Klaus Rohardt and Jan Vliegenthart. *Farbe und Lack*, v. 65, Sept. 1959, p. 506-509.
Steel sheet was painted using various binding substances to determine the cathodic protection of Fe by Zn powder present in paint. In subsequent corrosion tests by exposure to an $NaCl + SO_2 + H_2O$ atmosphere, paint with basic binders provided the best corrosion protection. 4 ref. (L26n, R10d; ST, 4-53, NM-g30, *Zn*)

705-L.* Determination of Sulfuric Acid in Copper Plating Baths. M. R. Verma, V. M. Bhuchar, S. K. Mathur and S. S. Sharma. *Chemist-Analyst*, v. 48, June 1959, p. 41.
When a neutral potassium oxalate solution is added to an acidic copper plating solution the soluble copper-oxalate complex forms. If it is present at a molar ratio of oxalate to Cu of 3:1 or more the complex does not hydrolyze even when an excess of alkali is added. The free acid can then be titrated with standard caustic solution without interference by the Cu present. (L17a, 1-54; Cu)

706-L.* Influences of Hydrogen in Vitreous Enamelling of Steel. Gordon P. K. Chu. *Institute of Vitreous Enamellers Bulletin (Silver Jubilee Conference Edition)*, Sept. 1959, p. A1-A17.
Effects of hydrogen upon enamelling processes in relation to its evolution from the steel substrate. Evolution is determined by the diffusion and occulsion of hydrogen within the steel. (L27; ST, *H*)

707-L.* Blistering of Wet Process Vitreous Enamels on Cast Iron—Some Facts and Theories. E. R. Evans and A. D. Morgan. *Institute of Vitreous Enamellers Bulletin (Silver Jubilee Conference Edition)*, Sept. 1959, p. A19-A29.
Blistering has been associated with the presence of a casting skin. Evidence indicates that evolution of oxides of carbon from the iron causes blistering independently of any casting skin effect. (L27; CI, 9-71)

708-L.* Pinholes and Blistering of Enamelled Cast Iron. C. A. Saunders. *Institute of Vitreous Enamellers Bulletin (Silver Jubilee Conference Edition)*, Sept. 1959, p. A31-A37.
Pinholes and blistering are dependent on chemical composition, impurities, entrapped gas, and local hardening. (L27; CI, 9-68, 9-71)

709-L.* Metallic Abrasives Prepare Surfaces for Enamelling. J. P. S. Jenner. *Industrial Finishing (London)*, v. 11, Aug. 1959, p. 28-29.
Steel and chilled iron shot or grit for blasting iron and steel surfaces. (L10c, W2a; ST, CI)

710-L.* Electropolishing Techniques for Metals and Alloys. S. Gruettner. *Industrial Finishing (London)*, v. 11, Aug. 1959, p. 49-50, 50, 52.

Conditions for electropolishing Cu and its alloys, Ni, Zn, Fe and steels in phosphoric acid type baths. (L13p; Cu-b, Zn, Ni, ST, SS)

711-L.* Production of Embossing Plates From Texture Patterns by Electroforming Methods. John P. Young and Vernon A. Lamb. *Plating*, v. 46, Sept. 1959, p. 1033-1036.

Mounting of specimens; duplication of pattern; metallizing surface of mold; electroforming Ni-Cu replicas of pattern; joining to make a large master. 10 ref. (L18; Ni, Cu)

712-L.* Cleaning and Preparation of Metals Prior to Electroplating. Pt. 12. Effect of Fatty Acid Film. Henry B. Linford and Jean J. Grunwald. *Plating*, v. 46, Sept. 1959, p. 1039-1045.

Adherence of Ni plating on Cu specimens soiled with stearic acid films of varying thickness. Effect of greasy impurities on hydrogen bubble attachment and pitting. Literature survey. 30 ref. (L12, L17c, Q10c; Cu, *Ni*)

713-L.* Progress Toward the Development of a Nonembrittling Cadmium Electroplating Process. Pt. 2. Use of Aliphatic Amino Acids as Complexing Agents in Aqueous Baths. P. N. Vlannes and S. W. Strauss. *Plating*, v. 46, Sept. 1959, p. 1046-1051.

Throwing power and current density characteristics of ammoniacal Cd bath containing aliphatic mono-amino-acid. Results of delayed fracture tests on notched Cd plated AISI 4340 steel specimens indicate less embrittlement with amino acid baths than with standard cyanide solutions. 6 ref. (L17a, Q26s; AY, *Cd*)

714-L.* Decorative High Chloride Nickel Plating. Melvin Tippman. *Plating*, v. 46, Sept. 1959, p. 1054-1056.

Bath composition and operation for Plating Ni on steel, Al or Cu plated Zn. Causes of roughness, skips and cloudy plate. Advantages of high chloride bright plating baths. Corrosion resistance and appearance. (L17a; ST, Al, Zn, *Ni*)

715-L.* Plating Speeds Aluminum Soldering. William J. Ross. *Welding Design & Fabrication*, v. 32, Sept. 1959, p. 66.

Brush electroplating covers Al with easily soldered Ni surface. (L17; Al, *Ni*)

716-L. The Sulphuric Acid Recovery Plant in the Acid Circuit of a Wire Pickling Plant. W. Mallach. *Draht (English Edition)*, no. 42, Aug. 1959, p. 102-109.

Means of conserving water and achieving optimum acid recovery in $FeSo_4 \cdot 7H_2O$ process. (L12g, A8b; ST, 4-61)

717-L. A Modern Batch-Type Electric Furnace. Supplies Heat for Enamelled Holloware. *Industrial Finishing (London)*, v. 11, Aug. 1959, p. 32.

(L27, 1-52)

718-L. Modern Materials and Techniques. *Industrial Finishing (London)*, v. 11, Aug. 1959, p. 34-35.

Vitreous enamel and its application to cast iron and steel. (L27; CI, ST)

719-L.* Ceramic Coatings for Light Metals. G. L. Geltman and P. A. Huppert. *Ceramic Age*, v. 74, Sept. 1959, p. 32-39.

Use of ceramic containing lithium compounds to coat Al and Mg alloys. Results or tests for spalling, thermal shock, heat-transfer, reflectance, heat resistance, impact strength, adherence and dielectric strength. (L27; Al-b, Mg-b)

720-L. Development of Uranium Nitride—Stainless Steel Dispersion Fuel Elements. Stan J. Paprocki, Donald L. Keller, George W. Cunningham and Andrew K. Foulds, Jr. Battelle Memorial Institute. *U. S. Atomic Energy Commission*, BMI-1365, July 31, 1959, 19 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Fabrication procedures for stainless steel clad flat-plate fuel elements having a core of 28% uranium nitride dispersed in 318 stainless steel. The preparation of uranium nitride and its compatibility with the alloy matrix are investigated with the effects of fabrication variables on tensile strength, bend strength and corrosion behavior. 4 ref. (L22, T11g; U)

721-L.* Effect of an Ultrasonic Field, Applied During Electrolytic Zinc Plating, on the Elastic Properties of Steel. A. M. Ginberg and A. P. Gorina. *Metallovedenie i Termicheskaya Obrabotka Metallov*, no. 8, 1959, p. 20-24.

Electrolytic degreasing and galvanizing in a cell exposed to ultrasonic waves. By this measure, the time of operation is foreshortened and the decrease of elasticity, due to hydrogen absorbed in the electrolytic process, is partly eliminated. 7 ref. (L17, 1-74, N15e, Q21, 2-60; ST, H, *Zn*)

722-L.* Duplex Chromium. Edgar J. Seyb, Jr. *Die Casting Engineer*, v. 3, Sept. 1959, p. 9-12.

Results of Corrodkote tests and copper-accelerated acetic acid salt spray tests on Duplex and ordinary Cr; effects of plating thickness on corrosion. (L17, R11j; Cr)

723-L.* When Cleaning Aluminum. *Modern Metals*, v. 15, Sept. 1959, p. 38, 40, 44, 46.

Chemical, electrolytic and ultrasonic cleaning or Al parts. (L-general; Al)

724-L.* For a Good Mechanical Finish. *Modern Metals*, v. 15, Sept. 1959, p. 48, 50, 54, 56, 58, 60, 62.

Use of grinding, polishing, buffing, embossing, hammering, and blasting in finishing Al. (L10; Al)

725-L.* Chemical Finishing of Aluminum. *Modern Metals*, v. 15, Sept. 1959, p. 64, 66, 71, 72, 74, 76, 78.

Etching, desmutting, conversion coating, brightening and chemical polishing. (L12, L14; Al)

726-L.* Anodizing and Plating Aluminum. *Modern Metals*, v. 15, Sept. 1959, p. 80, 84, 86, 88, 90-91.

Pretreatment coloring, racks, sealing and electropolishing. (L19, L13; Al)

727-L.* Organic Coatings for Aluminum. *Modern Metals*, v. 15, Sept. 1959, p. 94, 96, 98, 100, 102.

Types of finish coats; dip painting; spray painting; lacquering. (L26, L26n; Al)

728-L.* Porcelain Enameling Aluminum. *Modern Metals*, v. 15, Sept. 1959, p. 104-106, 108, 110.

Design considerations; pretreatment frits; color applications; new developments. (L27; 17-51, Al-b)

729-L.* (Russian.) Bimetals and Their Manufacture. L. E. Miller. *Tsvetnye Metally*, no. 7, 1959, p. 59-69.

Manufacture of Invar-Ni, Invar-brass and Invar-beryllium bronze bimetals. (L22; SGA-s, Cu-n, Be-b)

730-L.* New Bonding Process Gives Added Versatility to Cladding. R. A. Davis. *Corrosion*, v. 15, Oct. 1959, p. 88-90.

Use of high vacuum, heat and atmospheric pressure. Stainless steels and nonferrous metals may be used on backing plate; stainless steels, Ni and its alloys and other nonferrous metals are used as cladding. (L22; SS, Ni)

731-L.* Methods for Investigating the Characteristics of Reactive Coatings. Max Kronstein. *Corrosion*, v. 15, Oct. 1959, p. 508t-512t.

Composition and formation of coatings formed by phosphatizing, pickling and sealing. (L14)

732-L.* (Russian.) Hard Surfacing by Welding With a Sheet-Like Electrode. B. M. Kontorov and N. V. Popova. *Svarochnoe Proizvodstvo*, Sept. 1959, p. 27-30.

Granulated flux is spread on the surface of part, the electrode sheet is laid against the surface, flux is spread on the upper surface of electrode and a Cu plate is put on the top to keep the flux in place. (L24, K1; ST)

733-L. New Ceramic Coatings Protection at 3000° F. A. V. Levy. *Ceramics*, v. 10, Aug. 1959, p. 17-20.

Flame-spraying ceramic refractory coatings on steel surface prepared by grit-blasting. Ceramic is applied either as powder or pressed sintered rods. (L27, L10c, 2-62; ST)

734-L. Electroforming of Intricate Electronic Components. E. B. Murphy. *Electronics*, v. 32, Sept. 11, 1959, p. 114-117.

Electrochemical deposition of metal onto a mandrel or into a mold made of plastic which has been made surface-conducting by chemical treatment. A thick plating layer is deposited, with periodic current reversal for smooth surface. (L18)

735-L. Recent Developments of Finishes and Application Techniques for Vacuum Metallizing Plastics. M. A. Self. *Society of Plastics Engineers, 14th Annual Technical Conference*, v. 4, 1958, p. 648-653.

Methods of vacuum deposition of Al upon plastic, obtaining adherence to the substrate by resin coating. (L25g; Al)

736-L. Development of Metal Coating in Australia. *Australasian Manufacturer*, v. 44, Sept. 5, 1959, p. 44-47.

Spraying system for coating Fe and steel with nonferrous metals. (L23)

737-L. Ceramic-Coated Stampings Chosen for High-Temperature Service. Carter C.

Higgins. *Metalworking*, v. 15, Oct. 1959, p. 113-115.
(L27; 4-59)

738-L.* Role of Thiourea in the Electrodeposition of Copper. Bacon Ke, John J. Hoekstra, Bienvenido C. Sison, Jr., and Dan Trivich. *Electrochemical Society, Journal*, v. 106, May 1959, p. 382-388.
Uniform adsorption of thiourea causes deposits of uniform bright polycrystalline plating. Radioactive tracer studies of thiourea adsorption. 25 ref. (L17a, N12d, 1-59; Cu)

739-L.* The Source of the Nitrogen Impurity in Electrodeposited Chromium. N. Ryan and E. J. Lumley. *Electrochemical Society, Journal*, v. 106, May 1959, p. 388-391.
Nitrate ion concentration in electrolyte. Ammonium compounds and dissolved nitrogen have no effect. 6 ref. (L17, 3-69; Cr)

740-L.* Electroplating on Thorium. John G. Beach and Glenn R. Schaer. *Electrochemical Society, Journal*, v. 106, May 1959, p. 392-393.
Previous anodic and chemical pickling permits adherent electroplating of Al, Cr, Cu, Fe, Ni, Ag, In, Zn, Pb and Sn. 8 ref. (L17; Th, *Al, Cr, Cu, Fe, Ni, Ag, In, Zn, Pb, Sn*)

741-L.* The Effect of Magnesium Salts on Nickel Plating Baths. Ahmad Geneidy and W. A. Koehler. *Electrochemical Society, Journal*, v. 106, May 1959, p. 394-403.
Lower nickel deposition potential; reduced cathode polarization; slightly increased cathode efficiency; improved throwing power; reduced coating porosity; harder, stronger, less ductile deposits. High Mg concentration is necessary. 106 ref. (L17a, 2-60; Ni)

742-L.* Electrodeposition of Adherent Titanium Coatings on Induction Heated Cathodes in Fused Salts. B. J. Fortin, J. G. Wurm, L. Gravel and R. J. A. Potvin. *Electrochemical Society, Journal*, v. 106, May 1959, p. 428-433.
KI-KF bath with soluble titanium anode produces smooth, uniform coating on steel cathode. KI-NaI with TiI_4 bath gave dendritic Ti deposit. 7 ref. (L17, C23p; Ti)

743-L.* Molybdenum Plating Inside of Large Bore Tubes. Paul L. Raymond. *Electrochemical Society, Journal*, v. 106, May 1959, p. 444-448.
Equipment and techniques for plating of steel by hydrogen reduction of $MoCl_5$ under vacuum. Effect of variables on plating quality. (L25k, L28; ST, *Mo*)

744-L.* Electroplating of Nickel From the Pyrophosphate Bath. S. K. Panikkar and T. L. Rama Char. *Electrochemical Society, Journal*, v. 106, June 1959, p. 494-499.
Satisfactory deposits are attained over wide range of operating conditions. Effect of addition agents. 24 ref. (L17, 2-60; Ni)

745-L.* Polarization and Polishing Studies on Cu in a Hull Cell. Indra Sanghi and V. R. Ramanathan. *Indian Academy of Sciences, Proceedings*, Section A, v. 49, May 1959, p. 281-292.
Effects of polishing time, specific gravity of the electrolyte, addition of E.D.T.A., electrolyte level on the position, size and shape of the variously polished bands in a Hull cell. (L13p; Cu)

746-L.* Finishing Pointers. Cadmium Plating High Strength Alloy Steels. Elimination of Hydrogen Embrittlement. Ed Calderon. *Metal Finishing*, v. 57, Oct. 1959, p. 76.
Use of improved plating solutions. (L17a; ST, *Cd*)

747-L.* A Survey of the Factors Controlling Metallic Diffusion From the Gas Phase. R. Samuel. *Murex Review*, v. 1, no. 18, 1958, p. 501-527.
Characteristics of diffusion coatings; interstitial, vacant site and grain-boundary diffusion; kinetics and thermodynamics of coatings. Diffusion methods from gas phase including chromizing, siliconizing of ferrous metals, Ni and Mo. 34 ref. (L15, N1; Mo, Fe, Ni, *Cr, Si*)

748-L.* Metallizing Applications for Wear Resistance and Salvaging. Knowles B. Smith. *Society of Automotive Engineers*, Preprint no. 40 S, 1959, 6 p.
Influence of coating composition on coating hardness, abrasion and oxidation resistance. (L23, Q9; 8-67)

749-L.* (Dutch.) The Importance of the Oxy-Acetylene Flame in Hard Surfacing. W. Jansen. *Lastechniek (NVL)*, v. 25, Sept. 1959, p. 237-239.
Hard surfacing with a reducing flame has advantage in that the melting point of

a very thin surface layer of the base metal is lowered by increase of the carbon content. This results in a very thin molten layer, very slight penetration of the deposited metal and reduced mixing with the base metal. (L24, K2h)

750-L.* Dry-Cleaning for Metals. *Corrosion Technology*, v. 6, July 1959, p. 210-211.

Current methods of vapor degreasing with trichloroethylene. (L12)

751-L.* Progress Toward the Development of a Nonembrittling Cadmium Electroplating Process. Pt. 3. The Use of Triethanolamine in Cadmium Plating Solutions. P. N. Vlannes, S. W. Strauss and B. F. Brown. *Plating*, v. 46, Oct. 1959, p. 1153-1157.

Plating of steel and Cu with Cd is improved by the use of triethanolamine in the plating bath. The brittleness of the platings is influenced by the temperature and current density. (L17a, 2-61; ST, Cu, *Cd*)

752-L.* An Outline of the Chemistry Involved in the Process of Catalytic Nickel Deposition From Aqueous Solution. Pt. 1. G. Gutzeit. *Plating*, v. 46, Oct. 1959, p. 1158-1164.

Catalytic electroless plating of metal with Ni is made possible by the reduction of Ni by sodium hypophosphite in the plating bath. The rate of deposition of Ni upon the surface to be plated is inversely proportional to the amount of complexing substances within the bath. (L28; Ni)

753-L. Granodising, Anodising, Alochroming at Hoovers. *Industrial Finishing (London)*, v. 11, Sept. 1959, p. 30-31.

Anodizing procedure includes cleaning and etching in caustic soda and acid, rinsing, immersion in dilute H_2SO_4, through which an electric current passes, and sealing in boiling water. Alochroming, which gives a protective oxy-chromatic film, is used rather than anodizing for Al castings. (L19; Al)

754-L. When to Consider Automatic Spray Equipment. Warren Beach. *Metal Finishing*, v. 57, Oct. 1959, p. 69-71, 76.

Advantages of automatic spraying and comparison with manual spraying. (L23, 18-74)

755-L. Fluidized Bed Coating. Solution to Difficult Finishing Operation. Walter R. Pascoe. *Metal Finishing*, v. 57, Oct. 1959, p. 74-75, 80.

New method of coating metals with plastics. (L26p)

756-L. Science for Electroplaters. Pt. 51. Copper Bath Analysis. L. Serota. *Metal Finishing*, v. 57, Oct. 1959, p. 77-80.

Gravimetric and volumetric analysis. (L17a, S11b, S11j; Cu)

757-L. Metal Degreasing. *Metal Treatment and Drop Forging*, v. 26, July-Aug. 1959, p. 291-292.

Use of liquid and vapor trichloroethylene. (L12j, L12h)

758-L.* Electrophoretic Plating Is Reborn. Robert A. Keeler and Louis C. Terminello. *Metalworking Production*, v. 103, Oct. 2, 1959, p. 1563-1564.

Electrophoresis is the movement of charged colloidal particles in a liquid by application of an electrostatic field. If two electrodes are immersed in a prepared suspension and a potential applied to them, the suspended material is deposited on one of the electrodes. The coating is obtained by connecting the workpiece as one of the electrodes and immersing it in the suspension. (L29p)

759-L.* Internally Coated Steel Drums. R. Zuideveld. *Corrosion Technology*, v. 6, July 1959, p. 212.

Manufacture and interior lacquer coating of plain steel drums which hold products incompatible with plain steel. Lacquer is not applied to the flat sheet prior to manufacture but rather to the completed drum components before assembly. (L26n, W12c; CN)

760-L.* The Anodic Oxidation of Zinc and a Method of Altering the Characteristics of the Anodic Films. H. Fry and Marjorie Whitaker. *Electrochemical Society, Journal*, v. 106, July 1959, p. 606-611.

Investigation of Zn and Zn alloys in alkaline solutions. Autoclaving in silicate solutions improves corrosion and abrasion resistance. 16 ref. (L19q; Zn)

761-L.* Some Investigations Into Bright Finishing in Nickel Baths and the Influence of Impurities. A. Chaybany. *Metal Finishing Journal*, v. 5, July-Aug. 1959, p. 263-268.

Action of brightening agent in Ni plating baths. Gloss destroying properties

of chloride compounds. Bath compositions and influence of Co, Fe and Cu impurities on brightness of plating. Bath treatment and purification. (L12a, 3-69; Ni, *Co, Fe*)

762-L.* The Production of Anodic Finishes in Automatic Plants. A. W. Brace. *Metal Finishing Journal*, v. 5, July-Aug. 1959, p. 269-274, 282.

Experiences and problems in automatic anodizing of Al; brightening, anodizing, dying and sealing procedures. Plant layout. (L19, 18-74; Al)

763-L.* Aluminized Steel—Its Properties and Uses. K. G. Coburn. *Metallurgia*, v. 60, July 1959, p. 17-20.

Weight, microstructure, heat resistance, reflectivity and corrosion resistance of hot dipped Al and Al-Si alloy coatings. Physical and mechanical properties of aluminized low carbon steel; fabrication and uses. (L17, Q-general; CN-g, *Al*, 8-72)

764-L.* Automatic Plating in Three Ways at Once. Nathan Sussmann. *Product Finishing*, v. 12, Aug. 1959, p. 54-58.

Layout and operating sequence for automatic electrodeposition of Ni followed by brass, bronze or Cr electroplating. (L17, 18-74; *Ni, Cu-n, Cu-s, Cr*)

765-L.* Organic Finishes for Metal. Pt. 2. B. M. Letsky. *Product Finishing*, v. 12, Aug, 1959, p. 60-62.

Surface preparation; comparative evaluation of phosphating and etch primer processes. (L14b)

766-L.* Razor Parts Plated Automatically. *Product Finishing*, v. 12, Aug. 1959, p. 67-71, 98.

Sequence and equipment for automatic electrodeposition of 20% Co-80% Ni alloy on brass razor parts. (L17, 18-74; Cu-n, *Ni-b, Co*)

767-L. Continuous Coating of Aluminum or Steel Strip. William M. Bevis and Allen S. Dawe. *Industrial Heating*, v. 26, Sept. 1959, p. 1788-1790, 1792, 1794, 1796, 1798, 1800, 1802.

New coating installation which can handle strip 60 in. or wider an entire operation, thus lowering production costs. Finishes now available permit shearing, slitting, forming, piercing and other fabrication processes without damage to finished surface. (L26, 1-61; 4-53, ST)

768-L. Developments in I.C.I. Trichloroethylene Degreasing Equipment. *Machinery (London)*, v. 95, Sept. 2, 1959, p. 399-402. (L12, 1-52)

769-L.* Zinc Coatings on Iron and Steel. Pt. 2. Methods of Applying Zinc Coatings to Iron and Steel Surfaces. A. K. Parker. *Metal Finishing Journal*, v. 5, Sept. 1959, p. 313-322.

Methods of applying the coatings; nature of coating formed; practical advantages and limitations. 14 ref. (L16, L23, L17; *Zn*, ST)

770-L.* Ceramic Coatings Fight Heat and Corrosion. W. J. Plankenhorn. *Metal Products Manufacturing*, v. 16, Nov. 1959, p. 46-48, 84.

Physical, thermal, electrical and chemical properties, processing and typical uses of ceramic coatings on metal. (L27, Q-general, P15; 8-71)

771-L.* Coating Coil Steel in 48-In. Width. *Metal Products Manufacturing*, v. 16, Nov. 1959, p. 54-58.

Plastic and other organic coatings. Cleaning, coating and bonding; results of tests of bond strength, abrasion and stain resistance. (L26p; ST, 4-53)

772-L. Preparing Zircaloy-2 for Autoclave Testing. The Pickling and Rinsing Process. D. W. Shannon and B. Griggs. Hanford Atomic Products Operation. *U. S. Atomic Energy Commission*, HW-60533, July 1, 1959, 78 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $2.25.

Pickling and rinsing processes developed to prepare Zircaloy-2 plutonium recycle test reactor (PRTR) fuel elements for autoclave corrosion. (L12g, L12e, R10c; Zr-b)

773-L.* (Czech.) Properties of the New Ni-Cr Hard Surfacing Alloy "Real NB". K. Lobl. *Zvaranie*, v. 8, Aug. 1959, p. 227-229.

Alloy developed for use in engine parts for corrosion and wear resistance. Surfaces revealed structural stability up to 700-800° C. Data on eutectics of the alloy. (L24; Ni-b, *Cr*, SS, SGA-m)

774-L.* (English.) Studies in Cladding. Eihachiro Tanaka and Tadatsugu Yoshiki. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, Aug. 1959, p. 317-331.

24S, 56S and 75S Al alloys are bonded by hot rolling, hot extrusion and cold rolling. Conditions under which ripples and cracks occur; suggested remedies for elimination of such defects. (L22, F23, F24; Al-b, 9-71, 9-72)

775-L. Metal Spraying in the Protection of Iron and Steel. T. P. Hoar. *Metal Finishing Journal*, v. 5, Sept. 1959, p. 303-307.

Metal spraying of Al and Zn by wire, powder spraying or molten metal techniques; grit and sand blasting processes for surface preparation before spraying. (L23, L10c; ST, *Al, Zn*)

776-L. Painting Sprayed Metal Coatings. L. A. Jordan. *Metal Finishing Journal*, v. 5, Sept. 1959, p. 307-312.

Advantages and limitations of Zn and Al sprayed metal coatings. Effects of environment, physical form, porous structure and chemical activity of sprayed metal. (L23, L26; Al, Zn, 8-67)

777-L.* (Japanese.) Coating of Diesel Engine Precombustion Chambers. Hiroharu Uchiyama. *Metal Finishing Society of Japan, Journal*, v. 10, Aug. 1959, p. 289-293.

Coating of SS34B and SEH3 stainless steel with Al. (L12g, L16; SS, *Al*)

778-L.* (Japanese.) Treatment of Aluminum Before Plating. Matsuhei Kishi. *Metal Finishing Society of Japan, Journal*, v. 10, Aug. 1959, p. 293-297.

Adhesive quality of plating on Al as influenced by pretreatment. 22 ref. (L12, L17; Al)

779-L. Let Phosphates Reduce Friction. *Iron Age*, v. 184, Oct. 29, 1959, p. 127.

Phosphate used as a rustproof coating and for lubricity on moving parts. (L14b, Q9)

780-L. (Russian.) Enameling of Aluminum. K. P. Azarov and V. E. Gorbatenko. *Tsvetnye Metally*, no. 1, 1959, p. 79-82.

10 ref. (L27; Al)

781-L.* (Japanese.) Vibratory Electrolytic Polishing in Phosphoric Acid. Takakado Nakayama. *Light Metals*, v. 9, July 1959, p. 13-21.

The reflectivity produced by electrolytic polishing of Al is dependent upon the impurities. (L13p; Al-a)

782-L.* Nature of Adherence of Porcelain Enamels to Metals. B. W. King, H. P. Tripp and W. H. Duckworth. *American Ceramic Society, Journal*, v. 42, Nov. 1, 1959, p. 504-525.

Good adherence is the result of metal-to-metal bonds between the atoms in the base metal and the proper metallic ions in the enamel. It is essential that the enamel at the interface must be saturated with an oxide of the metal and this oxide must be one which, when in the solution, the glass will not be reduced by the metal. (L27)

783-L.* Anodic Oxidation of Aluminum Alloys. R. E. Pettit. *Precision Metal Molding*, v. 17, Nov. 1959, p. 73-75, 82-86, 88, 90, 92.

Review of sulphuric acid, phosphoric acid and boric acid processes. (L19; Al-b)

784-L.* (Czech.) Hard Surfacing Alloys. K. Lobl. *Zvaranie*, v. 8, July 1959, p. 200-206.

Application of stellites to pressure vessel fabrication; chemical composition; tightening capacity of fittings; wear properties as a function of pressure is a limiting factor in the strength requirements demanded from the stellite materials. (L24, T26q; SGB-q)

785-L.* (German.) Surface Treatment and Material Behavior. H. Wiegand. *Metalloberflache*, v. 13, Aug. 1959, p. 226-228.

Importance of the interim surface treatment such as phosphating as a preliminary step to final surface treatment. Bend strength is dependent on thickness of the nitride layers. (L14b, L24, Q5k)

786-L.* (German.) Long-Time Strength of Chromium Hard Plated Carbon Steel. H. Wiegand and H. R. Kaiser. *Metalloberflache*, v. 13, Aug. 1959, p. 249-254.

Carbon steel C-45 is influenced by a phosphor-acid bath and SRHS-electrolyte. The layer-growth and permanent bending strength is analyzed. Influence of immersion time, current density and bath conditions on strength properties. (L17c, Q5g; *Cr*, CN)

787-L.* (German.) Influence of Wetting Agents on the Hardness of Electrolytically Deposited Nickel Layers. H. Spahn. *Metalloberflache*, v. 13, Aug. 1959, p. 259-264.

Iron-active fatty alcoholic sulphates, if added in only small concentrations to a galvanic bath, decrease the hardness from 340 to 190 kg. per sq. mm. A minimum content of 300 mg. per liter of

lauryl sulphate prevents any pore formation. The decreased hardness is often desired if increased ductility is necessary. (L17a, Q29n; Ni, 8-62)

788-L.* (German.) Theory of Bright Plating Baths. R. Weiner. *Metalloberflache*, v. 13, Sept. 1959, p. 269-273.

Reactions and results achieved by various agents in galvanizing bath vary widely. The curve of current density versus cathodic potential of the bath is changed by the brightening agents in a positive or negative manner. (L17a; Zn)

789-L.* (German.) Metallic Protective Coats. H. Reiniger. *Werkstoffe und Korrosion*, v. 10, Aug. 1959, p. 477-489.

Use of sprayed layers of Al, Zn, Cd and Pb as corrosion resisting coatings. Uniformity in thickness can be achieved only by mechanical spraying. Coating thickness and spray losses are dependent on the sprayed surface area. (L23; Al, Zn, Cd, Pb)

820-L.* Improvements in Metal-Diffusion Techniques. *Corrosion Technology*, v. 6, Sept. 1959, p. 267-268.
Dicrom diffusion process produces diffusion depth of between 1 and 15 mil.,

with surface purity of Cr always above 60% and up to 93% while overcoming defects and disadvantages of early techniques. (L15; ST, *Cr*)

821-L.* Practical Aspects of Electroless Nickel Plating. R. A. Edge, *Corrosion Technology*, v. 6, Sept. 1959, p. 285.

Electroless plating is extremely useful for plating objects having irregular and complicated shapes. Attention must be paid to filtering the plating solutions before use; the plating bath must be maintained at the correct temperature; correct pH control of the plating solution is essential for efficient plating. 6 ref. (L28; *Ni*)

822-L.* Electroclad Aluminum on Uranium. John G. Beach and Charles L. Faust. *Electrochemical Society, Journal*, v. 106, Aug. 1959, p. 654-659.

Uranium electroclad with 12 mils of Al over a 0.5-mil Ni or Ni plus Cu electroplate resists corrosion for more than 100 hr. in boiling water. Hot pressing improved corrosion resistance. 12 ref. (L22, R-general; Al, *U*, 8-66)

823-L.* Glycerol Baths for the Electrodeposition of Molten Indium or Indium-Cadmium Alloy. A. J. Certa, T. J. Manns, G. L. Schnable and H. S. Segal. *Electrochemical Society, Journal*, v. 106, Aug. 1959, p. 690-693.

Alloys of eutectic composition of 75% In and 25% Cd were deposited in the form of beads on the end of a 0.05-mm. Ni wire in 2 sec. (L17; In-b, *Cd*, Ni)

824-L.* Plating on Aluminum Using an Iron Inter Layer. Pt. 1. Application of an Iron Inter-Layer With Subsequent Flash-Plating of Copper or Brass. D. S. Tandon and T. Banerjee. *Indian Institute of Metals, Transactions*, v. 12, Mar. 1959, p. 37-44.

Conditioning of the Al prior to plating is essential. Effect of intermediate electrodeposition of brass or Cu in relation to the properties of final plated layers of Ni and other metals. The adhesion of Ni plating (with or without subsequent Cr deposition) obtained by these means and under controlled conditions on Al is highly satisfactory as judged by the usual qualitative adhesion tests. 12 ref. (L17; Al, *Fe, Cu*, Cu-n)

825-L.* Plating on Aluminum Using an Iron Inter Layer. D. S. Tandon and T. Banerjee. Pt. 2. Application of an Iron Inter Layer Without Subsequent Flash-Plating of Copper or Brass. *Indian Institute of Metals, Transactions*, v. 12, Mar. 1959, p. 45-53.

Fe was deposited by immersion in a ferric chloride solution at 90-95 C. and Ni was then directly electroplated on it. The adhesion of the Ni deposit was further improved by stoving at 250° ± 10° C. The adhesion of Ni on Al was good. 4 ref. (L17; Al, *Fe, Ni*)

826-L.* Plating on Aluminum Using an Iron Inter Layer. D. S. Tandon and T. Banerjee. Pt. 3. Use or Iron Inter Layer Deposited From Ferric Chloride Solution at Temperatures Lower Than 95° C. and Without Flash-Plating of Copper and Brass. D. S. Tandon and T. Banerjee. *Indian Institute of Metals, Transactions*, v. 12, Mar. 1959, p. 55-67.

Results obtained when an Fe interlayer was deposited from ferric chloride solution at temperatures lower than 90° C. When ferric chloride is used at 25° C. and below 70° C. for immersion deposit of Fe on Al and the final Ni-plated Al panel was heat treated at 250° C. immediately after Ni plating, some blisters were invariably formed. However, if the specimens after Ni plating were allowed to age for 24 hr. and then heat treated at 250° C., no blisters resulted. (L17, 2-64; Al, *Fe, Ni*)

827-L.* The Causes of Molding Matter and Sand Inclusions in Thin-Walled Iron Castings and Their Effects in Enamelling. P. Gobbels. *Institute of Vitreous Enamellers Bulletin*, v. 10, Sept. 1959, p. 158-162.

Cavities in castings produced by Croning process investigated by water-pressure tests. Acid content is determined by heat-extraction tests. Cavities occur through reaction between molten Fe and molding material causing gas formation. (L27, E16c; CI, 5-60, 9-71)

828-L.* Copper Electroforming of Heat Sinks for Missile Nose Cones. Frank D. Foley. *Plating*, v. 46, Nov. 1959, p. 1268-1274.

Electroforming of Cu-stainless steel heat sinks by Avco for the Titan nose cone. Difficulties associated with electroforming very thick deposits of Cu on a very large dish-shaped stainless steel shell. Chemical and physical properties of the electrodeposit. (L18, T24e; *Cu*, SS)

832-L. (Translation—ATS.) Preparation and Study of Phosphate Films on Zinc. I. V. Krotov. *Journal of Applied Chemistry of the U.S.S.R.*, v. 32, no. 9, 1959, p. 1952-1959.

21 ref. (L14b; Zn)

SECTION M

METALLOGRAPHY, CONSTITUTION and PRIMARY STRUCTURES

1-M.* Structure-Cell Data and Expansion Coefficients of Bismuth Telluride. M. H. Francombe. *British Journal of Applied Physics*, v. 9, Oct. 1958, p. 415-417.

Accurate measurements of the structure-cell parameters of bismuth telluride, Bi_2Te_3, have been made using annealed powders and etched rods cut from single-crystal ingots. Previously reported anomalies in the X-ray powder intensity data are found to originate entirely in preferred orientation of the crystallites. 8 ref. (M26c; Bi, Te)

2-M.* Metallography of Disturbed Uranium Surfaces. H. P. Roth and R. B. Russell. *Metal Progress*, v. 74, Oct. 1958, p. 140-141.

Micro-examination and X-ray diffraction work combined to provide data for accurate judgment. (M22g; U, 14-62)

3-M.* Effect of Cooling Rate on the Grain Size of Magnesium Casting Alloys. R. D. Green. *Modern Castings*, v. 34, Aug. 1958, p. 42-48.

The grain size of several Mg-Al-Zn alloys is established at 50° F. below the liquidus, while the grain size of Mg-rare earth-Zn alloy is established at 30° F. below the liquidus. Grain size and cooling rate correlated through the above ranges. In Mg-Al-Zn alloys the grain size decreases as the cooling rate increases to 200° F. per min.; cooling rate has little effect on grain size of Mg-rare earth-Zn alloy. Effect of cooling rate on grain size is explained on basis of constitutional supercooling and nuclei effectiveness. Nuclei in Zr-Mg alloys become effective with less undercooling than do those in Mg-Al-Zn alloys. 10 ref. (M27c, 2-61; Mg-b, *Al, Zn*)

4-M.* Climb of a Dislocation in a Twisted Whisker. F. R. N. Nabarro and P. J. Jackson. *Philosophical Magazine*, v. 3, Oct. 1958, p. 1105-1109.

The observation that twisted Hg whiskers have periodic imperfections separated by distances closely related to the pitch of the twist is explained by considering a dislocation which is approximately parallel to, but displaced from, the axis of the whisker. This dislocation is straight in cartesian coordinates, but helical in the coordinates provided by the crystal lattice. 5 ref. (M26b; 14-61, Hg)

5-M.* On the Stability of Dislocations in Metal Whiskers. J. P. Hirth and F. C. Frank. *Philosophical Magazine*, v. 3, Oct. 1958, p. 1110-1116.

Thermally activated slip of dislocations out of metal whiskers provides a mechanism for the cessation of whisker growth. A single axial dislocation will be in unstable elastic equilibrium if it has an edge component with respect to the whisker axis greater than a critical amount. Metastable dislocations with edge components less than this critical amount have an expectation time for slip out of the whisker which is dependent on whisker radius, temperature and the elastic properties of the whisker material. Effects on whisker morphology predicted by this mechanism. 12 ref. (M26b; 14-61)

6-M.* (Russian.) Investigation of Inner Grain Structure in Aluminum Casting. D. E. Obsienko and E. I. Sosnina. *Fizika Metallov*

i Metallovedenie, v. 6, no. 8, 1958, p. 433-443.

An Al casting with small additions of Si, Fe and Cu was subjected to X-ray photography and contour etching study. Three zones investigated are outer with a thin crust of minute crystals, columnar, and central zones with larger crystalline structures shown to be of complex crystalline formation. Various crystalline growth conditions affect grain structure of the three zones. The presence of alloy additions during the process of solidification affects the crystalline formation. 9 ref. (M27c; Al-b, 5-60)

7-M.* (Russian.) Determination of the Type of Equilibrium Diagram in Copper-Nickel Alloys at High Temperature. Pt. 2. Spectrum Analysis. L. S. Palathik, A. A. Levtchenko, A. F. Bogdanov and B. E. Tepletskiy. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 540-544.

In Cu-Ni binary alloys there are three types of liquid-vapor curves: the "cigar" type; the "cigar with a minimum"; and "cigar with a maximum"; each type answering its own definite curve. The vapor-liquid curve for Cu-Ni alloys is a "cigar with a minimum". (M24b; Cu, Ni)

8-M.* (Russian.) Effect of Elastic Tension on Crystal Structure of Silicon Iron. Ya. S. Schur and V. A. Zaikova. *Fizika Metallov i Metallcvedenie*, v. 6, no. 8, 1958, p. 545-555.

Under action of elongated tension, considerable changes occur in the magnetic crystalline structure of Si iron (3.5% Si). These depend upon tension magnitude, form of initial magnetic structure and tension orientation in relation to crystallographic direction in the crystal. Structure changes could be included in boundary displacements, size change and change in type of magnetic structure. Structural magnetic changes caused by elastic elongation may be irreversible. 6 ref. (M26, P16, 3-68; Fe, *Si*)

9-M.* Texture of Zinc and Cadmium Films Deposited on Fresh Cleavage Faces of Mica. V. R. Guru Moorti and M. K. Gharpurey. *Canadian Journal of Physics*, v. 36, Oct. 1958, p. 1319-1322.

Zn and Cd films condensed from vapor in vacuo on the two sides of mica cleavage exhibit well-matched textures in the corresponding regions on the two sides. In those cases where the deposition is due to the Frenkel mechanism of homogeneous nucleation, there is similarity in the gross features alone. When the condensation is due to the presence of "active" centers of nucleation on the mica surface, there is generally a "one-to-one" correspondence between the crystallites on the two faces. 5 ref. (M26c; 14-62, Zn, Cd)

10-M. (Russian.) X-Ray Investigation of Undistorted Steel. Pt. 1. M. Ya. Fuks and L. Ya. Goldschtein. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 512-516.

Investigation of the structure of a carbon steel with X-ray microcluster before and after distortion in a specially designed device. 7 ref. (M21f; CN)

11-M. (Russian.) Analysis of Metal Phases With Aid of X-Ray Diffractometer. D. M. Xheiker. *Zavodskaya Laboratoriya*, v. 24, no. 9, 1958, p. 1077-1083.

Device to study quantitative and qualitative aspects in phase changes, based on X-ray machine with ionized recording of rays and the intensity of their diffraction. 9 ref. (M22g, 1-53)

12-M. (Russian.) Electron Microscope Investigation of Internal Grain Structure of Powdered Tungsten. N. P. Vasil'eva, T. A. Sultanyan and I. N. Chaporova. *Zavodskaya Laboratoriya*, v. 24, no. 9, 1958, p. 1090-1091.

To study the submicrostructure, the powdered specimens were prepared by reduction of tungsten anhydrate with hydrogen at 900 and 1200°. (M20, M21e; W, 6-68)

13-M. (Russian.) Electron Microscope Investigation of Structure of Cermets. Z. V. Svistunova, I. P. Vasl'eva, T. A. Sultanyan and V. E. Kiselev. *Zavodskaya Laboratoriya*, v. 24, no. 9, 1958, p. 1093-1095.

New methods of preparing the impressions for study of hard alloys in carbide phase. Best results were obtained with impressions of Ti and lacquer materials which were tinted with Cr at an angle of 10-45°. 8 ref. (M20r, M21e; Ti)

14-M.* Design of Heat-Treatable Titanium Alloys. A. J. Williams. *Dept. of Mines*

and Technical Surveys, Mines Branch Research Report, Ottawa, Canada, no. R11, June 4, 1958, 26 p.

The Ti-rich corner of the 900° C. isothermal section of the Ti-Al-Mo constitutional diagram has been redetermined, based on a 4-hr. annealing time, and ternary tie-lines have been added. The presence of a three-phase field, $alpha_1$ + $alpha_2$ + beta, is indicated. A system for the design of heat treatable Ti-Al-Mo alloys, based on this isothermal section, is based on choice of the best beta composition available on solution treatment at 900° C, and the addition of controlled amounts of alpha of a fixed composition. 7 ref. (M24c; Ti-b, *Al, Mo*)

15-M.* Dislocation Etch Pits in Germanium. W. Bardsley, R. L. Bell and B. W. Straughan. *Journal of Electronics and Control,* v. 5, July 1958, p. 19-28.

Influence of the direction of the dislocation line on the shape of the etch pits produced on {111} faces of Ge single crystals. 10 ref. (M26b; Ge, 14-61)

16-M.* Study of Etching Structure on Aluminum by Transmission Electron Microscopy. R. Phillips and N. C. Welsh. *Philosophical Magazine,* v. 3, Aug. 1958, p. 801-805.

Extremely small cellular patterns (0.2 micron spacing) observed on acid-etch Al foil result from etching process and are not part of crystal structure. 9 ref. (M21e, M26n; Al, 4-56)

17-M.* Electro-Polishing Technique for Preparation of Metal Specimens for Transmission Electron Microscopy. Heather M. Tomlinson. *Philosophical Magazine,* v. 3, Aug. 1958, p. 867-871.

Thin metal specimens can be produced by electropolishing for examination by transmission electron microscopy. The method has been applied to Mg, Co, Cu, Ni, Al, alpha-brass and Fe. 7 ref. (M20p, M21e; Mg, Co, Cu, Ni, Al, Cu-n, Fe, 4-56)

18-M.* Solid Solution in $A^{III}B^{V}$ Compounds. J. C. Wooley and B. A. Smith. *Physical Society, Proceedings,* v. 72, Aug. 1, 1958, p. 214-223.

Ranges of solid solutions in GaSb-InSb, GaAs-InAs and in As-InSb systems. Complete solid solution throughout the entire range can be obtained only under special annealing conditions. 16 ref. (M24b, N12p; Ga, Sb, In, As)

19-M.* A General Scheme for the Examination of Precipitates and Inclusions in Steels. G. R. Booker, J. Norbury and Richard Thomas. *British Journal of Applied Physics,* v. 9, Sept. 1958, p. 361-365.

Included material is isolated by extraction replicas in a form suitable for examination by optical and electron microscopy, electron and X-ray diffraction and X-ray fluorescent and spectrographic analysis. The scheme allows the precise form and identity of the included material to be determined, even when only small amounts of specimen are available. 5 ref. (M20r; ST, 9-69)

20-M.* (Russian.) Influence of Deformation on Oscillation Effects in Metals at Low Temperatures. A. M. Kosevich. *Zhurnal Eksperimental'noi i Teoreticheskoi Fiziki,* v. 35, July 1958, p. 249-253.

Effect of elastic deformation on the properties of the electrons of the metal. In the presence of electron groups with significantly different numbers of electrons, the de-Haas-van-Alphen effect is very sensitive to deformation. 7 ref. (M25m, 3-68, 2-63)

21-M. Occurrence of Stacking Faults in Metallic Systems. J. Spreadborough. *Philosophical Magazine,* v. 3, Oct. 1958, p. 1167-1173.

Possible qualitative interpretation, using an extension of the ideal of Altmann, Coulson and Hume-Rothery. The metals Ca, Sc and Ti, the epsilon-phase in Fe-Mn, and the alpha-solid solutions of various B subgroup elements in the noble metals are treated as examples. Effect of temperature on hybrids. 7 ref. (M26s, 2-61; Ca, Fe, Mn, Sc, Ti, EG-c)

22-M. Gold-Manganese Alloys: Some Preliminary Studies by Neutron Diffraction. G. E. Bacon and R. Street. *Physical Society, Proceedings,* v. 72, Sept. 1, 1958, p. 470-474.

5 ref. (M22j; Au, Mn)

23-M. (Japanese.) Phase Diagram of the Silver-Rich Alloys of the Termary System of

Silver-Tin-Aluminum. C S. Cheng, S. J. Huang, S. S. Chen, T. M. Chen and K. S. Kan. *Acta Physica Sinica*, v. 14, July 1958, p. 346-353.

Ag-Sn-Al containing up to 30% Sn and 30% Al studied by X-ray and microscopic methods. (M24c; Ag, Al, Sn)

24-M.* The Energy Stored in Deformed Metals. L. M. Clarebrough and M. E. Hargreaves. *Australian Institute of Metals, Journal*, v. 3, May 1958, p. 31-43.

Properties of metals are determined primarily by concentration and arrangement of "crystal defects". Nature of these defects and their role in plastic deformation. Measuring this stored energy from the presence of crystal defects gives information about type, concentration and arrangement of defects. 18 ref. (M26s, Q24)

25-M.* Microradiography—Principles and Applications in Iron and Steel Research. W. Johnson and K. W. Andrews. *Iron & Steel*, v. 31, Sept. 1958, p. 437-444.

Principles and experimental methods illustrate microradiographs and their interpretations. Supplementary X-ray diffraction technique for exploring specific regions. Microradiograph gives information about microsegregation of elements; whereas the diffraction pattern usually gives positive identification of actual phases in same region. 11 ref. (M23n, M22g)

26-M.* A Note on the Grain Size of Non-Ferrous Castings. A. Cibula. *British Foundryman*, v. 51, Nov. 1958, p. 581-584.

Methods of revealing the macrostructure of cast nonferrous alloys by etching. Techniques for estimating and reporting grain size; influence of grain size on properties of cast alloys. (M27c; 5-60)

27-M.* Measurement and Effect of Grain Size in Steel Castings. W. J. Jackson. *British Foundryman*, v. 51, Nov. 1958, p. 584-588.

Simplest test, and the most likely to succeed in revealing austenite grain size in steel castings, is the grain-contrast or martensitic etch method. Simplest method of rating grain size is to compare the revealed grains with standard grain-size charts. Significance of austenite grain size in steel castings is at present not fully understood. (M27c, M20g; 5-60, ST)

28-M.* Problem of Grain Size in Cast Iron. H. Morrogh. *British Foundryman*, v. 51, Nov. 1958, p. 588-591.

Properties of malleable and nodular cast irons are considerably influenced by the type of matrix and grain size of the matrix, and by the type and dispersion of the graphite phase. 8 ref. (M27c; CI-s, CI-r)

29-M.* Evidence for Vacancy Clusters in Dislocation-Free Ge. A. G. Tweet. *Journal of Applied Physics*, v. 29, Nov. 1958, p. 1520-1522.

When dislocations are absent over volumes of the order of cubic centimeters the crystal etches much more rapidly than when dislocations are present. This enhanced etching behavior can be eliminated by appropriate heat treatment at 800° C. Ridges of normal etching rate were observed traversing the rapidly etched areas in (110) directions. Etch figures, usually spiral dislocations, are always associated with these ridges. (M26b, M20g; Ge)

30-M.* Torsion Tests on Whiskers of Silicon and Iron. Robert L. Eisner. Paper from "Growth and Perfection of Crystals", John Wiley & Sons, Inc., New York, 1958, p. 191-196.

Dislocations, whether originally present or not, operate only in the outermost portions of Si whiskers, where they are relatively immobile, but extensively in Fe whiskers, where they appear to move fairly easily. No plastic strain has yet been observed in Si whiskers smaller than 3 microns in diameter. (M26b; 14-61, Fe, Si)

31-M.* Structure and Elastic Properties of Graphite Whiskers. Roger Bacon. Paper from "Growth and Perfection of Crystals", John Wiley & Sons, Inc., New York, 1958, p. 197-203.

Whiskers consist of one or more graphite sheets rolled up like a scroll into a tight cylinder. Each sheet may be as much as several hundred Angstrom units thick. Evidence for the cylindrical structure is revealed by electron micrographs. 7 ref. (M26; Zn, 14-61, NM-k36)

32-M.* (French.) Dilatometry of the Zirconium-Hydrogen System. Lucien Espagno, Pierre Azou and Paul Bastien. *Comptes Rendus*, v. 247, Oct. 20, 1958, p. 1199-1202.

Equilibrium diagram; extent and variables involved in the eutectoid transformation. 5 ref. (M23b; Zr, H)

33-M.* (Japanese.) Metallographic Effect of Oxygen on Zirconium. Motoyuki Nakamura and Shizuo Suzuki. *Nagoya Government Industrial Research Institute, Reports*, v. 7, Sept. 1958, p. 22-27.

Microhardness, X-ray and grain structure testing of Zr containing 0.02-0.2% O. Hardness of Zr increased parabolically with increase of O content; when specimens were annealed in a vacuum recrystallization temperature and grain size also varied according to O content. (M26, M27, Q29q; Zr, O)

34-M.* (Polish.) Effect of Plastic Deformation in Austenitic Stainless Steels. A. P. Gulajew. *Hutnik*, v. 25, July-Aug. 1958, p. 237-241.

Plastic deformation in structure of crystals, splintering in blocks of mosaic structure, crushing and deformation of grains and phase deformations in austenitic stainless steels. Degree of deformation, temperature of deformation and state of austenite have effect on martensitic transformation gamma→alpha reverse transformation alpha→gamma and the little known transformation gamma→epsilon. (M27c, N8, 3-68; SS-e)

35-M.* Mechanical Properties of Zinc Whiskers. N. Cabrera and P. B. Price. Paper from "Growth and Perfection of Whiskers", John Wiley & Sons, Inc., New York, 1958, p. 204-213.

Elastic and plastic deformation of whiskers of hexagonal structure. Whiskers, of diameters down to one micron, do not appear to be perfect, but contain dislocation sources with their strength being due to the surface and the oxide layer present in preventing the escape of dislocations. 12 ref. (M26b, Q27; Zn, 14-61)

36-M.* Dislocation Structure of Whiskers. W. W. Webb. Paper from "Growth and Perfection of Crystals", John Wiley & Sons, Inc., New York, 1958, p. 230-238.

Screw dislocations in whiskers of Mn, Fe, Co, Ni, Cu, Ag, Cd, Zn and Pd. Unequivocal evidence for single axial screw dislocations found in only one metal, Pd. Results raise the question whether most metal whiskers actually have a screw dislocations in them during growth. 29 ref. (M26b; 14-61, Mn, Fe, Co, Ni, Cn, Ag, Cd, Zn, Pd)

37-M. Demagnetizing Energy and Domain Structure of a Uniaxial Single Crystal. M. Fox and R. S. Tebble. *Physical Society, Proceedings*, v. 72, Nov. 1, 1958, p. 765-769.

Closure domain structure of Co examined by Bitter pattern technique on the curved surface of a disk. (M27g; 14-61, Co)

38-M. (German.) Assumption of an Ordered State of Atoms in Iron-Nickel-Platinum Alloys of Low Thermal Expansion. Albrecht Kussmann and Kai Jessen. *Archiv fur das Eisenhuttenwesen*, v. 29, Sept. 1958. p. 585-594.

Fe-Pt alloys from 75 to 67 at.% Fe, Fe-Ni alloys from 71 to 64 at.% Fe and Fe-Pt-Ni alloys that represent, by their composition, a transition between the above two groups were heated to different temperatures, water quenched radiographically and tested for dilatometric and thermomagnetic behavior. 28 ref. (M26q, M23b, P16; Fe-b, Pt, Ni)

39-M.* Surface Distortion Round Dislocations. V. G. Bhide. *Physica*, v. 24, Oct. 1958, p. 817-820.

Surface surrounding a hollow dislocation in a single crystal of SiC examined by multiple beam interferometry. Dislocation is shown to be concave and not flat-bottomed. Indirect evidence exists for slip. 6 ref. (M26b; 14-61, Si, C)

40-M. Physical Metallurgy and Properties of Zirconium-Uranium Alloys. A. A. Bauer, S. Kass and K. M. Goldman. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF. 15/P/1785, 1958, 23p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Constitution and transformation kinetic behavior of Zr-U alloys. System is characterized by complete solid solution between gamma U and beta Zr at elevated

temperatures and by the intermediate hexagonal epsilon phase which forms this solution at about 600° C. and contains approximately 50% U. O and N have a pronounced effect on alloy constitution, stabilizing the alpha-Zr phase and restricting the epsilon and beta phase regions. 14 ref. (M24b, Zr, U)

41-M. Techniques for the Metallography of Plutonium. E. M. Cramer and F. W. Schonfield. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/528,1958, 13 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Adaptations of metallographic apparatus for polishing, etching, micrography, hardness testing. Mounted samples are mechanically polished in a glovebox train and electropolishing and electro-etching then used. Handling is done with forcepts and specimen surfaces remain completely bare during microscopy and hardness testing. (M20, M21, W12a, Pu)

42-M.* (French.) Various Micrographs of Alpha Uranium Before Irradiation. J. Lehmann and H. Aubert. Paper from "Symposium on Special Problems in Metallurgy", Presses Universitaries de France, Paris, France, 1958, p. 41-46.

Micrographs of pure and low-alloy U. Crude cast; recrystallized; quenched from 660-770° C. (beta phase); exposed to temperature cycles; alloyed with Cr, Mo, Sn, Al, Tc and Zr alloys. 4 ref. (M27, 2-61, 3-69; U, *Cr, Mo, Sn, Al, Cb, Zr*)

43-M.* (German.) Oxide Inclusions Deformable by Hot Rolling Observed in Rimming Soft Steels. Heinz Lessing and Hanns Malissa. *Archiv fur das Eisenhuttenwesen,* v. 29, Oct. 1958, p. 627-629.

Needle-like inclusions thought to result from sphere-shaped inclusions present in the ingot. 7 ref. (M28k; ST-d, NM-a34, 9-69)

44-M.* New Ways to Look at Corrosion Processes. E. A. Gulbransen. *Chemical Engineering Progress,* v. 54, Nov. 1958, p. 60-61.

Electron diffraction and electron microscope study of crystal structure of oxides formed by oxidation of Fe, Co, Ni, Cr and Cu between 300 and 700° C. (M26r, M22h, M21e, R1h; Fe, Co, Ni, Cr, Cu)

45-M. Electron Diffraction Studies of Crystal Structure of Oxides of Iron. A. Pande. *Journal of Scientific & Industrial Research,* v. 17B, June 1958, p. 205-208.

Oxide films formed on pure Fe heated to different temperatures. Effect of occluded hydrogen on the formation and orientation of the oxide. 11 ref. (M26r, M22h, 2-61; Fe-a)

46-M.* Grain Boundary Etching on Pure Aluminium. I. Braun. *Philosophical Magazine,* v. 3, Nov. 1958, p. 1312-1317.

In the etching of recrystallized Al (99.99% purity and zone-refined material) the grain boundaries resist attack immediately after electropolishing, but become susceptible to severe attack after a few days at room temperature. This is due to diffusion of impurities along the grain boundaries into the oxide film. (M20q, M27f; Al-a)

47-M.* Crystal Structure of Germanium Selenide. Atsushi Okazaki. *Physical Society of Japan, Journal,* v. 13, Oct. 1958, p. 1151-1155.

X-ray diffraction data obtained from relation and oscillation photographs taken with Ni-filtered Cu K radiation. Laue photographs and oscillation photographs taken with Zr-filtered Mo K radiation were used auxiliarily. (M26q, M22g; Ge, Se)

48-M.* Optical Method of Studying the Diffraction From Imperfect Crystals. Pt. 3. Layer Structures With Stacking Faults. B. T. M. Willis. *Royal Society, Proceedings,* v. 248, Nov. 11, 1958, p. 183-198.

Reciprocal lattice intensity distribution was determined quantitatively using a photomultiplier to measure the optical diffraction intensities. The systems examined included the simple-cubic structure with "wollastonite-type" stacking faults, the close-packed, hexagonal structure with growth faults and the face-centred cubic structure with deformation faults on one set and on two sets of {111} planes. 13 ref. (M22g, M26s)

49-M.* Interaction of Dislocation With Atomic Order on Solid Solutions. Koji Sumino. *Tohoku University, Science Reports of the*

Research Institutes, v. 10, Aug. 1958, p. 283-298.

Mechanism of interaction between a dislocation and atomic order due to the coupling of the stress field of the dislocation with the lattice distortion accompanied by ordering in superlattice alloys. Interaction energy and locking force against the motion of the dislocation calculated for superlattice of beta brass type. Effect of thermal motion on locking force. Expression of short-range order hardening in terms of order parameters for superlattice of the beta brass type. 12 ref. (M25g, M25m, M26b, N10a; Cu-n)

50-M.* Observations of Dislocations in Iron Whiskers. R. V. Coleman. Paper from "Growth and Perfection of Crystals", John Wiley & Sons, Inc., New York, 1958, p. 239-246.

Well-defined etch pits at dislocations can be developed on {100} faces of Fe whiskers using 4% picral or 2% nital etches. The pits develop immediately after deformation at room temperature or at 77° K. Annealing the deformed whiskers at 850° C for periods of 6 to 100 hr. and then etching produces alignment of the etch pits. 6 ref. (M26b, M20g; 14-61, Fe)

51-M.* (French.) Study of Molybdenum-Uranium Alloys. J. Bellot, P. Dosiere and Jean Marie Henry. *Metaux-Corrosion-Industries*, v. 33, Sept. 1958, p. 343-352.

U-Mo diagram for alloys up to 30 at.% (about 15% by weight) established by differential thermal analysis. Kinetics of decomposition of some alloys having a metastable gamma phase, which is maintained at low temperatures in alloys with high Mo content (over 5% by weight). Specimens placed in sealed tubes were hardened by stages from gamma solid solution to domain of stability alpha-epsilon. Transformation was studied by means of dilatometry, metallography and measurement of resistivity and Vickers hardness. For a given temperature, delay before start of transformation increases with increase in Mo concentration. 11 ref. (M24b; Mo, U)

52-M.* (French.) Microfractographic Study of Surfaces of Fatigue Fractures. Example of Application. J. Plateau, C. Crussard, J. Faguet, G. Henry, M. Weisz, G. Sertour and R. Esquerre. *Revue de Metallurgie*, v. 55, July 1958, p. 679-695.

Fracture surfaces in several steels and alloys examined by direct carbon replica technique. Striations on cleavage facets appear to correspond to successive positions of the fracture front and are also related to cross-slips. Influence of nature of metal and prior cold working on appearance of striations. Method is applied to study of surfaces of fractures caused by both fatigue and tension in a high-strength duralumin. 8 ref. (M23p, Q26n, Q7; ST, Al-b)

53-M.* (Russian.) Phase Transformation in the Manganese-Copper-Iron System. R. I. Agladze, L. I. Topchiashvili and V. M. Mokhov. *Zhurnal Neorganicheskoi Khimii*, v. 3, no. 10, 1958, p. 2354-2360.

Microstructural, electric resistance, dilatometric studies of Mn-Cu-Fe system showed that this alloy in an annealed stage presents a two-phase composition. (M24c; Mn, Cu, Fe)

54-M. Semi-Automatic Grinding of Metallographic Specimens of Very Hard Materials. Z. Ministr. *Industrial Diamond Review*, v. 18, Sept. 1958, p. 166-170; Oct. 1958, p. 190-194.

(M20p, SGB-q)

55-M. Identification of Inclusions in Steel by Microradiography. Ernest J. Duwell. *Iowa Academy of Science, Proceedings*, v. 65, 1958, p. 208-219.

6 ref. (M23n, 9-69; ST)

56-M. (German.) Surface Replicas on Films. Pt. 2. H. Mahl. *Metalloberflache*, v. 12, Nov. 1958, p. 321-323.

Plain and compound methods of replica making. Contrast resulting from different degrees of surface roughness. (M20r)

57-M. (Russian.) Structure of Electrolytic Manganese. O. S. Popova and K. M. Gorbunova. *Zhurnal Phizicheskoi Khimii*, v. 32, Sept. 1958, p. 2020-2028.

(M26n; Mn)

58-M.* Isochronal Annealing of Vacancies in Aluminium. C. Panseri and T. Federighi. *Philosophical Magazine*, v. 3, Nov. 1958, p. 1223-1240.

Electrical resistivity measurement at liquid nitrogen temperature on the isochronal annealing out of quenched-in vacancies in 99.995 Al. Annealing takes place in two stages, the first centered at about room temperature, the second at about 160° C., its amount increasing largely with quenching temperature. A clustering of vacancies exists in the first stage with a subsequent dispersion of clusters by self-diffusion in the second. 17 ref. (M26s, J23; Al)

59-M. Dislocation Loops in Quenched Metals. P. B. Hirsch and J. Silcox. Paper from "Growth and Perfection of Crystals", John Wiley & Sons, Inc., New York, 1958, p. 262-287.

Annealed specimens of Al (99.995% pure) and of Au (99.998% pure) foil, were quenched from a vertical tube furnace from 600 and 930° C., respectively, into iced brine. Au specimens were aged for about 1 hr. at temperatures between 100 and 250° C. Specimens of Cu of comparable purity were quenched in a manner similar to that for Au but in an atmosphere of argon. Specimens were thinned for transmission microscopy by electropolishing methods. 33 ref. (M26b, 2-64; Al, Au, Cu)

60-M.* (Book-German.) Constitution of Ternary Metal Systems. Compendium. William Guertler. 80 p. 1958. Dionysos-Verlag Thulcke und Schulzek.-G., Willdenowstr. 40, Berlin-Dahlem, Germany.

Constitution diagrams for binary systems Al-Mg, Al-Si, Al-Mn, Al-Fe, Al-Ni, Al-Cu, Al-Zn, binary systems from Mg, Si, Mn, Fe, Ni, Cu, Zn, and ternary systems Al-Mg-Fe, Al-Ni-Si, Al-Mn-Ni, Al-Mg-Ni, Al-Si-Zn, Al-Ni-Zn. Survey and discussion of literature after each phase diagram. (M24b, M24c; Al-b)

61-M. (Book.) Growth and Perfection of Crystals. R. H. Doremus, B. W. Roberts and David Turnbull. 1958. 609 p. John Wiley & Sons, Inc., 440 4th Ave., New York 16, N. Y. $12.50.

Proceedings of an International Conference on Crystal Growth held at Cooperstown, N. Y. on Aug. 27-29, 1958. Papers abstracted separately. (M26, N3)

62-M. (Book.) Structure of Steel. Edwin Gregory and Eric N. Simons. 176 p. 1958. Philosophical Library, 15 E. 40th St., New York 16, N. Y. $10.

Nontechnical discussion of structure effects of heat treatment, impurities and metalworking processes on steel, alloy steel and stainless steel. (M27, 2-64, 3-68, 3-69; ST, AY, SS)

63-M. (Book-German.) Aluminum From the Inside. Dietrich Altenpohl. 200 p. 1957. Aluminium-Verlag GmbH, Dusseldorf, Germany.

Behavior in different manufacturing processes and properties in relation to atomic and crystalline structures. Structural changes in deformation and heat treatment. Susceptibility to corrosion; applications. (M25, M26, A-general; Al)

64-M. (Translation.) New Opinions on Grinding and Polishing Especially of Metallographic Specimens. Z. Ministr. *Industrial Diamond Review*, v. 18, Jan. 1958, p. 7-10.

Previously abstracted from *Hutnik*. See item 34-M, 1957. (M20p, L10b)

65-M. (Translation—AIP.) Study of Thin Films of Varying Composition in the Indium-Antimony System. G. A. Kurov and Z. G. Pinsker. *Soviet Physics, Technical Physics*, v. 3, no. 1, 1957, p. 26-31.

Electrical properties and phase composition. Electrical conductivity as a function of temperature. An anomalously low electrical carrier (hole) mobility is noted. 12 ref. (M24b, P15; In, Sb, 14-62)

66-M. (Translation-Brutcher, 4394.) Effect of Conditions of Cold Working and Heat Treating on Fine Structure of Steel. E. Yu. Chemadurova. *Metallovedenie i Obrabotka Metallov*, Oct. 1958, p. 36-40.

Heat treating at 900-1050° C. and tempering at 800° C., cooling in H_2O and air. Deformation produces distortion of second order and reduction of grain size. In warm rolling, after stock is first heated in oil, the grains crumble in comparison with deformation without preheating. Hardness after rolling without preheating was increased from 85 in original sample to 94; after rolling with preheating hardness was increased to 96-97. (M26c, Q29n, 2-64, 3-68; ST)

67-M. (Translation—SLA, 58-1535.) Contributions to the Texture and Anisotropy of Cold Rolled and Recrystallized Iron-Cobalt-Vanadium Alloys of 50% Cobalt Content. E. Houdremont, K. Janseen, G. Sommerkorn and H. Fahlenbrach. *Technische Mitteilungen Krupp*, no. 1, 1957, p. 13-22.

(M26c; Fe, Co, V)

68-M. (Translation—SLA, R-4793.) Results and Trends in the Development of Soviet Metallography. C. A. Brauman. *Zavodskaya Laboratoriya*, v. 23, no. 10, 1957, p. 1202-1211.

(M-general)

69-M.* Solid Solutions of Mercury in Silver and Gold. H. W. Rayson and L. D. Gilbert. *Institute of Metals, Journal*, v. 87, Nov. 1958, p. 88-90.

Diffusion technique suitable for preparing alloys containing highly volatile solutes is used to obtain a new lattice-parameter/composition curve for the solid solution of Hg in Au. 15 ref. (M26p, N12p; Hg, Ag, Au)

70-M.* Uranium-Thorium System and Some Aspects of the Uranium-Thorium-Zirconium System. J. R. Murray. *Institute of Metals, Journal*, v. 87, Nov. 1958, p. 94-96.

A simple eutectic system is formed with a region of liquid immiscibility extending from 6 to 49 at.% Th. Solubility of Th in U is 0.30 at.% at 900° C. and <0.05 at.% at 700° C. Solubility of U in Th is also temperature-dependent. 13 ref. (M24b, M24c, P12e; Th, U)

71-M. Tabulation, Bibliography, and Structure of Binary Intermetallic Compounds. Pt. 4. Compounds of Zinc, Cadmium and Mercury. Iowa State College. *U. S. Atomic Energy Commission*, ISC-1047, Aug. 1, 1958, 50 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $1.25.

Crystal class, lattice parameter, X-ray data for some 260 compounds. 208 ref. (M26q)

72-M.* (Spanish.) Photo-Electron Microradiography of Excited Metal Surfaces. J. M. Bermudez. *Instituto del Hierro y del Acero*, v. 11, July-Sept. 1958, p. 180-184.

First application of this technique in Spain; results on samples of iron and steel. 5 ref. (M23n; Fe, ST)

73-M.* Metallography of Uranium. R. F. Dickerson. *American Society for Metals, Transactions*, v. 52, Preprint no. 120, 22 p.

Allotropic transformations occurring in U and the crystallography of these phases in relation to conventional preparatory techniques, including mechanical and electrolytic polishing methods, etching techniques and use of polarized light for the delineation of structure. Nonconventional techniques include vacuum-cathodic etching, anodic oxidation, hot stage microscopy and strain etching. 30 ref. (M20, M26, N6p; U)

74-M.* Constitution Studies of the Antimony and Bismuth-Rich Portions of the Sb-Bi-In System. E. A. Peretti. *American Society for Metals, Transactions*, v. 52, Preprint no. 123, 24 p.

The liquidus and solidus for the Sb-Bi-InSb-InBi portion of the In-Bi-Sb system are determined. Neither of the pairs InSb-Bi or InBi-Sb form true quasi-binary systems. Solid alloys lying approximately in the area bounded by InSb, Sb and Bi consist of alpha and beta and complete their solidification at temperatures ranging from 494 to 109.5° C., depending upon composition. 7 ref. (M24c, 2-60; In, Bi, Sb)

75-M.* Textures in Extruded Uranium. R. B. Russell. *American Society for Metals, Transactions*, v. 52, Preprint no. 124, 22 p.

Preferred orientation or texture of alpha-extruded, cold swaged, recrystallized and beta-quenched U. The mean thermal expansion coefficients are predicted from the texture and principal crystallographic thermal expansion coefficients. 11 ref. (M26c; U)

76-M. The Uranium-Platinum System. J. J. Park and D. P. Fickle. National Bureau of Standards. *U. S. Atomic Energy Commission*, NBS-5946, June 19, 1958, 30 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $1.

System, constructed from data obtained by thermal, microscopic and X-ray analysis, is characterized by two eutectics, one occurring at 1005° C. and a composition of 12 at. % Pt, and the second at 1345° C. and 87.5 at. % Pt. Four intermetallic compounds are formed — UPt, UPt_2, UPt_3 and UPt_8. 6 ref. (M24b; U, Pt)

77-M.* (Czech.) Study on Copper-Antimony Systems (Up to 20% Sb). Bohuslav Rajda. *Hutnicke Listy*, v. 13, no. 8, 1958, p. 761-768.

Metallographic study found maximum of Sb in Cu to be 10.65% Sb at eutectic temperature of 640° C. Solubilities within ranges of beta phase, alpha + beta phase, and alpha + eta phases. Two-phase transformations were found in the solid state, the alpha + beta transformed to alpha + etc and eta disintegrates into alpha + delta. (M24b; Cu-b, *Sb*)

78-M.* (Russian.) Investigation of the Process of Repeated Decomposition of Aluminum-Copper Solid Solutions. L. S. Palathik and B. T. Boiko. *Doklady Akademii Nauk SSSR*, v. 120, no. 5, 1958, p. 1015-1017.

Electrophotographic and electromicrographic study of repeated theta-phase decomposition and its separation from alpha solid solution of a thin Al-Cu alloy film of about 300 Å thickness. (M24b; Al, Cu, 14-67, 14-62)

79-M.* Constitution of the $AgSbSe_2$ - $AgSbTe_2$ - $AgBiSe_2$ - $AgBiTe_2$ System. J. H. Wernick, S. Geller and K. E. Benson. *Physics and Chemistry of Solids*, v. 7, Nov. 1958, p. 240-248.

The six pseudo-binary phase diagrams in the semiconducting system $AgSbSe_2$ - $AgSbTe_2$ - $AgBiSe_2$ - $AgBiTe_2$. Complete series of solid solutions with the cubic structure exist in this pseudo-quaternary system. Lattice constants as a function of composition for the cubic phase and thermo-electric power data for some of the solid solutions. 7 ref. (M24d; Ag, *Sb, Se, Te, Bi*, EG-j)

80-M.* Theory and Structure of Liquids. George H. Vineyard. Paper from "Liquid Metals and Solidification". American Society for Metals, 1958, p. 1-48.

Current theories of simple liquids; statistical mechanical basis of all liquid series; qualitative discussion of reason for sharp phase transitions which set liquid apart from solid and gaseous state. Use of cell models, distribution functions and numerical methods in theory of liquids. Determination of liquid structure by X-ray and neutron diffraction. Results obtained for liquid metals. 85 ref. (M25, P12; 14-60)

81-M.* Zirconium-Beryllium Phase Diagrams. Henry H. Hausner and Herbert S. Kalish. Paper from "Powder Metallurgy in Nuclear Engineering". American Society for Metals, 1958, p. 149-164.

Zr-Be system contains a relatively low melting point eutectic and several high melting point phases. Influence of small amounts of Zr in Be is most important in the powder metallurgy of Be-rich alloys for Zr can increase the melting point while the solidus line remains at approximately 2335° F. 6 ref. (M24b, H-general; Zr, Be)

82-M.* (French.) Chemical and Structural Heterogeneities Along Former Grain and Sub-Grain Boundaries. Pierre Coulomb and Paul Lacombe. *Revue de Metallurgie*, v. 55, Oct. 1958, p. 918-926.

When the A transformation point is crossed in annealing, the boundaries migrate or are swept out. A net of impurities remains along the former boundaries. Precipitation is influenced by geometric parameters of the boundaries as well as atmosphere used in heat treatment. 14 ref. (M27f, 2-64, 3-69; Fe-a)

83-M.* (Russian.) Analysis of Complex Systems by Images of Beta - Emissions. S. N. Kryokov, B. S. Bokshtein, T. I. Degaltsev and A. A. Zhukhovitskii. *Zavodskaya Laboratoriya*, v. 24, no. 11, 1958, p. 1305-1308.

Analysis of three-component system Fe-Mo-W and Fe in ore. Mixtures of isotopes Sr^{90} and Y^{90} were used for radiation. (M24c, M22h; Fe-b, *Mo, W*)

84-M.* (Russian.) Theories of Electro-Chemical Phase Analysis. Yu. A. Klyachko, M. M. Shapiro, V. S. Mal'tseva and V. A. Mil'chev. *Zavodskaya Laboratoriya*, v. 24, no. 11, 1958, p. 1308-1314.

Investigation of Ni-base alloys shows three phase separations: basic solid solution; intermetallic; carbide. (M24; Ni-b)

85-M.* (Russian.) Phase Analysis of Nitrided Steels. N. I. Block, M. N. Kozlova, N. F. Lashko and A. G. Andreeva. *Zavodskaya Laboratoriya*, v. 24, no. 11, 1958, p. 1315-1319.

To explain causes of corrosion behavior of nitrided austenitic stainless steels; methods of phase analysis; nature of phases; distribution of alloying elements between phases and solid solutions along the depth of the nitriding layer. (M24d, R1; SS)

86-M. (Russian.) Investigation of Metal Stream by Means of Rapid Filming. A. G. Il'in and B. Z. Kononov. *Stal'*, v. 18, Nov. 1958, p. 994-995.

Rapid filming makes possible the recording of many phenomena which cannot be detected by sense organs. It is now

widely used in Soviet aviation and rocket technology. (M21c, X5h)

87-M.* Crystal Structure of the Intermetallic Compound $Mg_2 Cr_2 Al_{18}$. Sten Samson. *Acta Crystallographica*, v. 11, Dec. 10, 1958, p. 851-857.

Lattice constant determined. The truncated tetrahedron, the icosahedron and the hexagonal prism are prominent coordination polyhedro in this structure. In places where interaction between the atoms of the transition element (Cr) and those of the hypo-electronic elements (Al and Mg) are to be expected, the packing of the atoms is very efficient, whereas in places where such interactions are less likely the packing of atoms appears to be normal or rather loose. 22 ref. (M26q; Cr, Mg, Al)

88-M.* Production of Dislocations in Germanium by Thermal Shock. K. S. Wagner. *Journal of Applied Physics*, v. 29, Dec. 1958, p. 1670-1682.

Dislocations introduced into single crystals of Ge grown by the Czochralski technique. Most of the dislocations do not originate during growth but are produced after growth as a result of thermal shock. Thermal stresses resulting from non-uniform temperature gradients during growth seem to have little or no effect on the dislocation density and distribution. (M26b; Ge, 14-61)

89-M.* (German.) Improvement of Metallographic Grinding Techniques. C. G. Nestler and F. W. Gunther. *Fertigungstechnik*, v. 8, Nov. 1958, p. 504-506.

Use of 50-50 Pb-Sn alloy plates coated with tungsten carbide powder. Excellent surfaces with time saving up to 50% compared to conventional abrasive paper or wax plates. Surface roughness of order 0.3 micron attainable. 14 ref. (M20p; Sn-b, *Pb*)

90-M.* Direct Observation of the Long Period of the Ordered Alloy CuAu (II) by Electron Microscope. Shiro Ogawa and Denjiro Watanabe. *Acta Crystallographica*, v. 11, Dec. 10, 1958, p. 872-875.

Parallel lines spaced at intervals of about 20 Å observed, corresponding to satellite spots flanking the direct spot in the diffraction pattern. Their spacing is in close agreement with the size of an anti-phase domain. Lines are believed to be caused by some lattice modulation with the same period as the domain size. 10 ref. (M26q; Cu, Au)

91-M.* (Polish.) Examination of Austenite Grains by Anodic Etching at High Temperatures. Z. Wojcik. *Prace Instytutow Ministerstwa Hutnictwa*, v. 9, No. 4, 1957, p. 141-150.

Etching eight grades of steel in molten lithium chloride. Results proved conformity between new method and methods of ferrite network or etching with Vilella reagent. 17 ref. (M20q; ST)

92-M. (German.) Metallographic Grinding Techniques. H. Klemm and K. Wiegmann. *Fertigungstechnik*, v. 8, Nov. 1958, p. 507-510.

Analysis of surface quality obtainable with emery paper of different origin and roughness. (M20p; Al)

93-M. (Russian.) New Method of Depositing Separation Grids Upon a Sample's Surface. L. M. Rybakov. *Zavodskaya Laboratoriya*, v. 24, no. 11, 1958, p. 1392-1394. (M20s)

94-M. (Russian.) Theory of Cathodic Disintegration. V. E. Yurasova. *Zhurnal Telchnicheskoi Fiziki*, v. 28, no. 9, 1958, p. 1966-1970.

Importance to ionic etching of substances and many phenomena such as appearance of polycrystal grain boundaries, formation of orientations on metal surfaces. 9 ref. (M20q)

95-M.* (Hungarian.) Thermal Expansion Measurements at High Temperatures. Gabor Szonyi. *Kohaszati Lapok*, v. 13, Feb-Mar. 1958, p. 135-138.

The usual types of dilatometers are not dependable when measuring the expansion of metals at about 1500° C., because the quartz tube recrystallizes at 1150° C. and its coefficient of expansion becomes uncertain. That shortcoming corrected by substituting a tube made of sillimanite for the quartz tube. 7 ref. (M23b)

96-M. (Translation—AIP.) Etchant for Gallium Arsenide. D.N. Naslevdov, A.Ia. Patrakova and B.V. Tsarenkov. *Soviet Physics, Technical Physics*, v. 3, no. 4, 1958, p. 726-728.

Methods of etching gallium arsenide surfaces. (M20q; Ga, As, 14-61)

97-M. (Translation—Brutcher, 4428.) Grain-Boundary Structure and High-Temperature Strength of an Austenitic Steel. E. N. Sokolkov, M. G. Lozinskii and E. I. Antipova. *Metallovedenie i Obrabotka Metallov*, Nov. 1958, p. 19-25.

Change in the structure of boundaries of austenitic grains caused by severe distortion in a preliminary plastic deformation brings about an increase in the high-temperature strength. Reduction of the creep rate is related to the breaking effect of plastic deformation along the austenitic grain boundary. 9 ref. (M27f, Q3n, Q27a, 3-68; SS-e)

98-M. (Translation-ConBur.) Study of the Zirconium Apex of the Zr-Ta-Nb Phase Diagram. V. S. Emel'lanov, Iu. G. Godin and A. I. Evstiukhin. *Soviet Journal of Atomic Energy*, v. 4, Feb. 1958, p. 211-220.

Zr apex with up to 82% Zr and a temperature of 1200° C. of the ternary system Zr-Ta-Cb. Phase regions found were two one-phase regions alpha and beta; three two-phase regions alpha + beta, beta + gamma and alpha + gamma; one three-phase region alpha + beta + gamma. 5 ref. (M24c; Zr, *Ta, Cb*)

99-M. (Translation—ConBur.) The Uranium-Oxygen System. *Soviet Journal of Atomic Energy*, v. 4, Feb. 1958, p. 299-301.

Structure and properties of uranium oxides. 9 ref. (M24b; U, O)

100-M.* The Sulphides, Selenides, and Tellurides of Titanium, Zirconium, Hafnium and Thorium. Pt. 1. Preparation and Characterization. F. K. McTaggart and A. D. Wadsley. *Australian Journal of Chemistry*, v. 11, Nov. 1958, p. 445-457.

Nine systems (Ti-S, Ti-Se, Ti-Te, Zr-S, Zr-Se, Zr-Te, Hf-S, Hf-Se and Hf-Te) investigated by X-ray techniques. Compounds prepared from materials of high purity by direct synthesis from the elements or by degradation of a higher to a lower phase. Several new compounds are reported, 19 ref. (M24b; Ti, Zr, Hf, *S, Se, Te*, 14-68)

101-M.* Selective Delineation of Screw Dislocations by Cathodic Sputtering. B. B. Meckel and R. A. Swalin. *Journal of Applied Physics*, v. 30, Jan. 1959, p. 89-93.

Method of revealing screw component dislocations involving low-energy cathodic sputtering with argon ions. Hillocks having the shape of truncated cones with a spiral pattern on their tops form at the sites of intersection of screw dislocations with the surface. Data for Ge single crystals. (M26b; 14-61, Ge)

102-M.* (Russian.) Hardness of Alloys in System $InAs-In_3Te_2$. N. A. Gopyunova and S. I. Radautson. *Doklady Akademii Nauk SSSR*, v. 121, no. 5, 1958, p. 848-849.

X-ray study of systems in which interaction of components produces heterovalent isomorphism, In-As-Te. Alloys are formed with structure of Zn blend throughout the concentration. 12 ref. (M24c, Q29n; In, As, Te)

103-M.* (Russian.) Solid Solution in Aluminum-Antimony-Gallium System. N. A. Goryunova and I. I. Buriyan. *Doklady Akademii Nauk SSSR*, v. 120, no. 5, 1958, p. 1031-1034.

Results show that inter-reaction of binary components in environments approaching equilibrium has no eutectoid character and brings about formation of solid solutions in a large range of concentration. (M24c; Al, Sb, Ga, 14-67)

104-M.* (Russian.) Magnetic Analysis of Deformed Texture of Cold Rolled Recrystallized Pure Electrolytic Nickel. I. L. Bryukhatov, I. A. Grinchar and I. Ya. Ekamasov. *Izvestiya Akademii Nauk, SSSR Seriya Fizicheskaya*, v. 22, no. 10, 1958, p. 1237-1243.

In high-purity Ni under cold rolling during forceable reduction (15-20 passes) up to 94-95%, the formed texture is of (112) order, while strong internal strain produces (111) order. (M26c; Ni-a)

105-M.* (Russian.) Thermodynamic Properties of Binary Iron-Manganese System in the Solid State. A. P. Lyubinov, A. A. Granovskaya and L. E. Berenstein. *Zhurnal Phiyzicheskoi Khimii Akademii Nauk SSSR*, v. 32, July 1958, p. 1591-1596.

Partial vapor pressure and activity coefficient show this system to approach an ideal solution with a slight deviation at lower temperature. (M24b, P12c; Fe, Mn)

106-M.* (Russian.) Boron-Carbon Phase Diagram. G. V. Samsonov. *Zhurnal Fizicheskoi Khimii*, v. 32, Oct. 1958, p. 2224-2229.

Based on comparison of data on the properties of alloys of the boron-carbon system, a tentative diagram is plotted within the concentration limit of 0-80% carbon. (M24; B, C)

107-M. (Russian.) Construction of Conoids by Microhardness Method in a 20-Phase Diagram of a Metallic System. V. N. Vigdorovich. *Doklady Akademii Nauk SSSR*, v. 120, no. 5, 1958, p. 1027-1030.

Geometric construction of conoids in an alpha + copper titanide (alpha + Cu_3

Ti) region of the Cu-Al-Ti diagram at 500 and 580° C. from given microhardness measurements. (M24c, Q29q; Al, Cu, Ti)

108-M. (Russian.) Electronic Theory of Metal Adhesion. B. V. Depyagin and V. P. Smilga. *Doklady Akademii Nauk SSSR*, v. 121, no. 5, 1958, p. 877-880.

Electrostatic force plays major role in adhesion of semiconductor metal layers. Residual electrostatic adhesive force in double-layer semiconductor metals and its effect on grain boundaries. The thinner the layers the greater the adhesive strength. 4 ref. (M25, M27f; EG-j)

109-M. (Russian.) Examination of Crystal Structure of Welds by Electrolytic Etching. V. A. Sidlyarenko, G. I. Parfessa and A. A. Rossoshinskii. *Zavodskaya Laboratoriya*, v. 24, Oct. 1958, p. 1217.

(M20q, 7-51)

110-M. (Russian.) Negative Ions of Iron, Cobalt and Nickel. V. M. Dukel'skii and V. M. Sokolov. *Zhurnal Experimental noi i Teoreticheskoi Fiziki*, v. 35, Sept. 1958, p. 820-829.

Electron structure of negative Fe, Co, and Ni ions. (M25; Co, Fe, Ni)

111-M. (Russian.) System InAs-In_2Se_3. N. A. Goryuhova and S. I. Radautsan. *Zhurnal Tekhicheskoi Fiziki*, v. 28, no. 9, 1958, p. 1917-1921.

11 ref. (M24c; As, In, Se)

112-M. (Russian.) Theory of Non-Elastic Electron Dispersions in Metals, Pt. 1. A. Ya. Vyazkin. *Zhurnal Tekhnicheskoi Fiziki*, V. 28, no. 10, 1958, p. 2217-2227.

(M25)

113-M. (Ukranian.) Investigation of Zirconium-Boron-Molybdenum System. M. S. Koval'chenko, V. S. Neshpor and G. V. Samsonov. *Dopovidi Akademii Nauk*, no. 7, 1958, p. 740-742.

(M24c; B, Mo, Zr)

114-M.* (Russian.) Dynamics of Substitutional Structure in Crystals of Transformer Steel Under Stress. L. V. Kurenskii, M. K. Savchenko and A. M. Rodichev. *Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya*, v. 22, no. 10, 1958, p. 1181-1184.

During elongation the dome structure changes considerably; the character of these changes depends upon direction of applied load. (M26, 3-68; AY-b, *Si*)

115-M.* (Russian.) Texture Formation of Transformer Steel During Annealing. L. V. Mironov. *Izvestiya Akademii Nauk SSSR, Seriya Phizicheskaya*, v. 22, no. 10, 1958, p. 1231-1236.

During annealing of cold rolled steel, subjected to a two-stage rolling with intermediate annealing, or single-stage with an area reduction of more than 75%, a secondary recrystallization takes place, creating conditions favoring growth of oriented grains. (M26c, 2-64, 3-68; ST, SGA-n)

116-M.* (Russian.) Structural Transformation Change in Permalloy Alloyed With Molybdenum. Yu. S. Avraamov, B. G. Lifshits and V. B. Osvenskii. *Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya*, v. 22 no. 10, 1958, p. 1263-1268.

Critical temperature range for alloys and analysis of the system. (M24c; Ni-b, *Fe*, Mo)

117-M.* (Russian.) Phases Forming in the System Chromium-Boron. V. N. Apel' baum, N. G. Sevastyanov, M. A. Gurevich, B. F. Ormont and G. S. Zhdanov. *Zhurnal Neorganicheskoi Khimii*, v. 3, no. 11, 1958, p. 2545-2552.

Investigation of products of interaction of initial elements of high purity with boron, in argon atmosphere at 1300-1350°. Chemical, X-ray and metal graphic methods were used. (M24b; Cr, B)

118-M.* (Russian.) Investigating the Gold-Silver-Copper System. Gricor'ev, L. A. Panteleimonov, V. V. Kuprina and V. S. Vorob'ev. *Zhurnal Neorganicheskoi Khimii*, v. 3, no. 11, 1958, p. 2932-2936.

System investigated by thermal analysis, Brinne's hardness microstructure, electric resistance and temperature coefficient. (M24c; Au, Ag, Cu)

119-M.* (Russian.) Heat Resistance Diagrams of Ternary Alloy: Titanium-Vanadium-Niobium. V. S. Vlasov and I. I. Kornilov. *Izvestiya Akademii Nauk, SSSR*, July 1958, p. 136-139.

Diagram of Ti-V-Cb system showed that all alloying metals of the ternary system crystallize out as unbroken solid solutions. Properties shown on a "composition-heat resistance" graph are independent of the number of components entering the system and are determined by the phase state and the phase structure. (M24c, M27, Q-general, 2-62; Ti-b, *Cb*, *V*, SGA-h)

120-M.* (Russian.) Phase Diagram of the System Zirconium-Boron ZrB_2 Phase. Pt. 2. V. A. Apel'baum and M. A. Gurevich. *Zhurnal Fizicheskoi Khimii*, v. 32, Oct. 1958, p. 2274-2281.

High-purity Zr plus B investigated in A atmosphere in vacuum at 1900-1200°. The formation of phase ZrB_2 takes place even at small B content. (M24b; B, Zr)

121-M* (Russian.) Structural Diagram of Magnesium-Neodymium Alloy. E. M. Savitskii, V. F. Terekhova and I. A. Novikova. *Zhurnal Neorganicheskoi Khimii Akademiya Nauk SSSR*, v. 3, no. 9, 1958, p. 2136-2142.

By thermal analysis, metallography and microhardness tests constructed a diagram of Mg-Nd alloy with 30% of Nd by weight, which is a eutectoid diagram. (M24b; Mg, Nd)

122-M.* (Russian.) Lower Columbium Oxides. S. I. Alyamovski, G. P. Shveikin and P. V. Gel'd. *Zhurnal Neorganicheskoi Khimii*, v. 3, no. 11, 1958, p. 2437-2444.

X-ray structural investigations of phase systems Cb-O, obtained by reducing Cb_2O_5 with metallic Cb and carbon. (M24b; Cb, O)

123-M.* (Ukrainian.) X-Ray Investigations of Approximate Structure of Zinc in Mercury Liquid Solutions. D. N. Kalikov. *Ukrainskii Phizichnii Zhurnal Akademii Nauk, Ukrainskoi RSR*, v. 3, no. 3, 1958, p. 370-373.

Structures of liquid solutions of Zn in Hg, with Zn concentrations of 8.7, 12, and 21%. (M27; Hg, Zn, 14-60)

124-M.* Sodium Improves Aluminum 356. R. A. Zuech. *Iron Age*, v. 183, Jan. 29, 1959. p. 88-89.

Small amounts of metallic Na added to liquid 356 (7% Si and 0.30 Mg) change the microstructure considerably. The Si crystals become very small and finely dispersed in the eutectic. Excess of Na lowers the fluidity and causes excessive porosity. (M27c; Al-b, *Na*, AD-p35, 5-60)

125-M. Metallography of Thorium. H. P. Roth. Nuclear Metals, Inc. *United States Atomic Energy Commission*, NMI-1193, June 17, 1958, 28 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $1.

Polishing by mechanical methods result in a speckled finish often described as a "salt-and-pepper" appearance, and it is difficult to remove all scratches. Three other methods are used-electrolytic, cathodic and chemical polishing. These methods produce a highly polished surface yet result in partial or complete destruction of inclusions. 12 ref. (M20p; Th)

126-M.* (German.) Quasi-Binary System of a Six-Component Nickel Solid Solution and Titanium Carbide. I. I. Kornilow and L. I. Priachina. *Planseeberichte fur Pulvermetallurgie*, v. 6, Dec. 1958, p. 80-88.

Studies on the equilibrium between a solid solution of Ni-Cr-W-Mo-Cb-Al and titanium carbide for the range from 700 to 3100° C. System was found to be of a eutectic character resembling the Ni-TiC system. 9 ref. (M24e, N9n; Ni-b, *Cr, W, Mo, Cb, Al*, Ti, *C*, NM-a35)

127-M.* (German.) Metallography of Tantalum Alloys. H. Braun, R. Kieffer and K. Sedlatschek. *Planseeberichte fur Pulvermetallurgie*, v. 6, Dec. 1958, p. 104-105.

Coarse powders of Ta and W were mixed, compressed at 6 tons per sq.cm. and vacuum sintered at 1750 to 2600° C. Polished sections were subjected to anodic oxidation. In micrographs, the Ta and W particles can be distinguished by color and progressive diffusion at increasing sintering temperatures. (M27d; 6-72, Ta-b, *W*)

128-M.* (German.) X-Ray Tests on Distortions and Particle Sizes, With Iron and Steel. Pt. 1. Influence of Elastic Deformation on Iron Compared With That on Tungsten. Friedhelm Brasse and Hermann Moller. *Archiv fur das Eisenhuttenwesen*, v. 29, Dec. 1958, p. 757-771.

Steel vacuum heat treated at 560° C. for 2 hr. and slowly cooled. Grain size was reduced by heating up to 800° C. and subsequent water quenching. By tensile elastic deformation the particle size was reduced. Imperfections influenced by position of lattice planes. (M27c, M26s, 2-64, 3-68; ST, *W*)

129-M.* (German.) Influence of Quenching Stresses on the Lattice Constant in the Aging of Iron-Copper Alloys. Gunter Wassermann and Peter Wincierz. *Archiv fur das Eisenhuttenwesen*, v. 29, Dec. 1958, p. 785-792.

Fe-Cu alloy homogenized under hydrogen at 100° ± 15° C. for 3.5 hr. and quenched in water of 11° C. and then aged under hydrogen at 500 ± 3° C. for different periods. Quenching stresses and precipitation process examined by radiographic measurements of the lattice

constant. (M26, J27d, 2-61, 3-67; Fe-b, *Cu*)

130-M.* (German.) Effect of Etching Process on the Representation of Structure in the Electron Micrograph. Angelica Schrader. *Archiv fur das Eisenhuttenwesen*, v. 29, Dec. 1958, p. 793-797.

Replicas from polished and etched surfaces of steel. With short etching times, ferrite that surrounds carbide inclusions is not attacked by picric or nitric acid as fast as the other ferrite. 11 ref. (M20q, M21e; ST)

131-M.* (Italian.) Influence of the Recrystallized Outer Layer on the Hot Deformation of Avional 24 Extrusions. C. Panseri and E. Di Russo. *Alluminio*, v. 27, Sept. 1958, p. 375-380.

Coarse-grained outer layer sometimes found in Av 24 extrusions causes forging and stamping defects. Effect of thickness of recrystallized layer, shape and size of grains and degree of deformation on such defects in extruded stock stamped with double-cone die. Macrographic study. (M28k; Al-b, 4-58, 9-71)

132-M*. (Italian.) Lattice Vacancies in Aluminum. T. Federighi. *Alluminio*, v. 27, Oct. 1958, p. 435-441.

Properties of vacancies introduced into Al by quenching from high temperature. Determination of energy of formation and energy of migration of vacancies, and of activation energy for self-diffusion of Al. Role of vacancies in phenomenon of aging. Influence of impurities on elimination of vacancies. 8 ref. (M26s, N1d, N7a, 3-69; Al)

133-M.* (Russian.) Electronic Conditions in Crystals. V. P. Shirokovskii. *Fizika Metallov i Metallovedenie*, v. 6, no. 1, 1958, p. 3-14.

Mathematical analysis indicates that the application of group theory to investigation of problems relating to the status and structure of electron energy bands in periodic poles yields solutions which may not be obtained by means of the usual methods of zonal theory. 6 ref. (M25)

134-M.* (Russian.) Study of Defects in Crystal Lattice by Means of Internal Friction. V. A. Pavlov. *Fizika Metallov i Metallovedenie*, v. 6, no. 1, 1958, p. 122-127.

Internal friction in pure Al and Al alloys with 3% Mg at low temperatures. Two peaks were determined at -50, -80, -170, -180°, and increases at -196°. Energy activation processes at peaks of internal friction correspond to 0.5, 0.14 e.v., and rising internal friction to 0.05 e.v. Diffusion defects in crystal lattices explained by position of peaks. 18 ref. (M26s, Q22, 2-63; Al-a, Al-b, *Mg*)

135-M.* A Note on the Cell Structure of Unmodified Al-Si Eutectic. S. Ghosh and V. Kondic. *British Foundryman*, v. 51, Dec. 1958, p. 637.

Small additions of Na and rapid cooling cause a change from a coarse to fine or modified structure. Suitable etching reveals that an unmodified alloy has a cell structure equally well developed as one that is modified. The tendency to form cell or grain structures is therefore not a basic difference between unmodified and modified (or normal) eutectic. (M27, N12q; Al-b, *Si*)

136-M.* (Russian.) X-Ray L-Spectra of CeB_6 and CeO_2. N. V. Troneva, I. D. Marchukova and I. V. Borovskii. *Fizika Metallov i Metallovedenie*, v. 6, no. 1, 1958, p. 141-147.

Influence of chemical bond on X-ray spectra of rare earth elements demonstrated experimentally. Chemical bond and valency of Ce atoms in compounds show considerable effect on emission and absorption spectra. 26 ref. (M25, P17c, P17d; Ce, *B*, *O*)

137-M.* (Russian.) Distribution of Silicon in Steel Dendrites. Ya. N. Malinochka. *Stal'*, Dec. 1958, p. 1130-1132.

Metallographic analysis of the intracrytalline structure of cast Si steel. Method can be applied in detecting distribution of other alloying elements. (M27, S11e; ST, *Si*)

138-M. (Russian.) Titanium Tetrachloride-Columbium Pentachloride and Titanium Tetrachloride-Tantalum Pentachloride Systems. L. A. Nisel'son and G. L. Perekurest. *Zhurnal Neorganicheskoi Khimii Akademii Nauk, SSSR*, v. 3, no. 9, 1958, p. 2150-2155. (M24b; Cb, Ta, Ti, *Cl*)

139-M.* Domain Configurations on Ferrites. D. J. Craik and P. M. Griffiths. *Physical Society, Proceedings*, v. 73, Pt. 1, Jan. 1, 1959, p. 1-13.

Mn, Ni and Ba ferrite patterns agree with nature of their magnetic constants. Mn-Zn ferrite crystal gave anomalous patterns due to strain-induced uniaxial anisotropy. 26 ref. (M27g; Mn-b, Ni-b, Ba-b, Cu-b, *Zn*, *Fe*, 14-61)

140-M.* Microtopography of Oxide Films on Niobium. J. V. Cathcart, J. J. Campbell and G. P. Smith. *Electrochemical Society, Journal*, v. 105, Aug. 1958, p. 442-446.

Anomalous oxidation rate behavior of Cb is explained in terms of the formation of small, blister-like cracks in the oxide film. An oxidation model is proposed, based on the idea that an oxidation process is maintained by interstitial-anion or anion-vacancy diffusion leading to the generation of stresses in the oxide film. 9 ref. (M26r, R1h; Cb, 14-62)

141-M.* Phase Diagrams Covering Pressure, Temperature and Composition. A. G. Guy and Shotaro Morozumi. *Metal Treatment and Drop Forging*, v. 26, Jan. 1959, p. 21-26.

Calculation of complete pressure-temperature-composition diagram from thermodynamic activity and vapor pressure data for Cd-Zn system. Determination of equilibria of solid-liquid, liquid-vapor, solid-vapor and liquid-solid-vapor sections. 14 ref. (M24f, P12, 2-60, 2-61, 3-74; Cd, Zn)

142-M. Correlation of Titanium Phase Diagrams. I. Cadoff. New York University. (Watertown Arsenal Laboratory). *U. S. Office of Technical Services*, PB 131691, May 1956, 14 p. $.75.

Twenty-five binary phase diagrams surveyed, grouped and analyzed according to similarities. Correlations are based on size factor, electronegativity, valence, crystal structure and free energy. (M24b; Ti-b)

143-M. Phase Transitions in Two-Component System. E. L. Rubin. *Royal Society, Proceedings*, Series A, v. 249, Jan. 13, 1959, p. 335-345.

8 ref. (M24b, N11h)

147-M. Crystal Structure of NaSb. Don T. Cromer. *Acta Crystallographica*, v. 12, Jan. 10, 1959, p. 41-45.

8 ref. (M26; Na, *Sb*, 14-68)

148-M. (Czech.) Distribution and Number of Spherical Grains in a Given Specimen. Stanislav Drapal and Vratislav Horalek. *Hutnicke Listy*, v. 13, Dec. 1958, p. 1105-1110.

Computation after measurements carried out with micrographs. 9 ref. (M27c)

149-M. (Russian.) Relationship Between Electron Emission From Hexoborides of Alkaline and Rare Earth Metals and Their Electron Structure. G. V. Samsonov and V. S. Neshpor. *Doklady Akademii Nauk, SSSR*, v. 122, no. 6, 1958, p. 1021-1023.

(M25; EG-f43, EG-g45)

150-M. (Russian.) Investigation of the Tin-Tellurium and Germanium-Tellurium Systems. N. Kh. Abrikosov, A. M. Vasserman and L. V. Poretskaya. *Doklady Akademii Nauk, SSSR*, v. 123, Nov. 1958, p. 279-281.

Sn-Ge-Te system along the transverse section of SnTe-GeTe. X-ray analysis, microhardness data, electroconductivity and thermo-emf. studies. 12 ref. (M24c; Sn, Ge, Te, 14-67)

151-M. (Russian.) Microheterogeneous Changes in Alloys Resulting From Interaction of Components. M. E. Drits, E. S. Kadaner and Z. A. Suiderskaya. *Izvestiya Akademii Nauk, SSSR*, May 1958, p. 120-124.

Study of binary Al and Mg-base alloys by radioactive isotopes. (M27, 1-59; Al-b, Mg-b)

152-M. Deformation Textures in Uranium-Aluminum Alloys. W. C. Thurber. Oak Ridge National Laboratory. *U.S. Atomic Energy Commission*, ORNL-2635, Nov. 20, 1958. 61 p. (Available from U.S. Office of Technical Services, Washington 25, D.C.) $1.50.

Textures for U-Al alloys containing up to 13% U and fabricated by both extrusion and cold rolling. Sheet textures of Al, 5% and 13% U-Al alloys determined for alloys reduced 90% in thickness by cold rolling. Fiber texture of the 13% U-Al alloy extruded at 455° C. with a 90% reduction in area; preferred orientation. (M26c; *U*, Al)

153-M. Metallography of Titanium Alloys. H. R. Ogdem and F. C. Holden. Battelle

Memorial Institute. *U.S. Office of Technical Services*, PB 121645, May 1958, 96 p. $2.75.

Titanium metallography as affected by composition and thermal treatment. Glossary; methods of preparing samples for metallographic examination. (M-general, 2-60, 2-64, 3-68; Ti)

154-M.* (Czech.) Structure of Heat Resistant Austenitic Stainless Steels. Frantisek Poboril and Marcela Zezulova. *Hutnicke Listy*, v. 13, Dec. 1958, p. 1061-1069.

Investigation on the structure of Cr-Ni austenitic steels and of ferritic and martensitic Cr steels. Increased ferrite content thought to reduce deformability in hot working and to cause brittleness and affect heat resistance. (M24d, N8; SS-e, SGA-h)

155-M.* (Czech.) Constitution of Fe-Cr-Mn Alloys. Bedrich Potucek. *Hutnicke Listy*, v. 13, Dec. 1958, p. 1070-1076.

Sigma phase found to be composed of all three elements. A certain amount of Mn makes the alpha phase disappear and the structure becomes austenitic. If the Mn is increased after this occurs, the sigma phase or, at high temperatures, delta ferrite may form. 44 ref. (M24c, 2-60; Fe, *Cr*, *Mn*)

156-M.* (French.) Structure and Magnetic Properties of Silver-Manganese-Aluminum. E. O. Hall. *Revue de Metallurgie*, v. 55, Dec. 1958, p. 1145-1148.

Examination of alloys centered around the basic composition, Ag_5MnAl, shows the ferromagnetic constitutent to be a hexagonal precipitate finely dispersed in the Ag matrix. It grows during heat treatment into Widmanstatten structure and transforms above the Curie point into beta Mn. 6 ref. (M27, P16, 2-61, 2-64; Ag-b, *Al*, *Mn*)

157-M.* (French.) X-Ray Tests of Stacking Faults in FCC Metals. Cold Deformation Studied on Nickel Filings Produced at Low Temperatures. C. N. J. Wagner. *Revue de Metallurgie*, v. 55, Dec. 1958, p. 1171-1176.

Broadening and shift of powder pattern peaks of Ni filings prepared under liquid oxygen. Peak shifts due to deformation stacking faults. Average fault probability one for every 200 (111) planes. Variations of particle sizes and strains with annealing temperatures and times. 20 ref. (M26s, 2-63, 2-64, 3-68; Ni)

158-M.* (Russian.) Radiographic Investigation of Deformed Steel Making Use of X-Ray Micro-Clusters. M. Ya. Fuks and L. Ya. Gol'dshtein. *Fizika Metallov i Metallovedenie*, v. 6, no. 4, 1958, p. 673-681.

Study of changes in microstructure taking place during tensile stress. (M27, M21f, 3-66; CN)

159-M.* (Russian.) Intensity of Radiograph Rear Lines in Cold Deformed Metals. O. H. Shivrin. *Fizika Metallov i Metallovedenie*, v. 6, no. 4, 1958, p. 682-685.

During static compression of Cu and brass up to a certain limit of residual deformation, an increase of the intensity of lines 331 and 420 was noticed. Same was noticed with Al where the intensity of lines 422 and 511 was increased through the entire range of residual deformation. Lines of brass, Cu, Al and steel that underwent annealed recrystallization are distorted. 6 ref. (M21f, 2-64, 3-68, ST, Cu-n, Cu-b, Al-b)

160-M.* (Russian.) Nature of Etched Shapes in Aluminum-Copper Alloys. V. G. Rankin and N. N. Buinov. *Fizika Metallov i Metallovedenie*, v. 6, no. 4, 1958, p. 687-691.

Etched form depends upon the degree of Cu dissociation and concentration and tendency to aging. 13 ref. (M20q, 2-65, Al-b, Cu)

161-M.* (Russian.) Microstructure of Aluminum-Killed Steel for Deep Drawing. V. M. Chirkin. *Stal'*, Dec. 1958, p. 1135-1137.

In some cases, it is possible to attain a drawn pancake-like structure in aluminum-killed low-carbon steel, and its capability for deep drawing is improved. Recommendations for attaining the desired grain structure by improved practice in melting and rolling. (M27, Q23q, F23, D11r)

162-M.* (Czech.) Equilibrium Diagrams of Alloys and Metals Obtained by Differential Thermal Analysis. Hanus Tuma and Miloslav Vyklicky. *Hutnicke Listy*, v. 13, Dec. 1958, p. 1077-1081.

Apparatus and method based on comparison of values measured on a standard sample with values measured on the sample tested. 9 ref. (M24, M23r, 1-53)

163-M.* (Czech.) Hypereutectoid Al-Si Alloys Treated With Phosphorus Pentachloride. Josef Koritta and A. Franek. *Hutnicke Listy*, v. 13, Dec. 1958, p. 1081-1087.

Effect of temperature and time on size of primary Si crystals. Phosphorus pentachloride was added to the melt at different temperatures and test pieces were cast at different times.. Optimum temperature for a fine and equally distributed state of Si crystals was 780 to 810° C. (M27c, 2-61, 2-60, 3-67; Al-b, *Si*)

164-M. (Translation—AIP.) Structure and Composition of the Carbide of Low-Tempered Steel. Iu. A. Skakov, I. N. Chernikova and A. V. Sharshatkina. *Soviet Physics Doklady*, v. 3, Jan-Feb. 1958, p. 151-153.

Electron diffraction of tempering of carbon steel shows that C atoms are distributed in the octahedral pores of hexagonal lattice of Fe atoms. 7 ref. (M25; CI, ST, *C*)

165-M. (Translation—AIP.) Study of the Structure and Phase Constitution of the Coating in the Hot Tinning of Sheet Iron. A. I. Vitkin, T. B. Plotnikova and G. A. Kokorin. *Soviet Physics Doklady*, v. 3, no. 2, 1958, p. 391-395.

Intermediate layer consists of dark and light areas. Electron diffraction revealed two structural phases of underlayer. 13 ref. (M22h, M27, 1-66; Fe, 4-53, 8-65, *Sn*)

166-M. (Translation—AIP.) Some Properties of Binary Metallic Systems. O. S. Ivanov. *Soviet Physics Doklady*, v. 3, no. 2, 1958, p. 423-425.

Systems of Ti, Th, U, PU, Fe, Mn-Cu, in terms of electron shells. (M24b; Ti, Th, U, Pu, Fe, Mn, Cu)

167-M. (Translation—AIP.) Variations in Short Range Order Structure in the Precrystallization Period of Semiconductor Chemical Compounds With ZnS Type of Lattice. D. A. Petrov and V. M. Glazov. *Soviet Physics Doklady*, v. 3, no. 3, 1958, p. 640-642.

7 ref. (M26; Zn-b, *S*, NM-a37)

168-M. (Translation—AIP.) Interaction Between Electrons and Lattice Vibrations in a Normal Metal. A. B. Migdal. *Soviet Physics JETP*, v. 7, Dec. 1958, p. 996-1001.

Method to obtain electron-energy spectrum and dispersion of vibrations without assuming that interaction between electrons and phonons is small. (M25, M26, P18)

169-M. (Translation—BISI, no. 1053.) Cube Orientation as Recrystallization Texture in Iron-Silicon Alloys. Hans Eberhard Mobius and Franz Pawlek. *Archiv fur das Eisenhuttenwesen*, v. 29, July 1958, p. 423-432.

See item 535-M, 1958. (M26c, N5; *Fe-b, Si*)

170-M. (Translation—BISI, no. 1196.) Theory of Counter Tubes With a Newly Designed Specimen Holder for the Determination of Textures in Quantitative Pole Figures. Johanna Grewen. *Archiv fur das Eisenhuttenwesen*, v. 29, Feb. 1958, p. 115-118.

See item 231-M, 1958. (M23c, M26c, 1-53)

171-M.* Flow of Impurities to an Edge Dislocation. R. Bullough and R. C. Newman. *Royal Society, Proceedings*, Series A, v. 249, Jan. 13, 1959, p. 427-440.

18 ref. (M26b, 3-69, 2-65; CN-g)

172-M.* (Spanish.) Metallographic Inspection of a Fusionless Weld in a Pearlitic Cast Iron. Alberto Sole. *Ciencia y Tecnica de la Soldadura*, v. 8, Sept-Oct. 1958, 6 p.

Fusion and fusionless welded specimens were tested for tensile strength and Brinell hardness and examined under microscope. Greater structural homogeneity of base and filler metal was found in fusionless weld. (M28h, Q27a, Q29b; CI, 7-51)

173-M. (Japanese.) Polarimetric Measurements of Thin Films. Yasuhiro Doi. *Mechanical Laboratory of Japan, Report*, no. 27, Nov. 1958, 48 p.

Techniques and analysis of measurement; heterogeneity and anisotropy of the film. (M21c; 14-62)

174-M. (Russian.) Interaction of External and Internal Electrons in Ferromagnetic Transition Elements. Yu. A. Izyumol. *Zhurnal Experimental'noi i Teoreticheskoi Fiziki*, v. 35, no. 5, 1958, p. 1148-1154.

8 ref. (M25; SGA-n)

175-M. (Russian.) Investigation of Alloys of the System Iron-Cobalt-Palladium. V. V. Kuprina and A. T. Gricor'ev. *Zhurnal Neorganicheskoi Khimii*, v. 3, no. 12, 1958, p. 2736-2739.

Diagram of meltability of Fe-Co-Pd studied in nine cross sections, with Pd content from 0 to 90% of at. wt., by method of thermal analysis, hardness testing and examination of microstructure. 27 ref. (M24c; Fe-b, *Co*, Pd)

176-M. Carbon Positions in Uranium Carbides. A. E. Austin. *Acta Crystallographica*, v. 12, Pt. 2, Feb. 10, 1959, p. 159-161.

Positions determined from neutron diffraction data. Metal-carbon bonding discussed. 8 ref. (M25m; U-b, *C*, NM-a35)

177-M.* (Japanese.) Microstructure of 99.85% Aluminum Extruded Rods. Yoshikazu and Eiichi Sawato. *Light Metals*, v. 8, Nov. 1958, p. 29-32.

Microstructures of rods extruded at different temperatures and in different reduction ratios. Higher reduction results in narrow and long grains in the extruding direction and microstructures of rods extruded at 325°C. are similar to those of cold worked ones and the subgrain structures which seem to be created from dendrite structure of cast billets and linear structures are observed in the rods extruded at 550°C. (M27, 2-61, 3-68; Al-a, 4-55, 4-58)

178-M.* (Japanese.) Microstructure of 99.85% Aluminum Extruded Rods on Fiber Structures. Yoshikazu and Eiichi Sawato. *Light Metals*, v. 8, Nov. 1958, p. 33-36.

The lower the temperature and the higher the reduction, the higher the amount of the structure, which has its axis in [111] + [100] direction. The change is not remarkable in the longitudinal direction, but in the radial direction, and is inclined to the extruding direction near the surface. (M27, M26, 2-61, 3-68; Al-a, 4-55, 4-58)

179-M.* (Japanese.) Microstructure of 99.85% Aluminum Extruded Rods; Changes Caused by Annealing. Yoshikazu Hosoi. *Light Metals*, v. 8, Nov. 1958, p. 37-40.

The softening characteristic of the rods is similar to that of cold worked rods; no generation and growth of nuclei occur; linear structure is created from fine-grained structure, whose grain boundary becomes obscure; linear structure tends to form a screw dislocation. (M27, M26; Al-a, 4-55, 4-58)

180-M.* (Ukrainian.) X-Ray Diffraction Study of Vanadium-Germanium Alloys. E. I. Gladushevsky and Yu. V. Kuz'ma. *Dopovidi Akademii Nauk Ukrainskoi RSR*, no. 11, 1958, p. 1208-1211.

4 ref. (M27; Ge, *V*, 14-68)

181-M. (Japanese.) Structure of 99.995% Aluminum Extruded Rods. Yoshikazu Hosoi. *Light Metals*, v. 8, Nov. 1958, p. 24-28.

Rods from cast billets have almost similar structure to those from forged billets. At 550° C. extruded rods do not change their structure by recrystallization. (M26, 2-64; Al-a, 4-55)

182-M.* Nature of Mechanically Polished Metal Surfaces: An Electron-Diffraction Examination of Polished Silver Surfaces. L.E. Samuels and J.V. Sanders. *Institute of Metals, Journal*, v. 87, Jan. 1959, p. 129-135.

Examination of polycrystalline and single crystal Ag polished mechanically. Diffraction patterns indicate that polished surfaces differ from the substrate only in that they have been plastically deformed. Deformation decreased progressively with increasing fineness of abrasive. (M20p, M22h, M26n, Q24; Ag, 14-61)

183-M.* Metallographic Study of the Deformation and Recovery of Beta-Brass by Means of the Etch-Figure Technique. Guido Bassi and J.P. Hugo. *Institute of Metals, Journal*, v. 87, Jan. 1959, p. 155-159.

On polycrystalline and single crystals of beta brass subjected to varying degrees of compressive deformation and to annealing treatments in range of 200-500° C. after compression. 7 ref. (M20q, Q24c, 3-68, 2-64; Cu-n, 14-61)

184-M.* The Constitution of Bismuth-Uranium Alloys in the Composition Range 0-35 Atomic Per Cent Uranium. P. Cotterill and H.J. Axon. *Institute of Metals, Journal*, v. 87, Jan. 1959, p. 159-160.

Differential thermal analysis in positive pressure of argon used to determined liquidus and solidus relationships. (M24b, 2-60; Bi-b, U)

185-M.* The Lattice-Spacing Relationships in Alloys. T.B. Massalski. *Metallurgical Reviews*, v. 3, no. 9, 1958, p. 45-96.

Lattice spacing relationships in fcc. primary solid solutions based on Cu, Ag, and Au. Bcc. alloys, closed-packed hexagonal alloys, binary and ternary alloys of trivalent Al. In, Sn and Pb-base alloys and various alloys containing transition elements. 93 ref. (M26, 2-60; Cu-b, Al-b, Sn-b, Pb-b, Au, In, Ag-b)

186-M.* Microstructural Changes in a 42% Ni, 30% Cr, 26% Fe Alloy During Creep Rupture Testing. R.J. Raudebaugh and E.P. Sadowski. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 23-29.

Alpha prime, the nonmagnetic, high-Cr bcc. ferrite formed at 1400 and 1600° F. but not at 1800°. Amount of N_2 pickup from atmosphere, magnetic change, grain growth. 5 ref. (M27, Q3m, 2-62; Ni-b, *Cr, Fe, N*)

187-M.* Microbeam Analysis of Widmanstatten Structure in Meteoritic Iron. R.E. Maringer, N.A. Richard and A.E. Autin. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 56-57.

Concentration and distribution of Fe and Ni in various phases of meteoritic Fe measured by electron probe microanalyzer. (M26, S11g; Fe-b, *Ni*)

188-M.* Effect of Orientation on Strain Induced Grain Boundary Migration in Silicon Iron Bicrystals. K.T. Aust, E.F. Koch and C.G. Dunn. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 90-96.

Bicrystal given 7% cold rolling strain and annealed at 1100° C. Analysis in terms of residual strain energy densities. Migration direction depends on orientation. 16 ref. (M27f, 3-72; Fe-b, Si)

189-M.* Formation of Beta Manganese Type Structure on Iron-Aluminum-Manganese Alloys. D.J. Schmatz. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 112-114.

Phase diagrams and isothermal sections showing extent of beta Mn phase and effect of quenching and Al. 8 ref. (M24c, N8g, 2-64, 2-60; Fe-b, *Al, Mn*)

190-M.* Metallurgy of Silicon. R.M. McPherson. *Australian Institute of Metals, Journal*, v. 3, Nov. 1958, p. 250-259.

High-purity Si becomes ductile at temperatures greater than about 600° C. and exhibits a sharp yield point not obtained on immediate reloading, but recovered on aging. Solid Si can be considered as an infinite covalent molecule in which edge dislocations have electrical properties associated with broken bonds. The yield behavior is qualitatively consistent with the Cottrell-locking hypothesis, the high interaction energy implied may be due to electrical defects associated with edge dislocations. 75 ref. (M26s, Q24; Si)

191-M.* Cavity Formation During the Heat Treatment of Aluminium Alloys. L.J. Polmear. *Australian Institute of Metals, Journal*, v. 3, Nov. 1958, p. 267-271.

Cavities appear to be associated with intermetallic compounds and perhaps form by the coagulation of vacant lattice sites at the sites of the compounds. With intermetallic compounds which do not dissolve during heat treatment the vacancies may collect together at the interfaces of the compounds with the matrix. 28 ref. (M26s, 2-64; 14-68, 9-72, Al-b)

192-M.* Study of Reversion Phenomena in the Carbon Alpha Iron System. D. Keefer and C. Wert. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 114-119.

Increases in aging temperature leads to reversion, studied according to grain size, C content and difference between final and initial aging temperature. 13 ref. (M24b, J27d, 2-65, 2-61, 2-60; Fe-b, *C*, 14-67)

193-M.* Grain Boundary Migration in High Purity Lead and Dilute Lead Tin Alloys. K.T. Aust and J.W. Rutter. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 119-127.

Migration depends on Sn and orientation relationship between adjacent grains. Relation to formation of annealing textures in metals and structure of high-angle boundaries. 19 ref. (M26c, M27f, 2-60; Pb-a, Pb-b, *Sn*)

194-M.* Nickel Titanium Carbon System. E.R. Stover and J. Wulff. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 127-137.

An 870° C. isothermal section, the solidus equilibria and solubility of TiC and graphite in Ni solid solution determined with arc cast specimens. Quasi binary and ternary eutectics occur. 6 ref. (M24c, N12q; Ni, Ti, C, 14-67)

195-M.* Electron Diffraction Study of Tempered Low-Carbon Martensite. B.S. Lement. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 163-165.

Determines if cementite forms directly from martensite under conditions which preclude epsilon carbide formation. 4 ref. (M22h, N8k; Fe-b, *C*)

196-M.* (Russian.) Use of Microhardness Method to Construct Conoids of a Two-Phase Region of a Ternary Component Diagram. V.M. Glazov and V.N. Vigdorovich. *Zavodskaya Laboratoriya*, v. 25, Jan. 1959, p. 57-62.

Method of constructing graphic conoids in a two-phase metal system by utilizing microhardness; Al-Mg-Si, Cu-Cr-Zi and Cu-Al-Ti systems. 6 ref. (M24c; Al-b, *Mg, Si*, Cu-b, *Cr, Ti, Zr*)

197-M.* (Russian.) Electron Microscope and Electronograph Examination of Diffraction Pattern of Alloy Steel Strip. Yu. A. Skakov, M.B. Arengold and A.V. Sharshatkina.

Zavodskaya Laboratoriya, v. 25, Jan. 1959, p. 64-65.

On the electron diffraction pattern there is disclosed, besides lines of solid solution, secondary system of lines which correspond to sections of the alloy's higher content of Mo and C. (M22; AY, *Co, Cr, Mo, C*)

198-M.* Review Paper on the Constitution of Uranium-Molybdenum Alloys. A. J. Carrea, D. R. F. West and J. G. Ball. *Journal of Nuclear Energy*, v. 7, Sept. 1958, p. 189-198.

Constitution of U-Mo alloys. Differences between the proposed equilibrium diagrams are due partly to the difficulty of establishing equilibrium in the solid state transformations. 22 ref. (M24b; U, Mo)

199-M.* Metallurgy of Welding and Fabrication of Steel. H. C. Skevington. *Sheet Metal Industries*, v. 36, Feb. 1959, p. 85-90.

Structure of zones in and around weld; influence of chemical composition on steel properties, weldability and corrosion. Effect of flame cutting, hot and cold forming, work hardening. (M27c, K9, G22g; ST)

200-M.* (French.) Micrographic Methods for Examination of Nuclear Metals and Alloys. H. Monti. *Metaux Corrosion-Industries*, v. 33, Dec. 1958, p. 481-492.

Methods of specimen preparation; grinding, polishing and etching techniques for Pu, U, Th, Cb, Ta, V and Al-Pu, U-Pu, Th-N Cb alloys. 7 ref. (M20, T11g; Al, Pu, U, Th, Cb, Ta, V)

201-M.* (German.) Texture Evaluation of Metallic Materials by the Counting Tube Technique. F. Haeszner. *Metall*, v. 12, Dec. 1958, p. 1094-1101.

Texture analysis by X-ray spectrometer, reflection and transmission techniques. (M26c, X2)

202-M.* (Russian.) Elastic Dislocation of Micro-Volumes in Alpha Cobalt on Heating. M. G. Lozinskii. *Izvestiya Akademii Nauk, SSSR*, July 1958, p. 134-135.

Presence of transposition of separate resilient grain volumes during heating and elongation tests. Study of resilient microcontour on alpha-cobalt. 7 ref. (M26b; Co)

203-M. Pseudo-Binary Systems of Uranium Carbide With Zirconium Carbide, Tantalum Carbide, and Niobium Carbide. L. D. Brownlee. *British Nuclear Energy Conference, Journal*, v. 4, Jan. 1959, p. 35-38.

13 ref. (M24b; U, Zr, Ta, Cb, C, NM-a35)

204-M. Investigation of an Alloy Surface With the Field Emission Microscope. R. C. Bradley and L. A. D'Asaro. *Journal of Applied Physics*, v. 30, Feb. 1959, p. 226-233.

Field emission patterns indicate that a high-temperature flash (2000°K.) reduces the surface concentration of Zr to zero. Subsequent heat treatment at 1000°K. brings Zr to the surface in small clusters at the {100} planes. (M21e, 2-64; Mo-b, *Zr*)

205-M. Dislocation Etch Pits in Bismuth. L. C. Lovell and J. H. Wernick. *Journal of Applied Physics*, v. 30, Feb. 1959, p. 234-235.

Etch pits which are probably the sites of dislocations produced on the (111) cleavage plane of Bi. (M26b; Bi)

206-M. Cellular Substructure in Zn Crystals Grown From the Melt. V. Damiano and M. Herman. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 136-138.

6 ref. (M26, N12, 3-72; Zn)

207-M. Pd-B System. W. M. Lehrer. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 168-169.

Thermal arrests and eutectic temperature and eutectic composition as function of B determined. (M24b; Pd, B)

208-M. Structural Defects in Germanium Mono-Crystals Irradiated by Beta Particles and Fast Neutrons, and the Influence of These Defects on Electron-Hole Recombination. V. S. Vavilov, L. S. Smirnov, A. V. Spitzin, V. M. Patskevitch and M. V. Chukichev. Paper from "Radioisotopes in Scientific Research". v. 1, Pergamon Press, New York, 1958, p. 482-494.

16 ref. (M25, P15g, 2-67; Ge, 14-61)

209-M. Electronic Band Structures of the Alkali Metals and of the Noble Metals and Their Alpha-Phase Alloys. M. H. Cohen and V. Heine. *University of Chicago, Institute for the Study of Metals, Quarterly Report*, no. 51, Dec. 1958, p. 445-474.

75 ref. (M25, P11, P15g, EG-c, EG-e)

210-M. (Russian.) Etching Methods to Bring Out Microstructure of High-Nickel Alloy. E. E. Levin and E. M. Pivnik.

Zavodskaya Laboratoriya, v. 25, Jan. 1959 p. 67-68.
(M20q; Ni-b)

211-M. (Russian.) Method of Qualitative Absorptional Microradiography of Chemical Non-Uniformity in Alloys. B. A. Mobchan. *Zavodskaya Laboratoriya*, v. 25, Jan. 1959, p. 68-70.
Method used successfully in binary and ternary alloys with Al and Cu base. (M23n; Al-b, Cu-b)

212-M. (Russian.) X-Ray Measurements of Macro and Micro Stresses by Method of Angular Diffraction. D. M. Vasil'ev. *Zavodskaya Laboratoriya*, v. 25, Jan. 1959, p. 70-75.
Method of determining oriented microstresses after macro homogeneous plastic deformation of polycrystallic samples and a method of sectional determation of residual macro and microstresses after passing through macroheterogeneous plastic deformation. 11 ref. (M22g, Q25)

213-M.* (French.) Physical and Metallurgical Properties of Alpha Iron-Silicon Alloys. Pierre Coulomb. *Metaux Corrosion-Industries*, v. 33, Nov. 195 8, p. 431-440.
Physical properties; techniques for studying metallurgical properties; grain boundary energy, anisotropy of grain growth, polygonization, rolling and primary recrystallization textures, exaggerated grain growth, double textures. 83 ref. (M26, M27, P-general; Fe-b, Si)

214-M.* (German.) Evaluation of Micrographs Obtained From Tempered High Speed Steels. Ernst Kunze. *Stahl und Eisen*, v. 79, Feb. 5, 1959, p. 145-148.
Clarification of grain boundaries in steel depends on degree of etching, etchant, and on the degree of tempering. (M27, M20q, 2-64; TS-m)

215-M.* (French.) The Concept of Trace Elements, Particularly in Metallography. Albert Portevin. *Genie Civile*, v. 136, Jan. 1959, p. 9-13.
Effects of traces on metal structures and properties; traces as impurities and as addition elements. 33 ref. (M26, 3-69)

216-M.* (French.) Micrographic Evidence in Support of Dislocation Theory. J. B. Lean and J. Plateau. *Metaux Corrosion-Industries*, v. 33, Oct. 1958, p. 389-405.
Microstructure correlated with slip, deformation and edge dislocations in single crystals of alpha brass, stainless steel, Ge, Si, Ag and Al. 85 ref. (M26b, Q24a; Ge, Si, Ag, Al, SS, Cu-n, 14-61)

217-M. (Russian.) Conoid for Estimating Composition, Structure and Strength of Pearlitic Cast Iron. A. A. Zhukov. *Liteinoe Proizvodstvo*, Jan. 1959, p. 36-41.
Methods for the composition of constitution diagrams and estimation of structure and properties of pearlitic cast iron starting from the C and Si contents. 20 ref. (M24e; CI, *C*, *Si*)

218-M.* New Wrought Iron Has Better Corrosion Resistance. E. P. Best. *Materials in Design Engineering*, v. 49, Feb. 1959, p. 100-102.
New 4-D wrought iron contains a fine dispersion of very thin silicate inclusions throughout its structure. Threads of silicate present in a concentration of approximately 250,000 per cross-sectional sq. in. interrupt the granular pattern of the metal, providing a fibrous pattern which gives the material its corrosion resistance. (M27, R-general; Fe-m)

219-M.* Binary and Ternary Alloys of Tin With the Elements of Groups IIB, IIIB and VB of the Periodic Table. H. W. Rayson, C. W. Goulding and G. V. Raynor. *Metallurgia*, v. 59, Feb. 1959, p. 57-62.
To examine the effect of third metals on the simple hexagonal tin-rich intermediate phases of the beta Sn-Cd type, tin-rich alloys of the systems Sn-Cd-Zn, Sn-Cd-Tl and Sn-In-Sb were examined by metallographic, X-ray and electrical resistance methods. Experiments on the binary systems Sn-Cd, Sn-Zn, Sn-Tl and Sn-In were also carried out. 20 ref. (M24b, M24c; 2-60; Sn, Cd, Zn, Tl, In)

220-M.* (German.) Electrolytic Treatment of Samples in Metallography. F. Rammele. *Technik*, v. 14, Jan. 1959, p. 46-50.
Etching and polishing of surfaces in an electrolyte by an electric current. Polishing effect depends on the voltage, current density and resistance of the external circuit of current and of the electrolyte. (M20q, M20p)

221-M. (Book.) Constitutional Diagrams of Uranium and Thorium Alloys. Frank A. Rough and Arthur A. Bauer. 153 p. 1959. Addison-Wesley Publishing Co., Inc., Reading, Mass. $5.

Compilation of U. S. and United Kingdom constitutional diagrams and data on crystallography of intermetallic compounds. Includes both binary and ternary systems. Melting points and allotropic modification of the basic metals. (M24, U, Th)

222-M. (Translation—AIP.) X-Ray Diffraction Analysis of the Changes in Mosaic Structure During the Aging of Beryllium Copper. Ia. Umanskii, V. Eliutina, A. Kagan and L. Pivovarov. *Soviet Physics, Crystallography*, v. 2, no. 4, 1958, p. 500-504.

Changes in size of subgrains which occur during isothermal precipitation from supersaturated solid solutions of Be in Ni or Cu are determined from the intensities of small-angle X-ray diffraction lines. 7 ref. (M26s, N7, 2-64; Ni-b, Cu-b, *Be*, 14-67)

223-M. (Translation—AIP.) Change in the Crystal Structure of Steel During Cold Work and Heat Treatment. E. L. Gal'tserin and Iu. S. Terminasov. *Soviet Physics, Crystallography*, v. 2, no. 4, 1958, p. 515-521.

Samples of steel 55 C (and some of steel 20) examined by radiometallography, microhardness testing and elastic constants measurement. Fragmentation, structural distortions, lattice binding forces and mechanical properties were studied before and after heat treatment and cold working. 21 ref. (M27, Q-general, 2-64, 3-68; ST)

224-M. (Translation—BISI no. 816.) Mottling of Tinplate. Hans Eggers. *Archiv fur das Eisenhuttenwesen*, v. 28, Dec. 1957, p. 777-783..

See item 298-M, 1958. (M26c; ST, Sn, 8-62)

225-M. (Translation—BISI no. 949.) Extraction of Sulphide Inclusions and Relation Between the Properties of the Steel and the Inclusions. Kurt Born. *Archiv fur das Eisenhuttenwesen*, v. 29, Mar. 1958, p. 179-187.

See item 221-M, 1958. (M23; ST, 9-69)

226-M. (Translation—BISI no. 1051.) Recrystallization Textures of Cold Rolled Transformer Steel. Helmut Stablein and Hermann Moller. *Archiv fur das Eisenhuttenwesen*, v. 29, July 1958, p. 433-447.

See item 536-M, 1958. (M26c, N5; ST, SGA-n)

227-M. (Translation—BISI no. 1079.) Investigations Into the Isolation of Grain Boundary Materials and Inclusions in Steels by the Thin Section Process. Hermann Schenck. *Archiv fur das Eisenhuttenwesen*, v. 29, Aug. 1958, p. 479-484.

See item 593-M, 1958. (M27f; ST)

228-M. (Translation—Columbia.) X-Ray Spectroscopic Investigation of Solid Solutions. I. B. Borovskii, K. P. Gurov, S. A. Ditsman, V. A. Batyrev and N. D. Lobanova. *Academy of Sciences of the USSR, Bulletin*, v. 21, no. 10, 1957, p. 1389-1399.

Variation of distribution in energy of electron states in continuous series of binary solid solution alloys of the transition elements as typified by the Cr-Mo system. 12 ref. (M25, M24b, M23, 3-69; Cr, Mo, 14-67)

229-M. (Translation—Columbia.) X-Ray Spectroscopic Investigation of Chemical Composition in Microvolumes of Alloys. I. B. Borovskii, N. P. Il'in, L E. Loseva, I. D. Marchukova and A. N. Deev. *Academy of Sciences of the USSR, Bulletin*, v. 21, no. 10, 1957, p. 1404-1411.

Analysis of phase composition and of structure of welded and soldered joints; investigation of diffusion layers. (M23, M27, N1c, M24; Cu-b, *Ni,Zn* SGA-h)

230-M. (Translation—Columbia.) X-Ray Spectroscopic Method of Investigating the Electron State Distribution in Metals and Alloys. N. D. Borisov, V. V. Nemoshkalenko and A. M. Fefer. *Academy of Sciences of the USSR, Bulletin*, v. 21, no. 10, 1957, p. 1412-1422.

Atomic structure of Fe-Cr alloys. 10 ref. (M25, M23; Cr-b, *Fe*)

231-M. (Translation—Columbia.) State of Atoms in Ferromagnetic Iron, Cobalt and Nickel-Base Alloys. I. Ia. Dekhtiar. *Academy of Sciences of the USSR, Bulletin*, v. 21, no. 10, 1957, p. 1440-1446.

9 ref. (M25, P16; Cr-b, *Co, Fe*)

232-M.* (German.) Testing of Kish Graphite. Franz Roll. *Archiv fur das Eisenhuttenwesen*, v. 30, Feb. 1959, p. 91-94.

Chemical composition and structure of kish obtained from pig iron and ferro-alloys. (M27; NM-k36)

233-M. Theory of the High Temperature Strength of Alloys. John C. Fisher. Paper from "High Strength Materials, Their Strength Potentials and Limitations". PB 131834, 1958. U. S. Office of Technical Services, Washington 25, D.C., p. 23-29.

Influence of elevated temperature on the six factors which originate strength

at low temperatures—dislocation pinning by short-range order, by solute atoms and by static friction, strengthening by second-phase particles, strengthening by other dislocations, strengthening by long-range order. Plastic deformation is accelerated at high temperatures largely because the process of diffusion occurs more rapidly. (M26b, Q24, N7e, 2-62)

234-M.* Uranium-Niobium Alloy System in the Solid State. P. C. L. Pfeil, J. D. Browne and G. K. Williamson. *Institute of Metals, Journal*, v. 87, Feb. 1959, p. 204-208.

Equilibrium diagrams and apparent phase boundaries as determined by metallography, X-ray diffraction and thermal analysis. Comparison with results obtained by other workers. 23 ref. (M24b; U, Cb)

235-M. Direct Observation of Anti-Phase Domain Boundaries in Ordered CuAu Alloy. Am. B. Glossop and D. W. Pashley. *Royal Society Proceedings*, Series A, v. 250, Feb. 24, 1959, p. 132-146.

Image by electron microscope consists of series of closed loops which are arranged so that there are zones of regularly spaced anti-phase boundaries with a period of 20 Å. Effect of dislocations on the formation. 19 ref. (M26q, M27g, M27f; Cu-b, *Au*)

236-M. Constitution, Metallurgy and Oxidation Resistance of Iron-Chromium-Aluminum Alloys. Walston Chubb, Sam Alfant, Arthur A. Bauer, Edward J. Jablonowski, Fred R. Shober and Ronald F. Dickerson. Battelle Memorial Institute. *U. S. Atomic Energy Commission, BMI-1298*, Oct. 16, 1958, 104 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $2.50.

Limits of the alpha-plus-sigma region are found to extend from 33 to 63% Cr at 600° C. Oxidation resistances of 23.7% Cr 6.0% Al iron-base alloy and of 20.0%, Cr 1.1% Cb nickel-base alloy are compared at 1900 and 2100° F. 66 ref. (M24c, R1h, 2-62)

237-M.* Orientation and Anisotropy in Low Carbon Steel Sheets. Robert S. Burns and Robert H. Heyer. Paper from "Annealing of Low Carbon Steel, Proceedings". Lee Wilson Engineering Co., Inc., Cleveland, Oct. 1957, p. 29-41.

Rimmed and Al-killed steels tested for directionality by means of tension test, tear length, magnetic torque, X-ray pole figures and microstructure. Effects of mechanical fibering and crystallographic preferred orientation on directionality. (M26c; CN-g, 3-72)

238-M. Structure of Evaporated Tungsten Films. R. L. Moss and I. Woodward. *Acta Crystallographica*, v. 12, pt. 3, Mar. 10, 1959, p. 255.

(M26; W, 14-62)

239-M. Electronic Band Structures of the Alkali Metals and the Noble Metals and their Alpha-Phase Alloys. M. H. Cohen and V. Heine. *Philosophical Magazine, Supplement-Advances in Physics*, v. 7, Oct. 1958, p. 396-434.

60 ref. (M25; EG-c, EG-e)

240-M. (Russian.) Radiographic Study of the Distribution of Columbium in Stainless Steel. L. S. Livshits and L. P. Bakhpach. *Svarochnoe Proizvodstvo*, Jan. 1959, p. 20-22.

Effect of heating conditions of steel 18-9 containing Cb on formation and solubility of Cb carbides studied by means of the isotope Cb-95. Optimum Cb content is given to assure stability against intercrystalline corrosion at temperatures ranging from 550-650° C. 4 ref. (M23q, R2h; SS, 14-68, *Cb*)

241-M.* (French.) Method of Testing Surface Layers. Louis Pons. *Comptes Rendus*, v. 248, Jan. 12, 1959, p. 188-189.

Deformation structure caused by friction in the surface zones of roller bearings is made visible by nitrogen diffusion. (M26c, Q9p, 3-68, T7d; ST)

242-M.* (German.) The Combined Platinum-Carbon Replica Method in Electron Metallography. Frank W. Gunther and Dieter Raab. *Neue Hutte*, v. 4, Feb. 1959, p. 113-115.

To increase the contrast of the carbon replica technique it is desirable to produce heavy-melted shadows. A new electrode evaporates both Pt and carbon, resulting in replicas with excellent contrast in electron microscopy. 14 ref. (M20r, M21e)

243-M.* Quenching of Imperfections in Aluminum. W. DeSorbo and D. Turnbull. *Acta Metallurgica*, v. 7, Feb. 1959, p. 83-85.

Energy of formation and annealing out of point defects in high-purity Al by resistometric techniques. 13 ref. (M26s, J23; Al)

244-M.* Behavior of Semiconductor and Magnetic Materials in Radiation Environment. Alvin Boltax. *Electrical Manufacturing*, v. 63, Mar. 1959, p. 90-95.

Atomic displacements in semiconductors; changes in magnetic properties of magnetic materials. 9 ref. (M25, P16, 2-67; EG-j, SGA-n)

245-M.* Aligned Crystals in Metals. B. D. Cullity. *Scientific American*, v. 200, Apr. 1959, p. 125-126, 128, 130, 132, 134, 137, 138, 141.

Mechanism of preferred orientation in silicon steel, Alnico and uranium. (M26c; ST, *Si*, Al-b, *Co*, *Ni*, U)

246-M.* (Czech.) Crystallization of Technical Fe-Al-C Alloys in the Alpha Range of Solid Solution. Miloslav Vyklicky and Hanus Tuma. *Hutnicke Listy*, v. 14, Feb. 1959, p. 118-127.

The constitution of alloys with approximately 10-32% Al and 0.1 and to 2.5% carbon after quenching from 900-1200° C. studied by thermal analysis and micrographs. In addition to the alpha phase, the epsilon phase, graphite and the carbide Al_4C_3 are also present. 20 ref. (M24c; Fe-b, *Al*, *C*)

247-M.* (Hungarian.) Methods for Investigating Inclusions in Steel. Jozsef Vero. *Kohaszati Lapok*, v. 91, Oct-Nov. 1958, p. 449-459.

Microscopic tests currently used to detect inclusions in steel; quantitative determination of oxygen in steel; laws of growth of oxygen inclusions. 15 ref. (M27, S11r, ST, *O*, 9-69)

248-M. (German.) Electron Investigations on Twin Formation in Silver Layers Deposited by Evaporation. L. Reimer. *Optik*, v. 16, Jan. 1959, p. 30-34.

Electron diffraction patterns of Ag layers deposited on the heated cleavage planes of NaCl crystals show satellites around the normal spot due to twin formation. 6 ref. (M22h, M21e, M27e, Ag)

249-M. (Rumanian.) Structure of Alloys as Determined by Radioactive Isotopes. S. Bercu, A. Kathrein, N. Petrescu and C. Rizescu. *Studii si Cercetari de Metalurgie*, v. 3, no. 3, 1958, p. 371-384.

12 ref. (M23q)

250-M.* Formation of Surface Pits by the Condensation of Vacancies. P. E. Doherty and R. S. Davis. *Acta Metallurgica*, v. 7, Feb. 1959, p. 118-123.

Formed on electropolished surfaces of Al single crystals during cooling from high temperatures. Possibly a definite and constant supersaturation of vacancies is required before condensation begins. 10 ref. (M26s, 2-64; Al, 14-61)

251-M. Improved Metallographic Technique for Revealing Temper Brittleness Network in Ordnance Steels. J. P. Rucker. U. S. Naval Proving Ground. *U. S. Office of Technical Services*, PB 131941, Aug. 1957, 28 p. $1.

Combination etch (zephiran chloride, followed by 5% nital) saves considerable time in metallographic preparation and analysis in determining presence of free ferrite, tempered martensite and network. (M20q, Q26s; ST)

252-M.* (French.) Electron Microscopy of Precipitates Illustrating the Multiplying Sources of Dislocations in an Aged 4% Cu Aluminum Alloy. P. A. Jacquet and E. Mencarelli. *Comptes Rendus*, v. 248, Jan. 19, 1959, p. 405-408.

Study of alumina replicas confirms that areas of heterogeneity produced at beginning of tempering of quenched solid solution are related to dislocations in lattice. Shape and orientation of precipitates. (M26b, M21e, N7a; Al-b, *Cu*)

253-M.* (French.) Electron Diffraction Study of the Epitaxy of Gold on Alkaline Halides. P. Conjeaud. *Comptes Rendus*, v. 248, Jan. 26, 1959, p. 566-569.

Epitaxial orientation of thin films of Au deposited by evaporation under vacuum on NaCl, KCl and KBr depends not only on nature and temperature of support but also on number of atoms of metal striking support per sq.cm. and per sec. Ultimate orientation of film is determined by that of nuclei formed at point of contact with support. 5 ref. (M26c, M22h; Au, 14-62)

254-M.* (Russian.) Heterogeneity in Magnesium Cast Iron. N. M. Zarubin. *Liteinoe Proizvodstvo*, Feb. 1959, p. 40-41.

Structure and distribution of chemical elements in spheroidal graphite cast iron. Data on dispersion of graphite. 11 ref. (M27; CI-r, *Mg*)

255-M.* (Russian.) Heterogeous Structure in Transformer Steel Ingots. N. F. Dubrov, I. A. Gorlach, N. V. Kets and D. G. Zhukov. *Stal'*, Feb. 1959, p. 117-122.

Heterogeneity of a 6.2-ton ingot of transformer steel (3.2% Si) prepared in an electric arc furnace. Stability of cold

rolled transformer steel is increased by reduction of heterogeneity and control or carbon content to 0.02%, S to 0.003% and elimination of Al. 5 ref. (M27, 2-60; SGA-n, 9-69, ST)

256-M.* (Russian.) Tellurium in Steel. Ya. E. Goldshtein. *Stal'*, Feb. 1959, p. 156-159.

Micro-alloying of structural steel with Te produces compact grain structure of rolled stock (or forging), and reduces sensitivity to overheating. (M27c, 2-60; ST, *Te*)

257-M.* Binary and Ternary Alloys of Tin With the Elements of Groups IIB, IIIB and VB of the Periodic Table. H. W. Rayson, C. W. Goulding and G. V. Raynor. *Metallurgia*, v. 59, Mar. 1959, p. 125-130.

To examine the effect of third metals on the simple hexagonal Sn-rich intermediate phases on the beta Sn-Cd type, Sn-rich alloys of the systems Sn-Cd-Zn, Sn-Cd-Tl, Sn-Cd-Bi and Sn-In-Sb were examined by metallographic, X-ray and electrical resistance methods. 20 ref. (M24c; Bi, Cd, In, Sb, Sn, Tl, Zn)

258-M.* (French.) Influence of Surface Condition on Some Properties of Uranium. C. Sella and J. J. Trillat. *Revue de Metallurgie*, v. 56, Feb. 1959, p. 105-121.

Reactivity of U with oxygen; nature of oxides and crystallographic structure and oxide texture tested with regard to surfaces mechanically or electrolytically polished and oxidized in varying conditions. 14 ref. (M26c, R1h; U)

259-M.* (German.) Comparison Between Feathery Crystalline and Fine-Grained Aluminum Bar of Commercial Purity With Reference to the Development of Ears in Finished Sheets. M. F. Jordan and J. C. Blade. *Metall*, v. 13, Mar. 1959, p. 193-196.

Feathery crystalline structure does not influence development of ears any more than fine-grained structure, but it creates a tendency for broader scattering of ears values and has some asymmetrical sequences. 4 ref. (M26c, F23; Al, 4-55)

260-M.* (German.) Effect of Process Annealing on Texture of Rolled Aluminum. W. Bunk and P. Esslinger. *Metall*, v. 13, Mar. 1959, p. 198-202.

An alloy-type rolled texture may be developed in Al under certain conditions. This type of texture is determined by its main maxima in the pole figures. (M26s, 2-64; Al)

261-M. Study of Metallic Carbides by Electron Diffraction. Pt. 3. Iron Carbides. Sigemaro Nagakura. *Physical Society of Japan, Journal*, v. 14, Feb. 1959, p. 186-195. 16 ref. (M26c; Fe, *C*, NM-a35)

262-M. Memorandum on the Use of X-Ray Diffraction for the Study of Titanium and Titanium Alloys. J. R. Doig, Jr. Battelle Memorial Institute. *U. S. Office of Technical Services*, PB 131940, Mar. 1958, 19 p. $.50. (M22g; Ti-b)

263-M. (Russian.) Structure of Titanium Weldments Revealed by Electropolishing. G. I. Parfessa and A. A. Rossoshinskii. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 185. (M20p; Ti, 7-51)

264-M. (Russian.) Fractography in Fracture Testing. M. L. Bernshtein and A. I. Paisov. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 186-189.

Use of electron microscope. 13 ref. (M23p, Q26)

265-M. (Russian.) Instrument for Analysis of Metallic Phases. Yu. D. Labut'ev, V. A. Mil'chev and M. M. Shapiro. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 227-228. (M24, 1-53)

266-M. (Russian.) Instrument for High-Temperature Quenching and Thermal Analysis. V. P. Lebedev. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 228-229. (M23r, 1-53)

Theory of electron scattering, process of structure determination, Fourier synthesis of potential and experimental investigations of organic and inorganic compounds, metals and alloys. 84 ref. (M22h)

272-M. (Translation—BWRA.) A Procedure for the Metallographic Investigation of Welds in Aluminum. V. F. Grabin and D. M. Rabkin. *Avtomaticheskaya Svarka*, v. 65, Aug. 1958, p. 35-38.

Etching reagent consists of three parts 60% nitric acid, one part 30% hydrochloric acid, one part distilled water. Sections are etched at room temperature for 3 to 5 min.; etching ends when the macrostructure has become sufficiently clear. Chemical, mechanical and electrolytic techniques for the preparation of surfaces for microstructural investigation. 5 ref. (M20q, M20p; Al, 7-51)

273-M.* (German.) Fracture Testing of Steel With the Electron Microscope. Carl-Georg Nestler and Frank Walter Gunther. *Archiv fur das Eisenhuttenwesen*, v. 30, Mar. 1959, p. 161-167.

Fractography of steel C75W3 with approximately 0.8% carbon tested after different heat treatments. Effect of testing temperature. (M23p, 2-64;CN-r)

274-M. Kinetics of Grain Boundary Grooving in Copper. W. W. Mullins and P. G. Shewman. *Acta Metallurgica*, v. 7, Mar. 1959, p. 163-170.

Theory predicts that shape of groove profile has a time-independent form and that groove width and depth increase linearly. Tested by studying grooving of tilt boundaries in Cu annealed in dry hydrogen at 930 and 1035° C. Calculates surface diffusion coefficient. 16 ref. (M27f, J23; Cu)

275-M. Dislocation Structure of Slip Bands in Iron. J. R. Low, Jr., and R. W. Guard. *Acta Metallurgica*, v. 7, Mar. 1959, p. 171-179.

Silicon iron examined by etch-pit technique showed that arrays, when viewed normal to edge component, are straight but not coplanar over long distances, while the arrays where the screw component emerges from the surface show much curvature. 11 ref. (M26b, Q24c; Fe-b, *Si*, 14-61)

276-M.* (Russian.) Structure of 50% Fe-50% Ni Alloy Strip. M. M. Borodkina and N. P. Gromov. *Fizika Metallov i Metallovedente*, v. 6, no. 5, 1958, p. 819-824.

Texture deformation and recrystallization investigated by means of pole figures. The predominant orientations in the deformed strip are $(110)[1\bar{1}2]$, $(11\bar{2})$, $[111]$ and $(236)[53\bar{3}]$. 5 ref. (M26c, N5; Fe-b, Ni, 4-53)

277-M.* (Russian.) Block Fragmentation and Distortion of Atomic Lattice. V. F. Mindukshev and Yu. S. Tepminasov. *Fizika Metallov i Metallovedenie*, v. 6, no. 5, 1958, p. 919-923.

Distortion phenomena under static and dynamic loading of duralumin and Cu at room temperature and at temperature of liquid nitrogen. At room temperature lattice distortion is higher under static than dynamic deformation. 10 ref. (M25, 3-68, 2-63; Al-b, *Cu*)

278-M. Nature of Mechanically Polished Metal Surfaces. L. E. Samuels. *Electroplating and Metal Finishing*, v. 12, Apr. 1959, p. 130-133.

Evidence establishes that the polishing of metal surfaces by mechanical metallographic methods occurs by cutting and not by surface flow. (To be continued.) (M20p)

279-M. Double Bragg X-Ray Scattering From Cold-Worked Metals. W. T. Ogier, R. L. Wild and J. C. Nickel. *Journal of Applied Physics*, v. 30, Mar. 1959, p. 408-412. 14 ref. (M21f, 3-68)

280-M. Cause of the Strengthening in Quenched Beta Brass. N. Brown. *Acta Metallurgica*, v. 7, Mar. 1959, p. 210-215.

Quenched Cu-Zn is strengthened by vacancies which are generated by the rapid disorder-to-order transformation. Temperature which produces maximum

strength is a function of quenching rate. 9 ref. (M26s, Q27a, Q29n, J26; Cu-n)

281-M.* Texture and Mechanical Properties of Iron. C. J. Ball. *Iron and Steel Institute, Journal*, v. 191, Mar. 1959, p. 232-236.

Substructures developed in pure Fe by deformation, in tension at temperatures in the range -77 to + 500° C. The flow stress on subsequent straining at room temperature is related to the substructure. Subgrain formation occurs by glide during formation and is not the result of a subsequent process of polygonization. 13 ref. (M26c, Q-general, 3-68; Fe-a)

282-M. Point Defects and the Mechanical Properties of Metals and Alloys at Low Temperatures. A. H. Cottrell. Paper from "Vacancies and Other Point Defects in Metals and Alloys". Institute of Metals, London, S.W.1, England, 1958, p. 1-39.

Mechanical effects of vacancies and other point defects introduced into metals and alloys by irradiation, quenching, deviations from stoichiometry and cold work. Irradiation with fast atomic particles hardens metals and sometimes embrittles them. A high yield stress, sensitive to temperature, results. Yielding often occurs with a fall in stress, and coarse slip lines, overshooting and changes of texture are observed. 148 ref. (M26s, Q-general, 2-63, 2-64, 2-67)

283-M. The Effects of Lattice Defects on Some Physical Properties in Metals. T. Broom and R. K. Ham. Paper from "Vacancies and Other Point Defects in Metals and Alloys". Institute of Metals, London, S.W.1, England, 1958, p. 41-78.

Various ways by which point defects are introduced into metals. Provisional interpretation of annealing processes for Cu in terms of the migration of interstitials, vacancy pairs, single vacancies and dislocations. Theoretical and experimental work on the effects of lattice defects on stored energy, electrical resistivity, density, X-ray lattice parameter, thermo-electric properties, thermal conductivity, magnetic properties and nuclear magnetic resonance. 141 ref. (M26s, P-general, J23; Cu)

284-M. Point Defects and Diffusion in Metals and Alloys. W. M. Lomer. Paper from "Vacancies and Other Point Defects in Metals and Alloys". Institute of Metals, London, S.W.1, England, 1958, p. 79-98.

A distinction is drawn between chemically homogeneous systems, in which diffusion may be followed by means of radioactive tracer atoms, and inhomogeneous systems, in which ordinary chemical diffusion occurs. The transport of mass by diffusion is also considered together with the relations between these various diffusion coefficients for dilute binary alloys. 54 ref. (M26s, N1)

285-M. Point Defects and Mechanical Properties of Ionic Crystals. P. L. Pratt. Paper from "Vacancies and Other Point Defects in Metals and Alloys". Institute of Metals, London, S.W.1, England, 1958, p. 99-130.

Distribution of point defects in annealed crystals. Changes in mechanical properties due to alloying, quenching and irradiation, with special reference to accompanying changes in density and distribution of point defects. Dislocation lines are shown to be electrostatically charged and surrounded by a space-charge of vacancies of the opposite sign, and by this means the development of a potential across the ends of a lightly deformed crystal is explained. 106 ref. (M26s, M26b, Q-general)

286-M. Point Defects Near the Surface of a Metal. E. C. Williams and P. C. S. Hayfield. Paper from "Vacancies and Other Point Defects in Metals and Alloys". Institute of Metals, London, S.W.1, England, 1958, p. 131-157.

Changes occurring during annealing of copper, as observed microscopically, are interpreted in terms of recrystallization, evaporation and diffusion of impurities to the surface. Worked surface layers do not readily recrystallize on heating because of retarded atomic mobility, probably due to impurities introduced into the surface layer by the working operation. 47 ref. (M26s, J23, N5, N1; Cu)

287-M. Point Defects and Mechanical Properties of Metals and Alloys at High Temperatures. D. McLean. Paper from "Vacancies and Other Point Defects in Metals and Alloys". Institute of Metals, London, S.W.1, England, 1958, p. 159-198.

Creep at high temperature seems to be governed in most metals by the rate of climb away from obstacles. In single-phase metals the obstacles are presumably the stress fields of other dislocations, and in most commercial creep resistant

alloys they take the form of small particles of a second phase. The strong effect of stress on creep rate is due to the influence of the stress on the number of active dislocations and their mean free path. 109 ref. (M26s, M26b, Q3, 2-62, 3-66)

288-M. Quenched-In Vacancies of Noble Metals. Pt. 1. Theory of Decay. H. Kimura, R. Maddin and D. Kuhlmann-Wilsdorf. *Acta Metallurgica*, v. 7, Mar. 1959, p. 145-153.

Decay laws for quenched-in vacancies in metals calculated using stray or network dislocations and sessile rings formed by the condensation of vacancies. Decay of quenched-in resistivity in Au analyzed. 22 ref. (M26b, J26; Au, EG-c)

289-M. Quenched-In Vacancies in Noble Metals. Pt. 2. Mechanism of Quench Hardening. H. Kimura, R. Maddin and D. Kuhlmann-Wilsdorf. *Acta Metallurgica*, v. 7, Mar. 1959, p. 154-162.

Hardening observed on aging after quenching Cu wire. Comparison of observed quench hardening in Cu and Au with the decay of quenched-in resistivity in Au shows that the two types of hardening can be explained assuming two types of sinks for vacancies. 12 ref. (M26b, J26, J27d; Cu, Au, EG-c, 4-61)

290-M. Electron Irradiation of Aluminum-Copper Alloys. C. W. Tucker, Jr., and M. B. Webb. *Acta Metallurgica*, v. 7, Mar. 1959, p. 187-190.

Mobile irradiation defects promote low-temperature clustering of Cu atoms at -60° C. Implies that thermally activated clustering of Cu proceeds by an excess vacancy mechanism rather than a dislocation mechanism. 11 ref. (M28n, 2-67, M26s; Al-b, *Cu*)

291-M. The Crystal Structure of Plutonium. Delta and Epsilon Phases. J. G. Ball, P. Greenfield, P. G. Mardon and J. A. L. Robertson. *United Kingdom Atomic Energy Authority*, AERE M/R 2516, June 1958, 12 p.

Thermal analysis experiments indicate that five allotropic modifications of Pu, designated alpha, beta, gamma, delta and epsilon, exist between room temperature and melting point. Of the five phases only two give simple X-ray patterns. These are the delta and epsilon phases. X-ray diffraction photographs are used to provide data on their patterns and structural interpretation. 13 ref. (M26, M24; Pu)

292-M.* Dislocation Etch Pits and Polygonization in High-Purity Copper. L. C. Lovell and J. H. Wernick. *Journal of Applied Physics*, v. 30, Apr. 1959, p. 590-592.

Chemical etch developed to reveal dislocations on the (111) plane of high-purity Cu without prior decorating. 14 ref. (M20q, M26b, N4; Cu-a)

293-M. The Lanthanum-Carbon System. F. H. Spedding, K. Gschneidner, Jr., and A. H. Daane. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 192-199.

From thermal, metallographic, X-ray, dilatometric and electrical resistance data a phase diagram is proposed. Two compounds are formed, body-centered cubic, La_2C_3 having a large range of solid solubility, and body-centered tetragonal LaC_2. Two eutectics are formed in the system; the first, at 2.2% carbon, melts at 806° C., the second occurs between LaC_2 and carbon with a melting point of 2271° C. 16 ref. (M24b; La, C)

294-M. The Antimony-Uranium Alloys System. B. J. Beaudry and A. H. Daane. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 199-203.

Four intermediate phases are present: USb_2 and USb_4 which undergo peritectic decomposition at 1355 and 1695° C., respectively, and USb and U_4Sb_3, which melt congruently at 1850 and 1800° C. There is a eutectic between U_4Sb_3 and USb which melts at 1770° C. 10 ref. (M24b; Sb, U)

295-M. A Study of the Liquidus in Aluminum-Uranium Alloys. Victor W. Storhok, Arthur A. Bauer and Ronald F. Dickerson. Battelle Memorial Institute. *U. S. Atomic Energy Commission*, BMI-1264, May 1, 1958, 10 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .50.

Liquidus temperatures for alloys containing 13 to 50% U. Neither Si additions up to 1% or Mg additions up to 0.5% produce any change in liquidus temperature, although the Si additions lower the peritectic temperature from 732 to 700° C. (M24b, P12, 2-60; Al-b, *U, Si*)

296-M. Comparative Measurements of the Velocity of Propagation of an Ultrasonic Pulse in Uranium Fuel Elements. Peter R. Morris. National Lead Co. of Ohio. *U. S. Atomic Energy Commission*, NLCO-764, Feb. 11, 1959, 47 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.

Equipment distinguished differences in preferred orientation between alpha-rolled and alpha-rolled, beta-heat-treated

U fuel elements and offers a more reliable test of the beta-heat-treating operation than currently employed grain size measuring equipment. (M26c, T11g, 2-64; U)

297-M. Phase Relationships in the System Iron-Aluminum-Oxygen. L. M. Atlas and W. K. Sumida. Armour Research Foundation of Illinois Institute of Technology. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 151000, Feb. 1957, 55 p. $1.50.

Research on specific regions of the phase field provides background for future development of cermets composed of Fe-Al alloys and Al_2O_3. (M24c; Al, Fe, O, 6-70)

298-M. Use of Diamond Abrasives in Metallographic Problems. E. C. Olden. Frankford Arsenal. *U. S. Office of Technical Services,* PB 151042, Mar. 1958, 23 p. $ .50.

New polishing procedure found to minimize three problems usually encountered in metallographic preparation of ferrous and nonferrous alloys—loss of nonmetallic inclusions, surface distortion, and insufficient flatness of field. (M20p)

299-M.* (English.) Constitution of Silver-Rich Silver-Arsenic Alloys. G. A. Eade and W. Hume-Rothery. *Zeitshcrift fur Metallkunde,* v. 50, Mar. 1959, p. 123-126.

Solubility of As in the alpha mixed crystal is lower than previously indicated in the literature. The lattice constant increases in proportion to the As content. 9 ref. (M24b, P12e, 2-60; Ag, *As*)

300-M.* (German.) Secondary X-Ray Diffraction of Metals After Deformation. Horst Fricke and Volkmar Gerold. *Zeitschrift fur Metallkunde,* v. 50, Mar. 1959, p. 136-145.

X-ray diffraction testing of monocrystalline and polycrystalline Cu and Al foils from 1 to 45 angular degrees. The scattering of diffracted rays following deformation is explained by double reflection of adjacent subgrains. 19 ref. (M22g, 3-68; Cu, Al, 4-56)

301-M.* (Italian.) Lattice Vacancies. Tiziano Federighi. *Metallurgia Italiana,* v. 51, Mar. 1959, p. 57-64.

Formation and importance of vacancies. Importance of vacancies in the diffusion process and in the aging of Al alloys; vacancies in relation to mechanical properties; methods of revealing vacancies. 15 ref. (M26s)

302-M.* Determination of Crystal Orientation by High Intensity Reflectograms. G. H. Schwuttke. *Electrochemical Society, Journal,* v. 106, Apr. 1959, p. 315-317.

Structural aspect for the temperature of 350° C. (M24c; Au, Cd, In)

320-M.* Metallographic Differentiation of Cobalt Metal, Oxide and Sulphide. R. S. Young. *Metallurgia*, v. 59, Apr. 1959, p. 210.

Etching with 1% mercuric chloride for 30 sec. or 35% sodium bisulphite for 2 min. (M20q; Co)

321-M.* Etching Reagents for Dislocations in Metal Crystals. L. C. Lovell, F. L. Vogel and J. H. Wernick. *Metal Progress*, v. 75, May 1959, p. 96.

General methods and precautions. Data sheet lists recommended etching solutions and times for various metals; typical results. (M20q, M26b)

322-M.* Use of the Electron Microscope. Study of Creep in a Chromium-Molybdenum Steel. K. F. Hale. *Metal Treatment and Drop Forging*, v. 26, Apr. 1959, p. 145-153, 160.

Observations on specimens of 2¼ Cr, 1% Mo steel covering stress and unstressed conditions between 550 and 675° C. and times to 20,000 hr. (M21e, M20r, Q3n; AY, *Cr, Mo*)

323-M.* (German.) Rolling Texture and Recrystallization Texture of Tantalum. Herbert Muller. *Zeitschrift fur Metallkunde*, v. 49, Nov. 1958, p. 575-577.

After a 90% deformation by cold rolling, with process annealing, of tantalum sheet, the texture showed preferred orientation in the (100) [011] and (112) [110] planes. Weaker orientations were found in the (111) [112] and (111) [110] planes. 4 ref. (M26c, N5f; Ta)

324-M.* (German.) Magnetic Measurements on Gold-Iron Alloys. Erich Scheil, Hansgeorg Specht and Ernst Wachtel. *Zeitschrift fur Metallkunde*, v. 49, Nov. 1958, p. 590-600.

Observation of a single-phase reaction in mixed gold-rich crystals and precipitation of alpha-iron mixed crystals. The change in the homogeneous phase influences the Curie-point while the number of Bohr magnetons remains almost constant. (M24b; Au-b, *Fe*)

325-M.* (German.) Carbide Phases in Tantalum. Richard Lesser and Georg Brauer. *Zeitschrift fur Metallkunde*, v. 49, Dec. 1958, p. 622-625.

Four phases are found in the system Ta-TaC from 1800 to 2100° C. Two are metallic phases, while two are phases with 39 at.% carbon and 42.5 to 50 at.% carbon. (M24b; Ta, *C*)

326-M.* (Hungarian.) Influence of the Macrostructure of Aluminum Slabs on the Properties of Rolled Sheets. E. Istvan Boczor. *Kohaszati Lapok*, v. 92, Jan. 1959, p. 17-23.

99.5% purity Al slabs cast in semicontinuous process investigated to determine how far grain size and orientation influence mechanical properties and fabrication of rolled sheets. (M28, Q-general, 3-72, 2-59; Al, 4-52)

327-M.* Segregation Substructure in Aluminum. Frank B. Cuff, Jr., and Nicholas J. Grant. *Institute of Metals, Journal*, v. 87, Apr. 1959, p. 248-254.

The three-dimensional structure is a continuous region of impurity-atom segregation enclosing small volumes of relatively high-purity Al. 9 ref. (M26s; Al)

328-M.* Constitution of Molybdenum-Rhodium and Molybdenum-Palladium Alloys. C. W. Haworth and W. Hume-Rothery. *Institute of Metals, Journal*, v. 87, Apr. 1959, p. 265-272.

Laboratory furnaces used to measure the melting points of Rh, Cr, Ir and Mo and to determine the equilibrium diagrams of Mo-rich alloys in the systems Mo-Rh and Mo-Pd. 12 ref. (M24b, P12n; Cr, Ir, Rh, Mo-b, *Pd*)

329-M.* Distortion of High-Carbon High-Chromium Die Steel. Effect of Variations in Carbide Distribution on the Sensitivity of the Steel to Distortion. K. Sachs and G. T. F. Jay. *Iron and Steel Institute, Journal*, v. 191, Apr. 1959, p. 353-360.

Influence of hammer, press and upset forging on distribution of carbide particle and dendritic cell sizes. Relation of forging method and macrostructure with heat treatment distortion. Distortion of cast specimens. (M28k, N8r, J26, F22, 9-74; TS)

330-M.* Morphology of the Pearlite Examined by the Direct Observation Method of Electron Microscopy. Zenji Nishiyama, Atsuo Kore'eda and Ken'ichi Shimizu. *Journal of Electronmicroscopy (Annual Edition)*, v. 7, 1959, p. 41-47.

Each ferrite and cementite plate in the pearlite colony is a single crystal. 5 ref. (M26, N8; ST, 4-56, 14-61)

331-M.* Structure and Density of Iron Films Formed by Thermal Evaporation. O. S. Heavens, M. M. Brown and V. Hinton. *Vacuum*, v. 9, Mar. 1959, p. 17-20.

Electron diffraction examination shows films to be in a crystallographically ordered state and electron micrographs show no voids or grain boundaries. 8 ref. (M26, P10a; Fe, 14-62)

332-M.* (German.) One-Phase Constitutional Change in Silver-Manganese Alloys. Heinrich Wollenberger. *Zeitschrift fur Metallkunde*, v. 49, Sept. 1958, p. 467-471.

Samples with 3.30-30.8% Mn quenched from 800° C. and annealed at 150 and 400° C., with various holding times. Measurements of magnetic susceptibility and specific heat point to the existence of one-phase changes occurring in short-time annealing at above 200 and 300° C. 8 ref. (M24b; Ag-b, *Mn*)

333-M. A Search for the Sigma Phase in the Fe-W and Co-W Alloys Systems. E. C. van Reuth. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 216-218.

Presence of sigma in the Fe-W systems is confirmed. The same sigma structure was found in the Co-W system. The peritctic temperature of 1640° C. in the Fe-W system is questionable. 4 ref. (M24b; Fe-b, Co-b, *W*)

334-M. On the Nickel-Rich End of the Zirconium-Nickel Phase Diagram. D. Kramer. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 256-258.

Zr-Ni system from 0 to 25 at% Zr shows the existence of two intermetallic phases, epsilon and sigma, which contain approximately 16 and 22 at.% Zr respectively. The epsilon phase decomposes at 1340 ± 10° C. while the sigma phase melts at 1575 ± 25° C. The eutectic temperature is 1185 ± 10° C. (M24b; Zr-b, *Ni*)

335-M. Cold-Rolling Textures of Iron Base Alloys Containing 3 to 12 Pct. Aluminum. R. G. Aspden, J. A. Berger and R. S. Mateer. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 251-253.

Cold rolling textures appear similar to those reported for other body-centered cubic alloys. Pole figures indicate no significant change in the cold rolling textures with an increase in Al content. Minor variations in the pole figures may have resulted from small differences in the orientations present in the strips prior to cold rolling. 4 ref. (M26c; Fe-b, *Al*)

336-M. X-Ray Detection of Dislocation Tilts and Strains in Single Crystals of Copper. Larry Kaufman and S. Andrew Kulin. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 273-279.

Broadening of X-ray double-crystal spectrometer rocking curves due to distribution of tilts and strains. If edge-type dislocations are the sole source of tilts and strains in the crystal then the measured broadening is found to be a function of only the dislocation distribution and the Bragg angle. 11 ref. (M26b; Cu, 14-61)

337-M. Orientation Sensitivity of Alpha Titanium to Electrostaining. R. H. Hiltz and R. W. Douglass. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 286-289.

Observed differences in the stain-etching response of alpha Ti are due to the orientation of the basal plain with respect to the polished surface. If a grain is oriented such that its basal plane makes an angle of less than 15° with the surface, that grain shows retarded activity to staining; the smaller the angle the slower the reactivity. 16 ref. (M20q, 3-72; Ti)

338-M. A New Etchant for Zinc Alloys. R. J. Gennone and E. C. Kersey. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 307-308.

An H_2SO_4-HF mixture is a simple one-step etchant which will reveal grain size for a variety of Zn alloys, the interface of Zn and Al and the depth of diffusion with bright field illumination. (M20q; Zn-b)

339-M.* Techniques Employed in the Electron Microscope Study of Titanium Alloy With 8% Manganese. Paper from "Symposium on Advances in Electron Metallography". American Society for Testing Materials, STP no. 245, 1958, p. 3-23.

Examination of structures corresponding to nine different heat treatments. Relative merits of various specimen preparation and replicating techniques. Usefulness of electron microscopy. (M20r, M21e, M27d, 2-64, 2-65; Ti-b, *Mn*)

340-M.* Technique for Easy Removal of Direct Replicas for Electron Microscopy. W. H. Bridges and E. L. Long, Jr. Paper from "Symposium on Advances in Electron Metallography". American Society for Testing Materials, STP no. 245, 1958, p. 25-31.

Pretreatment of surface with vacuum-evaporated wetting agent to facilitate stripping of replicas. Use on 85% Zr, 15% Cb alloy. Vanadium oxide, Zircaloy and Cu surfaces for shadowed carbon and Faxfilm replicas. (M20r; Cu, Zr-b)

341-M.* Examination of Metals by Transmission Electron Microscopy. F. W. C. Boswell and E. Smith. Paper from "Symposium on Advances in Electron Metallography". American Society for Testing Materials, STP no. 245, 1958, p. 31-42.

Individual dislocations, stacking faults and secondary phases in electrolytically polished Al, austenitic stainless steel, alpha brass, Fe and Al (10% Ag) alloy foils. 5 ref. (M20p, M21e, M26b; SS, Cu-n, Fe-a, Al-a, Ag-b, 4-56)

342-M.* Study of Dislocations in Thin Aluminum Foils Elongated in the Electron Microscope. H. G. F. Wilsdorf. Paper from "Symposium on the Advances in Electron Metallography". American Society for Testing Materials, STP no. 245, 1958, p. 43-67.

Patterns and behavior of dislocations during deformation of electron transparent Al foil. 18 ref. (M26b, M21e, 3-68, Q24c; Al, 4-56)

343-M.* Electron Probe Analysis of Segregation in Inconel. E. J. Brooks and L. S. Birks. Paper from "Symposium on Advances in Electron Metallography". American Society for Testing Materials, STP no. 245, 1958, p. 100-105.

Electron probe microanalysis of grain boundary and matrix precipitates, distribution and relative concentrations of Cb, Ti and Cr. 6 ref. (M27f, M21e; Ni-b, *Cb, Ti, Cr*, 9-69)

344-M.* Selected Etchants for Electron Microscope Studies of Magnesium Alloys. C. A. Moe. Paper from "Symposium on Advances in Electron Metallography". American Society for Testing Materials, STP no. 245, 1958, p. 106-120.

Etching techniques for preparation of Mg alloys for electron microscope examination; microstructures. (M20q, M21e, M27d; Mg-b)

345-M. The Nature of the Beta' and Beta'' Phases in the Cu-Al System. D. F. Toner. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 223-225.

Alloys from 11.0 to 13.4% were transformed for short periods at 535, 500 and 470° C. and analyzed by X-rays. No experimental verifications or ordering were found in the beta phase. The evidence is consistent with the existence of such a phase. It is likely that beta'' is not a separate phase from beta'. 15 ref. (M24b, N7c; Cu-b, *Al*)

346-M. CsCl-Type Equiatomic Phases in Binary Alloys of Transition Elements. A. E. Dwight. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 283-286.

Lattice parameters were determined for 18 equi-atomic alloys of the CsCl-type structure, ten of which are previously unreported. Formation of this type of structure is largely dependent on position of the elements in the periodic table. 9 ref. (M25; Cs)

347-M. (German.) Formation of Dislocations During the Plastic Deformation of Crystals. Doris Kuhlmann-Wilsdorf, Robert Maddin and Hiroshi Kimura. *Zeitschrift fur Metallkunde*, v. 49, Nov. 1958, p. 584-589.

Dislocations are thought to be originated by vacancies present around the spots of closely packed planes and which cause dislocations by slipping. 26 ref. (M26b, Q24a, 3-68)

348-M. (German.) Constitution of the Palladium Vanadium System. Werner Koster and Wolf-Dieter Haehl. *Zeitschrift fur Metallkunde*, v. 49, Dec. 1958, p. 647-649.

87 ref. (M24b; Pd, V)

349-M. (Book.) Symposium on Advances in Electron Metallography. 120 p. 1958. American Society for Testing Materials, STP no. 245, 1916 Race St., Philadelphia 3, Pa. $4.

Papers abstracted separately. (M21e, M20)

350-M. (Book.) Vacancies and Other Point Defects in Metals and Alloys. 238 p. 1958. Institute of Metals, 17 Belgrave Square, London,S.W.1, England. $6.

A symposium organized by the Institute of Metals and held at the Atomic Energy Research Establishment, Harwell, Berks., Dec. 1957. Papers abstracted separately. (M26s)

351-M. (Translation—AIP.) Electron Diffraction Analysis of the Processes of Decomposition of Supersaturated Solid Solutions in Systems Al-Cu and Ag-Cu. Z. G. Pinsker and N. A. Skobel'tsyna. *Soviet Physics Crystallography*, v. 2, no. 5, p. 610-614.

Effects of quenching and subsequent decomposition of the solid solution on annealing in the temperature range 130 to 180° C. (M24b, J23, J26; Cu-b, *Al, Ag*, 14-67)

352-M. (Translation—ConBur) Metastable State Diagram of the Iron-Chromium System. A. G. Lesnik. *Academy of Sciences of the USSR, Proceedings, Physical Chemistry Section*, v. 119, Mar-Apr. 1958, p. 249-251.

Energy of interatomic reaction in alloys of the Fe-Cr system; study was based on the data previously obtained and on results of experiments devised especially for the determination of curves representing the alpha-gamma phase equilibrium in this system. 5 ref. (M24b; Cr, Fe)

353-M.* Progress Report on Dislocation Behavior in Lithium Fluoride Crystals During Cyclic Loading. R. E. Keith and J. J. Gilman. Paper from "Symposium on Basic Mechanism of Fatigue". American Society for Testing Materials, STP no. 237, 1958, p. 3-20.

Motions of individual dislocation loops; changes in surface contour and dislocation densities; relation of point-defect clusters and dislocation motions. 19 ref. (M26b, Q7)

354-M.* (Russian.) Heterogeneity of Magnetic Properties of Cold-Rolled Transformer Steel. A. G. Petrenko, L. A. Kurtova, M. M. Petlyakov and A. I. Belyakov. *Stal'*, Mar. 1959, p. 267-268.

To prevent formation of fine-grained nontextured areas in cold rolled transformer steel with poor magnetic properties, it

is necessary to eliminate nonmetallic inclusions and to attain, as far as possible, a complete decarburization of the steels during various stages of its fabrication. 6 ref. (M27c, P16; SGA-n, AY, 9-69)

355-M.* (Russian.) The Iron-Palladium System. V. V. Kuprina and A. T. Grigor'ev. *Zhurnal Neorganicheskoi Khimii*, v. 4, no. 3, 1959, p. 655-661.

Differential thermal analysis, Brinell hardness, microstructure, electrical resistance and temperature coefficient studies. Solubility of Pd in alpha Fe does not exceed 5 at .%. Polymorphic alpha ⇌ gamma transition of Fe is reduced by Pd. A eutectic point exists at 40 at.% Pd. 10 ref. (M24b, N12q; Fe-b, *Pd*)

356-M.* (Russian.) Rhenium-Titanium System. E. M. Savitskii, M. A. Tulkina and Yu. A. Zot'ev. *Zhurnal Neorganicheskoi Khimii*, v. 4, no. 3, 1959, p. 702-704.

Metallographic study of the system Re-Ti by X-ray analysis. Data on melting temperature, electrical resistance, harness and microstructure. (M24b, P-general; Re-b, *Ti*)

357-M.* (Czech.) X-Ray Tests With Plastically Deformed Kovar Alloys. Alexander Spirkov. *Hutnicke Listy*, v. 14, Apr. 1959, p. 316-319.

Lattice distortions, thermal vibrations and phase transformations on Kovar alloys of various composition. 7 ref. (M22g, N6p, 9-74, 2-60; SGA-s)

358-M.* (German.) The Titanium-Magnesium System. I. Obinata, Y. Takeuchi and R. Kawanishi. *Metall*, v. 13, May 1959, p. 392-397.

Mg rods or a mixture of Ti and Mg were sealed in Ti sheaths, heated to various temperatures for various periods and cooled both slowly and rapidly. No intermetallic compound could be determined. 10 ref. (M24b, M22; Ti-b, *Mg*)

359-M.* (Russian.) Investigation of the System Tantalum-Tellurium. Yu. M. Ukrainskii, A. V. Novoselova and Yu. N. Simanov. *Zhurnal Neorganicheskoi Khimii*, v. 4, Jan. 1959, p. 148-152.

A combination of $TaTe_3$ and two components of varying compounds are found. These are alpha phase $TaTe_{0.85-1.2}$ and beta phase $TaTe_{1.5-2.0}$. The $TaTe_3$ has a tetragonal lattice. 4 ref. (M24b; Ta-b, *Te*)

360-M. Irradiation Damage. Papers Presented at the First Colloquium of the United Kingdom Atomic Energy Authority Diffraction Analysis Conference. April 2, 1958. *United Kingdom Atomic Energy Authority*, AERE M & C/R 2751, Nov. 1958, 37 p.

The five principal mechanisms of radiation damage, ionization, vacancies, interstitials, impurity atoms and thermal spikes, are investigated by diffraction techniques. Data are given for U and B with reference to application in control rods, fuel elements, moderators and structural materials. (M26b, M26s, M22g, 2-67; U, B)

361-M. Fractography of Some Reactor Fuel Materials. T. K. Bierlein and B. Mastel. Hanford Atomic Products Operation. *U. S. Atomic Energy Commission*, HW-57207, Aug. 15, 1958, 17 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.

Fractographic analysis of irradiated uranium is a sensitive method for revealing the effect and presence of the many gas fission products believed to be responsible for the macroscopic swelling of uranium during high-temperature irradiation. To facilitate valid fractographic interpretation of irradiated uranium nonirradiated beta heat treated uranium was fractured at -196, -80 and 25° C. At -196° C. impact produces large smooth fracture facets which contain few deformation twins; generalized step cleavage is common. (M23p, T11g, P10d, Q26, 2-67; U)

362-M. (Czech.) High-Temperature X-Ray Chamber. Zdenek Jiskra and Bernard Fleischer. *Hutnicke Listy*, v. 14, Apr. 1959, p. 280-287.

Apparatus for X-ray testing at high temperatures. 33 ref. (M22g, 1-53)

363-M. (Czech.) Carbon Replicas for Electron Microscopy and Diffraction. Miroslav Rozsival. *Hutnicke Listy*, v. 14, Apr. 1959, p. 307-309.

5 ref. (M20r)

364-M. (Czech.) Methods for Structural Testing of Uranium. B. Prenosil and J. Voboril. *Hutnicke Listy*, v. 14, Apr. 1959, p. 309-315.

Directions for grinding, polishing and etching in specimen preparation. 12 ref. (M20; U)

365-M. (French.) Influence of Crystal Orientation on Formation of Profiles on Copper and Silver Surfaces During Oxidizing Treatment at High Temperatures. Jean Moreau and Jacques Benard. *Comptes Rendus*, v. 248,

Mar. 16, 1959, p. 1658-1661.
(M26c, 2-62, 3-72; Ag, Cu)

366-M. (French.) Study of the Diagram of Gold-Copper Alloys in the Vicinity of $AuCu_3$. Antoine Pianelli and Rene Faivre. *Comptes Rendus*, v. 248, Mar. 16, 1959, p. 1661-1663.
(M24b; Au-b, *Cu*)

367-M. (French.) Study of Impurity Accumulation at the Grain Boundaries of Aluminum Bicrystals Prepared by Progressive Solidification. Claude Goux and Jean Montuelle. *Comptes Rendus*, v. 248, Mar. 16, 1959, p. 1667-1669.
(M27f, N12, 3-69; Al)

368-M. (Italian.) Microstructure Testing Methods and Equipment. Oscar Grossi. *Macchine*, v. 14, Apr. 1959, p. 389-405.
(M23, X4)

369-M.* (French.) Influence of Quenching Rate on the Structure of 6% Ti-Al-4% V Alloy. A. Saulnier. *Revue de Metallurgie*, v. 56, Mar. 1959, p. 205-214.
Electron microscopy of quenched and quenched and tempered alloys reveals a wide range between elastic limit and tensile strength when quenched from 850° C. If quenching is retarded or tempering is applied the transformation takes place by nucleation and growth. Rapid quenching from 950° C. produces needle-shaped grouping of sub-microscopic plates. (M27, J26, J29, Ti-b, *Al, V*)

370-M.* (French.) Dislocations in Aluminum-Magnesium Alloys at Various Temperatures. J. Caisso. *Revue de Metallurgie*, v. 56, Mar. 1959, p. 237-245.
Portevin-Le Chatelier phenomenon studied. It is shown that its appearance is restricted to tensile curves above a certain minimum deformation. 8 ref. (M26b, Q27; Al-b, *Mg*)

371-M.* (German.) Constitution of the Nickel-Copper-Germanium System. Walter Burkhardt and Konrad Schubert. *Zeitschrift fur Metallkunde*, v. 50, Apr. 1959, p. 196-198.
X-ray and metallographic testing after isothermal annealing at 500° C. The compound $Ni_3Cu_2Ge_2$ has a hexagonal lattice while the phase with 15 at.% Ni, 65 at.% Cu and 20 at.% Ge resembles beta-manganese in structure. Two phases of the gamma-brass type are assumed for the composition 15 at.% Ni, 58 at.% Cu and 22 at.% Ge. (M24; Ni, *Cu, Ge*)

372-M.* (German.) Ternary Carbides of the Transition Metals Nickel, Cobalt, Iron and Manganese With Germanium and Indium. Leo J. Hutter and Hans H. Stadelmaier. *Zeitschrift fur Metallkunde*, v. 50, Apr. 1959, p. 199-203.
Determination of ternary carbides, formed by three Ni, Co, Fe or Mn atoms, with one Ge or In atom, in the systems Co-Ge-C, Fe-Ge-C, Mn-Ge-C, Ni-In-C, Co-In-C and Fe-In-C. 15 ref. (M24c, M26; Ni-b, Co-b, Fe-b, Mn-b, Ge, In, C, NM-a35)

373-M.* Techniques for the Metallography of Porcelain-Enameled Steel. H. L. Conaway. *Porcelain Enamel Institute, Proceedings*, v. 20, 1958, p. 55-69.
Selecting, mounting, polishing, etching and photographing specimen. (M20; ST, 8-71)

374-M. (Japanese.) Lead KS Bronze With Homogeneous Fine Structure. Z. Takao, T. Noda and H. Takata. *Metals*, v. 29, Feb. 1959, p. 148-149.
Microstructure of a 77% Cu, 8.0% Sn, 15% Pb alloy. (M27; Cu-s, *Pb*)

375-M.* The Nature of Mechanically Polished Metal Surfaces. L. E. Samuels. *Electroplating and Metal Finishing*, v. 12, May 1959, p. 169-174, 178.
Election diffraction established that surfaces polished by metallographic methods are produced by cutting and not by surface flow. (Conclusion.) 74 ref. (M20p)

376-M.* (Italian.) Etch Figures on Iron and Ferro-Silicon Alloys for Determining of Crystal Orientation and Relationship to the Structure of Ferromagnetic Domains. F. Brossa, A. Ferro and G. Venturello. *Metallurgia Italiana*, v. 51, Apr. 1959, p. 139-141.
Reagents were developed, such as mercuric chloride and mercurous nitrate salts, which produce clear etch figures and permit rapid, approximate identification of crystal orientation. Prior passivation of surface of specimen is necessary. 19 ref. (M20q, M26c, M27g; Fe-b, *Si*)

377-M. (Ukrainian.) Determination of Dislocation Densities During Deformation of Nickel, Silver and Aluminum. S. D. Hertzricken and N. N. Novikov. *Ukrainskii Fizicheskii Zhurnal*, v. 3, no. 6, 1958, p. 802-814.
The number of dislocations in deformed materials may decrease only up to a certain limit, which varies according to the

material. The minimum possible distance between dislocation centers also varies slightly. (M26b, 3-68; Ni, Ag, Al)

378-M.* Direct Observations of Defects in Quenched Gold. J. Silcox and P. B. Hirsch. *Philosophical Magazine*, v. 4, Jan. 1959, p. 72-89.

Electron transmission microscopy of thin Au foil annealed at 930° C., quenched into iced brine and then aged for 1 hr. at 100-250° C. Formation of stacking faults and dislocation loops. 27 ref. (M21e, M26b, M26s, J26n; Au, 4-56)

379-M.* The Ejection of Atoms From Gold Crystals During Proton Irradiation. M. W. Thompson. *Philosophical Magazine*, v. 4, Jan. 1959, p. 139-141.

Directions in which atoms leave the surface of gold foil under irradiation. 5 ref. (M25, 2-67; Au, 4-56)

380-M.* (Russian.) Disclosure of Inter-Dendritic Nonmetallic Laminae in Cast Steel. H. A. Ermanovich, M. F. Longinov, L. G. Orlov and L. M. Utevskii. *Zavodskaya Laboratoriya*, v. 25, Apr. 1959, p. 440-442.

Metallographic, spectrographic, X-ray and chemical analyses in cupels of steels 40KHNMA, 12KH2N4A (Cr-Ni steels); 38KHVFYU (Cr-Ni-V) 30KHGSA (Cr-Si-Mn) and 30KHGSNA (Cr-Mn-Si-Ni) established that defects in these steels are caused by a coarse multilayer of laminae between the crystalline grains. (M26s; SS, Cr, Ni, V, Si, Mn)

381-M.* Partially Pinned Tilt Boundaries. T. Vreeland, Jr. *Acta Metallurgica*, v. 7, Apr. 1959, p. 240-245.

Theoretical study of the conditions under which small angle tilt boundaries in a crystal can be moved when subjected to a stress which does not produce general slip. The dislocations in the boundary are assumed to be partially pinned by Cottrell atmospheres, intersecting substructure or precipitates along the dislocation lines. Partially pinned dislocation boundaries may move at lower stresses then similarly pinned isolated dislocations if the density of pinned segments is sufficiently low. 7 ref. (M26b, 3-66)

382-M.* The Orientation Dependence of Etching Effects on Germanium Crystals. P. J. Holmes. *Acta Metallurgica*, v. 7, Apr. 1959, p. 283-290.

Patterns of smooth, polished, pitted and matt surfaces are, in many cases, characteristic of one type of etchant only and cannot be reproduced by any other, even if the latter's concentration is adjusted to give the same pH or reaction rate. This suggests that the detailed mechanisms of removal of Ge atoms from the bulk, and of removal of etch products from the vicinity of the surface, are the features controlling the observed results. 13 ref. (M20q, 3-72; Ge)

383-M.* (Russian.) Structure of Newly Deformed Magnetic Alloys. M. I. Raevskaya. *Izvestiya Akademii Nauk, Seriya Fizicheskaya*, v. 33, no. 3, 1959, p. 266-271.

Metallographic, X-ray and microstructure studies of Fe-Ni-Al-Cb isotropic alloys and Fe-Co-Ni-Al-Cb anisotropic alloys in high coercive field (deformed and tempered at 800-1200° C.) showed that they are composed of beta and beta prime phase with a large Cb separation in the background. At 1200° C. tempering temperature and at a cooling rate of 10° per hr. there is a beta prime phase separation with oriented beta separation with Cb in the background. (M24d, M26q, Q24g; SGA-n, Fe-b, *Ni, Al, Cb*)

384-M.* An Exploration of High Boron Alloys. A. U. Seybolt. *American Society for Metals, Transactions*, v. 52, Preprint no. 135, 1959, 23 p.

Vacuum high-frequency induction melting of boron alloys containing up to 6 at.% Ga, Y, Ce, Si, Sn, Ti, Zr, Cb, Ta, Mo, W, Re, Fe, Ni or Co. X-ray diffraction, metallographic examination and hot hardness testing of alloys. Hot pressing of boron and boron alloy powders. 11 ref. (M24b, M27d, Q29p; B, *Ce, Y, Ga, Re, Si, Sn, Ti, Zr, Cb, Ta, Mo, W, Fe, Ni, Co*)

385-M.* Some Properties of Crystals of Silver Chloride Containing Traces of Copper Chlorides. A. S. Parasnis and J. W. Mitchell. *Philosophical Magazine*, v. 4, Feb. 1959, p. 171-179.

Dislocations in crystals following annealing, recrystallization and plastic deformation. 11 ref. (M26b, N5f, Q24)

386-M.* The Positions of Dislocations in Arrays. A. K. Head. *Philosophical Magazine*, v. 4, Mar. 1959, p. 295-302.

Calculation of equilibrium positions of dislocations in a number of types of array. 11 ref. (M26b, Q24a)

387-M.* The Observation of Dislocations in Thin Single Crystal Films of Gold Prepared

by Evaporation. D. W. Pashley. *Philosophical Magazine*, v. 4, Mar. 1959, p. 324-335.

Transmission electron microscope observations of dislocations and their movements in coherent single crystal films of Au prepared by deposition on smooth Ag substrate. Effect of annealing. 25 ref. (M26b, L25g; Au-a, 14-61, 14-62)

388-M.* The Detection of Dislocations by Low Temperature Heat Conductivity Measurements. Jenifer N. Lomer and H. M. Rosenberg. *Philosophical Magazine*, v. 4, Apr. 1959, p. 467-483.

Calculation of dislocation density in Cu-Zn single and polycrystals containing 7, 15 or 30% Zn after deformation at room temperature from the decrease in lattice conductivity at 2 to 5° K. Comparison of electrical resistivity and thermal conductivity data. Transmission electron microscope observations. Dislocation densities during fatigue testing. 31 ref. (M26b, P11h, P15g, Q24, 2-63, 3-68; Cn-n)

389-M.* Helical Dislocations in Quenched Aluminum—4% Copper Alloys. G. Thomas and M. J. Whelan. *Philosophical Magazine*, v. 4, Apr. 1959, p. 511-527.

Transmission electron microscopy of thin foil of polycrystalline Al alloy quenched from temperatures of 440 to 540° C. Helical dislocations and dislocation loops. Theoretical mechanisms. 33 ref. (M26b, J26n; Al-b, *Cu*, 4-56)

390-M.* The Direct Observation of Metallic Surfaces in the Electron Microscope. K. Thomas and K. F. Hale. *Philosophical Magazine*, v. 4, Apr. 1959, p. 531-532.

Modification of electrolytic polishing technique retains surface detail on one side of foil aiding interpretation of dislocation arrays in deformed material. Application to Al and stainless steel tensile specimens and to observation of surface growths on vacuum annealed Al. 4 ref. (M20p, M26c, N3; SS, Al)

391-M.* (Czech.) Constitution of Phases Precipitating in Modified 12% Cr-Steels at Temperatures Above 550° C. Jaroslav Jezek, Jaroslav Koutsky and Jaroslav Pluhar. *Hutnicke Listy*, v. 14, May 1959, p. 469-472.

Samples of various composition held at temperatures from 600-800° C. for 100-3000 hr. The precipitates are isolated by electrolytic and chemical methods and studied by radiographs. 14 ref. (M24e, N7; AY, *Cr*)

392-M.* (French.) Crystallographic Studies of a Transformation by Means of Kikuchi Lines. Micheline Sorel. *Comptes Rendus*, v. 248, Apr. 6, 1959, p. 2106-2108.

Techniques to obtain electronic diffraction pattern and a micrograph simultaneously. (M22h, M21e)

393-M.* (French.) Statistical Aspects of Grain Measurement. Pt. 1. A. H. Bazin. *Cuivre, Laitons, Alliages*, no. 48, Mar-Apr. 1959, p. 35-51.

Homogeneity of grain size and shape in specimens of Cu and brass completely recrystallized after sufficient cold working to destroy foundry structure. (M27c; Cu, Cu-n)

394-M.* (German.) Equilibrium of Iron-Cobalt-Chromium System. Werner Koester and Gernot Hofmann. *Archiv fur das Eisenhuttenwesen*, v. 30, Apr. 1959, p. 249-251.

Isothermal equilibrium diagram of Fe-Co-Cr system for 20, 600 and -700° C. formulated after annealing for 1000 hr. An equilibrium between alpha and gamma solid solution resulted, while a short time heat treatment leads to an irreversible gamma alpha transformation. (M24c, N-general; Fe-b, *Co, Cr*)

395-M.* (German.) Carbide Phases of Columbium. Georg Bauer and Richard Lesser. *Zeitschrift fur Metallkunde*, v. 50, Jan. 1959, p. 8-10.

Binary system of Cb-CbC. Alpha, beta, zeta and delta phases were found between 1800 and 2000° C., the zeta phase being observed for the first time. Samples with very high carbide content proved thermally unstable. 7 ref. (M24b, N-general; Cb, 14-68)

396-M.* (German.) High Melting Sintered Tungsten Alloys. Richard Kieffer, Karl Sedlatschek and Horst Braun. *Zeitschrift fur Metallkunde*, v. 56, Jan. 1959, p. 18-24.

W-Cb and W-Ta systems investigated in relation to density, hardness, electric conductivity and corrosion resistance. Data on the W-V system. 15 ref. (M24b; W-b, *Cb, Ta, V*)

397-M.* (German.) Electron Microscopy of Thin Metal Slices Cut by Diamond Knife. Ludwig Reimer. *Zeitschrift fur Metallkunde*, v. 50, Jan. 1959, p. 37-41.

Thin metal slices (100 - 300 Å.) were cut of Al, Ni, Cu, Au, Pd, Ag, Pt and Fe with an "Ultramikrotom". Possibilities resulting from using slices instead of

replicas. (M20, M21e; Al, Ni, Cu, Pd, Ag, Pt)

398-M.* (German.) Lithium-Silicon System. Horst Boehm. *Zeitschrift fur Metallkunde*, v. 50, Jan. 1959, p. 44-46.

The constitution of Li-Si system investigated by thermal analysis. A compound Li_4Si (or $Li_{15}Si_4$) is formed peritectically at 633 ± 5° C. Li_2Si melts without decomposition at 752 ± 5° C. A eutectic is formed of Si and Li_2Si at 39.4 ± 0.5% and at 635° ± 5° C. (M24b, M23r; Li-b, *Si*)

399-M. Radioactive Cobalt-60. The Pill for Industrial Headaches. Maurice Daly. *Modern Castings*, v. 35, June 1959, p. 27-30.

Use of radioactive isotopes in testing casting hemogeneity. 6 ref. (M23q)

400-M.* (English.) A Survey of the Molybdenum-Platinum System. A. G. Knapton. *Planseeberichte fur Pulvermetallurgie*, v. 7, Apr. 1959, p. 2-3.

Constitution diagram based on melting point determinations, X-ray analysis and metallography. Existence of a congruently melting sigma phase with a wide homogeneity range and tetragonal alpha prime phase stable only below 1400° C. is established. (M24b; Mo-b, *Pt*)

401-M.* (Japanese.) Equilibrium Diagram of Iron-Carbon-Silicon Alloys. Ichiroh Iitaka. *Japan Foundrymen's Society, Journal*, v. 31, Mar. 1959, p. 165-171.

Stable Fe_3C can exist only when the alloy is solidified rapidly, although the compound Fe_3C can be observed only in the supercooled state. (M24c; Fe-b, *Si, C*)

402-M. (Japanese.) Banded Structure in Bearing Steel. K. Hurusawa and E. Yajima. *Nagoya Institute of Technology, Report*, no. 10, 1958, p. 208-212.

Even if specimens are quenched to dissolve the carbide into an austenite base, etched banded structure, due to elongated segregated area, is still observed. If spheroidal carbide is converted into lamellar carbide, banded structure becomes indistinct. (M27, N8r; ST, SGA-c, 9-69)

403-M. (Book.) Elements of Materials Science. Lawrence H. Van Vlack. 528 p. 1959. Addison-Wesley Publishing Co., Inc., Reading, Mass. $8.50.

Elementary text dealing with atomic structure, crystal structure, macrostructure and properties of metals and other materials. (M-general)

404-M.* (Translation—AIP.) Morphology of Spherulitic Graphite in High-Strength Cast Iron. I. Ezhek, I. Koritta and K. Lebl'. *Soviet Physics, Crystallography*, v. 2, no. 5, 1958, p. 653-658.

Investigation of segregations of graphite in gray high-strength and malleable cast iron showed differences in the mutual orientation of separate graphite plates. 8 ref. (M27; CI-n, CI-s, NM-k36)

405-M.* Inclusions in Uranium Metal. K. E. G. Meredith and M. B. Waldron. *Institute of Metals, Journal*, v. 87, June 1959, p. 311-317.

Occurrence and identity of inclusions due to the presence of carbon, nitrogen, hydrogen, Fe, Si and Al. A complex of oxygen, carbon and nitrogen with uranium can exist in normal-purity uranium owing to the isomorphous nature of the individual compounds UO, UC and UN. The metallic impurity elements Fe, Si and Al all form compounds with uranium which precipitate on cooling. 39 ref. (M27; U, *O, C, N, Fe, Si, Al, H*, 9-69)

406-M.* An Investigation of the Reported Occurrence of a Metastable Phase Y in Aluminium-Rich Alloys of the System Aluminium-Manganese-Nickel. A. R. Harding and J. W. H. Clare. *Institute of Metals, Journal*, v. 87, June 1959, p. 317-320.

Micrographic examination of both annealed and slowly cooled alloys has failed to confirm the presence of the Y phase and only alpha solid solution, $NiAl_3$, and the stable ternary compound X have been observed. Suggestions are made to account for the previous identification of an additional phase. (M24c; Al-b, *Mn, Ni*, 14-67)

407-M. (Russian.) New Materials for the Study of Crystallization Processes of Metals and Alloys. A. A. Kotovshchikov. *Liteinoe Proizvodstvo*, May 1959, p. 38-39.

A group of halogen salts of Ag, Ti and Cs, called "transparent metals", possessing optical and mechanical properties as well as cubic crystalline lattices similar to metals and capable of withstanding such operations as forging, rolling, hardening, cold working and annealing, are a good medium to study analogous structures of ferrous and nonferrous metals. 5 ref. (M26, Q24)

408-M.* The Structure and Phase Constitution of the Coating in the Hot Tinning of Sheet Iron. P. G. Morgan. *Sheet Metal Industries*, v. 36, June 1959, p. 445-446.

Intermediate layer on hot tinned plate consists of light and porous dark areas representing the same structural phase but differing in the closeness of the packing and development of crystals of FeSn. 11 ref. (M26, L16, 1-66; Fe-b, *Sn*, 4-53)

409-M.* (French.) Nondestructive Technique for the study of Fractured Surfaces With the Electron Microscope. Edmond Mencarelli and Pierre A. Jacquet. *Comptes Rendus*, v. 248, Apr. 17, 1959, p. 2477-2479.

The double print plastic carbon method is the preferred technique. (M21e, Q26)

410-M.* (French.) Comparative Study of Complex Structures AuCuII and $AuCu_3II$ of Au-Cu Alloys. Antoine Pianelli. *Comptes Rendus*, Apr. 27, 1959, p. 2475-2476.

Au-Cu alloys in the region of $AuCu_3$. (M24b; Al-b, *Cu*)

411-M.* (French.) Crystallographic Relationship Between Austenite and Alpha Phase Produced by Cold Working of Unstabilized Stainless Steel. Paul Bastien and Rene Margerand. *Comptes Rendus*, v. 248, Apr. 27, 1959, p. 2480-2482.

X-ray diffraction study of preferred orientation of alpha and gamma phase. (M26c, N8; SS)

412-M.* (French.) Direct Observation by the Electron Microscope of Mutual Cancellation of Dislocations During Restoration Annealing of a Work Hardened Al-Mn Alloy. A. Saulnier and P. Mirand. *Comptes Rendus*, v. 248, May 20, 1959, p. 2871-2872.

Individual dislocations at subgrain boundaries move rapidly along their slip planes between opposite walls. This results in mutual cancellation of dislocations located in the same plane. During prolonged heating the subgrain boundary disappears. Restoration of plasticity appears to be related to an increase in average free movement of dislocations. (M26b, 2-64; Al-b, *Mn*)

413-M. Distribution of Magnetic Domains Between the Two Phases in a Single-Crystal Flat Disk of Iron. K. F. Niessen. *Philips Research Reports*, v. 14, Apr. 1959, p. 101-110.

In a single-crystal flat disk of Fe, whose plane is a (001) plane of the crystal, there are four preferential directions lying in this plane, viz. [100], [010], [100], and [010], each occupied by 1/6 N domains when no external field is present. (M27g; Fe, 14-61)

414-M.* The Effect of the Method of Preparation on Surface Structure. A. J. W. Moore. *Australian Institute of Metals, Journal*, v. 4, May 1959, p. 19-21.

Applications of thermal etching and cathodic ion bombardment. The removal of foreign atoms from a surface makes ion bombardment particularly useful in rapidly freeing a surface from the monomolecular film of grease which may be retained after conventional degreasing processes. 6 ref. (M20q)

415-M.* Observations of Dislocations and Precipitates in Aluminium Alloys. G. Thomas. *Philosophical Magazine*, v. 4, May 1959, p. 606-611.

Electron transmission micrographs of quenched Al alloys show that the specimens contain many complex dislocations and large dislocation loops with diameters up to 2000 Å. These dislocations could not be moved by heating the foils in the electron beam and their immobility is thought to be due to substitutional atmospheres of solute atoms which form at, and lock, the dislocations by vacancy-aided diffusion. 12 ref. (M26b; Al-b)

416-M.* On the Crystal Perfection of Iron Whiskers. Paul D. Gorsuch. *Journal of Applied Physics*, v. 30, June 1959, p. 837-842.

Density and distribution of dislocations in tip grown iron whiskers produced by hydrogen reduction of liquid iron halide salts was measured by means of X-ray rocking curves. No evidence of large elastic twist was found in any of the whiskers as would be expected for whiskers grown by a screw dislocation mechanism. 18 ref. (M26b, N3r; Fe, 14-61)

417-M.* On the Determination of Preferred Orientations. C. G. Dunn. *Journal of Applied Physics*, v. 30, June 1959, p. 850-857.

Orientations of individual grains in cold rolled and annealed Si-Fe strip were obtained for single and a multiple-component textures to determine the preferred orientations in the two textures and investigate the nature of formation of textures. 11 ref. (M26c; Fe-b, *Si*, 4-53)

418-M.* X-Ray Measurement of Microstrains in Germanium Single Crystals. L. P. Hunter. *Journal of Applied Physics*, v. 30, June 1959, p. 874-884.

Effect of strains on anomalous transmission of X-rays. Some apparently dislocation-free crystals show a greater degree of crystalline imperfection than

crystals with a finite dislocation count. 10 ref. (M26b, 3-68; Ge)

419-M.* Anisotropic Mobilities in Plastically Deformed Germanium. R. A. Logan, G. L. Pearson and D. A. Kleinman. *Journal of Applied Physics*, v. 30, June 1959, p. 885-895.

Effects of edge dislocations on carrier mobility in n-type Ge and extent to which they can be explained by existing theory. 23 ref. (M26b, P15, 3-68; Ge)

420-M. Preferred Orientation in Rolled and in Recrystallized High-Purity Uranium Rod. M. H. Mueller and H. W. Knott. Argonne National Laboratory. *U. S. Atomic Energy Commission*, ANL-5887, Apr. 1959, 16 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Results indicate that the as-rolled texture could be described as a duplex (041) and (352) with the (041) being the major component and with considerable spread about each component. The recrystallized rod showed approximate (041) and (392) components with considerable spread. 8 ref. (M26c; U, 4-55)

421-M. Reactions in the Niobium-Hydrogen System. William M. Albrecht, W. Douglas Goode, Jr., and Manley W. Mallett. Battelle Memorial Institute. *U. S. Atomic Energy Commission*, BMI-1332, Apr. 1, 1959, 20 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Investigation showed that a solid solution of hydrogen in Cb is produced throughout most of the system. a miscibility gap was found at low temperatures and pressures, with a critical point at about 140° C., a hydrogen pressure of 0.01 mm. of Hg, and a hydrogen/Cb ratio of 0.3. 12 ref. (M24b; Cb, H, 14-67)

422-M. The Etching of Plutonium and Its Alloys by Cathodic Bombardment. Katherine Imlah. Los Alamos Scientific Laboratory. *U. S. Atomic Energy Commission*, LA-2287, Apr. 22, 1959, 43 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Cathodic bombardment is a particularly useful technique where remote handling of specimens is required, conventional methods fail or specific features such as inclusions, phase demarcation, grain size, deformation are of interest. (M20q; Pu)

423-M.* (German.) Vanadium-Boron System. Hans Nowotny, Friedrich Benesovsky and Riehard Kieffer. *Zeitschrift fur Metallkunde*, v. 50, May 1959, p. 258, p. 258-261.

Pressure-sintered, conventionally sintered, and molten specimens were investigated. Melting point determination, structure analysis and X-ray examination were carried out to produce a preliminary constitutional diagram. The compounds V_3B_2, VB, V_3B_4 and VB_2 were observed. 21 ref. (M24b, V, B)

424-M.* (German.) Silicon-Phosphorus System. Bill Giessen and Rudolf Vogel. *Zeitschrift fur Metallkunde*, v. 50, May 1959, p. 274-277.

Thermal analysis and structural examination indicate that Si and phosphorus can form only a SiP compound which dissociates into a liquid and a vapor phase on heating over 1131° C. 7 ref. (M24b; Si, P)

425-M.* (German.) Effect of Iron and Silicon Additions on Texture and Earing of Pure Aluminum. Wolfgang Bunk and Paul Esslinger. *Zeitschrift fur Metallkunde*, v. 50, May 1959, p. 278-287.

The tendency to 45° earing after soft annealing increases in proportion to an increase of Fe in relation to Si. The dependence of earing height and earing direction of soft strip is more distinctly evident with increasing degree of cold rolling and with increasing Si content. 33 ref. (M26c, F23, 2-60; Al-a, *Fe, Si*, 9-71)

426-M.* Absolute Interfacial Energies of [001] Tilt and Twist Grain Boundaries in Copper. N. A. Gjostein and F. N. Rhines. *Acta Metallurgica*, v. 7, May 1959, p. 319-330.

Analysis of the results obtained for small-angle, lineage boundaries, in terms of the appropriate dislocation model, shows that the Read-Shockley equation predicts the energy up to misorientations of 5 to 6, but that for larger misorientations, it gives much too small an energy. 40 ref. (M26b; Cu)

427-M.* (Russian.) Use of Color-Etching Metallography in Studying Iron-Chromium Alloys. S. A. Kisileva and G. A. Faivilevich. *Zavodskaya Laboratoriya*, v. 25, May 1959, p. 570-571.

Structural transformation caused by heat treating an Fe-Cr alloy with 39.15% Cr and 0.035% C. Color etching effectively delineates the heterogeneity within the grain and detects minute quantities of phases. Etching reveals that the isolated alpha phase is concentrated around carbide particles and that during prolonged

annealing a partial penetration of alpha phase into the grain body occurs. (M20q, N-general, 2-64; Fe-b, *Cr*)

428-M.* The Crystal Structures of $NbBe_2$ and $NbBe_3$. Donald E. Sands, Allan Zalkin and Oscar H. Krikorian. *Acta Crystallographica*, v. 12, June 1959, p. 461-464.

$CbBe_2$ has a face-centered cubic cell, with eight formula units in the unit cell. $CbBe_3$ has a rhombohedral cell with three formula units in the unit cell. 13 ref. (M26; Cb-b, *Be*, 14-68)

429-M.* The Structure of Thin Films of CuAu at Room and Elevated Temperatures. Eileen I. Alessandrini. *Acta Crystallographica*, v. 12, June 1959, p. 471-472.

The low-temperature CuAu ordered structure is made up of domains wherein the c-axes of the tetragonal unit cells are parallel with each other but perpendicular to the c-axes in adjacent domains. The disordered lattice has a face-centered-cubic structure. 4 ref. (M26; Cu-b, *Au*, 14-62, 14-68)

430-M.* Structure of Quenched and Irradiated Metals. R. E. Smallman and K. H. Westmacott. *Journal of Applied Physics*, v. 30, May 1959, p. 603-616.

Electron transmission microscopy and small-angle X-ray scattering techniques employed to study structure of quenched Cu and Al after aging. Alpha-irradiated Cu after annealing and neutron irradiated Cu. 38 ref. (M26s, M26b, M22g, 2-64, 2-65, 2-67; Cu, Al)

431-M.* Small Angle Scattering of X-Rays by Plastically Deformed Single Crystals. W. H. Robinson and R. Smoluchowski. *Journal of Applied Physics*, v. 30, May 1959, p. 617-621.

Small angle scattering from single crystals of Mg plastically deformed in simple shear. 16 ref. (M22g, M26s, 3-68; Mg, 14-61)

432-M.* Internal Double Reflection in a Perfect Crystal. A. Guinier and E. Guyon. *Journal of Applied Physics*, v. 30, May 1959, p. 622-628.

Theory of double Bragg reflections in single crystals derived on kinematical and dynamical basis. Double reflections in Al-Cu alloy and nonmetallic single crystals. 12 ref. (M22g, M26s; Al-b, *Cu*, 14-61)

433-M.* Small Angle Scattering From Dislocations in Deformed Single Crystals. Alfred K. Seeger. *Journal of Applied Physics*, v. 30, May 1959, p. 629-636.

Theoretical expression for small angle X-ray scattering from piled-up groups of dislocations in deformed single crystals. Conditions for experimental observation in face-centered cubic crystals. 18 ref. (M26b, M22g, 3-68; Cu, Ni, Co, 14-61)

434-M.* Small-Angle Scattering of X-Rays and Neutrons From Deformed Metals. H. H. Atkinson. *Journal of Applied Physics*, v. 30, May 1959, p. 637-645.

Theoretical consideration of scattering from deformed metals due to "true" small-angle scattering from dislocations and to double Bragg reflections. Scattering of X-ray and cold neutrons from cold worked or fatigued Cu and Al. 22 ref. (M22g, M22j, 3-68; Al, Cu)

435-M.* Small-Angle Scattering of X-Rays From Neutron Irradiated Copper. H. H. Atkinaon, R. E. Smallman and K. H. Westmacott. *Journal of Applied Physics*, v. 30, May 1959, p. 646-649.

Scattering from irradiated polycrystalline Cu. Interpretation in terms of double Bragg reflections and "true" small-angle scattering. Possible nature of irradiation damage. 6 ref. (M22g, M26s, 2-67; Cu)

436-M.* Study of X-Ray Scattering From Fatigued Metals. K. Thomas and A. Franks. *Journal of Applied Physics*, v. 30, May 1959, p. 649-655.

Examination of individual grains in fatigued polycrystalline Al and Cu specimens. Interpretation of low-angle patterns. 24 ref. (M26s, M22g, 3-66; Cu, Al)

437-M.* On the Mechanism of the Small Angle X-Rays Scattering From Cold Worked Metals. R. H. Neynaber, W. G. Brammer and W. W. Beeman. *Journal of Applied Physics*, v. 30, May 1959, p. 656-661.

Scattering from cold worked polycrystalline foils of Cu, Al and Ni. Temperature dependence of scattering. 7 ref. (M22g, 2-61, 3-68; Al, Cu, Ni, 4-56)

438-M.* Experiments on Double Bragg Reflections in Deformed and Undeformed Metal Foils. H. Fricke and V. Gerold. *Journal of Applied Physics*, v. 30, May 1959, p. 661-667.

X-ray scattering in the angular range from 1-50° in polycrystalline foils and single crystals of Al and Cu and in annealed Cu powder. 19 ref. (M22g, 3-68; Cu, Al, 14-61, 4-56)

439-M.* Small Angle X-Ray Scattering From Copper and Aluminum Under Cyclic Stress. J. C. Grosskreutz and F. R. Rollins. *Journal of Applied Physics*, v. 30, May 1959, p. 668-674.

Small-angle scattering at various stages of fatigue life, double Bragg scattering mechanism. Formation of subgrains. 15 ref. (M22g, Q7b, 3-66, Al, Cu)

440-M.* On the Kinetics of Quenched-In Lattice Vacancies in Platinum. G. L. Bacchella, E. Germagnoli and S. Granata. *Journal of Applied Physics*, v. 30, May 1959, p. 748-752.

Activation energy for formation and migration of vacancies calculated from quenching experiments and subsequent annealing behavior. 13 ref. (M26s, N1d, P15g, J23, J26; Pt)

441-M.* Magnetic Domain Observations by Electron Microscopy. M. E. Hale, H. W. Fuller and H. Rubinstein. *Journal of Applied Physics*, v. 30, May 1959, p. 789-791.

Domain patterns of thin Fe and Fe-Ni films observed by electron transmission microscopy. (M27g; Fe, Fe-b, *Ni*, 14-62)

442-M.* Morphology of the Pearlite Examined by the Direct Observation Method of Electron Microscopy. Zenji Nishiyama, Atsuo Kore'eda and Ken'ichi Shimizu. *Journal of Electronmicroscopy*, v. 7, annual edition, 1959, p. 41-47.

Pearlite in electrolytically polished high-carbon steel foil. 5 ref. (M27d, M27f, N8h; Cn-r)

443-M.* (French.) Dislocations and Strength of Metals and Alloys. Adrien Saulnier. *Revue de l'Aluminium*. v. 36, April 1959, p. 435-444.

Outline of theory of dislocations. Attempts to resolve the contradiction in that the strain necessary for plastic deformation of metals with regular lattice is about 10,000 times higher than the strain which can be determined experimentally, by assuming that metals are not formed by perfectly regular atomic arrangements but instead that they contain linear defects and dislocations. 4 ref. (M26b, M26s)

444-M.* (German.) Subgrain Boundary Dislocations of Iron-Chromium Alloys Made Visible by Ion Bombardment. Alois Masin and Vladimir Havel. *Acta Physica Academiae Scientiarum Hungaricae*, v. 9, no. 4, 1959, p. 471-474.

Treatment of an alloy with 24% Cr in a vacuum tube. The sample is fastened opposite an Al anode and a current of 3 Milliamp. and 1700-1900 volts is passed. 12 ref. (M20q, M26b, M27f; Fe-b, *Cr*)

445-M.* (German.) The Texture of Electrolytic Copper After Rolling at Low Temperatures. E. Schmid. *Osterreichische Akademie der Wissenschaften-Mathematisch-Naturwissenschaffliche Klasse-Anzeiger*, v. 95, no. 1-15. 1958, p. 117-119.

Texture patterns obtained after 95-98% deformation produced by rolling at -183° C. (M26c, F23, 2-63, Cu)

446-M. (French.) Field-Emission Microscopy. Rene Simon. *Metaux-Corrosion-Industries*, v. 34, Apr. 1959, p. 162-178.

Investigation of the secondary emission of a target bombarded with ions. (M21e)

447-M.* The Electron Structure of Metals. G. V. Raynor. Paper from "The Structure of Metals". Interscience Publishers, Inc., New York, 1959, p. 3-27.

Electronic structure theory, energy band system concepts and interpretation of metallic phenomena. 14 ref. (M25, P-general)

448-M.* Experimental Aspects of the Electron Theory of Metals. J. A. Catterall. Paper from "The Structure of Metals". Interscience Publishers, Inc., New York, 1959, p. 31-58.

Experimental techniques used in establishing energy range of outermost electrons, distribution of electrons over energy range, shape of Fermi surface, signs and numbers of charge carriers in electrical conduction and change of properties with alloying. 12 ref. (M25, P-general, P15)

449-M.* Dislocations in Metals. A. G. Quarrell. Paper from "The Structure of Metals". Interscience Publishers, Inc., New York, 1959, p. 61-83.

Basic concepts of dislocation theory and application to metallurgical problems. 3 ref. (M26b, Q24, Q22)

450-M.* Seeing Dislocations. J. Nutting. Paper from "The Structure of Metals". Interscience Publishers, Inc., New York, 1959, p. 87-113.

Decoration techniques, etch pit, X-ray diffraction and electron transmission microscope methods of revealing dislocations. 31 ref. (M26b, M20q, M22g, M22h)

451-M.* (German.) Determination by Residual Resistance Measurements of Lattice

Imperfections in Tungsten After Cold Deformation. Hermann Schultz. *Zeitschrift fur Naturforschung*, v. 142, April 1959, p. 361-373.

Recovery within the range of 300-400° C. is explained by the migration of imperfections. Decrease of dislocations occurs at 400-1100° C., while at higher temperatures, recrystallization takes place. 23 ref. (M26s, Q22n, N5, P15g, 3-68; W)

452-M.* Equilibrium Diagram, Activities and Densities in the Indium-Cadmium System. Th. Heumann and B. Predel. Paper from "Physical Chemistry of Metallic Solutions and Intermetallic Compounds", v. 2. Her Majesty's Stationery Office, London, 1959, 10 p.

Activities of In and Cd in their liquid binary alloys at 426 - 580° C. Partial and integral heat and entropy of mixing. Examination of equilibrium diagram using differential thermo-analysis, dilatometric measurement, metallographic and X-ray methods. 5 ref. (M24b, P12, P10a, P10d; Cd, In)

453-M.* The Non-Stoichiometry of Tantalum Carbide. D. A. Robins. Paper from "Physical Chemistry of Metallic Solutions and Intermetallic Compounds", v. 2. Her Majesty's Stationery Office, London, 1959, 10 p.

X-ray diffraction and chemical analysis of Ta carbide prepared by gaseous carburization of metal filaments or by reaction of Ta and C in molten bath of Fe or Al. Maximum percentage of carbon existing in carbide. Interpretation of lack of stoichiometric in terms of electronic structure. 14 ref. (M26r; M26q, Ta, *C, Fe, Al*, 14-68)

454-M.* Atomic Distribution in Liquid Bi, SnSb and InSb. H. Krebs, M. Haucke and H. Weyand. Paper from "Physical Chemistry of Metallic Solutions and Intermetallic Compounds," v. 2. Her Majesty's Stationery Office, London, 1959, 12 p.

Calculation of atomic distribution in liquid Bi, SnSb and InSb from intensity of X-ray scattering. Structural interpretation in terms of system of resonance bonds of electrons in p state. 28 ref. (M25; Bi, Sb, Sn, In, 14-60)

455-M.* Significance of Non-Stoichiometry in Metal Compounds. J. A. Anderson. Paper from "Physical Chemistry of Metallic Solutions and Intermetallic Compounds", v. 2. Her Majesty's Stationery Office, London, 1959, 29 p.

Theoretical interpretations of non-stoichiometric phase formation in terms of thermodynamic models. Relation to defects in crystal lattice. 131 ref. (M26s, M26q, M24a, P12, P13; 14-68)

456-M.* Thermodynamical Calculation of Phase Diagrams. J. L. Meijering. Paper from "Physical Chemistry of Metallic Solutions and Intermetallic Compounds", v. 2. Her Majesty's Stationery Office, London, 1959, 20 p.

Expressions for calculation of binary miscibility gaps, solid-liquid equilibria, ferrite-austenite equilibria and ternary miscibility gaps from thermodynamic data. 47 ref. (M24, P12)

457-M.* (Ukrainian.) Crystal Structure of Barium Silicate and Cerium Germanium. E. T. Gladishevskii. *Dopovidi Akademii Nauk Ukrain'skoi R.S.R*, no. 3, 1959, p. 294-296.

Types of structure and lattice constants are given for $BaSi_2$ and $CeGe_2$. (M26q; Ba, Si, Ge, Ce)

458-M. (German.) Theoretical Development of the Cast Iron System From the Maurer Diagram to the Collaud Graph. Hans Jungbluth. *Neue Hutte*, v. 4, May 1959, p. 267-276.

Summary of cast iron constitution diagrams formulated by Maurer, Holtzhausen, Ulitzsch, Weichelt, Schwarz, Vaeth, Greiner, Klingenstein, Sipp, Laplanche, Maruyama, Appel, Heller and Collaud. (M24; CI)

459-M.* Sulphur Printing—A New Evaluation. S. Ramachandran and W. G. Renshaw. *Metal Progress*, v. 76, July 1959, p. 101-104.

Normally quite accurate in outlining sulphide distribution in steels, sulphur prints can be adversely affected by tiny electrical currents generated between inclusion and base metal. The misleading indications which occur are explained by corrosion theory. (M23, 9-69; ST)

460-M.* (German.) Constitution Diagram of the Indium-Cadmium System. Theo Heumann and Bruno Predel. *Zeitschrift fur Metallkunde*, v. 50, June 1959, p. 309-314.

Observation of a peritectic reaction forming the phase $InCd_3$. In the presence of 4 to 5 at.% Cd, In changes from a tetragonal face-centered to a cubic face-centered lattice. (M24b; In, Cd)

461-M.* (German.) Textures of Hafnium After Rolling and Recrystallization. Herbert

Muller. *Zeitschrift fur Metallkunde*, v. 50, June 1959, p. 346-350.

After cold rolling, a characteristic change in the (0001)-pole figure is observed. Recrystallization at 800 C. causes a mixed (0001) [1120] texture. 25 ref. (M26c, N5, 3-68; Hf)

462-M. (Czech.) Development of the Equilibrium Diagram Fe-Cr-C. Jaroslav Koutsky. *Hutnicke Listy*, v. 15, June 1959, p. 527-531.

Literature review. 22 ref. (M24c; Fe, Cr, C)

463-M. (German.) Preparation of Tin and Tin Alloys for Metallographic Investigation. B. L. Eyre and Bernhard Keysselitz. *Zeitschrift fur Metallkunde*, v. 50, June 1959, p. 338-346.

11 ref. (M20; Sn)

464-M. (German.) S-Shaped Kink Bands in Deformed Metal Crystals. Pt. 2. Hartwig Muller. *Zeitschrift fur Metallkunde*, v. 50, June 1959, p. 351-363.

A theory is developed explaining the formation of kink bands. 71 ref. (M26s)

465-M.* The Thorium-Aluminium System. J. R. Murray. *Institute of Metals, Journal*, v. 87, June 1959, p. 349-352.

Investigated by thermal, X-ray and metallographic methods. Six intermetallic compounds occur; Th_2Al, Th_3Al_2 and $ThAl_2$ are formed directly from the liquid, while ThAl, $ThAl_3$, and a compound of approximate composition Th_2Al_3 are formed by peritectic reactions. (M24b; Al, Th, 14-68)

466-M.* (Slovakian.) Effects of Cold Deformation on the Inner Structure of Austenitic Grain. Ivan Hrivnak. *Hutnicke Listy*, v. 15, June 1959, p. 507-511.

Micrographs showing block-shaped and other structures and resulting modifications during cold deformation. Values for elementary slip, 10 ref. (M26, Q24a; SS-e)

467-M. (Book.) Elements of X-Ray Diffraction. B. D. Cullity. 514 p. 1956. Addison-Wesley Publishing Co., Inc., Reading, Mass.

Theory, experimental methods and main applications of the technique. (M22g)

468-M. (Book.) The Structure of Metals, A Modern Conception. 118 p. 1959. Interscience Publishers, Inc. 250 Fifth Ave., New York 1. 25s.

Lectures delivered at Institution of Metallurgists refresher course, England, 1958. Papers abstracted separately. (M25, M26)

469-M. (Book.) Vector Space and Its Applications in Crystal-Structure Investigation. Martin J. Buerger. 347 p. 1959. John Wiley and Sons, Inc., 440 Fourth Ave., New York 16, N. Y.

(M26)

470-M. (Book.) The International Bibliography of Electron Microscopy. v. 1. 166 p. 1959. The New York Society of Electron Microscopists, 2 East 63 St., New York 21.

(M21e, 11-65)

471-M.* (French.) Interrelationship and Calculation of Thermodynamic Data. E. Bonnier, R. Caboz and M. De Fromont. *Bulletin de la Societe Chimique de France*, Mar. 1959, p. 537-543.

Thermodynamic properties of Au-Sn, Mg-Pb, Fe-Si and Mg-Sb binary systems can be determined if some properties are known. The relationship between phase diagrams and free enthalpy data are studied. 51 ref. (M24, P12; Au-b, Mg-b, Fe-b, *Pb, Si, Sb*)

472-M.* (French.) Structures Resulting From Deformation by Rolling or Tensile Deformation. Importance of Grain Boundaries and Subboundaries. Aurel Berghezan. *Comtes Rendus*, v. 248, June 22, 1959, p. 3560-3561.

After tensile deformation of an Al-Ag alloy, dislocations and slip planes, made visible by precipitation, appeared at the grain boundaries. Rolling causes dislocations which appear to be distributed equally over the grain. 7 ref. (M26b, Q24a; Al-b, *Ag*)

473-M.* Structure and Density of Iron Films Formed by Thermal Evaporation. O. S. Heavens, M. M. Brown and V. Hinton. *Vacuum*, v. 9, Mar. 1959, p. 17-20.

Method of evaporation employing a pendant drop heated by electron bombardment. Mass of Fe films determined by microchemical colorimetric techniques. Electron diffraction examination shows films to be in a crystallographically ordered state and electron micrographs show no voids or grain boundaries. 8 ref. (M26, P10a, 2-62; Fe, 14-62)

474-M.* (English.) Charts for Determination of Crystal Orientation by Surface Traces in Cubic Crystals. Sakae Takeuchi, Toshio Honma and Susumu Ikeda. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, Apr. 1959, p. 81-93.

Method for determination of orientations of microscopic grains in polycrystalline specimens from angles between surface traces in (111) or (100) planes such as slip lines, annealing twins or etch pits. 4 ref. (M26c)

475-M.* (Chinese.) Formation of Cubic Texture in Nickel-Iron Alloy. L. C. Tai, S. Y. Change and R. P. Liu. *Acta Metallurgia Sinica*, v. 4, Mar. 1959, p. 52-59.

Rolling and recrystallization textures in a 50% Ni-Fe alloy are studied by the X-ray pole figure method. Formation of the cubic texture was found to begin at 600° C., becoming intensified at higher temperatures. 11 ref. (M26c; Ni-b, *Fe*)

476-M.* Retained Austenite by X-Rays. Robert E. Ogilvie. *Norelco Reporter*, v. 6, May-June 1959, p. 60-61.

X-ray spectrometer method of measuring the amount of retained austenite. Diffraction patterns are presented for quenched 52100 steel. (M22g, N8n; AY)

477-M.* Microradiographic Techniques as Applied to the Study of Metals and Ores. E. Niskanen. *Norelco Reporter*, v. 6, May-June 1959, p. 70-71.

Microradiograph of an Al alloy containing 2% Ni, 0.5% Fe and 0.2% Si. The radiographic exposure was made with unfiltered radiation from a Cu anode diffraction tube operated at 30 kv. and 20 ma. Microradiograph of an oolitic iron ore showing the concentric shells of varying iron concentration with the ooliths. (M23n; Al-b, *Ni, Fe, Si*, Fe, RM-n)

478-M.* Recent Developments in the Field of Silicides and Borides of the High-Melting-Point Transition Metals. R. Kieffer and F. Benesovsky. *Powder Metallurgy*, no. 1-2, 1958, p. 145-171.

Composition, crystal structure and equilibrium diagrams of silicides and borides of Ti, Zr, Hf, V, Cb, Ta, Cr, Mo, and W. 75 ref. (M26; Hf, Cb, Cr, Mo, Si, Ta, Ti, V, W, Zr, 14-68, 6-70)

479-M.* Bonding in Carbides, Silicides and Borides. D. A. Robins. *Powder Metallurgy*, no. 1-2, 1958, p. 172-188.

Bonding in carbides, silicides and borides of Ti, Zr, Hf, V, Cb, Ta, Mo and W explained in terms of a relationship between coordination of metal atoms and number of bonding electrons per atom. 18 ref. (M25h, M26r; Ti, Zr, Hf, V, Cb, Ta, Mo, W, C, B, Si, 14-68)

480-M.* Equilibrium, Diffusion and Imperfections in Semiconductors. J. N. Hobstetter. Paper from "Progress in Metal Physics". v. 7. Pergamon Press Inc., New York, 1958, p. 1-63.

Effects of vacancies on electrical properties and solubility of solutes. The precipitation is influenced by dislocations. 88 ref. (M26b, P15g, N7b; EG-j)

481-M. Annealing Effects in Thorium-Uranium Alloys. G. G. Bentle. Atomics International. *U. S. Atomic Energy Commission*, NAA-SR-2969, June 1, 1959, 19 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Microstructural changes were studied metallographically on long-time annealing of unirradiated Th alloys containing up to 10 wt.% U. These changes, an agglomeration of uranium phase and grain growth, have little effect on the irradiation stability. 12 ref. (M27, N3, 2-64, 2-67; Ph-b, *U*)

482-M.* (English.) Structure and Low-Temperature Annealing Effect in Cold-Rolled Alpha Brass. Pt. 2. Structures Cold-Rolled and Annealed at Low Temperatures. Osamu Izumi. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, Apr. 1959, p. 131-144.

X-ray and microscopic observation of structural changes in 70-30 brass due to cold rolling with reductions of 10-90% and annealing at 150-450° C. for various time intervals. Influence of grain size. 6 ref. (M27d, N5, J23, F23, 1-67, 2-59; Cu-n)

483-M.* (German.) Properties of Unalloyed and Alloyed Zirconium and Its Processing. K. Anderko and E. G. Hess. *Metall*, v. 13, July 1959, p. 638-643.

Crystal structure and degree of scaling in air, oxygen or nitrogen as affected by temperature. Procedures forging, extruding, cold rolling and pilgering. 11 ref. (M26, R2q, F-general, 2-61; Zr)

484-M.* (Italian.) Constitution of Ternary Iron Alloys Containing Phosphorus or Sulphur. R. Vogel. *Metallurgia Italiana*, v. 51, May 1959, p. 173-178.

Compilation of constitution diagrams. Effect of sulphur and phosphorus on the equilibrium. (M24c, 2-60; Fe-b, *S, P*)

485-M.* Magnetic Annealing in Permivar. Pt. 1. Structural Origin. R. D. Heidenreich, E. A. Nesbitt and R. D. Burbank. *Journal of Applied Physics*, v. 30, July 1959, p. 995-1000.

Electron diffraction investigation of the structure of soft magnetic materials which exhibit magnetic annealing. Heat treatment in a magnetic field depends upon the oxygen content present as an impurity and is associated with distinct diffraction phenomena. Structural model is based on interpretation of diffraction results, magnetic properties and oxygen content. (M26, P16, J23, 2-60; Ni-b, *Fe, Co*, SGA-m)

486-M.* Interstitial Structures. Roland Kiessling. *Powder Metallurgy*, no. 3, 1959, p. 177-180.

Behavior of various interstitial atoms. Structure of interstitital compounds formed with transition metals. 5 ref. (M26q, M26r)

487-M.* (German.) Iron-Carbon Casting Alloys. Adalbert Wittmoser. *VDI-Zeitschrift*, v. 101, July 11, 1959, p. 817-823.

Composition phases and crystal structures of materials for iron and steel castings. 27 ref. (M26, M24, 2-60; Fe-b, *C*, CI, ST, 5)

488-M. Transformation Temperatures and Structures in Uranium-Fissium Alloys. M. V. Nevitt and S. T. Zegler. *Journal of Nuclear Materials*, v. 1, Apr. 1959, p. 6-12.

The constitution diagram of uranium with its fission products is studied to reveal the solid-state transformation temperatures and the phase constitution of various U-Zr-Cb-Mo-Ru-Rh-Pd alloys. 9 ref. (M24d, T11g; U-b, *Zr, Cb, Mo, Ru, Rh, Pd*)

489-M.* (French.) Dilatometry of Gallium at Atmospheric Pressure. Andre Defrain and Israel Epelboin. *Comptes Rendus*, v. 249, July 6, 1959, p. 50-52.

Confirmation of the presence of a solid phase that is unstable at atmospheric pressure and melts at $-17 \pm 1°$ C. (M23b, M24; Ga)

490-M.* (Russian.) X-Ray Band Width of Metals Deformed at Various Temperatures. N. N. Davidenkov and B. I. Smirnova. *Izvestiya Akademii Nauk, Seriya Fizicheskaya*, v. 23, May 1959, p. 624-628.

Experimental deformations at various temperatures showed that the width of the X-ray band is not a well-defined function of the temperature and may be dependent on the temperature of previous heat treatments. 8 ref. (M26, 3-68, 2-61, 2-64)

491-M.* (Russian.) The Palladium-Ruthenium System. A. A. Rudnitskii and R. S. Polyakova. *Zhurnal Neorganicheskoi Khimii*, v. 4, June 1959, p. 1404-1414.

Phase diagram of hardened and tempered Pd-Ru alloys constructed by means of X-ray phase analysis, absolute thermo-emf., thermal analysis, hardness and electric resistance measurements. 5 ref. (M24n, Pd-b, *Ru*)

492-M.* (Russian.) The Zirconium Corner in the Zirconium-Tin-Molybdenum System. O. S. Ivanov and A. T. Semenchenkov. *Zhurnal Neorganicheskoi Khimii*, v. 4, June 1959, p. 1420-1427.

The phase diagram of Zr with total amounts of Mo and Sn up to 4 at.% showed alpha and beta solid solutions with intermetallic phases of $ZrMo_2$ and Zr_4Sn. The horizontal eutectic line corresponding to the transformation beta $\rightleftharpoons$ alpha + $ZrMo_2$ is located at 680° C. 7 ref. (M24c, M26q; Zr-b, *Mo, Sn, Sb, Mg*, 14-67, 14-68)

493-M.* (Russian.) Aluminum-Yttrium Diagram. E. M. Savitskii, V. F. Terekhonova and V. A. Zikalov. *Zhurnal Neorganicheskoi Khimii*, v. 4, June 1959, p. 1460-1462.

The phase diagram of an Al alloy with 60% yttrium is a complex system in which the region of the eutectic alloy is stretched up to 50% yttrium. In the hypereutectic alloys, containing 13.5 to 42% by weight of yttrium, crystals of chemical compounds appear and the number of these grows as the amount of yttrium is increased. (M24b; Al-b, *Y*)

494-M.* (Russian.) Phase Diagram of Columbium Alloys With Lanthanum and Cerium. E. M. Savitskii, V. F. Terekhova and I. B. Burov. *Zhurnal Neorganicheskoi Khimii*, v. 4, June 1959, p. 1462-1463.

La and Ce with Cb form a diagram with a wide range of immiscibility in liquid and solid solutions. Mono-eutectic horizonal

with Ce is at 2870 ± 20° C., and Cb with La is at 2400 ± 20° C. (M24c; Cb-b, *La, Ce*)

495-M.* (Ukrainian.) Vacancies in Metals and Alloys. S. D. Gertsriken and B. F. Slyusar. *Ukrainskii Fizicheskii Zhurnal*, v. 4, Feb. 1959, p. 137-149.

Formation of vacancies in pure Au, Al, Zn, Sb, Pb and Sn by measuring the increase of electrical resistance over a wide range of temperatures and the changes in the relative elongation caused by temperature variations. 33 ref. (M26s, 2-61; Au, Al, Zn, Sb, Pb, Sn)

496-M.* (Ukrainian.) Determination of Dislocation Density in Strained Metals From Microhardness Measurements. S. D. Hertzricken and N. N. Novikov. *Ukrainskii Fizicheskii Zhurnal*, v. 4, Feb. 1959, p. 247-252.

From the relationship between the interaction of dislocation stress and the tensile strength of a metal, the dislocation density can be computed for a given deformation. Dislocation densities in Al, Cu, Ag and Ni at various degrees of deformation caused by torsion. 17 ref. (M26h, Q29q, 3-66; Al, Cu, Ag, Ni)

497-M. (Czech.) Methods of Stereometric Metallography. Jiri Likes. *Hutnicke Listy*, v. 14, July 1959, p. 573-580.

15 ref. (m23c)

498-M. (Czech.) Metallography of Zirconium and Titanium. Frantisek Plzak and Helena Hubackova. *Hutnicke Listy*, v. 14, July 1959, p. 580-583.

Specimen preparation, chemical polishing, etching and coloring. 6 ref. (M20; Zr, Ti)

499-M. (Czech.) X-Ray Testing of Metals at Elevated Temperatures. Miroslav Cermak. Hutnicke Listy, v. 14, July 1959, p. 593-598.

Equipment and methods. (M22g, 2-62)

500-M.* Equilibrium Shape of an Edge-Dislocation Loop in the Presence of a Supersaturation of Vacancies. G. Saada. *Acta Metallurgica*, v. 7, June 1959, p. 367-373.

Dislocations climb out of the slip plane with the aid of jogs. With reasonable energies of formation and interaction of these jogs, the shape of the loops depends strongly on the crystalline structure at normal temperatures. At very high temperatures the shape of the loop approaches that of a circle. 6 ref. (M26b, M26s)

501-M.* Appearance of Dislocations in Metal Crystals on Evaporation: Twinning Dislocations and Their Relation to Annealing Twins in Copper. E. Votava and A. Berghezan. *Acta Metallurgica*, v. 7, June 1959, p. 392-398.

Evaporation of Cu surfaces produces a step structure which is related to the orientation of the crystals. On noncoherent twin boundaries this step structure has a characteristic aspect in which two cases can be distinguished by simple or multiple evaporation spirals, or evaporation channels. 35 ref. (M26b, N16n; Cu)

502-M.* Observations on Regular Arrays of Etch Pits in a Titanium-10% Molybdenum Alloy. T. H. Schofield and A. E. Bacon. *Acta Metallurgica*, v. 7, June 1959, p. 403-406.

Regular arrays of etch pits observed in rapidly cooled alloys are considered to indicate the sites of unstable groups of dislocations which collapse, at slower rates of cooling, into a more stable network of sub-grain boundaries. 6 ref. (M26b; Ti-b, *Mo*)

503-M.* (German.) Metallurgical Considerations of Steels Used for Weldments and Effect of Alloy Additions. K. L. Zeyen. *Industrieblatt*, v. 59, June 1959, p. 227-238.

Changes in microstructure caused by welding and their influence on mechanical properties. Composition and properties of new-type construction steels and welding electrodes. 30 ref. (M27, Q-general, W29h, 2-60; ST, 7-51, SGB-a, SGB-s)

504-M.* (Slovakian.) Effect of Cold Deformation on the Block Structure of 99.999% Aluminum. Dasa Hrivnakova. *Hutnicke Listy*, v. 14, July 1959, p. 598-602.

In regions of increased flow, block fragmentation is observed in electron micrographs. Slight deformation causes changes in shape and angular disorientation of blocks. After recrystallization, fragmentation along the grain boundaries appears. 8 ref. (M26n, 3-68, N5; Al)

505-M. (French.) Field Emission Microscope. Rene Simon. *Metaux Corrosion Industries*, v. 34, May 1959, p. 204-219.

Secondary emission of a target under ion bombardment. (M21e)

506-M.* Ternary Carbides of the Transition Metals Nickel, Cobalt, Iron, Manganese With Zinc and Tin. H. H. Stadelmaier

and L. J. Huetter. *Acta Metallurgica*, v. 7, June 1959, p. 415-419.

In the ternary systems Co-Sn-C, Ni-Zn-C, Co-Zn-C and Fe-Zn-C, double carbides were found that correspond to the formula T_3BC_2 where T is the transition metal. These compounds have an ordered fcc. structure. 17 ref. (M24c; Co, Ni, Fe, Mn, *Zn*, *Sn*)

507-M. The Role of Vacancies and Dislocations in the Nucleation and Growth of Gas Bubbles in Irradiated Fissile Material. G. W. Greenwood, A. J. E. Foreman and D. E. Rimmer. *United Kingdom Atomic Energy Authority*, AERE-R 2863, 1959, 43 p.

Bubbles nucleate either homogeneously with a spacing less than a micron or on any suitable nucleation sites that may exist on this or a finer scale. The bubbles when once nucleated grow by a vacancy diffusion mechanism, the vacancies being created by the fission process or possibly diffusing from the grain boundaries in very small grains. 38 ref. (M26b, N1, 2-67, P10d; U)

508-M. Tabulation, Bibliography and Structure of Binary Intermetallic Compounds. Pt. 5. Compounds of Aluminum and Indium. A. E. Ray, J. A. Kingston and J. F. Smith. Ames Laboratory. *U. S. Atomic Energy Commission*, ISC-1155, Apr. 23, 1959, 41 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Crystal class, lattice parameters, structure and general observations of several hundred compounds. (M26q, 14-68)

509-M.* (French.) Statistics and Grain Measurements. A. H. Bazin. *Cuivre Laitons Alliages*, no. 49, May-June 1959, p. 33-41.

Application of statistical methods in measuring grain size and determination of homogeneity and heterogeneity of Cu, brass and Al crystal structures. (M27c, M26, S12; Cu, Al, Cu-n)

510-M. (German.) Line Broadening in Stress Measurement Radiography. Ulrich Wolfstieg. *Archiv fur das Eisenhuttenwesen*, v. 30, July 1959, p. 447-450. (M22g, Q25)

511-M. (German.) Use of a New Electric Counting Instrument in the Determination of Microscopic Grain Size. Gunther Schneider and Walter Laux. *Freiberger Forschungshefte*, B39, 1959, p. 1-52.

Description of the Eltinor electric counting instrument, used in conjunction with a microscope. 14 ref. (M27c, 1-53)

512-M. (Russian.) A New Type X-Ray Spectrograph. Ivan Solc. *Czechoslovak Journal of Physics*, v. 9, no. 3, 1959, p. 366-373.

4 ref. (M23n, 1-53)

513-M.* Effects of Irradiation Upon Metals. Frederick Seitz. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 354-367.

Generation and properties of point imperfections (vacant lattice sites and imperfections) in the noble metals, particularly Cu, which is gained from the studies of effects produced by bombardment. Interstitial atoms migrate at temperatures well below that of liquid nitrogen with activation energies near 0.1 ev. Lattice vacancies can be generated with less energy under equilibrium conditions. 32 ref. (M26s, 2-67; Cu)

514-M.* Description of the Sigma Phase as a Structure With Sphere Packing. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 408-411.

Investigation as to whether a model of sphere packing permits the computation of the lattice parameters; their variation with concentration in various sigma phases shows that it does, except in sigma phases containing Si. Observations indicate that a particular role is played by the "E-atoms" in the lattice. 15 ref. (M26)

515-M.* The Constitution of Aluminum-Rich Alloys of the Aluminum-Chromium-Manganese System. J. W. H. Clare. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 429-433.

Equilibrium isotherm at 550° C. for ternary alloys rich in Al containing 0 to 15% Cr and 0 to 20% Mn. Phases encountered are: Al solid solution; theta, eta; a stable ternary compound G; $MnAl_6$. Experiments limited the composition of the G phase at 550° C. and established that the G phase is not stable above 590 $\pm$ 1° C. 5 ref. (M24c; Al, Cr, Mn)

516-M. Aluminum-Silicon Eutectic. R. A. Meussner. *U.S. Naval Research Laboratory*, NRL Report 5331, June 26, 1959, 10 p.

A new eutectic composition of 12.7% Si at 577.2° C. is determined with the

aid of phase transformation studies, quenching experiments and equilibration processes. 8 ref. (M24b; Al-b, *Si*)

517-M.* (German.) The Ternary System Iron-Molybdenum-Oxygen. Willi Juger, Alfred Rahmel and Klaus Becker. *Archiv fur das Eisenhuttenwesen*, v. 30, July 1959, p. 435-439.

Radiographic proof for the presence of the Fe_2MoO_4, $Fe_2(MoO_4)_3$, $FeMoO_4$ and $Fe_4Mo_5O_{16}$ phases. Determination of their respective boiling points. 22 ref. (M24c, P12p; Fe-b, *Mo, O*)

518-M.* The Observation of Dislocations and Other Imperfections by X-Ray Extinction Contrast. J. B. Newkirk. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 483-497.

The Berg-Barrett method for making X-ray diffraction micrographs is capable of revealing individual undecorated dislocations in crystals of Si and Li fluoride. Not only can the positions of the dislocations be seen with respect to the topography of the crystal, but also the direction of their Burgers vector can be determined by a relatively simple procedure. 26 ref. (M26b, M22g; Si)

519-M.* Quantitative Deformation Textures of Aluminum, Copper, Silver, and Iron Wires. August Freda and B. D. Cullity. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 530-535.

Quantitative measurements of the skin testure of Al and the inside texture of Al, Cu, Ag, and Fe by a new diffractometer method. Double <111> + <100> textures were observed for the three fcc. metals, and a single <110> texture for Fe. The results on Cu show that the starting texture can control the deformation texture, and that a strong <100> texture can be obtained by starting with a texture having a strong <100> component. 18 ref. (M26c, 3-68; Al, Cu, Ag, Fe)

520-M.* The Crystallographic Angles of Indium. E. A. Cisney. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 538-539.

Formula for calculating the crystallographic angles of a tetragonal lattice. Angles between the crystallographic planes have been calculated for In. (M26; In)

521-M.* (Russian.) Phase Structure of Chromium-Nickel Steels With Solution Strengthening. K. P. Sorokina, N. I. Blok and N. F. Lashko. *Zavodskaya Laboratoriya*, v. 25, June 1959, p. 659-661.

The phase structure of Cr-Ni Steel forms a six-component system consisting of a strengthening phase beta-Ni_3Ti, two primary phases TiC and TiB_2, two phases Fe_2Ti and alpha-Ni_3Ti and a solid solution. (M24b, N7; SS, *Cr, Ni, B, Ni, Ti*)

Vapor deposition of Ge on a cleavage plane of a CaF_2 crystal. Structure of the Ge layer is influenced by the direction of vapor jet with reference to the crystal. 4 ref. (M26, L25; Ge)

534-M.* (French.) Direct Observation of Thin Metal and Alloy Foil With the Electron Microscope. Claude Beauvais. *Metaux Corrosion-Industries*, no. 407-408, July-Aug. 1959, p. 291-301.

Micrographs of 18-8 type stainless steel, carbon steel, aluminum bronze, Cu-Be and Ni-Cr-Co alloys and duralumin in the normalized, hardened and tempered conditions. 12 ref. (M21e, N-general, M27d, 2-64; Cu-b, Cu-s, *Al, Be*, Ni-b, *Cr, Co*, Al-b, SS, CN, 4-56)

535-M. Preparing Foil for Micro-Examination. Dorothy J. Rahn. *Metal Progress*, v. 76, Aug. 1959, p. 109-111.

The problem was to prepare cross sections of foil less than 1/16 in. thick for metallographic study. The procedure is based on a mounting medium which cures at room temperature and on careful control of polishing. (M20; 4-56)

536-M. Mounting Thin Tungsten Wire and Sheet. U. E. Wolff and L. B. Fradette. *Metal Progress*, v. 76, Aug. 1959, p. 111-112.

Fusing tungsten wire in glass prior to mounting improves the flatness of transverse and longitudinal samples for metallographic study. (M20; W, 4-53, 4-61)

537-M.* (German.) Constitution of the Aluminum-Manganese-Silicon Ternary System. W. Guertler. *Konstitution der Ternaren Metallischen Systeme*, no. 7, 1959, 11 p.

$MnAl_4$ and $MnAl_6$ phases. Existence of a ternary metallide ("T") with 40% Mn

and 15% Si. Primary field of the Al crystals from 0-11% Si. From the Mn side the solubility of Al-Si melts increases from 1% at 577° C. to 2% at 660° C. Vertical section of Al-Mn-Si alloys with 1.5% Mn, 6% Mn, 1% Si and 4% Si. Equilibrium diagram of the Al-Mn-Si alloy at 460° C. (M24c; Al, Mn, Si)

538-M.* (German.) Constitution of the Aluminum-Magnesium-Silicon Ternary System. W. Guertler. *Konstitution der Ternaren Metallischen Systeme*, no. 7, 1959, 4 p.

The binary Mg-Si system is characterized by the dominant position of the stable and high-melting Mg_2Si phase. Solubility of Mg_2Si with increasing temperatures; phase equilibrium of the Al-Mg-Si alloy at room temperature. (M24c; Al, Mg, Si)

539-M.* (German.) Constitution of the Aluminum-Manganese-Zinc Ternary System. W. Guertler. *Konstitution der Ternaren Metallischen Systeme*, no. 7, 1959, 4 p.

In the crystalline stage two ternary equilibrium phases exist between $MnAl_6$ and the Zn-containing crystals. Mn is dissolved in Al crystals up to 0.4%. With increments up to 2% Zn, the Mn solubility is decreased to 0.1%. The existence of the $MnAl_4$ phase on the Al side of the diagramatical section cannot be explained by heterogenic equilibrium laws. (M24c; Al, Mn, Zn)

540-M.* (German.) Constitution of the Aluminum-Copper-Zinc Ternary System. W. Guertler. *Konstitution der Ternaren Metallischen Systeme*, no. 7, 1959, 17 p.

Liquidus areas of the system with 40 to 100% Cu. Equilibrium diagrams at 200, 300, 370 and 385° C. Isotherms at solidification. Section diagrams at constant Al concentration from 300 to 1000° C. Vertical section for constant Zn concentrations. Solubility limits at 800, 600, 475 and 410° C. (M24c; Al, Cu, Zn)

541-M.* (German.) Constitution of the Aluminum-Iron-Zinc Ternary System. W. Guertler. *Konstitution der Ternaren Metallischen Systeme*, no. 7, 1959, 2 p.

In the vicinity of the binary eutectic point of Al-Zn at 380° C., the Al_3Fe phase is present. The eutectic ternary decomposition is reached only later at 363° C. The Fe present exists in the Al_3Fe form. The primary Al_3Fe crystals are of a rhombic nature. (M24c; Al, Fe, Zn)

542-M.* (German.) Constitution of the Aluminum-Iron-Manganese Ternary System. W. Guertler. *Konstitution der Ternaren Metallischen Systeme*, no. 7, 1959, 6 p.

In the Al-Fe-Mn ternary system the binary system of Fe with an open gamma field is combined with a second binary system in a closed gamma field. A closed binary space system is thus created. The ternary equilibrium between the melt, the alpha-Al-Fe crystal and the gamma-Mn-Fe crystal develops with the addition of Al to a higher Mn concentration and decreases at the Mn-Al side of the space diagram. The melting curve cannot be positively indicated. (M24c; Al, Fe, Mn)

543-M.* (German.) Constitution of the Aluminum-Magnesium-Manganese Ternary System. W. Guertler. *Konstitution der Ternaren Metallischen Systeme*, no. 7, 1959, 9 p.

Positions of the peritectic space curves between liquidus areas in the Al-Mg-Mn system. Semi-binary sections in the Al corner between the $Al\text{-}MgAl_3\text{-}MnAl_4$ and $MnAl_6$ corners. Solubility of Mn in liquid Mn is decreased by Al additions. The solidification temperature of the alloy in the Mg corner decreases in proportion to increasing Al content. (M24c; Al, Mg, Mn)

544-M.* Metals and Alloys of the Platinum Group. Ernst Raub. *Journal of the Less Common Metals*, v. 1, Feb. 1959, p. 3-18.

Atomic and crystal structures; transformation behavior. 35 ref. (M25, M26, N-general; EG-c)

545-M.* Tungsten Alloys of High Melting Point. R. Kieffer, K. Sedlatschek and H. Braun. *Journal of the Less Common Metals*, v. 1, Feb. 1959, p. 19-33.

546-M.* Factors Affecting the Grain Structure of As-Cast Molybdenum Ingots. A. R. Moss. *Journal of the Less Common Metals*, v. 1, Feb. 1959, p. 34-41.

Effect of thermal factors such as arc voltage and current, arc length, geometric position of the arc in relation to the mold walls, partition of the arc's energy at the positive and negative poles and heat losses; electromagnetic stirring; physical factors; ingotism and undercooling. 6 ref. (M27c, C5h; Mo, 5-59)

547-M.* An Examination of Part of the Titanium-Carbon System. R. L. Bickerdike

and G. Hughes. *Journal of the Less Common Metals*, v. 1, Feb. 1959, p. 42-49.

Data on the liquidus at the Ti-rich end of the phase diagram up to 1763° C. The eutectic exists at 4.39 at.% C. and 1645 ± 8° C. The solubility of carbon in beta-titanium at the eutectic temperature and at 1558° C. is 0.55 at.%. 4 ref. (M24b; Ti-b, *C*)

548-M.* Techniques Used in Alloy Investigations at Temperatures Above 1200° C. J. R. Murray and G. K. Williamson. *Journal of the Less Common Metals*, v. 1, Feb. 1959, p. 73-76.

Problems related to U and Th and their alloys. Data on thermal analysis and use of the arc furnace for casting various shapes and determination of melting points. (M23r, 2-62, C5h, P12n; U, Th)

549-M. (Russian.) Phase Structure of Cobalt-Boron Alloys. P. T. Kolomytsev. *Doklady Akademii Nauk, SSSR*, v. 125, June 1959, p. 1247-1250.

Cobalt-boron system has four compounds: Co_3B; Co_2B, CoB and eta-phase in the form of CoB_2. Phase structure of alloys with 4 to 5.76% boron is a eutectic alpha + Co_3B and an excess of Co_3B crystals. 7 ref. (M26q, M24b; Co-b, *B*)

550-M.* (German.) Effect of Chromium Carbide Additions to Sintered Hard Metals. Vladimir Dufek. *Neue Hutte*, v. 4, July 1959, p. 425-428.

Effects on structure, bend strength, hardness, wear resistance, corrosion resistance, sintering properties, specific weight and resistivity. (M26r, Q5g, Q29n, Q9n, R1h, P10a, P15g, 2-60; 6-70)

551-M.* (Russian.) The Formation of Sigma Phase in the Rhenium-Manganese and Rhenium-Iron Systems. Ch. V. Kopetskii, N. Ageev, V. Sh. Shekhtova and E. M. Savitskii. *Doklady Akademii Nauk SSSR*, v. 125, Jan. 1959, p. 87-88.

X-ray analysis of a Re-Fe alloy (25% Fe) annealed at 1500° C. for 6 hr. reveals that the epsilon phase Re-Fe has a crystal structure similar to the sigma phase. Re-Mn containing 21.3% Mn, after annealing in vacuum for 360 hr. at 1000° C., has a crystal lattice of the sigma phase. 4 ref. (M26, M24b; Re-b, *Mn, Fe*)

552-M.* (Russian.) Stability of Beta Phase in Titanium-Iron and Titanium-Nickel Systems. N. V. Ageev and L. A. Petrova. *Zhurnal Neorganicheskoi Khimii*, v. 4, May 1959, p. 1092-1099.

Metastable diagrams of phase composition of Ti-Fe and Ti-Ni alloys established by subjecting them to a tempering temperature of 700-1000° C. Beta phase is stable at +20° C. for 100 hr. and at −196° C. for 2016 hr. Beta solid solution of both alloys disintegrates at 100-400° C. with precipitation of omega phase, which is transformed into alpha phase. 6 ref. (M24b, N6p; Ti-b, *Fe, Ni*)

553-M.* (Russian.) Stabilizing Conditions for Beta Phase in Titanium-Molybdenum-Manganese Alloys. N. V. Ageev and Z. M. Smirnova. *Zhurnal Neorganicheskoi Khimii*, v. 4, May 1959, p. 1100-1105.

Phase composition of Ti-Mo-Mn ternary alloys, tempered at 700-1000° C. Stability of metastable beta phase is achieved by heating to 100-600° C. With 17.87% Mn and 4.56% Mo heated at 100-500° C. beta phase of the alloy is retained for 100 hr. With other amounts of Mn and Mo, beta phase is unstable and decomposes during heating into beta→beta + omega→beta + alpha. 5 ref. (M24c, N6p, 2-60; Ti-b, *Mo, Mn*)

554-M.* (Russian.) Investigation of the Antimony-Aluminum Tellurium System. M. S. Mirgolovskaya and E. V. Skudnova. *Zhurnal Neorganicheskoi Khimii*, v. 4, May 1959, p. 1113-1119.

By establishing a relationship between temperature and electroconductivity the solidus line was constructed for a section of AlSb-Al_2Te_3. The solubility limit of Al_2Te_3 in AlSb was established by X-ray analysis and this showed that the solubility of Al_2Te_3 in AlSb is a heterovalent displacement. 11 ref. (M24d; Al-b, *Sb, Te*)

555-M. (Russian.) The Structure of Liquid Gold-Tin Alloy. A. S. Lashko. *Doklady Akademii Nauk SSSR*, v. 125, Jan. 1959, p. 126-128.

There is no interdispersing of atoms during melting. However, one half of the atoms near the melting temperature retain the short-range order of the same type as is found in the crystalline state. 5 ref. (M25n, N10; Au-b, *Sn*, 14-60)

556-M. (Russian.) Continuous Metalloid Solid Solutions in the Ternary System Cobalt-Nickel-Boron. I. I. Kornilov and P. T. Kolomultsev. *Doklady Akademii Nauk SSSR*, v. 125, Feb. 1959, p. 325-326.

With the aid of metallographic and X-ray structure analysis of the system Co-Ni-B the existence was established of

continuous solid solutions between the low borides Co_3B and Ni_3B and between Co_2B and Ni_2B. 8 ref. (M27b, M24c; Co-b, *Ni, B*)

557-M. (Russian.) The Selective Penetration of Elements From the Liquid Phase Into Crevices. V. A. Movchan and I. Ya. Dzykovich. *Doklady Akademii Nauk SSSR*, v. 125, Feb. 1959, p. 354-355.

Investigation to determine the penetration of a liquid alloy into crevices which appear on the dividing interphase boundary, in Al-Cu and Al-Zn alloys. The amount of Al and Zn which appears in the crevices corresponds to the alloy concentrations which are determined by the liquidus line of their phase diagram. The selective penetration of the dissolved elements into the crevices is explained by their inclination to establish an equilibrium between phases. 9 ref. (M24b; Al-b, *Cu, Zn*)

558-M.* (German.) Liquid-Like Atomic Distribution in Solid Amorphous Substances and in Mono-Atomic Metal Melts. Hans Richter and Siegfried Steeb. *Zeitschrift fur Metallkunde*, v. 50, July 1959, p. 369-378.

Radiographic determination of the atom distribution in noncrystalline solid Ge, I, B, Si, As, Sb and Ga and in molten Bi, Ga, In and Sn. Amorphous Bi and Ga show, in the solid state, a distribution of atoms as in a liquid, while Si, Ge, As, Sb and I show a lattice-like atomic arrangement. 50 ref. (M25, M27a; Ge, I, Bi, Si, As, Sb, Ga, 14-66, 14-60)

A preliminary constitution diagram based on results of X-ray tests and melting point determinations and micrographs. 31 ref. (M24b, 2-60, 2-61; Cb-b, B, Ta-b, *B*)

561-M.* (German.) Palladium-Rhodium Alloys and Allotropy of Rhodium. Ernst Raub, Hans Beeskow and Dorothea Menzel. *Zeitschrift fur Metallkunde*, v. 50, July 1959, p. 428-431.

Effects of composition, temperature, quenching or slow cooling from 1300° C. and various heat treatments on the lattice constant. At 845° C. a miscibility gap was observed. (M26p, N6p, 2-61, 2-60, 2-64; Pd-b, *Rh*)

562-M. Technique for Preparing Thin Films of Alpha-Iron. D. G. Brandon and J. Nutting. *British Journal of Applied Physics*, v. 10, June 1959, p. 255-256.

Preparation of foils of alpha-iron which are suitable for direct-transmission examination in an electron microscope. (M20; Fe, 14-62, 4-56)

563-M.* (French.) Nondestructive Metallography Using Large-Size Replicas. Pierre A. Jacquet. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, July 1959, p. 101-110.

Replica method using nitrocellulose lacquer permits optical examination of surfaces inaccessible for direct observation. Used in conjunction with new method of local electrolytic polishing, with a plug-type polisher, procedure allows the study of specimens and objects of any size and shape. 13 ref. (M20p, M20r)

564-M.* (French.) Arrangement of Dislocations in Polycrystalline Metals and Their Relationship to the Stress-Strain Curve. M. J. Whelan. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, July 1959, p. 153-162.

Dislocations in austenitic stainless steel studied by transmission electron microscopy. For low deformations (less than 1% strain), arrangement consists mainly of stacking at grain boundaries. Strain of 1 or 2% or more produces irregular lattice which appears to be formed by stacking caused by stress-relaxation mechanism involving interaction between stacked and isolated dislocations or slip systems which intersect them. 17 ref. (M26b; SS-e, Al, Au, Ni)

565-M.* (French.) New Applications of the Castaing Electronic Microprobe. J. Philibert and H. Bizouard. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, July 1959, p. 187-200.

Results of recent studies pertaining to dendritic segregation, fine precipitates, refractory steels, samples taken during bessemer conversion, identification of oxide films and analysis of nonconductors. 19 ref. (M21e, 1-52)

566-M.* (French.) Relationship Between Processing Conditions, Structure and Properties of 1.25% Manganese Aluminum Alloys. M. K. B. Day. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, July 1959, p. 201-220.

Electrical resistivity measurements were used in conjunction with optical and electron microscopy to follow changes in structure of alloys rolled from semi-continuously cast ingots and given a homogenizing anneal. 28 ref. (M27c, J21, P15g; Al-b, *Mn, Fe, Si*)

567-M.* (German.) "Imaginary" Chemical Compounds in Solid and Molten Eutectic Systems. Anton Hrbek. *Zeitschrift fur Metallkunde*, v. 50, July 1959, p. 431-433.

Dependence of the reduced activation energy in the Bi-Sn system on concentration and temperature of superheating. Changes in activation energy are explained by the existence of a chemical compound of Bi with Sn. 12 ref. (M24e, N14, 2-61; Bi-b, *Sn*, 14-60)

568-M.* The Equilibrium Diagram of the System Bismuth-Palladium. J. Brasier and W. Hume-Rothery. *Journal of the Less-Common Metals*, v. 1, Apr. 1959, p. 157-164.

The freezing point of Bi is depressed by the addition of Pd and sinks to a eutectic at 5.83 at.% Pd and 256° C. The liquidus then rises to 485.4° C., at which temperature the compound Bi_2Pd melts without change of composition. The compound BiPd gives rise to a pronounced max. in the liquidus curve at 618° C., and there is a Pd-rich eutectic at 577° C. At low temperatures the composition of the Bi_2Pd is about 34 at.% Pd. 5 ref. (M24b)

569-M.* Equilibrium Diagrams With InSb as One Component. J. C. Woolley and D. G. Lees. *Journal of the Less-Common Metals*, v. 1, June 1959, p. 192-198.

Three equilibrium diagrams formed from InSb with Sn, Ge, GaSb respectively. The InSb-Sn system shows a peritectic form with a peritectic line at 235° C. No solid solution of InSb in Sn is detected but the limit of solid solution at the Sn end of the diagram is estimated to be 92 at.% Sn. The InSb-Ge system shows eutectic behavior, with eutectic temperature of 512.5° C. and eutectic composition of 5 at.% Ge. No solid solution of InSb in Ge is detected but there is approximately 0.75 at.% solution of Ge in InSb. 14 ref. (M24d; In, Sb, *Sn, Ge, Ga*, 14-68)

570-M.* Equilibrium Diagram of the Ga_2Te_3-In_2Te_3 System. J. C. Woolley, D. G. Lees and B. A. Smith. *Journal of the Less-Common Metals*, v. 1, June 1959, p. 199-205.

Complete solid solution occurs throughout the whole range of composition, but the form of the liquidus and solidus curves shows that the section is not quasi-binary and must be treated as a general section of the ternary system. 7 ref. (M24d; Ga, Te, In, 14-67)

571-M.* The Uranium Monocarbide-Uranium Mononitride System. J. Williams and R. A. J. Sambell. *Journal of the Less-Common Metals*, v. 1, June 1959, p. 217-226.

From 1200° C. upward, the carbide and nitride form a continuous series of solid solutions. At 1200° C. the alloys prepared by solid-state diffusion obey Vegard's law but those prepared by fusion deviate from this law in a systematic fashion. The results of X-ray diffraction studies of the diffusion process suggest that homogenization occurs by solution of the carbide in the nitride, but not by the reverse process. (M24d; U, NM-a35, NM-a36)

572-M.* 1300° C. Isotherm in the System Iron-Chromium-Nickel. Peter E. Price and Nicholas J. Grant. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 635-637.

Limits of the two-phase ferrite-austenite field at 1300° C. The shape of this region, predicted from the Fe-Cr and Cr-Ni binary diagrams, is simply a narrow two-phase field originating close to the Fe corner of the Fe-Cr binary and broadening across the middle of the ternary diagram to meet the Cr-Ni side. 10 ref. (M24c; Fe, Cr, Ni)

573-M.* Comments on the Determination, Analysis and Representation of Preferred Orientation. Robin O. Williams. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 646-647.

Use of inverse pole figures for sheet textures. 7 ref. (M26c)

574-M.* Solid-Liquid Phase Equlibria in the Pseudo-Binary System Bi_2Te_3-Bi_2Se_3. J. P. McHugh and W. A. Tiller. *Metallurgical*

Society of AIME, Transactions, v. 215, Aug. 1959, p. 651-655.

The liquidus and solidus surfaces for the pseudo-binary system Bi_2Te_3-Bi_2Se_3 are determined by conventional cooling and heating-curve techniques and by a new controlled solidification technique. Partition coefficients for Te and Se were also determined. Results of the two methods are in excellent agreement. (M24d, N12; Bi, Te, Se)

575-M.* (French.) Thin Metal Films. Adrien Saulnier and Paul Mirand. *Revue de l'Aluminum*, no. 266, June 1959, p. 687-697.

Methods of preparing thin films used in electron microscopy allowing the production of micrographs and electron diffraction patterns. Data on Al-Cu, Ti-V, Cu-Be, Al-Mg and U-O Alloys. 10 ref. (M20, M21e, M22h, M26; Al-b, *Cu, Be, Mg*, U, *O*, 14-62)

576-M.* (Polish.) Crystallographic Orientation of Iron Single Crystals. Z. Bojarski. *Prace Instytutow Hutniczych*, v. 11, no. 1, 1959, p. 19-23.

Crystallographic orientation as determined by means of back-reflection Laue patterns. 8 ref. (M26c, M22g; Fe, 14-61)

577-M.* Transformation Twins in Alpha Iron. D. S. Hutton, G. L. Coleman and W. C. Leslie. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 680-681.

Transformation twins, identified by their appearance on a polished and etched section, were found in zone-refined iron, in several "high-purity" irons, in Fe-Mn alloys containing up to 0.5% Mn, in enameling Fe, and in low-carbon openhearth steels. They were observed after heating above the Ae_3 temperature, followed by cooling at various rates from furnace cooling to quenching in iced brine. 9 ref. (M27e; Fe-a, Fe-b, *Mn*, ST-e)

578-M.* An X-Ray Method for the Determination of Beta Phase in a Titanium Alloy. B. L. Averbach, M. F. Comerford and M. B. Bever. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 682-685.

The volume fraction of beta phase was determined in a Ti-6Al-4V alloy by measurements of integrated diffraction intensities. A specimen quenched from 1475° F. (800° C.) contained approximately 5% beta, but in specimens quenched from higher temperatures no beta was found. The beta phase formed during aging, and in specimens solution treated at 1570° F. (855° C.) approximately 10% beta was present after aging at 1000° F. (540° C.) for 24 hr. 20 ref. (M22g, J27; Ti-b, *Al, V*)

579-M.* The Constitution of Delta-Phase Alloys of the System Uranium-Zirconium-Molybdenum. M. S. Farkas, A. A. Bauer and F. A. Rough. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 685-693.

In uranium alloys a ternary cut joining 31.5 at.% Mo to 74 at.% Zr is presented on the basis of differential thermal analysis, metallographic and X-ray diffraction data. Hypothetical isothermal ternary sections, inferred from the determined delta-phase relationships, are presented for the U-Zr-Mo system. A ternary eutectoid at 454° C. was found in Zr-rich alloys. 8 ref. (M24c; U-b, *Zr, Mo*)

580-M.* Observations on the Niobium (Columbium)-Hydrogen System. H. W. Paxton, J. M. Sheehan and W. J. Babyak. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 725-727.

Martensitic transformation phenomena. 11 ref. (M24b, N6q; Cb-b, *H*)

581-M.* The Epitaxial Relationships of Cuprous Oxide Formed on Copper Single Crystals Immersed in an Aqueous Solution of Copper Sulfate. Kenneth R. Lawless and G. Tyler Miller, Jr. *Acta Crystallographica*, v. 12, Aug. 10, 1959, p. 594-600.

Shape and orientation of oxide polyhedra on five crystal faces of Cu observed by electron diffraction and electron microscopy techniques. 11 ref. (M26r, R1h; Cu, 14-61, 14-68)

582-M.* Seeing the Invisible With Electrons. F. W. C. Boswell and E. Smith. *Design Engineering*, v. 5, Aug. 1959, p. 23-25.

Applications of electron microscopy in studying the microstructure of steel. (M21e; ST)

583-M.* The Equilibrium Phase Diagram. Its Significance to Foundrymen in Solidification and Heat Treatment. John F. Wallace. *Foundry*, v. 87, Sept. 1959, p. 84-89.

Use of equilibrium diagrams in predicting fluidity, mode of solidification, amount of segregation, feeding distance of risers and type of shrinkage defects.

Effectiveness of grain refiners and influence of heat treatment. 10 ref. (M24, N12, J-general, E25n, E25p; 5-60)

584-M.* Solidification and Heat Treatment. Aluminum and Magnesium Alloys. E. E. Stonebrook. *Foundry*, v. 87, Sept. 1959, p. 90-101.

Equilibrium phase diagrams of Al-Cu, Al-Mg, Al-Si, Al-Zn, Mg-Ce, Mg-La and Mg-Th systems. Appraisal of solidification characteristics, grain refinement and heat treatment using cooling curves and equilibrium diagrams. 12 ref. (M24b, N12, E25n; Al-b, *Cu, Mg, Si, Zn*, Mg-b, *Ce, La, Th*)

585-M.* Solidification and Heat Treatment. Copper-Base Alloys. William L. Rudin. *Foundry*, v. 87, Sept. 1959, p. 102-107.

Cu-Sn, Cu-Al and Cu-Zn constitution diagrams. Prediction of casting characteristics, microstructure, response to heat treatment and mechanical properties. 6 ref. (M24b, N12, E25n, 2-64; Cu-b, *Sn, Zn, Al, Mn*)

586-M.* (Czech.) Isolation of Phases in Fe-Al-C Alloys. Hanus Tuma and Miloslav Vyklicky. *Hutnicke Listy*, v. 14, Aug. 1959, p. 706-710.

Separation of phases by dissolution in electrolytes composed of citric acid or one of its compounds, NaCl, HCl and Br. Time and temperature are controlled. 5 ref. (M20s, M27d, 3-67, 2-61; Fe-b, *Al, C*)

587-M.* The System Titanium-Calcium. I. Obinata, Y. Takeuchi and S. Saikawa. *American Society for Metals, Transactions*, v. 52, Preprint no. 157, 1959, 10 p.

Data on the system Ti-Ca up to 1300° C. No intermediate phase exists in this system. The solubility of Ti in molten Ca decreases from 0.18% at 1250° C. to 0.05% at 860° C. Ca is soluble in Ti to the extent of at least 0.13% at 1300° C. (M24b, P12e; Ti-b, Ca)

588-M.* Substructure Characteristics of Fine-Grained Metals and Alloys Disclosed by X-Ray Reflection Microscopy and Diffraction Analysis. Sigmund Weissmann. *American Society for Metals, Transactions*, v. 52, Preprint no. 171, 1959, 12 p.

Method permits a direct correlation between a quantitative X-ray analysis of the substructure of a fine-grained specimen and a metallographic analysis of the same grains. An X-ray reflection microscopy method is also presented which can be used to provide a topographical analysis of the lattice distortions within the grains and can be correlated to the quantitative analysis of the substructure characteristics. 8 ref. (M27c, M21f, 1-53)

589-M. (Book.) The Sequestration of Metals. Robert L. Smith. 256 p. 1959. Macmillan Co., 60 Fifth Ave., New York 11, N. Y. $8.50.

Definition of sequestration; influence of valency and basicity on sequestration; formation of chelate ring and strength of metal-ligand bonds; stability of chelate system; physical and chemical properties and application of sequestering agents. (M25; AD-q42)

590-M. (Translation—AIP.) Crystal Structure of the Compounds $MoBe_{12}$, WBe_{12} and $TaBe_{12}$. E. I. Gladyshenskii and P. I. Kripiakevich. *Soviet Physics, Crystallography*, v. 2, n.d., p. 730-733.

4 ref. (M26q; Mo, Be, W, Ta)

591-M.* (Translation—AIP.) Exact Determination of the Atomic Coordinates in the Metastable Phase of Ti-Cr Alloys. I. A. Bagariatskii and G. I. Nosova. *Soviet Physics Crystallography*, v. 3, Jan. 1957, p. 15-26.

By means of X-ray goniometric photographs obtained with the reciprocal lattice camera, the trigonal form of the omega phase has been confirmed. The positions of the atoms in the hexagonal unit cell have been determined more exactly. (M26; Ti-b, *Cr*)

592-M. (Translation—AIP.) Electron Diffraction Study of the Structure of Liquid Metals and Alloys. A. I. Bublik and A. G. Buntar. *Soviet Physics Crystallography*, v. 3, Feb. 1957, p. 31-40.

Methods of obtaining electron diffraction photographs of liquid metal films and calculating the distribution function of the atoms. (M22h; 14-60, Sn, Al, 14-62)

593-M. (Translation—AIP.) Determination of the Structure of SCB_2 by X-Ray Diffraction. N. N. Zhuravlev and A. A. Stepanova. *Soviet Physics Crystallography*, v. 3, Feb. 1957, p. 76-77.

Powder photographs of Sc with stationary and rotating samples. On the stationary samples two series of lines belonging to two phases with crystals of different sizes were distinguished. The

larger crystals were those of the rhombohedral boron carbide. (M22g, M26; Sc)

594-M.* The System Titanium-Bismuth. I. Obinata, Y. Takeuchi and S. Saikawa. *American Society for Metals, Transactions*, Preprint no. 156, v. 52, 1959, 12 p.

X-ray diffraction examination and differential thermal analysis of Ti-Bi alloys with less than 65% Bi in the range below 1350° C. The beta-transus of Ti is lowered by addition of Bi and a eutectoid reaction beta alpha + Ti_3Bi occurs at 29% Bi and 725 + 10° C. (M24b; Ti, Bi)

595-M.* The Uranium-Hafnium Equilibrium System. David T. Peterson and D. J. Beerntsen. *American Society for Metals, Transactions*, Preprint no. 158, v. 52, 1959, 15 p.

Hf increases the temperature of the alpha-beta uranium transformation on heating from 668 to 676° C. and lowers the beta to gamma transformation to a eutectoid at 733° C. and 4.5 at .% Hf. Uranium lowers the alpha-beta transformation in Hf to a monotectoid at about 1150° C. and 55 at .% Hf. 10 ref. (M24b; U, Hf)

596-M.* The System Zirconium-Iron-Tin. L. E. Tanner and D. W. Levinson. *American Society for Metals, Transactions*, Preprint no. 166, v. 52, 1959, 19 p.

The Zr-rich corner of the Zr-Fe-Sn system was determined up to the intermetallic compounds $ZrFe_2$ (55% Fe) and Zr_4Sn (24.5% Sn) between the temperatures 200 and 1100°C. (392 and 2012° F.) At ternary phase, theta was found between 7 and 8% Fe at about 24.5% Sn. 11 ref. (M24c; Zr, Fe, Sn)

597-M.* An Electron Microscope Study of Stainless Steel Deformed in Fatigue and Simple Tension. P. B. Hirsch, P. G. Partridge and R. L. Segall. *Philosophical Magazine*, v. 4, June 1959, p. 721-729.

Structure of deformed specimens thinned by electropolishing from one side and examined by transmission electron microscopy. Slip lines and associated dislocations; fatigue striations. 12 ref. (M26b, M21e, Q24c; SS-e)

598-M.* The Silver-Based Heusler Alloys. E. O. Hall. *Philosophical Magazine*, v. 4, June 1959, p. 730-744.

Microscopic and X-ray diffraction examination of ferromagnetic Ag-Mn-Al alloys. Approximate equilibrium diagrams at 400 and 650° C. Structures arising after quenching in water at 650° C. Identification by extraction and electron diffraction of nonequilibrium precipitates in dilute alloys around the composition Ag_5MnAl. Variation of magnetization with temperature. Origin of high coercivity. 13 ref. (M24c, M26p, P16; Ag-b, Al-b, Mn-b, SGA-n)

599-M. (Russian.) Effect of Cooling During Crystallization on the Quantity of Eutectic Formed in Binary Systems. A. A. Popov and E. E. Blyum. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 160-164.

Bi-Cd, Sn-Bi and Sn-Cd alloys were cast into metal molds, sand molds or allowed to cool slowly in a furnace. With very high cooling velocities the forming eutectic can be reduced or its formation even eliminated. With a high cooling rate, diffusionless crystallization takes place. (M24b, N12q, N6, 2-61; Bi-b, *Cd*, Sn-b)

600-M. (Russian.) The Mutual Linkage Between the Elements of Crystal Structure in the Quench Hardened or Strain Hardened State. L. I. Mirkin and Ya. S. Umanskii *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 179-181.

Dislocations formed in carbon and alloy steels by quenching from various temperatures or by plastic deformation (degree of deformation 80%). Effect of composition on the dislocations and relationship between the number of dislocations and the size of blocks formed. (M26b, N7e, 3-68, 2-60, 2-64; AY, CN)

601-M. (Russian.) Effects of Lithium, Zinc and Magnesium on the Crystal Structure of Aluminum. N. I. Varich. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 182-188.

Effect on hardness, third-order dislocations, lattice constants, binding forces within the lattice and on the tensile strength. 9 ref. (M26, Q29n, Q27a, 2-60; Al, *Li, An, Mg*)

602-M. (Russian.) Changes in the Crystal Structure of an Iron-Nickel Alloy Caused by Annealing After High-Frequency Hardening. I. N. Kidin. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 196-202.

Effect of the velocity of heating, chosen for reaching the hardening temperature, on crystal structure and hardness. (M26b, Q29n, J2g; Fe-b, *Ni*)

603-M.* (English.) Magnetic and Crystallographic Analysis by Electron Diffraction. S. Yamaguchi. *Nuovo Cimento*, v. 12, May 1959, p. 1198-1201.

The Lorentz effect observable in electron diffraction is utilized for measurement of the magnetization of ferromagnetic substances. The martensitic transformed layers of austenitic stainless steel were also studied by electron diffraction. (M22h, P16; SS-e)

604-M. (Russian.) Effects of Quenching and Subsequent Annealing on the Crystal Structure of Steel. K. F. Starodubov, A. A. Sazonova and V. K. Babich. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 230-232.

Effect of various heat treatments on the number of second-order dislocations and on dimensions of mosaic blocks in the alpha-phase. (M26b, J23, J26; ST)

605-M.* Columbium-Oxygen System. Rodney P. Elliott. *American Society for Metals, Transactions*, Preprint no. 143, v. 52, 1959, 17 p.

Metallographic examination of arc-cast alloys made of electron-gun-refined Cb metal and special purity Cb pentoxide. Two intermediate oxides, CbO and CbO_2, melt without decomposition at 1945 and 1915° C. (3533 and 3479° F.), respectively. Eutectic reactions exist between Cb and CbO at 1915° C. (3479° F.) and between CbO and CbO_2 at 1810° C. (3290° F.) 13 ref. (M24b; Cb-b, *O*)

606-M.* The Yttrium-Magnesium Alloy System. E. D. Gibson and O. N. Carlson. *American Society for Metals, Transactions*, Preprint no. 146, v. 52, 1959, 13 p.

Three peritectic compounds, gamma (Y-Mg), delta (Y-Mg) and epsilon (Y-Mg) have been identified from microstructures and X-ray data. Gamma (Y-Mg) has the formula YMg (21.5 wt.% Mg) and decomposes at 935° C. (1715° F.) The delta phase (Y-Mg) occurs at approximately 41 wt.% Mg and decomposes at 780 C. (1425° F.), and epsilon (Y-Mg) occurs at approximately 60 wt.% Mg and decomposes at 605° C. (1120° F.). 6 ref. (M24b; Y, Mg)

607-M.* Investigation of the Thorium-Yttrium System. D. T. Eash and O. N. Carlson. *American Society for Metals, Transactions*, Preprint no. 142, v. 52, 1959, 17 p.

A high-temperature bcc. allotrope of yttrium was identified above 1490° C. A region of complete solid solubility occurs at elevated temperatures in this system and a eutectoid at 1375° C. and 25 wt.% yttrium. The solid solubility limits of the alpha Th and alpha yttrium regions are approximately 20 and 30 wt.% yttrium, respectively. 7 ref. (M24b; Th-b, *Y*)

608-M.* Fabrication Variables Related to Texture and Mechanical Properties of Beryllium. Jacob Greenspan. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 183-190.

The anisotropy of fracture and slip (the brittleness and ductility of the Be single crystal) is characteristic also of polycrystalline Be in which the grains are oriented in a preferred manner. Be with grain orientations resulting from hot working either unidirectionally or bi-directionally is ductile or brittle in directions given by the anisotropy and orientation of the grains. Textures developed from various hot working sequences; tensile results are correlated with textures. 7 ref. (M26c, 3-68, Q-general; Be, 14-61)

609-M.* Preferred Orientation in Uranium, Thorium, Zirconium and Beryllium. C. J. McHargue and K. Jetter. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 430-459.

Effect of preferred orientation on physical and mechanical properties. 47 ref. (M26c; U, Th, Zr, Be)

610-M. (Russian.) High-Temperature Segregation Into Two Phases of the Solid Solution in Cu-Ni-Co Alloys. S. S. Gorelik. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya*, no. 2, 1959, p. 176-180.

Conditions thought to favor phase segregation; great difference of diffusion coefficients; small difference of free energies and slight difference between segregation and melting temperatures. (M24b, 2-62; Cu-b, *Ni, Co*, 14-67)

611-M. (Russian.) Formation and Movement of Dislocations in Nickel and Ni-Cr Alloys. O. I. Mgebran. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya*, no. 2, 1959, p. 202-206.

Effects of quenching temperature, cold deformation and annealing temperature. Dislocations are investigated by exposing

the samples to a current and measuring the difference of potentials. 8 ref. (M26b, 2-64, 3-68; Ni, Ni-b, *Cr*)

612-M. (Russian.) Blocking Effect of Grain Boundaries on the Consistency of Dislocations. O. I. Mgebran. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya*, no. 2, 1959, p. 207-211.

Investigation on Zn, Al, Cu and Fe. Reduction of consistency depends on the ratio of deformation energy to freed heat. 5 ref. (M26b, M27f, 3-68; Zn, Al, Cu, Fe)

613-M.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Physical Metallurgy of Zinc. E. A. Anderson. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds. ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 400-422.

Metallographic techniques; effect of impurities and added elements on microstructure and mechanical properties. Mechanisms of plastic deformation in single crystal and polycrystalline specimens. 59 ref. (M20, M26n, Q24, 3-69; Zn, 14-61)

614-M.* Zinc as an Alloying Agent. C. H. Mathewson. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 573-626.

Designation, composition and chemical properties of wrought and cast Cu-base alloys containing Zn. Compositions of other materials containing Zn including Mg alloys, Ag solders, Al alloys, brazing filler metals, Ni silver, white Au and Sn alloys. Comprehensive compilation of phase diagrams of binary and ternary Zn alloy systems. 55 ref. (M24b, M24c, Q27a; Zn-b, Cu-n, Al-b, Mg-b, SGA-f)

615-M.* (German.) Deformation and Recrystallization Occurring in the Preparation of Metallographic Zinc Specimens by Grinding and Mechanical Polishing. H. Borchers and R. Schwarzwalder. *Metall*, v. 50, Aug. 1959, p. 738-739.

619-M. (German.) Carbonitrides of Columbium. Georg Brauer and Richard Lesser. *Zeitschrift fur Metallkunde*, v. 50, Aug. 1959, p. 487-492.

Phases of the ternary system columbium-columbium carbide-columbium nitride. 16 ref. (M26r; Cb, 14-68)

620-M.* (English.) X-Ray Studies on the Substructures in Extended Aluminum Crystals. S. Karashima. *Osaka University, Memoirs of the Institute of Scientific and Industrial Research*, v. 16, 1959, p. 43-54.

Striations in the Laue spots of the X-ray diffraction pattern of Al single crystals. Such striations are thought to be due either to the formation of edge dislocation walls, or, more probably, to mixed dislocation walls in the subgrain boundaries. Relation of these phenomena to the mechanism of recovery. (M22g, M26b; Al, 14-61)

621-M.* (German.) High-Temperature Microscopy. F. Gabler and W. Wurz. *Metall*, v. 13, Sept. 1959, p. 819-823.

Observation of grain growth in electrolytic Cu, alpha-gamma-delta transformation in pure iron, solidification of pure iron, and alpha-beta transformation in Zr, through a hot stage microscope. 5 ref. (M21c, M27, N8, N3, 2-62; Fe-a, Zr, Cu)

622-M.* (German.) Microradiography Using X-Rays. K. Sagel. *Metall*, v. 13, Sept. 1959, p. 842-850.

Various testing methods with X-rays and gamma rays. Mass coefficients for X-ray and gamma ray absorption are listed for a number of elements. 23 ref. (M23n)

623-M.* Plutonium Constitutional Diagrams. F. W. Schonfeld, E. M. Cramer, W. N. Miner, F. H. Ellinger and A. S. Coffinberry. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 579-599.

Compilation of binary constitutional diagrams together with crystal structures. 5 ref. (M24b, M26; U)

624-M.* Uranium Alloy Systems. Arthur A. Bauer and Frank A. Rough. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 600-611.

Crystal structure data for uranium phases and compounds. 45 ref. (M24b, M26; U)

625-M.* Thorium Alloy Systems. Arthur A. Bauer and Frank A. Rough. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 612-620.

Constitution diagrams and tabulation of crystal structure data. 18 ref. (M24b, M26; Th)

626-M. (German.) Dependence of the Deflection of a Band on the Position of an Edge Dislocation. Frantisek Kroupa. *Czechoslovak Journal of Physics*, v. 9, no. 4, 1959, p. 488-494.

Deflection angle as a function of the position of edge dislocations with reference to the central plane of band. 6 ref. (M26b)

627-M.* The Crystallography of the Beta-Alpha Transformation in Zirconium and in Two Titanium-Molybdenum Alloys. P. Gaunt and J. W. Christian. *Acta Metallurgica*, v. 7, Aug. 1959, p. 534-543.

The habit planes and orientation relationships associated with the transformation studied in two specimens of crystal bar Zr. X-ray and kinetic observations both show that deformation accompanying transformation is much more severe in Zr than in Ti, possibly as a result of a large volume change, and the discrepancies may be due to the accommodation stresses. 18 ref. (M26c, N6; Zr, Ti-b, *Mo*, 5-67)

628-M.* The Fe-Cr-Co-C Quaternary System. D. Coutsouradis and L. Habraken. *Cobalt*, no. 4, Sept. 1959, p. 3-27.

Isothermal sections at 850, 1000 and 1100° C. were drawn for the 10% Co alloys. Results reveal that Co additions to Fe-Cr-C alloys with less than 30% Cr produce only a shift in the transformation lines and do not lead to new phases. Co in Cr steels shows an appreciable gamma-field-broadening effect, provided that the Cr content is sufficiently high. Thus Co can easily transform the martensite-ferrite structure of some low-carbon stainless steels into an entirely martensitic structure. 24 ref. (M24d, N8; Fe, Cr, Co, C, SS)

629-M.* Evidence of Dislocations in Crystals. A. K. Mallik. *Indian Institute of Metals, Transactions*, v. 12, June 1959, p. 154-164.

Growth of metal whiskers; spiral growth of crystals; local precipitation; etching techniques; electron microscopy. 21 ref. (M26b, M20, M27, N3r)

630-M. An Electrolytic Saw. M. Metzer. University of Illinois. (Office of Naval Research.) *U. S. Office of Technical Services*, PB 151574, Mar. 1958, 8 p. $.50.

Much higher rates of strain-free cutting of metal crystals in the laboratory can be achieved by the use of the electrolytic saw instead of the usual chemical method. Chemical saws may be converted to electrolytic ones by substituting a metal wire cathode for the thread and passing a current from the specimen to the wire through an electrolyte which flows over the specimen. (M20, 1-52; 14-61)

631-M.* (French.) Elimination of Vacancies in High-Purity Aluminium. M. Wintenberger. *Acta Metallurgica*, v. 7, Aug. 1959, p. 549-555.

In high-purity Al, air-cooled from elevated temperatures, the resistivity increment due to vacancies is completely eliminated at room temperature. The rate of this recovery increases with the dislocation density. Dislocations probably remove all the vacancies by a process of elastic interaction. It is thus possible, after having determined the energy of diffusion of vacancies, to evaluate the

dislocation density produced by cold working. 22 ref. (M26b, 3-68, P15g; Al-a)

632-M.* (French.) Blocking Dislocations by Cavities and Small Precipitate Particles. P. Coulomb. *Acta Metallurgica,* v. 7, Aug. 1959, p. 556-559.

Investigation of the influence of thermal agitation and applied stresses on the liberation of blocked dislocations from the cavities. The heat of activation of the phenomenon varies linearly with the applied stress. (M26b, 3-66)

633-M.* New Macroetch Eases Study of High Alloy Steels. *Steel,* v. 145, Oct. 12, 1959, p. 118.

Composition of etchant given for superalloys. Mixture is simple, chemically stable and nonfoaming. (M20q, M28; SS)

634-M. Electron Microscopical Examination of Bonds in Zircaloy-2. Arthur P. Young and Charles M. Schwartz. Battelle Memorial Institute. *U. S. Atomic Energy Commission,* BMI-1364, July 29, 1959, 28 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.

Effects of various mechanical and surface treatments and impurities on the structure of Zircaloy-2 bonds. (M21e, 3-69; Zr-b, 7-58)

635-M. Zirconium Fluoride Phase Studies. Pt. 1. A Preliminary Investigation of Solid Phases. A. G. Chapman and R. A. Woodriff. Phillips Petroleum Co. *U. S. Atomic Energy Commission,* IDO-14469, Jan. 15, 1959, 19 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Solid phases in the system zirconium-hydrofluoric acid-nitric acid. 8 ref. (M24d, P12e; Zr)

636-M.* (Russian.) Constitution Diagram of the System Li-Li N. K. A. Bol'shakov, P. I. Fedorov and L. A. Stepina. *Izvestiya VUZ—Tsvetnaya Metallurgiya,* no. 4, 1959, p. 52-53.

Melting under argon. Measurements by means of a thermocouple. Recording of crystallization graphs. (M24a, P12n, N12n; Li, NM-a36)

637-M.* The Nature of a Metal Surface. Walter Boas. *Australasian Engineer,* v. 51, July 1959, p. 48-57.

Appearance of metallic surfaces at high magnification; kinetics by which structural features are produced; effects of surface structure on physical and chemical properties. 28 ref. (M27, M26)

638-M. (Russian—Book.) Effect of Irradiation on Structure and Properties of Structural Metals. M. S. Lagovskaya. 39 p. 1958. Oborongiz, Moscow. (Available from Library of Congress, Washington, D. C.)

The strongest effect on the structural properties of metal is produced by neutrons, which, because they lack an electric charge, are capable of penetrating the crystal lattice and causing various alterations. It is concluded that the Frenkel' defect in the crystal lattice is responsible for the basic structural change in metals that determines their physical and mechanical properties. (M26, 2-67; SGB-s)

639-M. (Translation—ISA.) Production of Thin Alloy Specimens of Varying Composition. G. A. Kurov. *Pribory i Tekhnika Eksperimenta,* July 1959, p. 692-695.

Production of a variety of alloy specimens in the form of thin films by vacuum deposition. Design of evaporator and vacuum system. (M20, N15g, 1-73; 14-62)

640-M.* (Swedish.) Testing of Low Deformation Degrees by Means of X-Rays. Anders Sandin. *Metallen,* v. 15, no. 1, 1959, p. 15-16.

Measurement of small degrees of deformation, down to 0.1% on brass wire, following the Laue back-reflection method. (M22g, Q24; Cu-n, 4-61)

641-M.* (Swedish.) Testing of the Cold Deformation of Brass by Metallographic Etching. Lennart Johansson. *Metallen,* v. 15, no. 1, 1959, p. 17-21.

Electrolytic etching in a 0.25% solution of Na_2SO_4 subsequent to electrolytic polishing. The method allows the discovery of small deformation degrees. Its sensitivity is influenced by the Zn content. (M20, Q24, 2-60; Cu-n)

642-M.* Lattice Spacing Relationships in Magnesium Solid Solutions. D. Hardie and R. N. Parkins. *Philosophical Magazine,* v. 4, July 1959, p. 815-825.

In binary Mg solid solutions containing Al, Bi, Cd, In, Pb, Li, Ag, Sn and Zn, the lattice distortion accompanying the introduction of a solute depends on the difference in size of the solute and solvent atoms, their relative electronegativity and the electron:atom ratio in the solution. 15 ref. (M27b; Mg-b, Al, Bi, Cd, In, Pb, Li, Ag, Sn, Zn)

643-M.* Laves Phase Compounds of Rare Earths and of Hafnium With Noble Metals. Vera B. Compton and Bernd T. Matthias. *Acta Crystallographica,* v. 12, Sept. 10, 1959, p. 651-655.

X-ray diffraction determination of lattice constant of cubic and hexagonal laves phase compounds. Superconducting and ferromagnetic transition temperatures. 16 ref. (M26q, P15g, P16, EG-g45)

644-M.* Preferred Orientation in Silicon Iron. P. N. Richards. *Australian Institute of Metals, Journal,* v. 4, Aug. 1959, p. 114-123.

Development of a preferred orientation of the (110) 001 or "Goss" type in cold reduced 3% Si iron is shown to occur during final annealing by a process akin to secondary recrystallization. For secondary recrystallization to occur normal grain growth of the primary structure must be restrained. This may be brought about by the presence of finely dispersed silicon nitride. 18 ref. (M26c, N5; AY, *Si,* SGA-n)

645-M.* Studies of the Structure of Anodic Oxide Films on Aluminum. Pt. 1. D. J. Stirland and R. W. Bicknell. *Electrochemical Society Journal,* v. 106, June 1959, p. 481-485.

Formation voltages less than 100 v. produce nonporous amophous oxide layers, while those over 100 v. also produce some crystalline gamma alumina. The low-voltage layer dissolves quickly in a phosphoric-chromic acid mixture. 16 ref. (M26r, 8-73; Al)

646-M.* Exploring Beryllium's Potential. Charles J. Giemza. *Missiles and Rockets,* Sept. 7, 1959, p. 22, 29, 31-32.

Anisotropic character of crystal structure; influence of hot pressing, hot upsetting or extruding and rolling on development of desirable crystallographic texture and mechanical properties. Factors causing embrittlement. Difficulties in assessment of properties. (M26c, Q23p, 3-68; Be)

647-M.* The Crystal Structure of UPt_2. B. A. Hatt and G. I. Williams. *Acta Crystallographica,* v. 12, Sept. 10, 1959, p. 655-657.

X-ray diffraction patterns of powder and single crystal UPt_2. 4 ref. (M26q, M25m; U-b, Pt-b)

648-M.* The Crystal Structure of $ZrAl_2$. C. G. Wilson. *Acta Crystallographica,* v. 12, Sept. 10, 1959, p. 660-662.

X-ray diffraction examination of powder and single crystals. 5 ref. (M26q, M25m; Al-b, Zr-b)

649-M.* Transition Element—Rare Earth Compounds With the Cu_5Ca Structure. J. H. Wernick and S. Geller. *Acta Crystallographica,* v. 12, Sept. 10, 1959, p. 662-665.

Crystallographic investigation if intermetallic compounds of yttrium or rare earth and transition elements Co, Ni or Cu. Powder diffraction data; lattice constants and interatomic distances. 9 ref. (M26q; Co-b, Ni-b, Cu-b, *Y, Ce, Pr, Nd, Gd, Dy, Er,* EG-g45, *La*)
